Beyond the useful but static classification of the case studies, it is essential to consider the transformations at stake. In the context of this research, the main identified pattern is a bipolarization of the makerspace's spectrum.

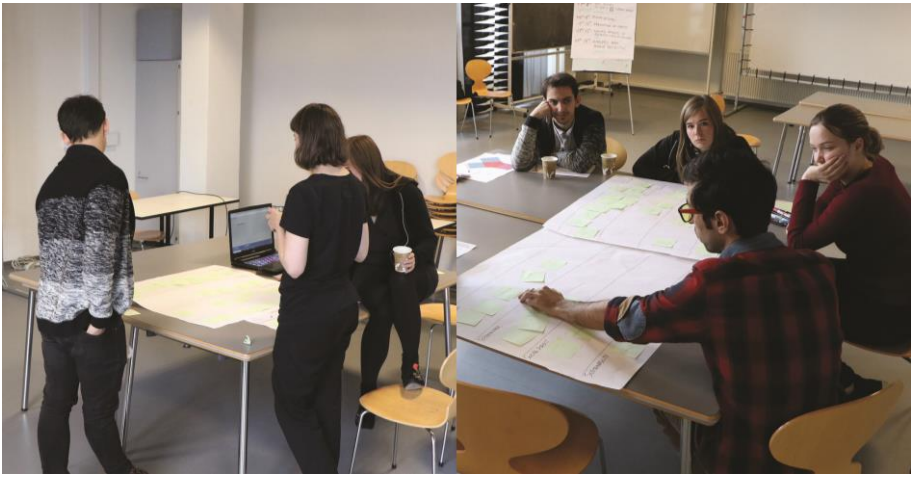

Figure 3: The participants first familiarized with their given case in groups, before sharing their insights and observations in plenary. The contrasting between cases led to the exploration of possible future scenarios regarding the development of makerspaces.

4.1. Towards Two Complementary Poles

The first premise of this paper, building on Hennelly et al.'s work (2019), is that Type 2 makerspaces will progressively disappear and be absorbed by the two other types.

This will firstly stem from the emergence and enhancement of more makerspaces embracing the productive aspect of digital fabrication – Type 3 –, invigorating short supply chains and local economies. Beta Factory gives a good example of this transition, originating in the impossibility for Underbroen to accommodate the productive ambitions of both its founders and some of its members.

This evolution was perceived, during the experiment, as a way to add to the Maker movement a higher level of craft and expertise, as well as to sustain «craftsmanship and make sure that craftsmen will persist in the future». This combination of craftsmanship values, sometimes compared to the original hacker ethic (Himanen, 2001), and digital tools of communication, conception and fabrication, represent a real disruption potential (Micelli, 2015). Incidentally, an increasing number of frameworks now advocate for "globally connected, locally productive" models (Fab City Global Initiative, n.d.)

Nevertheless, there is a risk for Type 3 makerspaces to be taken too far away from their Maker-based roots, following the same path as the "sharing" economy with examples such as Uber and Airbnb. The Maker movement being absorbed back into business-as-usual is in fact one of the three potential scenarios derived from the two years long European Make-it program (Sbeih, 2017). In the Copenhagen context studied here, the yellow line might be

quite close. With the high running costs induced by the rent and the energy consumption, Beta Lab is in need of big projects and partners coming from the outside, which could eventually divert them from the forward-looking decentralized model they started setting up (Javelle & Péché, 2013).

This concern is obviously not a plea to slow down the move towards productive makerspaces but more an invitation to operate this move reflectively, in order to avoid these shifts to generate «negative patterns with unfortunate consequences» (Stewart & Tooze, 2015).

The second expected dynamics of this bipolarization process are the strengthening of existing educational poles. Through their accelerating implementation in diverse public spaces and educational institutions (Barrett, 2015), and with the increased awareness about the culture of making, it is believed that these spaces will gain agency as well as more design sensitivity.

This drift could be matched with the observed expansion of Fablab Copenhagen. This topic was also raised by the designers during the experiment, questioning what could be the consequences of such a scaling up.

4.2. Two Poles, One Hub

The second premise internalizes, while pushing further, some of Stewart and Tooze vision (2015) of the potential for educational makerspaces to prepare «a future generation of 'employees'» for their productive counterparts.

This vision is the core contribution of the design experiment to this paper, and perhaps the core postulate of the paper itself. The anticipated bipolarization, instead of creating two very discrete entities, could rather give birth to a duo, or Hub. Considering simultaneously the role of super users in the Fablab organisation and the sharing of skills and knowledge already taking place at Beta Factory, the experiment participants quickly visualized the potential of bridging these two into a single loop. Instead of paying for their membership, willing craftsmen could facilitate introductions to certain skills, as superusers do, therefore substituting money flows with knowledge ones and reviving a commons-based economy (Kostakis et al., 2016). Hobbyists would benefit from experts' supervisions and have the choice to keep their activity as hobbies or to scale it up in the adjoining facilities.

This theorized Hub would provide communities with locally produced goods and services, as well as with a pool of locally shared skills and competences. Municipalities and regional political bodies, in return, could provide support through subventions and public sector partnerships. It is believed that making this fabrication culture more visible and desirable will ease the shift of current consumption habits towards more conscious, sustainable and local behaviours (Clune, 2010; Shove, 2003). The Hub could also become a favourable platform for the emergence of "local discontinuities", easing the generation of sustainability through social innovation (Manzini, 2015).

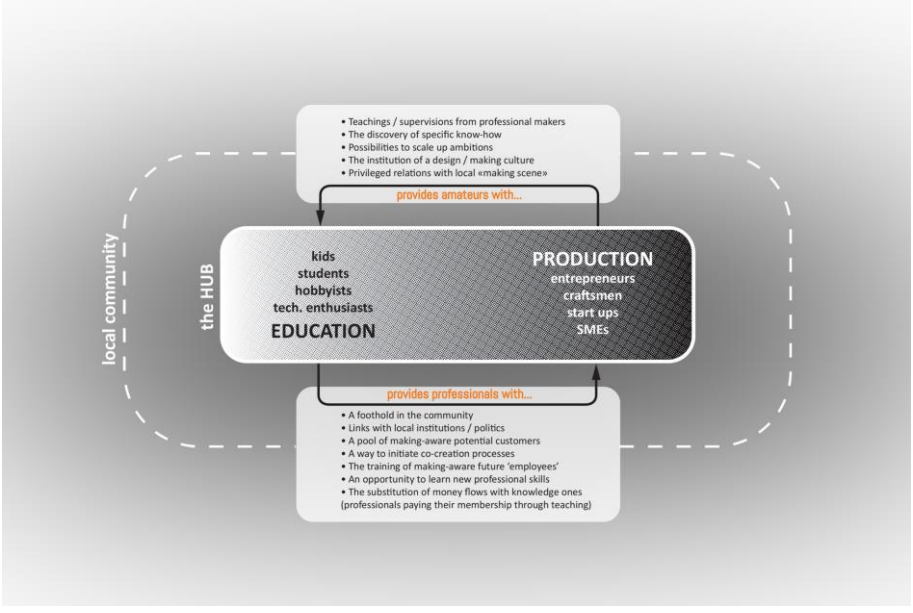

Figure 1. The theorized education/production Hub

4.3. Towards a Sustainable Model of Production

By drastically shortening supply chains and reorganising the economy around distributed Hubs; by empowering people and communities through a culture of making and a strong local alternative to global-market goods; by establishing tight connections with both local political bodies and SMEs; it is strongly anticipated that the above-described shifts could deeply impact the current societal model. The focus would then be moved away from profit-making only, allowing a true path towards sustainable development, or, in a more utopian but enviable vision, a path towards the true «roots of sustainability» (Erhenfeld, 2005).

It is shown that, at the moment, environmental sustainability is not at the core of Makers preoccupations (Klemichen et al., 2018; Kohtala & Hyysalo, 2015; Millard et al., 2018). However, the case studies and the design experiment indicated that, despite this lack of attention, local making and manufacturing practices are already embedded with a number of unconscious sustainable behaviours. This is inherent to the nature of the Makers and Hackers movements (Kohtala, 2015; Himanen, 2001).

Besides the environmental aspect, there are signs that the Makers movement is already generating great social sustainability (Kostakis et al., 2016). Furthermore, the experiment laid the foundations for an economically sustainable re-distributed model of production.

These existing patterns only need to be fostered and, in certain cases, guided to meet their full potential (Klemichen et al., 2018). Progressively integrating more links of the design chain within makerspaces will give them more agency and, it is hoped, generate a bigger impact. Finally, moving away from Type 2 makerspaces will help establishing them more as truly local institutions and less as incubators for ideas to enter back the globalized market afterwards.

5. Conclusion

In an attempt to open new perspectives towards more preferable futures, this paper advocates the implementation of a strong decentralized, re-distributed manufacturing model. Its main postulate is that this vision could be met by guiding more makerspaces towards productive purposes, and by operating them in parallel with existing education-oriented spaces. It is expected that the newly created Hubs will play a big role in diffusing a «making culture» within local communities or, at least, in raising the awareness of these communities about their disruptive power.

It would of course be incorrect to consider the case studies presented in this paper as the sole and entirely representative reflections of the current makerspaces landscape, mainly because of its heterogeneous nature. However, they give real-life examples of a possible model of development for these spaces.

The future of makerspaces as well as the path to decentralized production in general are highly uncertain, and subject to a number of threats that could spoil their original discourse and ethos. But this paper aims, building on the visions of numerous other authors, to look beyond the inevitable and apparently inexorable. It urges the concerned stakeholders – makers, designers, educational institutions, politics and potentially everyone – to join forces towards preferable futures that could sustain and gather communities around values such as respect, collaboration and sustainability.

Research on the Application of Lacquer Craft in Modern Accessories

Tianxiao Xie[a]

[a]Beijing Institute of Fashion Technology

Abstract | From the perspective of the environment, mood, behavior and significance, the present study analyzes why and how Chinese lacquer is applied in modern accessories. A bodiless rapid prototyping method is proposed in the study for accessories coated with Chinese lacquer, and a drying method is put forward for 3D-printed metal materials coated with Chinese lacquer. The feasibility of the two technical solutions is verified by experiments. Finally, from the perspective of future opportunities and challenges, the study analyzes the environmentally sustainable value of lacquer and people's demand for lacquer accessories, and looks forward to the lacquer craft assisting Chinese accessories manufacturing industry to upgrade and transform.

KEYWORDS | LACQUER CRAFT, ACCESSORIES DESIGN, TRADITIONAL TECHNOLOGY, RAPID PROTOTYPING

1. Research Background

"The Inheritance and Innovation of Chinese lacquer" has been a hot subject in the design and craft research field of East Asia (especially China, Japan and South Korea) in recent years. To apply traditional craft elements in modern design has become a consensus within the academic circles and a hotspot of attention of today's craft artists and designers. Throughout the history of craft development, craft has been corresponding to art all the time. "Art is created for appreciation while craft is born for a practical purpose"[1]. Inheriting the traditional craft in the modern society does not mean documenting and reviewing the craft only, but also means returning it to the original concept of "craftsmanship" to primarily meet living needs. "Usage" values are more important than "ornament" values. For this reason, "usage" must be blended with "ornament" to make the traditional craft adapt to the modern society.

Lacquerware used to be indispensable articles in the Oriental society and infiltrated in many sectors such as food utensils, furniture, ornaments and architecture. Unlike royal ornamental lacquerware and modern lacquer artworks, long-standing lacquerware for daily use does not provide an amazing visual effect, but it can meet our needs for production and living. The same is true for accessories. An exquisite crown stands for the status and power like a piece of royal lacquerware, displayed in museums to be appreciated by visitors; however, most accessories (e.g., bags, footwear, hats, cuffs and brooches) are nothing more than articles requisite for common people like lacquerware for daily use. Not only are they used in everyday life, but they make us move with ease. On the other hand, lacquerware for daily use is slowly disappearing from life for the reason that the traditional lacquerware prototyping method is time-consuming, costly and complicated, and that many new materials have come into being along with the development of modern technology. Will Chinese lacquer remain useful? In the present study, the author tries to review material performance from the perspective of an accessories designer and then points out the application values and methods of Chinese lacquer in modern life from the angle of accessories design by combining people's needs for accessories with their aesthetic demand in modern society. Then, the author compares the traditional technologies by which lacquerware is made out of different materials, including wood, bamboo, cloth, paper and earthenware, from a Chinese lacquerer's perspective, and conducts experiments on bodiless lacquerware using a new method and metal lacquering based on the modern prototyping technology, effectively shortening the production time and lowering the manufacturing costs of lacquered accessories.

2. Chinese lacquer performance and accessories design

2.1 The Application and Conflict of lacquer craft in Modern Life

Chinese lacquer, made from lacquer tree sap, is referred to as the "blood of the Orient". It is a material that becomes increasingly bright-colored as time goes on, and has been used as paint in China for more than 7,000 years. In Asian countries such as China, Japan, South Korea and Vietnam, it can often be found that artists use lacquering technology to convey ideas. They have created lots of world-renowned works. Application of Chinese lacquer can also be seen in the works of art created by western countries such as France, Germany, the USA and Belgium. There is a Chinese idiom which goes, "cleave together as firmly and inseparably as glue and lacquer". It suggests that in the Oriental history of technology, Chinese lacquer is an important binder. Mother-of-pearl inlay, gold foil, jade, crystal, pearl, coral, agate, tortoiseshell, lapis lazuli, turquoise, beeswax, agilawood……whether it is a rare gem or a precious metal or other common materials for accessories manufacturing, it can be inlaid on the surface of an object through Chinese lacquer, producing a magnificent and colorful visual effect. With high impact resistance, Chinese lacquer is used as a surface coating for lots of industrial products (e.g., fountain pen, camera, automobile and mobile phone) to enhance product performance. With a certain antibacterial activity, Chinese lacquer plays an important role in food preservation. Therefore, most of sushi plates are coated with Chinese lacquer. In addition, the physiological activity of laccase was tested in Japan, confirming that laccase has an antitumor activity and can inhibit platelet coagulation[2].

Although Chinese lacquer has many excellent characteristics, with the development of technology, lots of new compounds have been created as adhesives and coatings, which have basically replaced Chinese lacquer. Although the new substances do not have so gorgeous color or ultra-strong stickiness, and neither can they inhibit bacteria, prevent corrosion, resist acid or suppress shock, they can fully meet common people's daily needs. Moreover, the cost is very low, and the molding or production process is very easy to operate. Therefore, almost none of Chinese lacquer is applied for the articles of everyday use. Tableware is primarily made of porcelain, glass and plastics while furniture and building coatings are made from chemical composed materials and clothes are decorated with synthetic metals and plastic gems……In the Chu and Han Dynasties of China, lacquer could be applied for everything, including clothing, dinnerware, housing and vehicles, but it is rarely seen in modern daily life. In the face of wide varieties of new materials, Chinese lacquer becomes increasingly substitutable. Compared with efficient and convenient new production methods, the complicated lacquer craft is to be lost. The splendor of daily lacquerware has disappeared. Except the exquisite lacquer artworks displayed in museums and galleries, we can only find its trace in luxuries, whose "ornament" values are more important than their "usage" values. The applicability of Chinese lacquer may be found out from the perspective of the "usage" of luxuries. Expensive lacquer products can be used as "components" and combined with rapidly

[2] Tetsuo Miyakoshi. Chapter 7: Minutes of Lacquer Science Conferences, 1993

producible parts; then, the production efficiency of “lacquer components”can be improved for mass production; finally, products with more “usage” values than “ornament” values may be created.

2.2 Lacquer’s performance and accessories design

In luxury goods, accessories (such as jewelry, glasses, watches, bags, shoes and so on) account for a large proportion, so that people pay attention to whether it can properly display taste and shape personal image in key occasions. They should not only be suitable for daily use, but also match clothes in a specific environment. What matters more is whether they can demonstrate personal taste and build a personal image on an important occasion. In the present study, a long-lived daily-use accessories design scheme with an aesthetic additional value is proposed based on the attributes and visual effect of Chinese lacquer. Taking presbyopia glasses for middle-aged and elderly people (figure 1.) for example, sandalwood beads, which can calm the mind, are inlaid at the root of the temple according to the health habits of Chinese middle-aged and elderly people. After reading a book or newspaper or playing with a mobile phone, they can take off the glasses and use the temple to massage their periocular acupuncture points to relieve eyestrain; the frame is composed of redwood, Chinese lacquer and mother-of-pearl inlay. Its color and texture tone in with middle-aged and elderly people’s dressing style, making wearers look simple, natural, quiet and easy-going. Taking a small bag suitable for a dinner party (Figure 2.) as an example, its volume and opening-closing pattern are clearly designed based on the quantity and size of contents taken to a dinner party in the bag; in consideration of the requirements for the user’s image at the party, the exquisite handicraft art is used to convey the Oriental taste and traditional culture. As for a brooch and handbag for daily use (Figure 3.), they are designed in line with a quiet, elegant, cordial and simple dressing style. The thick color of Chinese lacquer is blended with folding and cutting marks, giving office ladies a clean-cut look in daily life and the workplace.

Figure 1. presbyopia glasses

Figure 2. Figure 3. handbags for daily use

3. Feasibility study of bodiless rapid prototyping for accessories lacquering

3.1 Traditional bodiless lacquer prototyping technology

The bodiless prototyping technology came into being in China during the Warring States Period. It was widely used for the construction or production of Buddhist statues, architecture and daily necessities. Bodiless lacquerware is light and durable. Taking the lacquered plate with phoenix pattern painted on (as shown in the figure 4) unearthed in the Mashan 1st Tombs of Jiangling as an example,its shape changed a little, but the color is still bright and the surface is still flat although more than 2,000 years has passed. As for the traditional bodiless prototyping craft, the inner body is made in the manner of clay sculpturing, wood carving and throwing. It takes about 1 week to make a body only. After the end of body-making, the 3D surface layer is wrapped in ramie fabric. In case of morphological protuberance or shrinkage, the fabric is folded in the form of tailoring with the redundant plane cut away so that the ramie covers the 3D surface up. In this process, Chinese lacquer is used as a curing agent to harden the ramie and as a binder to make fibers adhere to the 3D surface. The redundant plane is often cut away unevenly, causing the formation of holes or humps on the surface of the ramie. In this case, Chinese lacquer needs to be mixed with plaster for filling. If Chinese lacquer is still not dried when used as a binder, surface fibers may easily be dislocated during filling, ruffling and deforming the ramie, making the surface rougher. To be dried, Chinese

lacquer needs to be placed in a shady room[3] for over 12h. It cannot be mixed with plaster until the next day. In order to make the surface smooth, the plaster needs to be ground and filling needs to be repeated after drying. In this way, it usually takes about 1 week to smoothen the surface by covering the surface with a single layer of fibers and plaster. This process has very high requirements for the craftsman's craftsmanship, and carelessness is bound to make fibers fail to be tight against the surface, further roughening the surface. The above steps often have to be repeated 3 to 5 times before the shell is strong enough to have the inner body removed. Even a skilled craftsman must spend about 1 month finishing the work. Costing high, this prototyping method is unsuitable for modern fast-paced production. So, it is rarely used for the production of accessories and daily necessities at the present time.

Figure 4. lacquered plate with phoenix pattern painted on unearthed in the Mashan 1st Tombs of Jiangling

3.2 Quick bodiless prototyping experiment based on accessories application

The use of modern technology to improve the prototyping efficiency brings about a total difference in every aspect, including inner body making. 3D modeling and printing was performed in the experiment, with only 2~3 hours spent in making a complex inner body. The ramie was not cut when used to wrap the body up. Instead, the multilayer sinamay prototyping method used for traditional European hat accessory-making was adopted. Since the coarse ramie fabric is woven both longitudinally and latitudinally, when it is pulled at a

[3] A shady room is a device essential for lacquering and an enclosed space at temperature of 20-28°C and relative humidity of 70%-80%. Under the above environment, the urushiol in Chinese lacquer must fully absorb water molecules before a lacquer film forms and the liquid lacquer is solidified. The more humid the environment is, the faster the Chinese lacquer dries. When the relative humidity exceeds 80%, colored lacquer tends to turn brown with the lacquer film darkened and unable to be reduced. Excessive relative humidity has great effects on the color and glossiness of lacquer only, and has little effect on the form and hardness of the body.

certain angle, the density at the junction of the longitudinal and latitudinal lines can be changed to generate deformation. With a hollow structure, the ramie yarn becomes very resilient in water. So, after wetted, the ramie fabric was attached to the body with fibers straightened out by hand to adjust the density of the junction of the longitudinal and latitudinal lines in accordance with the body form until the fabric was deformed and tight against the body surface. After the 5 layers of ramie were basically prototyped in this way, it was removed layer by layer and coated with Chinese lacquer from inside out. Then, the ramie was attached to the body again and placed in a shady room until it was dried. When the outer layer was basically dried the next day, the inner body was taken off with the rest continuing to be dried in the shady room (as shown in figure 5.). On the third day, the inner and outer layers of the ramie shell became dry, but the Chinese lacquer on the middle layer was still liquid. Without the support of the body, the shell was severely deformed, so the inner body was stuffed into the shell gain so that the shell would be further dried. On the fifth day or so, the 5 layers of ramie were completely dry. With the body removed, the shell was placed in the daily environment for several months but was not deformed.

Figure 5. Quick bodiless prototyping experiment based on accessories application

For the use of this method, it takes only 3 days to do the work and only 5 days to have the shell fully dried. It takes a long time to make a body on the first day, but a much shorter time needs to be spent adjusting the body on the remaining 2 days. Compared with the traditional method, by which the prototyping process takes one month, the new method greatly reduces the time costs. In addition, this method is so easy that even an inexperienced primary or middle school student can do the work without difficulty. Compared with the traditional method, which requires a well trained craftsman to work meticulously with great care, the new method is easier to be promoted in the society. For a ramie shell made by the new

method, its hardness and impact resistance are obviously lower than that of the traditional ramie-assisted bodily lacquerware for lack of plaster support, but significantly higher than that of sinamay hat accessories and headwear. In addition, a body made by the new method has high water resistance, wear resistance, folding resistance and corrosion resistance. Dust in and around it can be washed away with water and daily detergent. From the perspective of accessories, a body made by this method can fully meet the requirements of daily use.

4. Research on the Application of Metal Forming Methods in Lacquer Accessories

4.1 Traditional forming methods and lacquer accessories

In addition to bodiless prototyping, the common bodies of traditional lacquerware are divided into the wooden body, bamboo body and ceramic body. The wooden body and bamboo body are made of wood and bamboo by the gouging method[4], turning method[5], rolling method[6] and weaving method. The surface is coated with Japanese lacquer evenly. Because there are tiny holes on it, the plant surface needs to be coated with cloth and puttied (the same as the way single layers of ramie are wrapped and puttied in the step of body removal) to prevent the body from being wetted and deformed and the lacquer surface from being broken. The prototyping process usually takes 2~3 weeks. This type of body cannot be used for modern fast-paced production. Neither can it be used for production of light accessories such as bags and hats, owing to its large mass.

Ceramic forming takes a short time and is easy to operate. Some process steps, such as blank making, drying and firing, are the same as that of ceramic ware making. After it is made, the prime ceramic body just needs to be coated with lacquer. However, the ceramic body has poor impact resistance with high fragility. “Without the skin, where can hair rest itself?” After the body is broken, the lacquer
on the ceramic surface will be no longer in existence. That’s why lacquerware with a ceramic or vitreous body is relatively rare. In addition, the sharp shards of a broken body are likely to

[4] The gouging method is a wooden body manufacturing technique, by which a sharp tool is used to gouge a solid log until the columnar wood is shaped like a bowl.
[5] The turning method is a wooden body manufacturing technique, by which a solid log is cut with a sharp tool when it is rotating on a turning lathe until the columnar wood is shaped like a bowl or a morphological change takes place with the log turned into something like a vase, kettle or basin.
[6] The rolling method is a wooden body manufacturing technique, by which a wood veneer or thin batten is soaked in water for a number of days until it is softened and then shaped like a barrel in a mold. After drying, the mold is removed and the barrel-shaped veneer or batten is lacquered.

cause damage to the human, so it is not a suitable body for accessories. 3D printing is one of the currently common rapid prototyping methods, and common printing materials include engineering plastics, photosensitive resin, rubber and metals. Although the above materials are light and durable, a lacquer film can hardly be attached to them owing to their smooth surface. If lacquer are dried in a shady room in an ordinary way, lacquer finish will scale off their surface, so the lacquer craft cannot be applied. According to a traditional lacquering technique, Chinese lacquer is baked for better coating ironware in order to protect it from rusting. So, for the combination of a 3D printed body with lacquer, the lacquer is baked when being applied to the surface of metals.

4.2 Experiment on lacquering a 3D printed metal body

Silver alloy and aluminum alloy, metals commonly used for 3D printing, are selected in the present study. First, a blow torch is used to burn the back of the two lacquered metals, according to the traditional metal lacquering method. Although the lacquer film is dried quickly, the lacquer finish may be ignited carelessly, causing failure because of carbonation. Chinese lacquer comes to the boiling point at about 200°C and to the ignition point at 450°C. The temperature of the blow torch is hard to control. In addition, if high temperature lasts too long, the hardness of the lacquer film will be affected, reducing the wear resistance of the coating.

As the experiment went on, a constant-temperature oven was used, and the hardness of the dried lacquer film was recorded. After lacquered, the silver alloy and aluminum alloy were baked at 150°C for 15min. The lacquer film surface was obviously viscous while the Chinese lacquer was brown but not so transparent. 30min later, lacquer film surface was slightly viscous, and the texture of the metal materials could be seen on the lacquer surface. 45min later, the lacquer film surface became dry, but an obvious mark could be left on the surface by fingernail pressure. 60min later, no mark was left by fingernail pressure, and the lacquer surface became more transparent; however, the hardness was not so high that the lacquer surface was damaged and metal body was exposed after it was ground slightly with 2000# fine sandpaper. There was no significant change taking place 75 and 90min later compared with 60min later. When baking lasted for 120min, the hardness of the lacquer surface was obviously enhanced and became resistant to the 2000# fine sandpaper. 150min later, the lacquer surface became resistant to the 600# moderately coarse sandpaper, and it felt hard in the grinding process. An experiment was performed at a constant temperature of 170°C in the same way. 45min later, the lacquer film became very strong, and felt harder in the grinding process than it did at 150°C 150min later. At a constant temperature of 190°C, there appeared speckles on the thin lacquer surface in the drying process while the thick lacquer surface was crinkled, but the surface became fully dry 15min later and the hardness became resistant to grinding treatment. The speckles might be due to an actual temperature approximately equal to the boiling temperature of Chinese lacquer while crinkling might be caused by excessively quick surface drying. There was basically no difference in lacquer surface between the silver alloy and aluminum alloy. As can be seen from experimental results, under the condition of

170°C and 45min, the lacquer surface was flat, hard and wear-resistant and rarely peeled off. This condition is more suitable for lacquering the surface of a 3D-printed metal material. A metal body wrapped in lacquer was barely visible and lighter than one made of the lower-cost aluminum alloy. The 3D printing method, which could also shorten the time of body-making, is better for the production of accessories such as headwear, jewelry and brooches as well as the hard parts of bags and belts. (As shown in Fig.6)

Figure 6. Daily accessories of Lacquer Craft such as brooches, headwear, jewelry

5. Research on the Application of Japanese Lacquer to Accessories Manufacturing

5.1 Sustainable value of Chinese lacquer for the environment

With current development of information technology and intelligent manufacturing, traditional lacquering craft can be combined into modern design and modern industry. In addition to solving the complicated and time-consuming production mode, we should also think about the sustainable value of Chinese lacquer for the environment so as to guide consumers to discover a new lifestyle, thus helping them form an environment-friendly and energy-saving consumption concept. Originating from nature, Chinese lacquer is a pure plant material. Chemical synthesis is not required for its refinement or deep processing. Lacquerware production is mainly in manual mode, with low energy consumed, suggesting that it is a process technology in harmony with the natural environment. After dried, Chinese lacquer is highly stable, acid-resistant, corrosion-resistant, waterproof and difficult to degrade naturally. The body is sturdy, highly impact-resistant and hard to break. Lacquerware is very difficult to damage fatally, and longtime use may just leave scratches on its surface, but it will be made new again as long as its surface is re-lacquered and polished in a simple way. Even

cracks can be repaired by the simple Kintsukuroi technique (a lacquering technique commonly used for restoration of historical relics). If you are visually tired of lacquerware that has been used for a long time, you just need to polish its surface finish rough and then redecorate its surface in another way to "change" it into a new object. Thus, the durability and variability of Chinese lacquer make it possible to effectively prevent people from discarding lacquerware at will after purchasing.

5.2 Continuous demand for lacquer accessories and its future application

Lacquer accessories are durable and can be handed down from the older generations of a family. Looking calm and quiet, Chinese lacquer boasts the Oriental elegance and simplicity, which enable it to match clothes for an impressing appearance on different occasions. Different demountable and easy-to-install lacquer components can even be applied to accessories made of different materials to meet many practical and aesthetic requirements. For example, these lacquer components can replace the metal accessories and ornaments on bags and shoes to form a wide range of accessories by combining with different materials, patterns and colors. It can also be made into modular multi-purpose accessories, such as used on scarves and cuffs to decorate formal wear or as earrings and key chains to match casual clothes. It can even be made into accessories used on mobile phones, computers, stationery and other products to decorate not only the body, but also a space. The emergence of universal and modular lacquer accessories can set a consumption trend, thus making it possible to provide the pubic with technical services including lacquerware maintenance, repairing and customization. If so, jobs can be created for lots of lacquerers to continue this traditional craft.

In the present study, the traditional lacquering technology is applied to the design of accessories not to change the traditional manufacturing technology, but to propose a futuristic lacquer craft's survival mode as well as a kind of accessories production mode based on profound insights into scenes of life and manufacturing techniques. Although the daily necessities created by industrial technologies have greatly met our material needs, overcapacity has been caused, followed by waste of resources and environmental degradation. The fashion industry, to which accessories manufacturing belongs, is one of the typical industries troubled by overcapacity in China. In today's China there are a large number of OEM of accessories, which have poorly-educated workers and thus can hardly make independent innovations in technology and design; for lack of advanced equipment, they can only produce low-quality products with a low added value. In the fast-paced and high-stress modern society, people have a preference for individualized and differentiated high-end accessories. Thus, for Chinese accessories manufacturers, they must transform their low-end traditional sub-contract manufacturing mode into creation of high-end brands with independent intellectual property rights. "The traditional technology is not merely a culture, but a productive force."[7]

[7] Yang Bin. Handicraft is a Culture and more of Productivity [J]. Art Observation, 2010 (04): p8-10.

Cultural integration is one of the important ways to increase the high value of the fashion industry chain more quickly. As the "all-round renaissance of the traditional culture" is promoted as a mainstream ideological trend in the Chinese society, the Oriental humanistic factors, including cultural accumulation and traditional crafts, make an increasingly significant value contribution to accessories manufacturing. By applying Chinese lacquer to modern accessories, "China fashion" can endow "Made in China" with a cultural connotation to set a new consumption trend and accelerate the transformation and upgrading of some accessories manufacturers from low-end production to high-end customization so as to further resolve the problem of overcapacity.

The Emerging Fashion-Tech Paradigm in the Contemporary European Landscape.

Chiara Di Lodovico*[a], Chiara Colombi[a],
[a]Politecnico di Milano, Design Department, Milan
*chiara.dilodovico@polimi.it

Abstract | Fashion-Tech is an emerging sector resulting from the intersection of design, natural sciences, engineering and business. The paper is aimed at exploring innovation trajectories of the emerging fashion-tech phenomenon in Europe. The work is structured in five sections aimed at giving a systematic overview of historical references and current experimentations. The first paragraph retraces the three industrial revolutions to pinpoint the interdependence of fashion and technology. The second introduces the 4.0 paradigm origin, technologies and configurations, offering preliminary insights on potentials deriving from its adoption in the Fashion-Tech industry. The third section illustrates the main challenges of emerging and established fashion-tech businesses. The forth section offers insights on possible trajectories for the long-term competitive advantage of the European Fashion-Tech industry, starting from the observation of the ongoing research agenda. The insights emerge from a multiple case study analysis of four fashion-tech design-driven innovation projects funded by the European Commission. Finally, the paper concludes identifying trans-disciplinary and cross-sectoral strategic partnerships as the key factors to effectively support the growth and development of the sector, leveraging on the European emerging ecosystems.

KEYWORDS | FASHION-TECH, ENTERPRISE 4.0, DIGITAL TECHNOLOGIES, PROCESS INNOVATION

1. Fashion and Technology: A History of Interdependence

Fashion and technology have always had a symbiotic relationship, interwoven paths, and mutual influences on both cultural and material level (Tomico, et al, 2017). Technological developments have always fostered process and product innovation in fashion and, at the same time, "fashion has always been a wearable expression of the technological state of society" (Scaturro, 2008, p.473). Evidence of this relationship can be demonstrated by retracing the evolution of industrial revolutions from the textile and clothing sector's perspective, pinpointing their key role in shaping and disrupting both production and consumption patterns of fashion products, processes, and services (Duarte, et al, 2018; Bertola and Teunissen, 2018). This preliminary overview will lay the foundation to state that the emergent Forth Industrial Revolution, also referable as 4.0 paradigm, is going to influence and bring together actors from inside and outside the traditional sphere of the fashion system, involving existing and new stakeholders throughout all the stages of the value chain, challenging traditional dynamics, and introducing new consumption, production, and entrepreneurial patterns.

The First Industrial Revolution, historically located between 1760 and 1830, led to a general mechanization of manufacturing industries powered by water and steam technologies. One of the key and exemplar inventions fostering improvements in the textile industry was the Spinning Jenny, developed in Britain by James Hargreaves in 1764. It consisted in a spinning system that allowed to turn raw materials (i.e. cotton and wool) into thread processing at the same time from 8 to 16, 24, 80 and eventually 120 spindles (Bellis, 2010). Prior, weaving was performed at home by farmers who alternated spinning and weaving with work in the fields (cottage industry) or manufactured raw materials provided by merchant entrepreneurs (putting-out system). In both cases, workers could not fulfil the market demand for textiles, as the production of yarn and fabrics was time demanding and economically not sustainable. With the introduction of the Spinning Jenny and further improved models, as well as the development of fully mechanized looms, the domestic and artisanal handmade production was replaced with mass manufacturing of consumer goods coming from factories and textile industries. High production volumes and manufacturing speed led to the decrease of yarn and fabric costs, generating a greater availability of textiles for a wider audience at more affordable prices (Bellis, 2010; Duarte, et al, 2018).

The Second Industrial Revolution, occurred between 1850 and 1914, was characterized by an intense micro-invention activity in energy, manufacture, chemical, steel, and railway industries. Such clusters of novel inventions entered as never before into workers' and middle classes' daily lives increasing their living standards and their purchasing power, as consumers. Defined by Homburg et al. (1998) "science-based industrial capitalism", this period presented an acceleration of connection and mutual feedback between science and technology, the emergence of large scale corporations gaining economic benefit from it and the spread of First Industrial Revolution technological systems, previously limited and localized, towards other European countries. Improvements in the manufacture industry

concerned the adoption of electricity as power source, the set-up of continuous-flow production process, the scientific organisation of labour and the mass production of interchangeable parts. Breakthrough developments in chemistry laid the ground for research, development and supply of new artificial materials and synthetic dyestuff. In textiles, progresses occurred gradually. The major innovation was the introduction of the sewing machine – perfected and patented in America in 1851 by Isaac Bashevis Singer – a machine able to replace hand-stitching, greatly speeding up the apparel making process. The annual production of sewing machines went from few thousands in 1853 to half a million units in 1870 (Mokyr and Stortz, 1998), becoming a mass-manufactured and mass-marketed consumer good, mainly intended for a domestic environment (Duarte, et al, 2018). On the other hand, mechanized machines for wool combing, spinning and weaving, mainly perfected in the US, started to be adopted and slowly spread only towards the end of the XIX century, due to the reluctance of adoption by European industries (Mokyr and Stortz, 1998).

The Third Industrial Revolution, also called the Digital Revolution, started in the 1970s and has been historically paired with the invention and development of microprocessors, integrated circuits and advanced electronics with computational capacity, and the spread of Information Communication Technologies (ICT). The integration of such technologies within the Textile and Clothing Industry led to a further automation of manufacturing activities (Bertola and Teunissen, 2018; Duarte, et al, 2018; Hermann, et al, 2015) increasing again production volumes, lowering prices, and fostering over-consumption patterns, leading to manufacturing delocalization to further reduce costs. From the industry perspective, since the 1990s, the combination of Computer-Aided Design (CAD) and Computer-Aided Manufacturing (CAM) software with ICT strongly influenced the evolution of design and production processes in the fashion system (Rose Sinclair, 2014). They enhanced connections among stakeholders operating along the supply chain, helping them managing the entire process in more seamless ways. In particular, the former sped the creative design process, making it easier to communicate it at different stages, the latter made the prototyping and testing process better connected and allowed a greater management of the different manufacturing phases. Moreover, from 2000s on, the emergence of Internet and the Web 2.0 led to a radical change in the user's perspective and involvement. Digitally-mediated interactions disrupted the relationship between producers and consumers (Crewe, 2013), fostering Business to Consumer (B2C) and Consumer to Consumer (C2C) exchanges, giving rise to experiences of co-creation of fashion products and values (Prahalad and Ramaswamy, 2004).

In the last decade, an emerging Forth Industrial Revolution has been introducing a set of disruptive technologies and approaches, once again, promising to impact and challenge traditional industries and established systems, including fashion (Bertola and Teunissen, 2018). A key differentiation factor of the 4.0 concept, stressed by Herman et al. (2015), is that for the first time an industrial revolution is illustrated a-priori, not interpreted ex-post. This leads to multiple opportunities for different stakeholders, from research centers and

academic institutions to entrepreneurs and businesses, to dynamically shape the future (Herman, et al, 2015).

The present paper aims at exploring how the 4.0 paradigm could be implemented supporting emerging fashion-tech realities to grow and foster product, process and business model innovation. The reflection is limited to the European landscape, mostly including SMEs, start-ups, self-employed, micro-companies, and individual craftsmen (EC, 2012).

2. The Potentials of 4.0 Paradigm in the Fashion-Tech Industry

The Industry 4.0 (I4.0) concept was formalized in 2011, during the Hannover Fair in Germany, where representatives of politics, business, and academic institutions presented a future project aimed at implementing and strengthening the competitiveness of the German industrial sector leveraging on the possibilities offered by upcoming technologies (Hermann, et al, 2015). The support from German Government followed by integrating it within national strategic plans and, in 2013, Acatech—the German Academy of Engineering Sciences—shared a research agenda illustrating development recommendations for the Industry as well as the vision behind this model (BMBF, 2015). I4.0 aimed at the introduction of digitization at all stages of the supply chain, based on the development of cyber-physical systems/environments, on the integration of digital-mediated interconnected networks thanks to cutting-edge technologies enabled by the Internet of Things. Brunelli et al. (2017), from the Boston Consulting Group, listed nine I4.0 digital enabling technologies: Advanced Robots, Additive Manufacturing, Augmented Reality, Simulation, Horizontal&Vertical Integration, Industrial Internet of Things, Cloud Computing, Cybersecurity, Big Data and Analytics. From 2010s on, further initiatives spread all over Europe, and similar ones were being performed in the US and China (Hermann et al., 2015). Leveraging on multiple investigations involving both large scale businesses and start-ups, Brunelli et al. (2017) extract key learnings to support businesses in the set-up of an I4.0 implementation strategy. The findings are clustered in the following five lessons learned:

- Use Industry 4.0 to accelerate operational improvements,
- Integrate new and existing capabilities and technologies,
- Manage information architecture as a critical enabler,
- Thoughtfully design the transformation roadmap,
- Approach 4.0 as a change of managerial project.

In 2015, contemporary to the acknowledgement around I4.0, Klaus Schwab - the executive chairman of the World Economic Forum - introduced the expression “Forth Industrial Revolution” extending the conceptual paradigm shift to all disciplines, economies and industries, as well as people’s way of living. This revolution, built on the previous digital one, is characterized by the fusion and combination of different technologies blurring the lines among physical, digital, and biological worlds (Schwab, 2016).

Being an international and cross-sectoral phenomenon impacting all industries, also fashion system stakeholders are starting to contextualize the 4.0 paradigm. Among the scholars investigating such scenarios, Bertola and Teunissen (2018) offer a comprehensive overview of the overall impact the 4.0 paradigm could have in the Fashion-Tech industry evolution:

> "Digital networks and interaction can create an integrated system of actors, assets and stakeholders where not only supply-chains can be real-time tuned with the factory, but also retail channels and even products and final customers can communicate and exchange data within the system. […] Therefore, decision making processes can be better informed by market and users demands, making of the factory a knot of a complex networked eco-system. […] Consequently, all upstream manufacturing process (such as R&D, sourcing, inbound logistics etc.) and downstream functions (such as outbound logistic, retail, customer services etc.) should be included within the 4.0 architectural model." (Bertola and Teunissen, 2018: p.353)

The scholars' contribution suggests an interesting twofold reflection. On one side, it is argued that the introduction of disruptive technologies in the "smart factory" is by definition linked to the other actors and phases of the value chain, because they are integral part of the cyber-physical interconnected environment enabled by the 4.0 architectural model. On the other side, it implies that consumers and prosumers—producer + consumer—perform an active role, both conscious and unconscious, in the decision making process. As a matter of fact, the exchange of data is the basis of 4.0 concept. The efficient analysis and integration of such data generated by all interested parties could inform the product development process, if properly implemented (Duarte et. al, 2018).

Further potentials deal with trans-disciplinary approaches, at the crossroad of engineering, computer science, design, and business management, constantly and iteratively explored beyond the boundaries of the factory. The cross-fertilization of fashion with engineering and computer science is evolving the creative process, fostering experimental projects and paths (Musto, 2017) stimulating the development of wearable technologies, smart textiles, and systems as instruments to augment the self. Software developments and digital fabrication tools are giving rise to new industrial models where start-ups and digital craftsmen are able to deliver on-demand and tailor-made products (Mazzucotelli and Lunghi 2015), as well as promote locally designed and globally manufactured fashion products. At the same time, the democratization of such technologies is enabling figures like the Designer = Entreprise (Arquilla, Bianchini and Maffei, 2011) to grow and approach the market. The opportunities offered by the integration of Augmented and Virtual Reality technologies and processes in the downstream of the supply chain are trying to disrupt the retail customer experience, developing more and more sophisticated phygital—physical and digital—spaces (Chastel et al. 2019). 3D modelling and simulation technologies are redesigning the way apparel and accessories are experienced, from digital fitting towards products designed to live in the digital domain only. Big Data and analytics as integral elements of the infrastructure could nurture the whole system, from production processes optimisation to consumer demand anticipation. While existing technologies such as RFID (Radio Frequency Identification) and

NFC (Near Field Communication) embedded in textiles and accessories, are starting to be adopted not only to improve supply chain management, security, monitoring and tracking of resources (Nayak, Singh, Padhye and Wang, 2015; Garrido Azevedo and Carvalho, 2012), but also to improve in-store shopping, promote events (Ryan, 2017) and improve the customer-brand relationship (O'Neil, 2019) based on transparency and co-creation of value.

Key reflections emerging from the described scenarios suggest the need to formalize and extend the conceptual remit of this revolution from the industrial context only to a wider and more inclusive entrepreneurial one. This is possible also by exploring supportive governmental actions set-up by individual European countries, i.e. Italian National Plan called "Impresa 4.0" (Enterprise 4.0), introduced by the Ministry of Economic Development in 2016. Its aim is to promote training activities for new skills development and access to investments, in order to support innovation and competitiveness of national enterprises regardless of their legal nature, economic sector, size and accounting regime adopted (mise.gov.it, 2019). From this standpoint, "Enterprise 4.0" could be considered as a wider scenario in which "Industry 4.0" factory automation concept co-exists with "entrepreneurial-led augmented experiences", addressing micro, small, medium enterprises, as well as start-ups and artisans as potential adopters and implementers.

3. Challenges of Emerging Fashion-Tech Businesses

This section intends to collect main challenges emerging fashion-tech start-ups and SMEs need to tackle when embracing the Enterprise 4.0 paradigm. The phenomenon is illustrated clustering the challenges identified by Bertola and Teunissen (2018), CBInsights (2019) and Fashion Technology Accelerator (Filocamo, 2020), under the ones codified by Salamzadeh and Kawamorita Kesim in the paper "Startup Companies: Life Cycle and Challenges"(2015): support mechanism, human resources, financial challenges and environmental elements.

- **Support mechanism.** The lack of access to support players as incubators and accelerators, investors, and technology parks could increase the companies risk to fail. Many traditional incubators and other support organisations does not incorporate the specific know-how necessary to offer tailored support for fashion-tech innovative businesses. Furthermore, lack of financier networks focused on fashion-tech could lead to underestimation of the sector investment potentials and growth.

- **Human resources.** If the team lacks adequate knowledge of the sector the company risks to fail due to unsuitable management of human resources. The lack of awareness about contingent and future skills that in-house professionals will need to embody in order to support the company evolution and the lack of knowledge on domain specific issues (Bertola & Teunissen, 2018) could hinder the business success. Building the right team of professionals with different backgrounds, expertise and skill set corresponding to the company key activities,

and evaluating internalization of professionals vs resources externalization, are fundamental actions to consider (CBInsights, 2019; Filocamo, 2020).

- **Financial challenges.** Running out of cash, choosing the wrong time for fundraising, and underestimating the importance of pricing and costs (CBInsight, 2019; Filocamo, 2020) are some of the ingredients bringing start-ups to failure. For established companies, substantial re-engineering of existing assets as well as a profound reorganization of managerial processes (Bertola & Teunissen, 2018) could be difficult to achieve due to low system flexibility and high costs. Moreover, fashion-tech businesses are not aware of where to access funding or how to present themselves to attract investment.
- **Environmental elements.** Start-ups can encounter many difficulties in surviving if they lack attention to relevant external elements. The challenges related to the environment could deal with unawareness of existing trends, markets limitations, consumers' negative feedback, market competition (CBInsight, 2019; Filocamo, 2020), legal issues, and vendor inertia in B2B context (Betts, 2015). Such underestimation, along with the absence of a real product market need, the lack a clear business model and solid market strategy, could greatly contribute to the company fail.

The European Commission's "Action Plan for Fashion and High-end Industries", published in 2014, suggests a roadmap to address many of the challenges previously identified. Among the policies and activities to be performed, the following key actions are pointed out (EC, 2014):

- Anticipating skills needs and promoting cooperation between industry, governmental and educational institutions.
- Supporting innovation by integrating ICT innovative solutions in traditional businesses.
- Stimulating transdisciplinary partnership to enhance creativity towards product, process and business model innovation.
- Stimulating cross-sectoral cooperation boosting to new industrial value chains and business models to support and implement the innovation potential of SMEs.
- Improving access to finance.

The document prepared the ground and set the guidelines to support the growth of the European Fashion-Tech Industry leveraging on collaborative networks. As a matter of fact, in the last ten years, the birth of a great number of start-ups has stimulated the funding of European projects aimed at supporting their competitiveness and the diffusion of alternative support systems inspired by the culture of innovation of high-tech Silicon Valley hubs (Engel, 2015).

4. Addressing Fashion-Tech Challenges Through Strategic Partnerships: a European Perspective

This paragraph contextualizes how the fashion-tech ecosystem could be supported at a European level. A multiple case study analysis on four pan European fashion-tech design-driven innovation projects, currently funded by EASME COSME[1] and Erasmus+[2] programmes, is illustrated. The aim is to distill insights on possible trajectories for the long-term competitive advantage of the European fashion-tech industry starting from the observation of the ongoing research agenda.

The projects illustrated hereafter are represented by consortiums of trans-disciplinary and cross-sectoral professionals, in which fashion and design, engineering and business management academic and research institutions are joining forces with tech-driven and design-driven entrepreneurs and businesses, network of business support organisation (accelerators, incubators and hubs), trade associations and/or investors. According to the Boston Consulting Group (2017), such strategic partnerships are key for entrepreneurial realities to "gain an insider's perspective on the development of breakthrough innovations" (Brunelli, et al, 2017, p.7).

The case study analysis that follows combines the four challenges clusters identified in the previous section with a detailed breakdown of the actions performed to tackle them, foreseen by the European projects selected for the analysis: DeFINE, WORTH Project, Education4FashionTech, and FTAlliance.

DeFINE – Developing a Fashion-Tech Innovation Network for Europe is a 3-year project co-funded by the COSME Programme, aimed at building a Pan-European network of fashion-tech start-ups and SMEs, incubators and accelerators, and investors. The project delivers a series of inter-related events, training sessions and mentoring programme for selected companies, as well as knowledge sharing initiatives for the fashion-tech community at large.

The project aims to provide insights to face the following challenges: supporting mechanism, human resources, environmental elements and financial challenges.

- **Supporting mechanism**

Mapping, establishing, and moderating networks of financiers and investors, incubators and accelerators already active and/or interested in supporting fashion-tech businesses.

[1] The EU programme for the Competitiveness of Small and Medium-Sized Enterprises (SMEs). It aims to support better access to finance for SMEs, access to markets for SMEs, entrepreneurship, more favourable conditions for business creation and growth.
[2] Erasmus+ is the EU's programme to support education, training, youth and sport in Europe. It offers opportunities for a wide range of organisations, including universities, education and training providers, think-tanks, research organisations, and private businesses.

Connecting ecosystem stakeholders and nurturing cross-sectoral and transnational collaboration, through a series of informational and networking events, bootcamps, entrepreneurial and financiers workshops, and dedicated digital channels.

Supporting a selected number of fashion-tech businesses through bespoke technical, business and investment readiness mentoring programme. Mentorship is mainly aimed at better understanding specific challenges and tailored support needed by fashion-tech companies, in order extract exploitable learnings and best practices for replication and transferability purposes.

- **Human resources**

Stimulating the the ecosystem awareness around missing key competences and resources, valuable connections and partnership, through dedicated encounters with industry experts along the mentoring programme, bootcamps and investment readiness workshops.

- **Environmental element**

Guiding selected start-ups to develop a consistent product-market-fit and competitors research, to discover novel technological and innovative solutions for their products/services, to target the right consumer and structure sustainable marketing strategies accordingly.

Setting-up dedicated channels aimed at fostering knowledge sharing initiatives leveraging on the consortium partners and the fashion-tech community at large. Relevant events, incubation, acceleration and funding opportunities, as well as webinars, podcasts and asrticle on the sector trends, enabling technologies, business insights, investment strategy tips, success stories and best practices are publicly shared for the benefits of the whole community.

- **Financial challenges**

Supporting fashion-tech companies in getting investment ready through insights on the investors' perspective, investment strategy development, pitching mentoring and investors profile identification.

Helping expert and 'novice' financiers in identifying investment targets in fashion-tech and in (co)investment opportunities.

Organising pitching sessions and investment forums where selected fashion-tech companies can connect with potential financiers, in order to facilitate matching and foster investment opportunities.

WORTH Partnership Project is a 4-year project funded by the COSME Programme, designed to foster transnational, cross-sectoral collaboration connecting fashion designers, creatives, manufacturing SMEs and technology providers. It is aimed at boosting the creation of

innovative and design-driven products through the codification of cross-disciplinary partnerships supported by an incubation programme, mentoring and access to funding.

The project tackles the following challenges: human resources, supporting mechanism, environmental elements and financial challenges.

- **Supporting mechanism**

Organising networking events and activities to encourage entrepreneurial collaboration and market up-scale.

Establishing tailor-made coaching and mentoring process for selected partnerships, to improve knowledge and skills linked to design, technology, manufacturing processes, business strategy, legal support and IPR management.

- **Human resources**

Matching complementary SME/start-up designers and manufacturers with technology providers from the fashion and consumer goods industry.

Promoting creative partnerships as a model to sustain the development of cross-sectoral innovative projects.

- **Environmental elements**

Raising awareness and sharing knowledge on Fashion-Tech industry key topics through webinars, interviews and lectures on innovative partnerships creation, entrepreneurship, internationalisation, marketing&communication, IPR, pitching, business strategy, fashion and technology trends, incubation support opportunities, success stories and best practices.

- **Financial challenges**

Providing direct access to financial support to selected partnerships going across the incubation process, so as to bring their projects and ideas to life.

E4FT - Education4Fashion-Tech: Interdisciplinary Curriculum for Fashion in the Digital Era is a 3-year project co-funded by Erasmus+ Programme - Strategic Partnerships for higher education. Its purpose is to answer the market need shaping hybrid professionals able to manage fashion, technology and entrepreneurial domains. One of the project's output is an innovative fashion-tech higher education curricula to build up and progress skills and knowledge concerning smart textiles, wearables and digital manufacturing.

The project presents piloting experiences aimed at enhancing the awareness mainly on: supporting mechanism and human resources.

- **Supporting mechanism**

Mapping and sharing the state of the art of Higher Education programmes and other high-qualitative fashion-tech training experiences provided by public and private organisation.

- **Human resources**

Mapping subject specific fashion-tech skills at the intersection of design and multimedia communication; technology and engineering; and human, social, psychological, and economic context.

Developing teacher's toolkits and flexible MA programmes as resources to support the implementation of fashion-tech interdisciplinary teaching and learning activities, validated and continuously updated thanks to short term educational pilots (hackathons and workshops) promoted in collaboration with research and development centers and fashion-tech companies.

Collecting and sharing course material, edited lectures and other contents developed from educational activities as MOOC-type materials to allow future engagement by a European-wide creative community.

FTalliance - Weaving Universities and Companies to Co-create Fashion-Tech Future Talents is a 3-year academia-industries partnership co-funded by Erasmus+ Programme - Knowledge Alliance. Its goal is to enable and facilitate the exchange, flow of knowledge and co-creation paths between universities and companies operating in the Fashion-Tech sector. The partnership aims to boost a twofold impact. From one side, enhancing students' employability and innovation potential, equipping fashion and textile, design and engineer with updated fashion-tech competences. From the other side, supporting the competitiveness of and growth of the EU Fashion-Tech sector.

The project aims to mainly address the human resources challenge.

- **Human resources**

Designing and piloting a series of challenge-based design educational activities to boost creative encounters within the framework of a number of industry briefs, allowing beneficial and reciprocal exchanges between the student participants and companies.

Fine tuning a multidisciplinary fashion-tech curriculum integrating fashion, design and engineering with industry relevant challenges through open innovation and project-based learning methodologies.

Developing fashion-tech residency programme and co-creation opportunities to foster innovative concept development and products prototypes. Students are involved in hands-on innovation activities within fashion-tech companies, in order to let them benefit from the know-how, expertise, tools and channels of the host organization.

7. Conclusions

The necessity to embrace strategic partnerships and build networked ecosystem in constant dialogue seems to emerge as a valuable resource to tackle the novel challenges of the Fashion-Tech sector. The key activities when dealing with collaborative and distributed networks should be: understand the stakeholders needs, codify a common language, connect and match key players, and iteratively feed these relationships. As in the cases presented, universities and research centres should formalize long lasting parterships to align educational curricula with the future needs of the job market. The vision should not be limited to contingencies, but it has to look at the impact of disruptive technologies in the medium and long term. Given the novelty of the phenomena, the evolutionary and dynamic nature of this emerging paradigm lead to the fact that new approaches to create value from 4.0 model are still in progress, and that value will spread as best practices are shared, laying the foundation for further adoption. In this regard, fashion-tech dedicated ecosystems of innovative enterprises, business support organisations, academic institutions and financiers network should grow and drive innovative paths, fostering networked and capillary cross-disciplinary knowledge sharing initiatives and creating awareness and common literacy on key challenges and successful approaches.

The evolving role of prototypes in design research: a discussion on terms and meanings.

Silvia D. Ferraris[a]*, Gabriele Barzilai [a],

[a]Department of Design, Politecnico di Milano
*silvia.ferraris@polimi.it

Abstract | In this paper, we present the preliminary findings of an ongoing research project addressing the role of advanced prototypes in design research. The project aims at investigating the evolution of the role of the prototype in design research, given the recent advances in prototyping techniques and processes. In the first phase, we collected a diversity of definitions from literature, outlining both traditional and emerging traits of the use of prototypes. We observed that researchers tend to classify prototypes based on a variety of different purposes, which are tightly bound to the type of enquiry being carried out and the specific area of research in which they work. The emergent heterogeneity of terms and meanings shows that the definition of prototype is anything but univocal. This multiplicity of definitions led us to develop an overview of the assortment of terminologies and purposes that researchers use to describe the role(s) of the prototype.

KEYWORDS | PROTOTYPE, RESEARCH ARTIFACT, DESIGN RESEARCH

1. Introduction

1.1 The changing role of prototypes

Design is deeply rooted in the culture of making, being traditionally devoted to transforming ideas into tangible outcomes. This hallmark of design is currently undergoing a radical change due to a twofold countertrend phenomenon. On the one hand, a profound process of dematerialization, which largely affects the world we live in (Moles & Jacobus, 1988). This process entails everyday objects losing their physical attributes and turning into either purely digital artefacts (e.g., bitcoins) or new types of product merging physical and digital features (e.g., smart objects, IoT, etc.). On the other hand, the emerging role of speculation – meant both as a means and as an end of the enquiry – in some areas of design research (e.g., design fiction (Bleecker, 2009; Dunne, 2013)). This shift makes tangible artefacts no longer an imperative stage of the design process, paving the way for a wider notion of both prototype and prototyping.

In other words, designers are still in charge of making things come into being, but regardless of their physicality. In the context of this paradigm shift, prototypes (both tangible and intangible) have come to acquire a crucial role in the process of knowledge production – mainly at the academic level – as they are considered carriers of meaning and, as such, *means* to conduct research. The terms of this new role are reflected in the preliminary findings we report on in this paper. Indeed, the proliferation of new jargons and terminologies in some areas of design research signals the attempt of giving a status to a *changed role* of the prototype.

1.2 “Advanced prototypes”: scope and limitations

As part of an ongoing research project addressing the “role of advanced prototypes in design research”, our findings shed light on the plurality of perspectives regarding the notion of prototype. From this plurality of views, besides the traditional understanding of what a prototype is (i.e., first unit of a product to be mass-produced), new conceptions emerge clearly, emphasising the theoretical and generative contribution that prototypes give to the research process. As an example, in the field of interaction design, prototypes are often employed to test the experience of users systematically, with the aim of producing knowledge to be shared with other researchers. In this field, prototypes are made mixing physical and digital features, sometimes relying on advanced manufacturing processes (e.g., PCB laser-cutting or milling). This peculiarity led us to term these types of prototype “advanced”. Because this way of prototyping, we believe, marks a significant shift in the way present-day design research contributes to the development of products, our project was named after this term. That being said, the true novelty in this field is that prototypes are conceived of as *means of knowledge production*, whether or not they are made by using advanced manufacturing processes. Indeed, this new role is played by other types of

prototype (and prototyping) as well – substantially intangible – which are gaining significance in design research (e.g., storytelling in design fiction – see section 4.1).

1.3 Focusing on the emerging role(s) of prototypes

Based on literature review, we found that prototypes in design research are used nowadays as means to produce knowledge (i.e., theory), throughout the research process. This innovation, we believe, is of great relevance for the understanding of the emerging role(s) of the prototype in design research. Indeed, the new role of prototypes as *means of knowledge production* extends beyond our notion of "advanced prototypes", including intangible artefacts that are often unrelated to manufacturing processes. Therefore, the focus of our project shifted towards the *evolution* of the role of prototypes in design research, which is not limited to those artefacts made by means of advance manufacturing techniques.

This project is funded by the Department of Design of Politecnico di Milano and developed by nine affiliated researchers, working in different areas of design research. The research group brings together a wide spectrum of expertise ranging from product design to interaction design, fashion design and materials in design. In this plurality of specialisations, the joint interest is the design of products and its evolution. Indeed, the proposal at the base of this research project originated from directly observing the emerging role(s) of the prototype in our daily academic work.

2. Literature review

2.1 Phase 1: "Defining and Understanding"

As a first stage of the project, we collected a wide range of definitions of prototype circulating in different areas of design research.

Analysing the literature, we found that there is no consensus among authors regarding the meaning of the term *prototype*, even when referring to the context of design practice. Some authors use the traditional notion, which understands prototypes as refined artefacts ready for production (Pei, E., Campbell, I. & Evans, M., 2011). Others, in contrast, ascribe a wider role to prototypes, viewed as "design-thinking enablers deeply embedded and immersed in design practice and not just tools for evaluating or proving successes or failures of design outcomes" (Lim, Y., Stolterman, E., & Tenenberg, J., 2008; McElroy, K., 2016).

Despite this lack of consensus, recent studies address specifically the context of design research (mainly academic), where "prototypes are made for operationalization, validation and exploration, and these uses seem to fit in different research approaches. They can be done to test preconceived hypothesis or to reflect on open-ended exploration. Roles prototypes can play in research projects are to confront theories; to confront the world; to evoke discussion and reflection; to changing the world; to test a theory" (Stappers, P. J. ,

2013). This idea of prototypes as means to carry out research extends to areas such as service design and design fiction, where they often consist of intangible artefacts (Kimbell, L., & Bailey, J., 2017; Kymäläinen, T., 2016).

The initial purpose leading the data collection was that of reaching a shared definition of the emerging role of prototypes in design research. Nevertheless, the heterogeneity of definitions that we found in literature led us to rethink the purpose of this stage, directing our efforts towards a mapping of the *diversity* emerged (section 4.2). Giving an account of this diversity, we thought, better responds to the underlying aim of the research project, i.e., *understanding* the emerging role of the prototype in design research.

3. Method

3.1 Selection and review of relevant sources

The term *prototype* is largely used nowadays in several areas of design research to describe unfinished and instrumental artefacts (McElroy, K., 2016; Wakkary, et al., 2015). This connotation revises and overcomes the long-established difference between *model* and *prototype* in the field of industrial design (see section 5.2). Furthermore, the notion of prototype currently used in design research (i.e., academic context) comprises a larger spectrum of categories of artefacts than the traditional one. For this reason, we decided to search for terms such as *model* and *artefact*, which the current notion of prototype seems to have gathered under the same umbrella-term (i.e., *prototype*).

Overall, the role of prototypes, their understanding and the terminology used to differentiate their purposes vary across the wide spectrum of design research, from engineering-based design studies to arts and crafts design research. Therefore, besides the terms *model* and *artefact*, we searched for definitions under the term *demonstrator*, mainly used in engineering-oriented design research.

3.2 Literature review process

Source finding
We started the literature review by collecting relevant sources, using keywords according to terminology (e.g., prototype and design), disciplinary areas (e.g., interaction design, product design, design research, etc.) and research areas (e.g., manufacturing techniques, product development, etc.). We made use of search engines and sharing platforms, such as Google Scholar, ResearchGate, Academia.edu, Mendeley, Online databases (library of Politecnico di Milano, ACM Digital Library).

Collection

We selected and sorted 95 publications among books, journal articles, papers, web articles and definitions from encyclopaedias. Hence, we extracted relevant content, consistently with the key topic of our research. Thereupon, we clustered the excerpts according to terminology, disciplinary area, and role played in the (design) research process. We identified eight clusters: prototype (49 publications); artefact (11 publications); culture and artefact (8 publications); design (encyclopaedia) (5 publications); model (5 publications); fashion (4 publications); product (design) (8 publications) and systems (design) (5 publications).

Document analysis using the Data Grid

We developed a grid to organise and review the excerpts systematically (Tab.1).

DATA GRID					
reference	**general definition**	**extensive definition**	**synthesis**	**interesting aspects**	**comment**
publication data	overall description of prototype and its meaning	extended description of prototype and its meaning	sum up of the publication	highlight of the relevant parts of the publication	reader's annotation
"Artifact"					
Design Dictionary: Perspectives on Design Terminology Michael Erlhoff, Tim Marshall (Eds.) Birkhauser, Berlin (2008)	"Quite literally, an artifact is an object that is the product of human skill and ingenuity. The term derives from the Latin ars (art or skill) and factum (made or done), and thus is a pivotal term to describe almost any designed entity." p.27	"All products of design are artifacts of one kind or another, and a common definition of design is the organization of the interface between humans and the "made world," that is, the interaction between people and our artifacts" p.27 "Although usually understood to refer to a material object, artifact can also refer to designed spaces, images, [...].	The term refers to anything is produced by humankind: the "made/designed world". Thus, the notion of artefact is not limited to tangible objects; rather, it includes non-tangible things such as software and environments.	The meaning of the term "artefact" is much wider than that of "prototype", though sometimes they are used interchangeably in some studies.	Artefacts is often another word for prototype; the fact that the term may refer to a diversity of things, much different from each other, raises the problem of the limitedness of the notion of prototype based on materiality. In other words, understandably and rightly enough, the term prototype can be applied to non-tangible things.

Table 1. Data Grid for literature synthesis and analysis – example of the term "artifact" in the Design Dictionary (Erlhoff M. & Marshall T. Eds., 2008).

Organizing literature

The literature review was carried out over a four-month period. During this process, unfitting publications were discarded. On the other hand, new ones were included, relying on the references of those we had already collected. The number of publications collected was considered enough to gain a general understanding of what a prototype is and what roles the latter plays in today's design research.

4. Results

4.1 Preliminary findings

The literature review carried out using the Data Grid (Tab.1) allowed us to gain a first understanding of the evolving role of prototypes in design research. We collected a wide range of definitions that describe what prototypes in research are meant by, under terms such as “demonstrator”, “proof of concept”, “sample” – just to mention a few. Such terms constitute a specialised lexicon used in specific areas of design research. Over the last ten years, a variety of new terms have been introduced, with the aim of defining some emergent types and uses of prototypes. One example is the notion of *counterfactual artefact*, developed by Wakkary et al. (2015), which encompasses critical design, HCI, interaction design and philosophy. Another example is the notion of *diegetic prototypes* by Kirby (2010), who investigates the narrative role of those prototypes that are used to influence cinema audiences. These neologisms signal the need to fill an ontological gap related to prototypes in today’s design research, beyond terminology. In other words, the proliferation of new terms used to describe the role of prototypes testifies a change of perspective in the field of design, where research has expanded its horizons. In particular, various strands of research in design have been turning their attention to theory and social phenomena, besides the development of products. In these strands, prototypes are used as means to conduct research and generate knowledge, which does not pertain to one or more specific products. In fact, the knowledge generated may be used at a later time by other researchers either to develop a product or to investigate relevant theoretical matters further. This understanding of the role of prototypes sets apart from the traditional view spread in industry, showing the occurrence of a shift in the way the very research in design is understood.

4.2 Prototype: from *definition* to *role*

Overall, we observed that the diversity of terms currently circulating are part of a jargon that design researchers use to classify prototypes, according to a variety of purposes deemed as most relevant to their specific research areas. As a result, terms and definitions vary according to the specific research contexts, questions and, sometimes, stages of the process. In this respect, the classifications are often based on the specific *objectives* or *purposes* to which the single prototype aims. Therefore, terminology is tightly bound to both the specific aim and the general purpose (i.e., *role*) that the prototype is expected to help achieve. Such a functionalist approach to taxonomy is widespread among researchers and led us to move our focus from the *definition* to the *role* of prototypes. We therefore reframed the Data Grid, highlighting the diverse *roles* and *aims* ascribed to prototypes (Tab. 2). Moreover, we revised the data collected according to the changes made.

DATA GRID II			
Reference	**Role of the prototype in the interpretation of the author**	**Categorisation criteria:** **Aim** **Discipline** **Terminology** **Context (academia, practice…)** **Fidelity (low, medium, high)**	**Author's specific distinction(s) (to be highlighted)**
publication data in APA style	description of the authors' intepretation of the role of prototype	collection of information based on a set of criteria of categorisation	notes about any author's specific distinctions about the role of prototypes
"Prototype"			
Blackwell, A. H. (2015). Prototype. In UXL Encyclopedia of Science (3rd ed.). UXL.	The role of prototype is to perfect items and processes of a design before implementing them on a large scale.	Aim: Allowing designers to see their design in action; Persuading marketers. Discipline: Design and Engineering. Terminology: Prototype (prototype for testing); Fully working prototype (first type of a series). Context: Industry (R&D); design practice (studio). Fidelity: No reference to the concept of fidelity. However, it is implicit in the definition of prototype (plain one) – "[...] a prototype is not exactly what the final design will contain, but that is close enough to let the designers see if it will work or not." Phase (process): Not specified but implicitly it should be throughout the process.	Prototype vs Fully working prototype (clear distinction).

Table 2. Data Grid II (revised version) for literature synthesis and analysis – example of the term "prototype" from Encyclopaedia of Science (Blackwell, A. H., 2015).

The new grid for analysing the literature allowed us to identify two main roles that prototypes have in design research. These roles differ substantially from each other. One, more traditional, consists of giving researchers the chance of gaining useful insights about the prototype itself, as part of the product development process. The other, unusual compared to the long-established role in industrial design, consists of enabling researchers to gain knowledge regarding phenomena that lie outside of the domain of design. In the latter case, prototypes work as instances, embodying ideas and theoretical concepts. In this regard, they can be used to generate new hypotheses, answering research questions, and envisioning new design propositions. This is the major innovation, we observed, regarding the *role* played by prototypes in current design research.

Regarding the specific aims of prototypes, we collected over 140 statements. After a process of review, we made a list of 34 primary aims and clustered them into 9 categories: *Develop*, *Assess*, *Communicate*, *Represent*, *Comprehend*, *Research*, *Explore*, *Provoke* and *Envision* (Fig.1). These clusters well represent the range of purposes for which prototypes are made in design research.

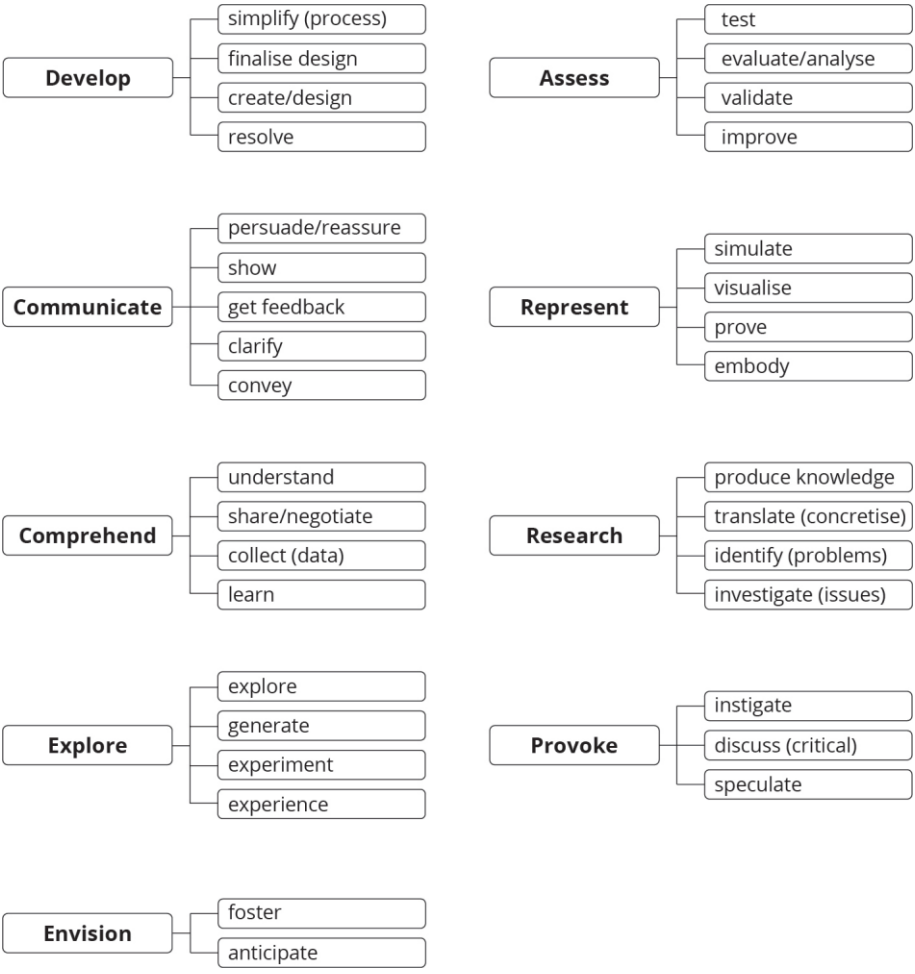

Figure 1. Aims of prototypes: categories and sub-categories

Later, we used this outline as a starting point to proceed with the next stages of our research. In this article, however, we focus on the insights gained by analysing the terminology and the definitions of prototypes currently spread in various areas of design research.

5. Discussion

5.1 The role of prototypes through terminology

Our shift of focus from *definitions* to *roles* of prototypes allowed us to pinpoint a major change of perspective in the field of design research, which has expanded its scope of interests, including theory and social phenomena related to material culture. In particular, our preliminary results show that prototypes have acquired the role of means for the production of theoretical knowledge, which complements the traditional role of testing aesthetic and technical aspects of the to-be-product. Moreover, drawing on literature, we were able to develop an overview of 34 primary aims for which prototypes are used, both in practice and research, defining 9 main categories.

It must be clarified, however, that the emerging role of prototypes – i.e., its evolution – in design research is tightly bound to the terminology used to describe them. That is to say, terminology defines the role of prototypes, highlighting the nuances related to their specific purposes. Indeed, through their discourses – i.e., fine-tuning terms and ascribing new meanings – the actors of research have constructed, conceptually, a new role to be played by prototypes, so influencing the practical dimension of the very research.

The classification of aims that we developed (fig.1) well shows the importance of terminology in the emergence of a new role of prototypes. Take, e.g., the two categories *Develop* and *Research*. It is clear that the aims that these categories gather refer to quite different paradigms, hinting at two distinct roles. Interestingly, other categories – such as *Comprehend* and *Represent* – gather aims that refer to both roles, traditional and emerging, reinforcing the idea that such roles often coexist in design research.

What is relevant about these examples is that the terms that we used to define the sub-categories (i.e., aims) are faithful to the claims made by various authors active in the field. That is why the lexicon used in design research to describe and frame prototypes is relevant to an enquiry into their emerging role in the field (see next sections).

5.2 Semantic overlaps

By mapping the definitions of prototype, we collected over 80 terms and related meanings. In this respect, we noticed that in some cases different meanings are ascribed to the same term (e.g., the term “prototype” is used to address both the provisional draft object that represents the concept of a product and a detailed object that represents the final product before production). In some other cases, the same meaning is described with different terms (e.g., the provisional draft object that represents the concept of a product in an early stage of development might be termed “model”, “mock-up”, “sketch”, “prototype” or otherwise). Therefore, the literature is riddled with semantic overlaps, which show a lack of a shared understanding among researchers of what a prototype is meant by.

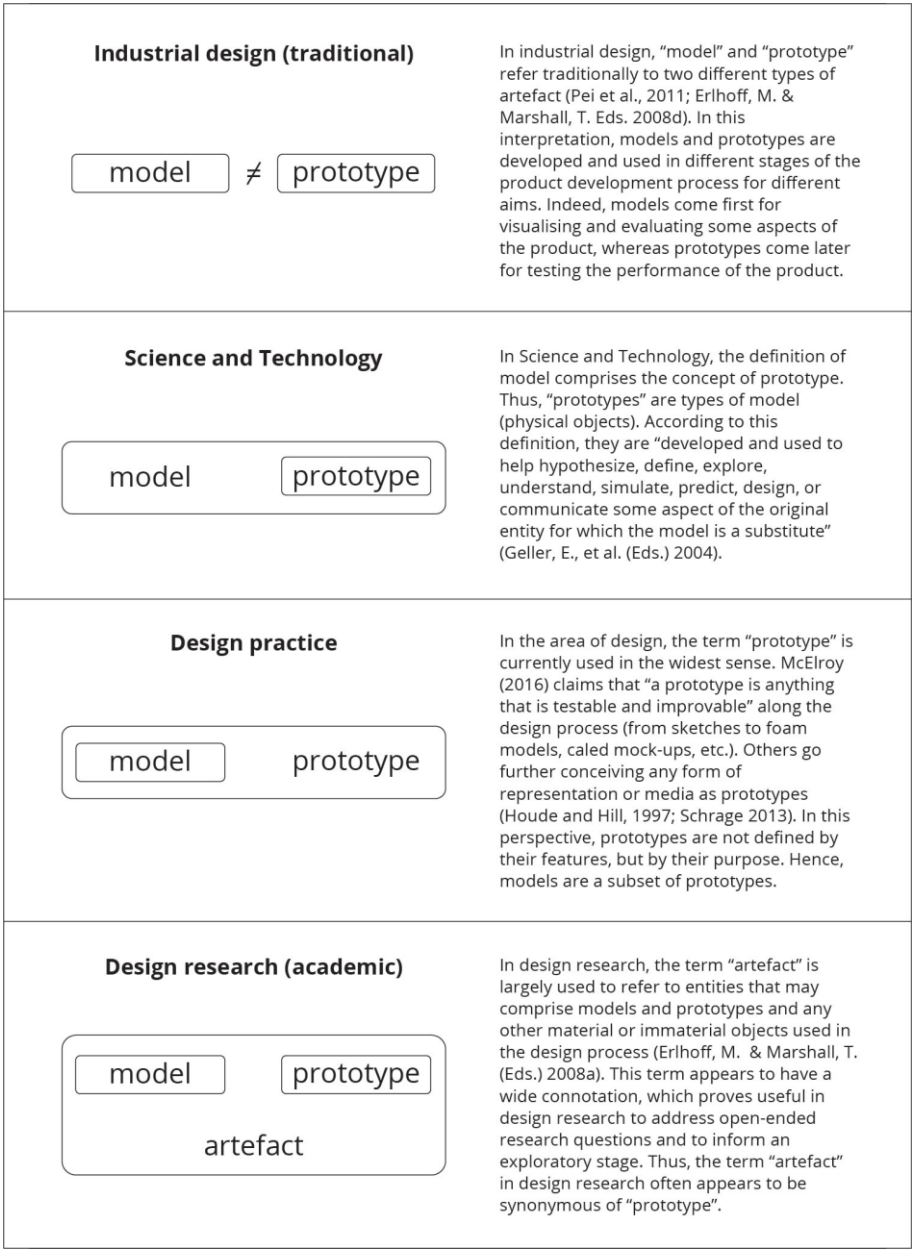

Figure 2. Interpretations of three widely used terms (i.e., artefact, model, prototype) in different areas of design research.

To bring some clarity, we give an overview of the way three widely used terms (i.e., *artefact, model, prototype*) are interpreted in different areas of design research (Fig.2). In addition, we elaborate upon a further term coming from the field of engineering (i.e., *demonstrator*), also adopted in some areas of design research (see section 5.3). Finally, we discuss the interpretation of the term prototype in the field of design research (see section 5.5) and in fields other than design (see section 5.4).

5.3 “Demonstrator” in Engineering

In the process of selecting relevant publications, we extended our scope of enquiry to engineering-oriented areas of design research. In these areas, we found that the term “demonstrator” is often used as a synonym of prototype. Moultrie (2015) points out that “[usually] demonstrators are viewed as technological prototypes which are close to market”. In this respect, Moultry proposes a new conception, arguing that “by considering the broader development space, it is possible to explore the potential for other types of demonstrators”. This point of view assimilates the term “demonstrators” to many of the interpretations of the term “prototypes" used in design research.

5.4 “Prototype” in disciplinary areas other than design

It is worth noticing that the term “prototype” can refer to a diversity of artefacts, depending on the specific disciplinary area. This semantic dissimilarity may lead to misunderstanding, especially in the context of multidisciplinary teamwork, where designers collaborate with researchers coming from different fields. Therefore, as Hallgrimsson puts it:

> “Product designers have to work with professionals from other disciplines where the term prototype could be used to describe many things that are not three-dimensional. Software designers use the term prototype in the context of code. Electronics engineers speak about prototyping printed circuit boards. […] It is worthwhile becoming more aware of these semantic differences since product design has become inherently interdisciplinary.” (Hallgrimsson, B., 2012).

5.5 “Prototype” in Design research

In the field of design research, as in that of design practice, prototypes are understood generally as means to represent ideas, namely, give an intelligible form to undetermined and abstract concepts pertaining to design solutions. In other words, prototypes are deemed as practical instruments to advance the design process, moving from the typical vagueness that characterises the concept phase to the clarity that implementation and experimentation usually require.

This general conception is common to all views on the role of prototypes that dot the diverse landscape of design research. Whether practice-oriented research (e.g., R&D context) or academic research, prototypes in the field of design serve the fundamental need to make magmatic and conceptually embryonic ideas manifest through fathomable forms of representation. Unlike in the professional world, however, in design research, the guiding

principle is that of gaining and/or producing knowledge, often regardless and outside of market requirements. That is to say, the kind of ideas and concepts that research prototypes embody are part of a process of knowledge production, which is not directly related to manufacturing and marketability.

Although in all areas of design research prototypes are used to produce knowledge, their (claimed) role differs widely depending on both the scope of research and the approach adopted, leading to a diversity of terms and definitions. Notably, Wensveen & Matthews (2015) identify four main roles, highlighting different ways in which prototypes and prototyping contribute to generating design-relevant knowledge. Prototypes can be used either to "test specific hypotheses" (*experimental components*) or to conduct "open-ended explorations" (*means of inquiry*) or to embody/show concepts and arguments (*research archetypes*) (p.272). Moreover, the very process of prototyping can be "a means of enquiry, akin to a research method" (p.269). Each role is bound to a specific methodological approach that proves consistent with the kind of knowledge sought, and yet a single research project may include all of them, relying on several prototypes having different purposes throughout the process (p.271). Thus, not only is the role of prototypes in design research multifarious, but also its variations can be combined in the same project, if needed.

As Wensveen & Matthews (2015) clarify, besides contributing to the discussion on the use of prototypes in design research, their categorisation aims to show that the approach commonly referred to as *Research-through-Design* (RtD) brings together "a multitude of legitimate intersections between design research and practice" (p.263). In other words, making prototypes, as a distinct practice of design put to the service of research, can contribute to producing knowledge relevant for design in many different ways. This open-minded view, which embraces the heterogeneity that characterises the field of design research, leaves room for new conceptions of prototype and prototyping in emerging areas such as that of design for social innovation (e.g., Kimbell & Bailey, 2017; Blomkvist, 2014). In this regard, the attempt of settling an inclusive epistemology for design research, beyond typologies and segmentations around the definition of RtD, is openly expressed by several researchers who proposed the term *Constructive Design Research* (CDR) (Wensveen & Matthews 2015; Krogh et al., 2015).

Notwithstanding someone's attempts of agreeing upon an inclusive epistemology, researchers active in different areas of design tend to emphasise their peculiar way of doing research, coining terms that aim to distinguish their conception from that of others. This need to stand out is also reflected in the understanding of the role of prototypes. To give an example, while Wensveen & Matthews (2015) discuss prototypes and prototyping, Frens & Hengeveld (2013), who share a similar background, prefer to use the term *making* (instead of *prototyping*). Krogh et al. (2015), who present a typology of methods used to produce knowledge in RtD, on the other hand, emphasise the activity of *sketching* (p.5). These few examples show how even strands of research that share the same methodology attribute

different roles to prototypes and prototyping in design research. Interestingly, they claim differences of substance by emphasising semantic nuances and using distinct lexicons.

All things considered, the plurality of views on the role(s) that prototypes and prototyping play in design research – included their terminological inventory – are held together by the common aim of producing knowledge relevant for the design field, besides developing products for the market. This common trait, we believe, is what can be generally viewed as the emerging role of prototypes and prototyping in design research, without detracting from the significance that the diversity of views on such role (i.e., its nuances) offers.

6. Conclusions

In today's design research, a variety of terms are used to describe tangible and intangible artefacts playing the *role* of prototypes. The reason behind this diversity is that the notion of prototype is highly context and purpose dependent, i.e., varies depending on both the specific disciplinary area in which is developed and its use in the research process as it is performed in that very area. Our preliminary findings show that prototypes are best defined by both their general purpose (role) and their specific aims. Furthermore, we found that the role of prototypes in design research has evolved from a traditional conception (i.e., the first unit of a product series to be manufactured) to a new and wider notion, which views them as means to investigate phenomena outside of the domain of design. This evolution reflects a widespread and influential perspective into vogue in various areas of design research today. According to this view, prototypes are no longer aimed exclusively at developing products, also serving the process of knowledge production in the context of academic research.

The contribution of this paper is threefold. First, we provide a classification of prototypes by aims (fig.1), based on the claims made by various authors active in the field of design, both research and practice. Second, we discuss the emerging role of prototypes in current design research, highlighting a change of paradigm regarding the way research is conducted. This change follows an expansion of the scope of investigation, which includes theory and social phenomena. Third, we show that the emergence of a new role of the prototype in design research depends largely on the definitions and discourses that are developed over this topic. In such discourses, terminology plays an important role, influencing the very practice of research.

The Making of a Dress: Explicating the Implicit Processes

Adrian Huang

LASALLE College of the Arts
adrian.huang@lasalle.edu.sg

Abstract | This case study aims to provide fresh perspectives on design culture through the examination of the (usually overlooked) human decisions, interactions and processes involved in the design and making of an occasion dress. Four areas - actors and networks, project and praxis, benefits and limitations of technology, and artefact and meaning - were explored to address the questions, "What were the requirements for this dress to be made?" and "What is the cultural significance of this dress?" Interviews and observations revealed the motivations, co-design, risk-management, negotiations, relational capital, tacit knowledge, resources, technology and processes required in the making of the dress. The imagery referenced in the design of the dress gave it symbolic meaning. The making of the dress represents cultural cross-pollination through networks, artefact, and craft. The findings suggest that aside from brand storytelling, post-industrial designers should consider how they are helping clients craft their stories.

KEYWORDS | DRESS-MAKING, HAND-EMBROIDERY, IMPLICIT PROCESSES, CULTURAL HERITAGE, CO-DESIGN

1. Introduction

What can the making of a dress, commissioned in Singapore, inspired by Mexican Tehuana traje, and hand-embroidered in India, teach us about design culture in this post-industrial age? In the 20th century, shopping was a means of warding off the unhappiness created by a loss of self and identity (Bocock, 1992, cited in Press and Cuswoth, 1997). In the 21st century, everyday people are increasingly dissatisfied with simply being "consumers" and want to be "creators" as well (Sanders, 2006). Sanders (2006) identifies four levels of creativity that people seek. These include, from the most basic to the most advanced – doing, adapting, making and creating. Hur and Beverly (2013) cite the construction of IKEA flat-pack furniture as an example of 'doing'; the mass-customization of predetermined shoe styles by Nike as 'adapting'; and the growing number of DIY craft and fashion micro-producers embracing co-design activities as 'making'. The ground-up co-design of the dress in this study is presented as an example of 'creating'.

Numerous studies, including Jha and Narang (2014), examine the symbiotic relationship between contemporary fashion designers and craft communities in India. However, the end user (customer) is rarely, if ever, in the picture. The implicit human decisions, interactions and processes so critical to the culture of making are, likewise, rarely explicated. The author, having connected the client and the designer, had the opportunity to witness this design project as both an insider and a neutral observer. Considering the investment of time, effort and money involved in the creation of this artefact, gave rise to two questions: "What were the requirements for this dress to be made?" and "What is the cultural significance of this dress?" Four key areas were explored to address these questions – actors and networks, project and praxis, benefits and limitations of technology, and artefact and meaning.

2. Method

This case study involved detailed, in-depth qualitative and relevant quantitative data collection from multiple sources of information (Cresswell, 2013; Yin, 2009). Research tools included observation, interviews, and analysis of relevant data, such as WhatsApp chat proceedings between involved persons. Some of the key people involved in the making of the dress were interviewed, including the client, the designer, and embroiderers.

3. Actors and networks

Culture is created and defined by people. This section identifies the actors connected to the making of the dress. The client, Circe Henestrosa, is a fashion curator and heads the School of Fashion at LASALLE College of the Arts, Singapore. The idea for the dress came about when she was contemplating what to wear for the opening of Frida: Making Herself Up at the V&A Museum scheduled for June, 13, 2018. Circe considered two options, "My debate

was whether I should wear the traditional (Tehuana) dress or a more modernized version of it." Eventually, Circe had both versions made. She commissioned a Mexican designer to make a more traditional two-piece outfit and a Singapore-based LASALLE alumnus to produce a contemporary version.

The Singapore-based designer, Vikas Dayal, was born in India, but currently works and resides in Singapore as a permanent resident. His 2012 graduation collection stood out from his peers for his use of detailed embroidery and beadwork. A key advantage he possesses over other Singapore-based designers and arguably the main reason for his selection, was that he has his own embroidery workshop in India.

In New Delhi, Taufir and Mamu are Vikas' "main sampling guys" for machine-aided embroidery and hand embroidery respectively. Having previously worked for a renowned Indian fashion designer, Taufir chose to work for Vikas' workshop due to proximity to his home and higher wages. He was responsible for producing the first embroidery sample for this project. Together with five other embroiderers, Mamu was responsible for the hand embroidery used in the final dress.

Figure 1. The silk embroidery thread seller.

There is a group of supporting actors, largely overlooked in the literature, who enable the continuation of the craft of embroidery – merchants who supply the essential materials, tools and equipment used in the craft. A representative of this supporting network is an elderly embroidery silk thread seller who operates a hole-in-the-wall shop close to Vikas' workshop (Figure 1). Vikas prefers to patronize this particular thread seller because he provides the special service of color matching. The different colors of threads are stored in cardboard boxes with only numerical indications. Customers simply hand him color swatches and he will find the matching threads from memory.

Vikas has only one staff back in Singapore due to the country's restrictions on foreign manpower. His sample-maker, Chote, who is skilled in both pattern-cutting and sewing. Chote was responsible for making and altering the dress toile (prototype) for the fittings and assembling the final dress. Although Circe knew Vikas personally, she first sought the author of this paper, Adrian, for his opinion as to whether Vikas would be able to produce the dress she had in mind. Adrian was one of Vikas' lecturers at LASALLE and they had remained in contact since the designer graduated. Having previously worked together on a number of custom-orders, Adrian could attest to Vikas' dressmaking and embroidery capabilities. Circe also enlisted the help of another LASALLE colleague, Dinu Bodiciu, a fashion design lecturer, to plan the embroidery placement for the dress.

4. Project and praxis

The making of the dress took place between March and May 2018. On March, 28, Vikas had the first meeting with Circe and Adrian to discuss the design of the dress. He accepted the commission on Adrian's recommendation and because it aligned with his schedule. Vikas usually returns to India two to three times a year to work on the production of his own collections. He was scheduled to fly back to India on April, 2, to prepare for a showcase of his work at the International Fashioner Week on April, 7. Work for the dress progressed quickly at the onset. Chote completed the toile for the first fitting on March, 31, and altered it for a second fitting the next day. On April, 2, Vikas flew back to India, on schedule, with the toile and a Manila shawl sample, from Circe, as reference for the embroidery.

Amidst preparations for the fashion show, Vikas discussed the work for Circe's dress with his embroiderers. They estimated that the embroidery with all its colors would require at least three months to complete, making it "impossible" to deliver by the end of May 2018. They strongly advised him to drop the project.

When Vikas is not around, the workshop usually produces embellished ready-to-wear dresses for the domestic market. During my visit in October 2019, the workshop was producing such a design. A distributor wanted to order 80 units of that dress a month, but the workshop was only able to churn out about half that quantity. This was a good problem for them to have, with demand exceeding supply. The dress I saw in production was embellished with hundreds of glued-on crystals. Initially, I thought that this type of work

could be what Mohsini (2016) refers to as 'labor'. In fact, although the materials used differ from traditional embroidery and beadwork, the work still leverages the experienced hands and dexterity of the embroiderers. The making of these dresses utilized skilled workmanship.

Nevertheless, adopting Pye's (1968) use of terminology, Vikas demands 'craftsmanship' for his own designs as opposed to 'workmanship'. As a designer-producer, he is more than willing to make the distinctions between the two. His own designs require experimentation at the onset and close supervision during actual production. He told me, "If I'm not there, the work does not move." Even when he is there, the embroiderers can be reluctant to take on new work. New designs require a lot of preparatory work.

Vikas' own designs, with their higher price points, may not garner as many orders as the crystal-embellished dress, but he still secures multiple custom-orders for some styles. Vikas also pays his artisans extra for the higher quality he expects for his work. Circe's dress, however, came across as a time-consuming one-off piece involving a style of embroidery different from what they usually do. It was not technically difficult for them to adapt to, but they did not see potential return-on-investment for the time and effort that would be required for the dress embroidery. Therefore, dissuading Vikas from proceeding with the order was simply a matter of avoiding risk.

On April 22, 2018, Circe followed up with Vikas via WhatsApp. She negotiated with him, suggesting a compromise of making either a top or skirt with the embroidery if the dress could not be completed on time. Vikas actually thrives on overcoming challenges. Over one of their regular chai and biscuits breaks, Vikas tells his team that his reputation will be tarnished if he fails to produce the dress. For "brotherhood", the embroiderers agreed to start work on the dress. Once the sampling started, Vikas had to commit to the investment in materials and wages. He incurred a financial risk even before the actual "workmanship of risk" (Pye, 1968) commenced. On April, 24, Vikas sends images of the first machine-aided embroidery sample (Figure 2) to Adrian and Circe.

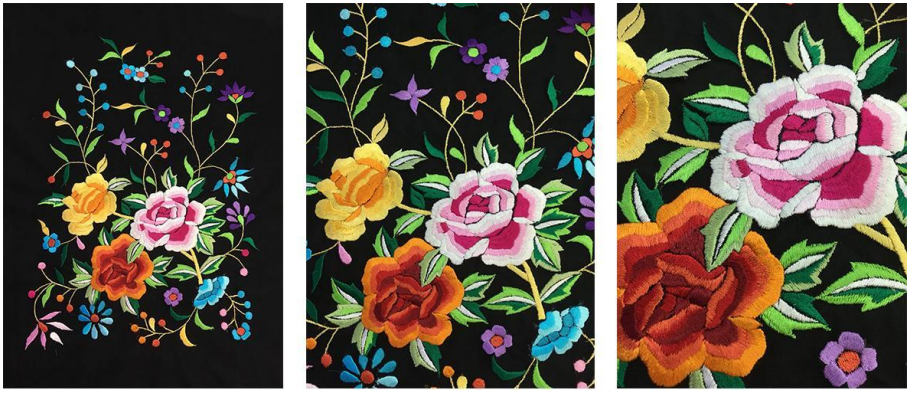

Figure 2. Images of first machine-aided embroidery sample at different magnifications

Apart from commissioning another dress with the Mexican designer, Circe's decision to get Dinu to work on the placement of the embroidery after approving the machine-aided embroidery sample was also risk-management. Believing that the scale and placement of the embroidery motifs could "make or break" the outcome of the dress, she sought Dinu's help to ensure that the embroidery on the dress would look right. This process delayed the start of the actual embroidery work. On April, 28, Vikas sent Dinu images of the dress pattern pieces and the first embroidery sample photographed with measuring tape for scale. With these images, Dinu prepared the embroidery placements (Figure 3) and shared them on May, 6.

Figure 3. Embroidery placements prepared by Dinu. Clockwise from top left image: front bodice, back bodice, sleeve, and skirt placements.

The same day, Vikas started drawing the embroidery pattern (Figure 4) on plastic sheets. Each completed section was handed over to Taufir to punch holes along the drawn lines using his machine. Once the holes were punched, the embroidery patterns were ready for use as stencils. In the workshop, these are called “kah-kah” which actually refers to the plastic material but is understood as the embroidery patterns. The artisans use a chalk solution and the kah-kah to transfer the embroidery pattern to the dress fabric which is stretched out on a wooden frame.

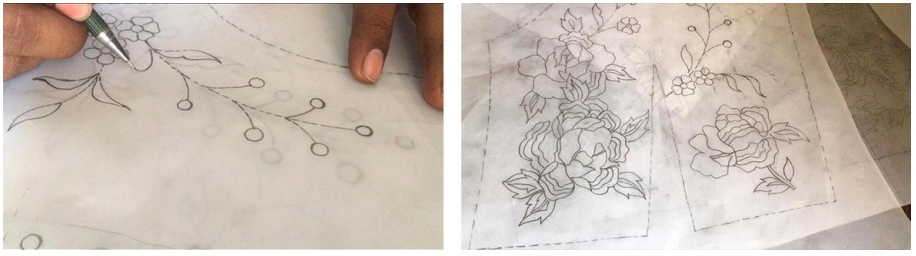

Figure 4. Hand drawn embroidery pattern, referred to as “kah-kah” in the Delhi workshop.

Dinu’s embroidery placements did not save Vikas any time directly, as the kah-kahs still had to be meticulously drawn from scratch. However, Dinu’s placements contained more negative space compared to what Vikas would have left on his own. Accordingly, this resulted in indirect time savings as less embroidery was required.

Mamu produced the first hand-embroidered sample which was followed by another embroiderer, Mona. Another four embroiderers, who worked on the actual dress together with Manu and Mona, would then "copy from the sample”. Referencing Derek Sivers’ (2010) observation of the “first follower”, Manu played the role of the leader, establishing the instructions and standard for the embroidery. Mona played the crucial role of the first followers and showed that the standard Manu sets could be achieved. The other less-experienced embroiderers then proceeded with their work by copying the pattern that had been set for them.

Vikas’ responsibility was to ensure the timely completion of the work by assigning the right number of embroiderers according to the pace of the progress. Vikas revealed that there are two flowers in the dress which are more finely embroidered than the rest. These initial flowers were embroidered by Mamu according to the standard that Vikas usually demands for his work. However, with just under three weeks left to delivery, the progress was too slow and Vikas had to instruct the embroiderers to reduce the refinement and increase the speed of the embroidery.

Worried that his own embroiderers could not finish on time, Vikas tried to sub-contract some of the work to two other embroidery workshops, offering the same extra rate he pays his own embroiderers. They rejected his offer, judging the work to be too time-consuming.

Money alone was not enough to get the work done and Vikas did not have the same amount of relational capital to leverage with the external workshops as he had with his own embroiderers.

In total, the dress took 720 man-hours to produce, including sampling and work on the actual dress. On May, 25, Vikas flew back to Singapore with the embroidered panels of the dress. That same day, Chote sewed up and finished the dress. His work took place behind-the-scenes; cutting and sewing according to drawings, measurements, verbal instructions, and photographs provided by Vikas. He never met Circe in person throughout the process. At 2 pm on May, 26, Adrian accompanied Vikas to deliver the finished dress to Circe (Figure 5). In the evening, Circe messaged her thanks to Vikas for completing the dress and asked about the price.

While certainly not recommended practice, there were two reasons why the price was not established until the end of the project. Firstly, Vikas did not have a close-enough prior reference for this particular style of embroidery involving so many different colors. It was difficult for him to accurately predict the time and resources required for its completion prior to commencement. Secondly, the project was not merely transactional. There was a relational component and the need for trust amongst stakeholders. The client had to trust the designer to complete the dress on time. The designer upon accepting the commission had to trust that his team would help him complete the work satisfactorily and that the client would pay him for the finished work. Both the client and the designer shared the risk of the project. It was a coproduction in which failure was not an option.

Figure 5. Circe trying the completed dress for the first time.

5. Benefits and limitations of technology

In this digital age, we are surrounded by so much technology that it is easy to take it all for granted. Today, when people speak of technology, they are usually referring to computers, smart devices, robots, blockchain, artificial intelligence, and 3D printing etc. In this case study, examples of technology from the present digital age, the industrial age, and the pre-industrial age were observed. More specifically, the smartphone, the sewing machine, and hand embroidery tools respectively. In this section, we examine the use of technologies in the making of the dress.

Digital technology enabled communication between actors in different locations and across time zones. The mobile application WhatsApp was used for the majority of the communications between client and designer. They only spoke face-to-face during the initial design discussion, for the initial fittings, and when the finished dress was delivered. WhatsApp was used to share visual references, follow up on the progress, negotiate solutions, provide assurance and approval, etc. Embroidery placements shared by Dinu via Google Drive, a cloud storage service, were accessed by Vikas on his smartphone. Vikas also used his smartphone's camera to capture images and take videos of the embroidery work at various stages. Images of the first embroidery prototype were sent to Circe for her approval. Subsequent images and videos of work-in-progress were used to keep her assured of progress. Vikas also provides his clients with videos of the work-in-progress as a guarantee of the "handmade". Ironically, when the embroidery seems too refined, clients sometimes question if the work was really being done by hand or machine.

Figure 6. The embroidery sewing machine (left) and embroidery hoop (right).

Machine-aided embroidery, an industrial age technology, is typically faster than hand-embroidery but has its limitations. The work area is limited to the clearance between the machine body and needle and the largest hoop used was about 15-inches in diameter

(Figure 6). Only one machine embroiderer can work on a dress panel at one time; continually repositioning the hoop after each section is embroidered. The embroidery, consisting of 17 colors (Figure 7) meant having to re-thread the machine many times for each hoop position. A final drawback is that machine embroidery tends to produce a stiffer, more rigid hand feel as compared to hand embroidery because the main fabric has to be stabilized with interfacing.

Figure 7. The 17 colors selected for the embroidery.

Ari hand-embroidery, utilizing tools from the pre-industrial age, was eventually used to complete the embroidery for the dress in 15 days. This embroidery produced a softer hand-feel as compared to machine-aided embroidery since the use of interfacing was not required. It was also the more efficient option as the larger embroidery frame allowed multiple embroiderers to work on the same piece simultaneously (Figure 8). In Ari embroidery, switching between different colored threads can be done more quickly compared to the sewing machine. Ari embroidery involves chain stitching with an awl. Without getting too technical, each stitch leaves two threads on the surface where the thread is looped and a single thread on the under-side. This results in a higher density of the face-side embroidery compared to the reverse (Figure 9).

Figure 8. Two embroiderers working on the front bodice of the dress.

Figure 9. Close up of Ari embroidery sample. Top of embroidery on the left, back of the embroidery on the right.

6. Artefact and meaning

As curator of the Frida: Making Herself Up exhibition, Circe had dedicated almost two years in preparation. The opening at the V&A museum was an important milestone for her. A regular off-the-rack dress would not be sufficiently commemorative. Her motivation to wear a version of Tehuana dress for this occasion stemmed from her research on Frida Kahlo's adoption of Tehuana costume in her everyday dressing. While Frida was from Coyocoan, Mexico City, she mixed various types of indigenous garments in her dressing. Circe felt personally connected to this research being Mexican herself and for the fact that her grand-aunt, Alfa Rios Henestrosa, provided Frida with some of the Tehuana garments she wore. In the footsteps of Frida, Circe's choice of dress was consciously driven to fulfil the duo purposes of constructing identity and showing her appreciation for artisanship. The intention of the client, in this case, imbued the artefact with its meaning.

While the dress holds personal meaning for Circe, any cultural significance depends on how it is perceived by others. Today, there is a strong association between peony embroidered Tehuana traje and Mexican identity, thanks in part to Frida's influence. Historically, the Tehuanas adopted the peony embroidery from the imported Manila Shawl. The Manila shawl, unlike what its name might suggest, did not originate from the Philippines but from China. For the Chinese, each motif used in the embroidery had a purpose and was a metaphor, but this symbolism was lost in time as the designs were adapted to suit the tastes of different markets (Arbues-Fandos, et. al., 2008). The indigenous people of Oaxaca (Mexico) changed the colors and increased the size of the peony motif embroidery in the Manila shawl. This style of embroidery was also applied to the Tehuana dress. This historical cross-pollination continues with Circe's dress, bearing Manila shawl-style peony motifs executed in Indian Ari embroidery.

The making of the physical dress was accompanied by the creation of many digital artefacts; including images, videos and text. Arguably, these intangible artefacts contribute more to the construction of cultural significance than the tangible artefact itself. On the night of the V&A exhibition opening, Salma Hayek, who played the role of the titular character in the 2002 biographical film *Frida*, came dressed in traditional Tehuana traje. Her outfit was a close interpretation of a photo of Frida as a Tehuana that accompanied the 1948 Time magazine article entitled "Mexico: Fashion Notes" (Belnap, 2017). This same image was Circe's initial reference for her dress. This outfit while so representative of Frida in our collective psyche was not found amongst her personal belongings in the bathroom of the Blue House. Should Hayek's traditional rendition and Henestrosa's modern interpretation be seen as reincarnations of a lost outfit or an immortalized image? In any case, the image of

Salma, Circe, and Frida's Self Portrait, 1948 (Figure 10) posted on Instagram has become memorialized as a part of contemporary media culture.

Figure 10. (Left) Instagram post of Salma, Circe, and Self Portrait, 1948 by Frida Kahlo. (Right) Image of Salma and Circe at the V&A exhibition opening shared via WhatsApp.

7. Reflections

The following are some of my reflections on the findings of this study in response to the research questions.

What were the requirements for this dress to be made?

This dress would not exist without the initial vision of the client, Circe, who was not only the patron/producer but arguably the lead designer. The commissioned designer, Vikas, adopted different roles over the course of the project, including translator, tailor, middleman, negotiator, production manager, artisan, quality control, photographer, videographer, customer service, etc. Possibly due to the privacy of such arrangements, such examples of co-creation between end user and professional designer are uncommon in the literature. Understanding the motivations of clients and producers in the co-design process can be valuable in enhancing existing or even creating new design service offerings.

It is important to note that money alone was insufficient incentive to get the work done. Trust and relational capital were necessary to overcome the perceived risks of the project. The client made initial contact with the designer through the author, who shared a closer

working relationship. The designer's negotiations with his embroiderers took place during the workshop "ritual" (Sennett, 2009) of the tea-break. These seemingly trivial connections played their part in the realization of the dress.

The designer's tacit knowledge was observed in other minute production decisions. Although Dinu suggested using French tulle at one point, Vikas stuck to a tulle he was familiar with because he could accurately gauge, from experience, the amount of allowance required to compensate for the shrinkage that occurs after releasing the fabric from the embroidery frame. During prototyping, he reduced the number of colors in the embroidery from the initial 21 that the thread seller picked out to the essential 17. He mobilized multiple hand embroiderers after realizing that the machine-aided embroidery would take too long. He made sure the embroiderers applied the right balance between refinement and speed. He personally oversaw the dry-cleaning of the embroidered panels and hand-carried them back to Singapore. Process management was also critical to Vikas' workflow. Placing his pattern cutter/sample-maker in Singapore allows him to perfect toiles where his clients live and make final adjustments when necessary.

The flexibility of the artisans' skill enabled the tangible embroidery work. Ari embroidery was adapted to mimic the single-needle embroidery found in the Manila shawl. The smartphone facilitated processes from design negotiations to confirmations, and providing assurance.

What is the cultural significance of this dress?

Jha and Narang (2014) state that the challenge of bridging the gap between traditional craft and fashion lies in harmonizing the local and global, the urban and the rural, tradition and modernity, creating new market potential in a way that is beneficial for all stakeholders. I believe that the making of this dress has bridged the gap between traditional craft and fashion quite successfully. In the precedent of Frida, this dress was a celebration of Circe's cultural identity and personal affiliations. As a designed artefact, this dress was the result of centuries of globalization, from the Manila shawl trade routes of the 1500s to present day expatriation; reflecting the cross-pollination of cultural symbols, design sensibility, and craft technique. In this digitally connected age, the images of the dress extend cultural significance well beyond the artifact. However, what cultural significance would the image have without the dress and the intangible design decisions, craftsmanship, and cross-pollination of cultural heritage that went into its making?

8. Conclusions

By explicating the usually implicit processes involved in the making of this dress, we see how the meaning and value of the crafted artefact is ascribed by the collective of actors involved in the making of the object rather than a single author. In this age of multiple networks and connections, the handmade still has its place alongside industrial and digital technologies as long as people continue to value its expression.

The earlier industrial revolutions may have led to the redundancy of the craftsman's workshop and craft guilds (Sennett, 2009) but the 4th industrial revolution can empower small craft businesses to once again thrive. However, as customers continually evolve, the designer's work now involves catering to – with reference to Maslow's hierarchy – "higher-order" needs. In cases like this, the client and designer are engaged as co-designers.

In this post-industrial age, quality and craftsmanship are important, but they increasingly only fulfil clients' baseline expectations (Langer, 2020). From a behavioral perspective, the higher purpose of this dress was art – an "activity of making the things one cares about special" (Dissanayake, 1995, p.223). I suggest that while conventional wisdom emphasizes brand storytelling, contemporary designers should consider how they are helping clients craft their own stories.

The shape of wellbeing: investigating an approach for the development of a design requirements framework for design for wellbeing projects.

Sandra Dittenberger[a]

[a]New Design University, St. Pölten, Austria
*sandra.dittenberger@ndu.ac.at

Abstract | Positive psychology and positive design are becoming increasingly important in contemporary design discussions. The previous research work provides inspiring approaches to reflect on the way how human wellbeing can be shaped by products and indicates to the importance of the creation of meaningful activities and experiences through design. However, the actual transfer of these theoretical approaches to design practice has not yet been widely researched. This paper deals with the question of how approaches from the research field of design for wellbeing can be implemented in design projects. Using the case study of planning an interior design semester project, the investigation of an alignment strategy of the process phases requirements engineering and design in form of a design requirements framework is presented. This framework could act as a guideline for the assessment of the technical-practical, aesthetic and symbolic design function in design for wellbeing projects.

KEYWORDS | DESIGN EDUCATION, DESIGN PROCESS, WELLBEING, REQUIREMENTS ENGINEERING, DESIGN RESEARCH METHODS

1. Introduction

The research fields of positive psychology, well-being and human flourishing have been increasingly taken up and addressed by the design community. For an interior design project, where students got the task to develop redesign-concepts for an existing public building in an urban environment, the decision was made to take up the approaches presented in literature on positive psychology and positive design and try to apply them in this project. For the project's clients, it was particularly important to make sure that people feel motivated to linger, exchange ideas, have fun and are able to experience an overall feeling of wellbeing while being inside the building. In the course of the preparation of the project, the review of the related work in this research area showed that the design community is aware of the importance of this research area within design practice, but nevertheless its implementation is still in its infancy. Missing tools and methods, as well as no real alignment strategy for the subsequent design process phases are complicating its implementation process. It became clear that the approaches generated so far, focused on the question of how the user requirements engineering process can be informed by collecting positive social practices and meaningful experiences from people of the project's target group. But how to proceed from there? How to implement design for wellbeing in a design project? This paper aims to contribute to the research realm of design for wellbeing, by addressing the design process structure for projects in this field. For the preparation of the interior design project, the decision was made to work on an alignment strategy that would make it possible to move from the requirements engineering phase to the design phase with concrete results. The following chapters describe, the approach taken and lessons learned in the course of this undertaking, as well as present a proposal for an alignment strategy in form of a design requirements framework, bridging the requirements engineering and design phase of a wellbeing project.

2. Related Work

Based on the psychological approaches on the subjective (Diener, 1984), psychological (Ryff, 1989) and social well-being (Keyes, 1998, 2002), as well as human flourishing (Seligman, 2012) different design disciplines have worked on translations of these approaches in order to use them in design practice. Desmet and Pohlmeyer (2013) address the issue of design's possible contribution to the creation of subjective wellbeing of individuals and respectively their happiness and coin the term positive design as an umbrella term to describe all forms of design, design research and design initiatives which focus on the increase of subjective wellbeing of individuals. They propose their positive design framework with the three components: design for pleasure, design for personal significance and design for virtue. Brey (2015) investigates the question of how and in which way it is possible to design for wellbeing and mentions that four approaches exist to implement design for wellbeing in design projects, namely the approach of emotional design, the capability approach, the

positive psychology approach and the life-based design approach. He sees a complementarity in the four presented approaches since they highlight different factors for wellbeing. The inclusion of the role of physical objects and the symbolic meaning of material possessions has also been discussed. The role of objects was examined by means of the question, how the use of physical objects, in combination with psychological interventions, could possibly support human flourishing (Desmet & Sääksjärvi, 2016). For the design of meaningful experiences, the decoding of social practices is seen as an interesting starting point from a design perspective (Klapperich et al., 2018). Referring to design strategies for the creation of symbolically meaningful objects and interactions the SIM toolkit has been developed, which was later on illustrated with product examples for the 16 symbolic meaning-focused design for subjective well-being directions in order to inspire their application in design projects (Cassais et al., 2016a, 2016b, 2018). In summary, these efforts have mostly inspired the development of meaningful actions and experiences (Diefenbach & Hassenzahl, 2017) and it can be stated that the topic of implementing the design for wellbeing approach in a design process has not yet been addressed sufficiently.

3. Design process and seminar structure

During the preparation of the interior design project the decision was made to use, due to the projects' goal, a human-centred design process methodology. The choice fell on a revised presentation of the Human-Centered Design ISO Standard 9241: 210-2010 (International Organization for Standardization, 2019) with a focus on the product design aspects within the process (Dittenberger, 2019). This design process is divided into the phases Inspire, Collect, Design and Evaluate (Figure 1). In the process step "Inspire", the focus lies on learning about the projects' context. Methods of qualitative social research, such as observational and survey methods, are applied. Based on the results of these studies, problem areas within the project context can be identified and subsequently comparatively researched in literature. In order to investigate the identified problem areas in more depth, further methods of qualitative social research are used in the "Collect" phase, such as interviews, focus groups or cultural probes. After each method has been carried out, the aim is to focus the project on a specific problem as well as the target group and to collect for this the human, technical, aesthetic, symbolic, ecological and economic requirements. After the broad preparation of the requirements for the selected problem area, the results are evaluated and a specific aspect is selected. For its processing, a research question and a design briefing for the projects' practical, aesthetic and symbolic functions is formulated which should be addressed in the following design phase. Furthermore, archetypal users, personas, are defined to ensure that the project focuses on the selected target group. The process phase "Design" is dedicated to the development of design approaches, the conduction of design studies and analog and digital model building. This process step also includes the active involvement and creative incorporation of feedback from the target group in the design development. The phase "Evaluate" represents the final

step of the process. Before the final prototype is built, the project gets finally evaluated by people of the target group to see whether the defined design briefing meets the requirements. In an iterative approach, the process is repeated until the evaluation results fulfil the defined requirements.

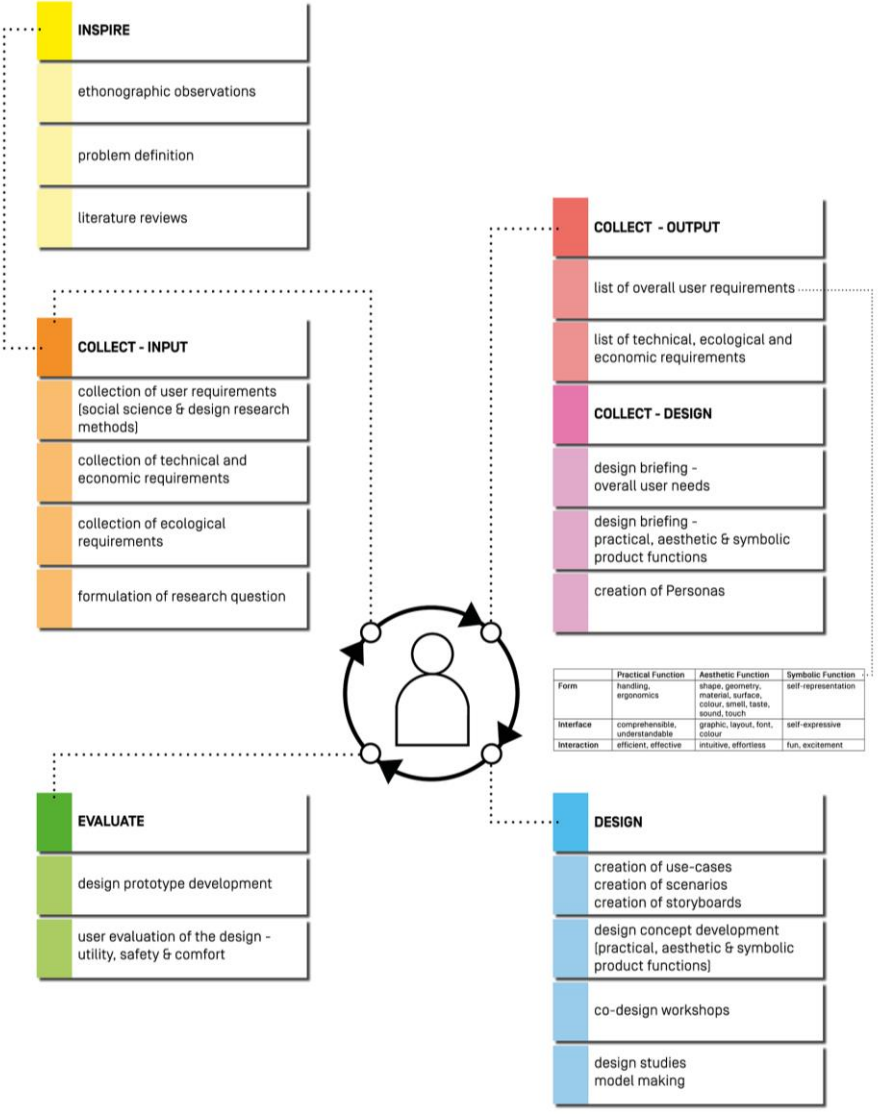

Figure 1. Human-centred design process (Dittenberger, 2019).

The project's design process phases were divided between the seminars design research and design studio practice. The design research seminar had to cover the design process phases "Inspire" and "Collect-Input/Output" and the design studio practice seminar had to cover the process phases "Design" and "Evaluate". Within the design research seminar, all framework conditions for this project had to be determined in order to use the findings to create the students' individual design briefings for their semester projects.

Design research is instructed and trained as an integral part of a design process during students' design projects, to understand the real wishes and needs of the people they are designing for. Teaching experience, gathered while working with the presented human-centered design process model, had shown, that it is essential to highlight the further use of the generated data of a design research study in order to be able to use the results for the next project phase, the design phase. It has been observed that after carrying out a user requirements study, students had great difficulty in formulating criteria for a design briefing from the results of such studies. But in order to design a human-centered solution based on real end-user needs, the results of a requirements engineering process should deliver detailed design related information to enable the creation of a design briefing.

From a design education perspective, we posed the question of how we could make the desired output of the process phases, in the form of a collection of criteria for the technical-practical, aesthetic and symbolic design function (Schneider, 2005), more clearly visible and thus more understandable.

4. Collection of building blocks for the design requirements framework

As mentioned before, by applying during a user requirements study mainly methods which provide information about the life context, the needs as well as how the lives of the target group could be improved by a particular product field, the problem occurs that there is a lack of information which would be needed in the next process phase, the design phase. In order to give the students an overview of the requirements that should be collected during the design research phase, an approach for a new design requirements framework, addressing the technical-practical, aesthetic and symbolic design functions, was created based on existing models. Since a design briefing defines parameters for the functions of the design which should be achieved, reference is made here to Schneider's (2005) subdivision of the functions of design. He suggests a division into three parts: technical-practical functions, i.e. the physical functions of objects, aesthetic functions that affect all communicative, informative and formal functions of objects, and symbolic functions that relate to the social or psychological aspects of objects. In order to visualize the students what information is required for a design briefing, Heufler's (2004) items for the creation of a design briefing and Pugh's (1991) items for the creation of design requirements were used.

4.1 Design Briefing

Gerhard Heufler describes a design briefing as a "concise description or list of all the factors, requirements and requests affecting product design" (2004., p. 185). For him, a design briefing has to define items in the categories application, target group and market; technical, economic demands; environmental impact; and schedule. The following Table 1 offers a detailed overview.

Application, target group, market	Technical, economic demands	Environmental impact	Schedule
Functions, users	Technical data (dimensions, weight)	Energy and raw material consumption in production and use	Development, design, construction
Decisive features	Environmental conditions (temperature, dampness)	Long life, repairable, retrofittable, remoutable, recyclable	
Target group definition	Operation, maintenance, service life	Reduction in raw materials	
Competition analysis, market situation	Process, action		
Corporate identity	Type of construction, model assembly, packaging		
	Requirements, standards, patents, product liability, quantity, price		

Table 1. Items for a design briefing (Heufler, 2004).

4.2 Design requirements

To work on this identified challenge on the creation of a design requirements framework for the technical-practical, aesthetic and symbolic design functions, Stuart Pugh's (1991) checklist of 24 items for the generation of design requirements was selected as a starting point. He argued in his publication *Total Design: Integrated Methods for Successful Product*

Engineering in support of the performance of participatory design for product design projects by transdisciplinary teams. The first part of his suggested total design activities consists of the six phases: user needs, product specification, conceptual design, detail design, manufacture and sales. The second part focuses on the product design specification in terms of design, manufacture and sales. The third part deals with information gathered from methods to inform the design core. The fourth part addresses the inputs needed from technology sources. The aspects addressed in the four parts were used to develop a checklist of 24 items for the generation of design requirements (Table 2).

Number	Item
1	Performance (function)
2	Environment (use context)
3	Life in service (intensity of use)
4	Maintenance
5	Target product cost
6	Transport
7	Packaging
8	Quantity
9	Production facilities
10	Size and weight
11	Aesthetics, appearance finish
12	Materials
13	Product life span (duration of use)
14	Standards, rules & regulations
15	Ergonomics
16	Reliability
17	Storage

18	Testing (quality test to withstand)
19	Safety
20	Product policy (company's portfolio)
21	Societal & political implications
22	Product liability (guarantee)
23	Installation & initiation of use
24	Reuse, Recycling

Table 2. Checklist of 24 items for the generation of design requirements (Pugh, 1991).

4.3 Symbolic meaning-focused design directions

The approach of Casais, Mugge and Desmet (2016a, 2016b, 2018) was chosen to explain the meaning of the symbolic design function. They address the topic of material possessions and their corresponding happiness-related symbolic meaning by arguing that material possessions contribute to the individually experienced happiness due to memories we have with them, achievements they stand for or aspirations they remind us of. In their paper the authors present the SIM toolkit (Casais et al., 2016a), which means the design with symbolic meaning for user happiness, as well as a symbolic meaning framework including 6 happiness-related symbolic meanings and 16 design directions for it (Table 3). Based on Carol Ryff's model of psychological wellbeing from the year 1989, consisting of the six basic elements: self-acceptance, positive relations with others, autonomy, environmental mastery, purpose in life and personal growth, they analysed narrations of personally meaningful objects concerning their happiness-related symbolic meaning. Afterwards, they started to develop concrete design directions for each of the six categories to be used during a design process. The result of this research work was the SIM toolkit.

Symbolic meaning	Design direction
Positive relations with others	Support meaningful affiliations
	Embody characteristics of a group
Personal growth	Support active personal development
	Embody personal growth

	Support acceptance and growth form past experiences
	Enhance memories
Purpose in life	Encourage positive change
	Provide a sense of control
	Keep track of progress
Environmental mastery	Support multi-sensorial communication
	Provide a context for meaningful interaction
Autonomy	Destigmatize
	Design for mindfulness
	Redirect the user's attention
Self-Acceptance	Allow shared transformation
	Allow self-expression

Table 3. 16 design directions to design for happiness (Casais et al., 2016a).

4.4 Design requirements framework

This collected information was used to create a new overview table. The aim of this new table was to give the students a compact overview of which criteria of the technical-practical, aesthetic and symbolic design function are necessary to create a design briefing. As already mentioned in chapter one, past experience from teaching showed that it is important to show the students at the beginning of a project what results of a design research study are necessary to base their design on relevant data collected. Table 4 shows an allocation of the different items to the respective design functions.

Technical-practical design function	Aesthetic design function	Symbolic design function
= physically experienced	= sensually experienced	= socially experienced

Main functions	Shape (geometry, proportion, size)	Positive relations with others
Ergonomics	Sign functions (delimination, grouping, surface texture, colour contrasts, orientation, endurance, stability, precision, flexibility/variability, operation, comprehensibility)	Personal growth
Handling and interaction	Material (warm/cold to touch)	Purpose in life
Size and weight	Surface (tactile properties smooth/textured surface)	Environmental mastery
Environment	Colour (signal/restrained effect)	Autonomy
Maintenance		Self-acceptance
Standards, rules and regulations		
Installation and initiation of use		
Reuse, recycle		
Cleaning		

Table 4. Items for the design requirements framework.

5. Alignment strategy

After creating the design requirements framework, the project phases and thus the seminar structure were worked on. As already mentioned, the design process phases “Inspire” and “Collect” should be covered within the design research seminar and the phases “Design” and “Evaluate” within the design studio seminar. As experience has shown that the design research phase raises most questions among the students, special attention was paid to the structural planning of this seminar.

5.1 Study design

The students' projects had to follow a qualitative research approach to answer their research question. The qualitative research process is oriented towards the understanding of the humanities and cultural sciences and regards the subject as the constructor of his reality. Already during the research process results are put into practice theories and hypotheses are generated. Flick (2009) describes the research process in non-standardized qualitative research through the steps of selecting a research problem, systematic literature analysis, formulation of the problem, development of a project plan, selection of appropriate methods, entry into the field of investigation, data collection (data documentation and data analysis) and discussion the results.

For the study design the approach of action research, which can be understood as comparative research, was chosen. Here, the focus is on research into the conditions and effects of social action as well as the reflected action within a design process. Although the course of an action research process depends strongly on the practical conditions, there are two steps that must be considered. According to Muratovski (2016), first a goal or a research question is formulated, followed by an action which is subsequently evaluated. The process is characterized mainly by the constant change and the repetition of information collection, analysis and processing. In several iterations, preliminary results are already being implemented and tested during the research process. Another criterion of action research is the equality of all involved, which is ensured by the constant exchange between researchers and persons of the target group.

In order to proceed with the preparation of the semester project, the next step addressed the selection of qualitative and design research methods to enable the collection of valid data for the creation of a list of design requirements regarding the aspects of technical-practical, aesthetic and symbolic design functions, after the conduction of a design research study.

5.2 Data collection of the technical-practical and aesthetic design function

A spatial analysis was planned to ascertain the collection of items for the technical-practical as well as the aesthetic design function of the project. For this the method "Photo and Video Diaries" (Milton & Rodgers, 2013, p. 24-25) was chosen. The aim of this method is to record the actual state of a situation, room conditions or product uses in order to identify potential problems.

In order to synchronize the step of data collection and the subsequent data analysis, the method "AEIOU" (Martin & Hannington, 2012, p. 10-11), meaning A - activities, E - environment, I - interactions, O - objects and U – users, was defined at the same time. The following Table 5 provides an overview of the criteria on which students should collect image material when using the Photo & Video Diaries method.

Categories	Items
Activities	Main space and room functions
Environment	Measurements, statics, acoustics
	Colours
	Light
	Norms, rules, regulations
Interactions	Human interactions – all floors/rooms
Objects	Material/Surface - Space
	Material/Surface – Products
Users	Target groups

Table 5. Preparation of the data analysis grid.

The preparation of the results of the spatial analysis within the analysis grid enables a good overview of the identifiable problems or open questions within the project.

5.3 Data collection of the symbolic design function

The data collected and the problem areas identified from the spatial analysis should be used to obtain further information about the symbolic meaning of the rooms within the building. In order to ascertain the symbolic spatial function, a guideline interview with identified persons of the target group was planned. The development of the guideline questions should be developed in group work. Based on the 16 design directions by Casais, Mugge and Desmet (2016a), the focus was placed on the parameters "positive relations with others" and "environmental mastery" with regard to the project context. The students should develop questions with the aim of finding out which activities within the building generate joyful moments and which materials, lighting moods and colour worlds are to be found.

In addition, participants should also be asked about activities they remembered which put them in a joyful mood and what the material contexts of these situations were. The results of the guideline study should be included in the data analysis grid. In summary, the result of

the analysis grid should enable the definition of a research question, which should further be used as a basis for the redesign concept of each individual student's project.

In order to show the students, the connection between the seminars design research and design studio as planned from the beginning of the semester on, respectively the start of the project, and thus also to point out the alignment strategy of the seminars, a visualization of the table for the items of the design requirements framework was created (Figure 2).

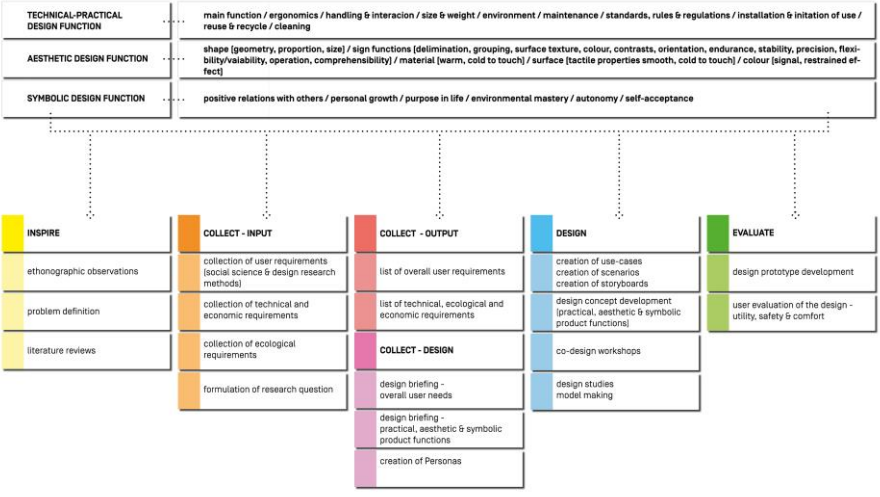

Figure 2. Visualisation of the Design Requirements Framework.

After the detailed preparation, it was also planned that the teachers of both seminars should lead the kick-off with the students at the beginning of the semester project. In the course of the semester, the lecturers should also come together for special input sessions in order to indicate the connection between the teaching content of the two seminars with a physical presence. In a first interim presentation, the students should present the results of their study from the design research seminar in the form of a design briefing for their design phase.

6. Discussion and conclusion

How to implement design for wellbeing in a design project? After the completion of the project it can be stated that the intensive planning work of the semester project supported the actual implementation very well. After the presentation of the semester project and the

semester planning, the design requirements framework was well received by the students. Within the design research seminar, the positive design literature and the existing project examples were discussed thoroughly. The topic itself and the examples were reflected very interested by the students.

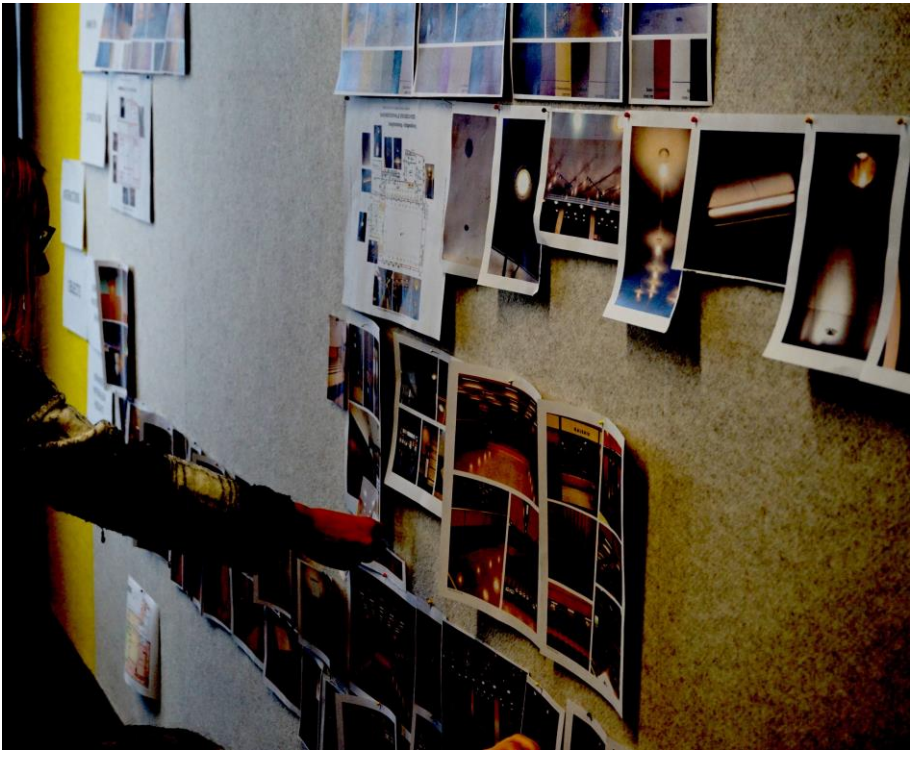

Figure 3. Students filling the data analysis grid.

However, how this content should be used in their projects was not very clear to them. The fact that design for wellbeing focuses primarily on the creation of meaningful actions and experiences is understandable for students, but the actual translation of these approaches to their own projects is very difficult to grasp.

During the implementation of the design research methods, the Photo and Video Diaries and the guideline interview, the design requirements framework was repeatedly used as a guidance to maintain the focus of the survey on the goal.

In a discussion with the students after completing the design research seminar, how they felt about the alignment strategy and the design requirements framework, it was reported that the meaning and implementation of design research as an integral part of a design

process was now much more understandable for them. The goal was always clearly insight and so they didn't feel lost in a purely theoretical approach that needed to be physically translated.

Wellbeing will become an increasingly important factor in design projects in the future. Previous research in this area has brought valuable knowledge from the field of psychology and positive psychology into design. Nevertheless, it is important to continuously work on the actual applicability of the theoretical approaches in practice. The approach of the design requirements framework and alignment strategy presented in this paper, in the sense that the factors for the technical-practical, aesthetic and symbolic function of design should act as a guiding principle in all design process phases, has proven to be sensible and practically applicable and will be worked on in further studies.

Weaving sequential changes – designing textiles with multiple embedded stages

Riikka Talman*[a]

[a]The Swedish School of Textiles, University of Borås
*riikka.talman@hb.se

Abstract | The development of dynamic materials has changed the ways in which textiles are designed, but few research projects have investigated multiple sequential changes in textiles. This paper explores the design of textiles with the ability to undergo transformations involving multiple stages. Dynamic shrinking, hardening and dissolving yarns were combined in industrially woven structures to create a collection of five textiles, the texture, size, thickness, and number of layers of which were possible to change through heat and moisture. The fabrics were used in two workshops, and a series of prototypes was developed to explore potential application areas. The outcomes of the experiments show that textiles can transform in several stages through alterations to their properties, and that it is possible to embed this in their structures. Further research is needed on potential applications and how to better integrate textiles into product design processes.

KEYWORDS | WEAVING, MATERIAL, DYNAMIC, LIFESPAN, TEXTILE DESIGN.

1. Introduction and related work

This paper explores the design of textiles with the ability to undergo multiple stages of transformation within a sequence; these transformations can relate to changes in texture, size, thickness, and number of layers. Experimental work with dynamic materials, including shrinking, dissolving, and stiffening yarns, explored the concept of embedding irreversible changes in industrially woven fabrics.

The experiments presented build on the inherently changeable properties of various materials. There is a wide range of dynamic materials with various properties on the market, and these are used for a wide variety of purposes. The materials that were investigated are often used in industry within manufacturing processes, and are generally removed from the final product before it reaches the consumer.

1.1 Yarns with changeable properties

Polyvinyl alcohol (PVA) is a water-soluble synthetic fibre (Sakurada, 1985). When a piece of PVA thread is dipped in water, it shrinks, becomes rubbery, and eventually dissolves completely. Wet PVA can be formed around objects and becomes hard and translucent when it dries, losing its textile qualities. In the experiments presented in this article, a spun yarn with a dissolving temperature of 40°C was used. PVA is non-toxic and degrades into water and carbon dioxide, and is used within e.g. the food, pharmaceutical, and textile industries (DeMerlis & Schoneker, 2003; Kuraray, 2019).

The properties of PVA have been explored in several projects: Storey, Ryan, and Belford's (2008) dissolvable PVA dresses comment on the current fashion system, while Valle Noronha (2017) uses PVA threads and fabrics to embed pre-determined alterations, such as changes in shape and details, in garments.

Grilon yarns are thermoplastic copolyamide and copolyester yarns with a low melting point, and are used to separate, bond, and reinforce [something] (EMS-GRILTECH, 2019). Grilon LT yarn, which was used in the experiments presented in this paper, melts, shrinks, and disintegrates at temperatures of above 85°C (Districo, 2019). Single threads of Grilon can be easily disintegrated using a hairdryer, but larger quantities need prolonged heating through e.g. ironing or steaming.

The properties of Grilon have been explored from a design perspective by e.g. Dumitrescu and Persson (2011), whose knitted materials responded to touch by warming up, causing the structure to break. Resortecs (2019) uses stitching in a heat-dissolvable yarn to separate fabrics, buttons, and zippers in relation to the disassembly, reassembly, repairing, and recycling of garments.

Comfil yarns are thermoplastic composites that combine a reinforcement fibre and a thermoplastic matrix polymer, and are used for e.g. vacuum and compression moulding (Comfil, 2019). The Comfil polyethylene terephthalate (PET) yarn used in the experiments

presented in this article shrinks and stiffens when heated, and can be activated by steaming and ironing, for example. When combined with other yarns it creates shrinkage and texture, while the other materials allow the fabric to retain their soft and flexible qualities.

Dumitrescu and Persson (2011) use thermoplastic yarns that shrink and then stiffen in response to heat to transform the textures and patterns of knits in response to touch. Brock's (2018) 'self-assembling' Jacquard weaves use structure and yarn shrinkage to create three-dimensional textiles that gain their final form when steamed. Miyake's three-dimensional steam-stretch fabrics use after-treatment of heat-shrinking materials in industrially woven Jacquard patterns to create fabrics with three-dimensional surface structures (Howarth, 2014).

The changes in all of the dynamic materials used in the experiments presented in this paper are irreversible. The materials are not able to regain their original expressions, and instead their expressions are built up gradually (Worbin, 2010).

1.2 Designing textiles with dynamic yarns

The development of dynamic materials has changed the ways in which textiles are designed, in that various changes can be achieved in a textile's structure and visual expression. Such materials can be used to make textiles with qualities that can be changed after production, affording alternative uses. However, the designer's perspective on the material – whether it is central to the product idea or a detail chosen at the end of the design process – influences how closely the material design and product design processes are intertwined (Nilsson, 2015). A material's inherent changeability influences the changes that occur, and as such they are central to the design of textiles with the ability to undergo multiple stages of transformation, as well as investigations of potential applications. Textile techniques and material properties define the qualities of textiles, as well as ultimately the qualities and uses of products.

Several projects in the field of fashion have explored embedding changes in garments: Riisberg and Grose (2017) explore the concept of designing garments that evolve over time, facilitating an extended garment life and thus the usage of fewer resources. Valle Noronha (2017) explores the embedding of pre-programmed temporary and permanent changes into garments for stronger person-product attachment in order to highlight the materiality of the garments themselves.

1.3 Lifespan thinking

Lifespan thinking could be embedded in fashion and textiles in multiple different ways. Products could, depending on their uses, have lifespans ranging from fast to slow, with flimsy, recyclable, or durable materials that match the intended lifespan (Fletcher, 2014). Longevity could be addressed from the perspective of two different 'speeds': products with short, fast lifespans with materials that go through multiple 'loops', and extended, long

lifespans through emotional durability, repair, and up-cycling (Goldsworthy, 2017). Streamateria is a digital platform for made-to-measure, biodegradable garments with short, pre-defined lifespans, connecting designers to companies that work with renewable, biodegradable materials and processes to promote circular and closed-loop practices (Streamateria, 2019; Vinnova, 2019). Embedding multiple stages of transformation in a textile's structure encourages a better matching of the lifespans of the product and the material that starts during the design of the textile material itself.

2. Experiments

Various experiments were conducted in order to ascertain whether multiple stages of transformation, involving changes in size, thickness, opacity, softness, texture, and number of layers, could be embedded in industrially woven textiles. Single-, double-, and triple-layered woven structures were made using the aforementioned dynamic, heat- and water-reactive, shrinking, dissolving, and stiffening materials (Table 1). As a result, a collection of five fabrics was developed; the structure of each was possible to alter through ironing, steaming, and machine washing.

Two workshops were organised with designers and product developers at IKEA of Sweden to investigate the possible applications that the qualities of the fabrics might suggest. Based on the workshops, six preliminary prototypes of everyday textile products were made in order to explore the materials' changeable qualities and to adjust and change the products during their use phases. The project was carried out in collaboration with Linda Worbin from IKEA of Sweden.

2.1 The experimental setup and materials

The aim of the experiments was to explore how multiple sequential changes could be embedded in textiles. Heat and water were chosen as the main activators of changes due to their availability and the possibility of applying them to fabrics either separately (for example by ironing or washing) or simultaneously (through steaming or washing at a high temperature; Table 1).

The dynamic yarns were used as floats to create texture when they shrank, as a binding weft between the layers of fabric to enable separation of the layers when they dissolved, and as stripes to shrink parts of the fabric in order to create texture. They were combined with more stable materials such as cotton and paper yarn to form the main body of the fabric. All of the experiments were undertaken using an industrial Jacquard loom for flexibility with regard to developing and altering the weave structures and proportions of the materials. All of the structures were woven in two variations to test how the choice of dynamic material influenced the function of the textile; one used water-reactive, shrinking PVA, and the other either the heat-reactive, evaporating Grilon or shrinking Comfil yarns.

Table 1. The properties of the three dynamic yarns.

Stimulus Yarn	Ironing	Steaming	Machine wash 30°C	Machine wash 40°C	Machine wash 60°C
PVA 40°C	-	Shrank	Shrank and melted	Shrank and melted	Shrank and melted
Grilon LT	Broke slightly	Broke slightly	-	-	Shrank slightly
Comfil PET	Shrank	Shrank	Shrank and melted	Shrank	Shrank slightly

2.2 The final fabrics

A collection of five materials was developed as a result of the experiments, and is presented below (Figs. 1–5). These weaves were chosen due to the variation with regard to the number of possible transformation stages of each, as well as for the variation in stages that the different fabrics offered as a collection.

All of the fabrics were systematically tested with treatments that included water, heat, and steam. The tests showed that the fabrics could each undergo differing numbers of stages. For some, but not all, of the samples, the order of the treatments affected how the materials changed. For example, first steaming and then ironing the wavy-textured paper and PVA fabric produced a different texture than first ironing and then steaming it (Fig. 2). The fabrics could be washed several times before their layers separated, and had to be steamed or ironed for a long time in order to effect a change in them. If the fabrics are used in their textured state over a long period of time, patterns of dirt may be formed.

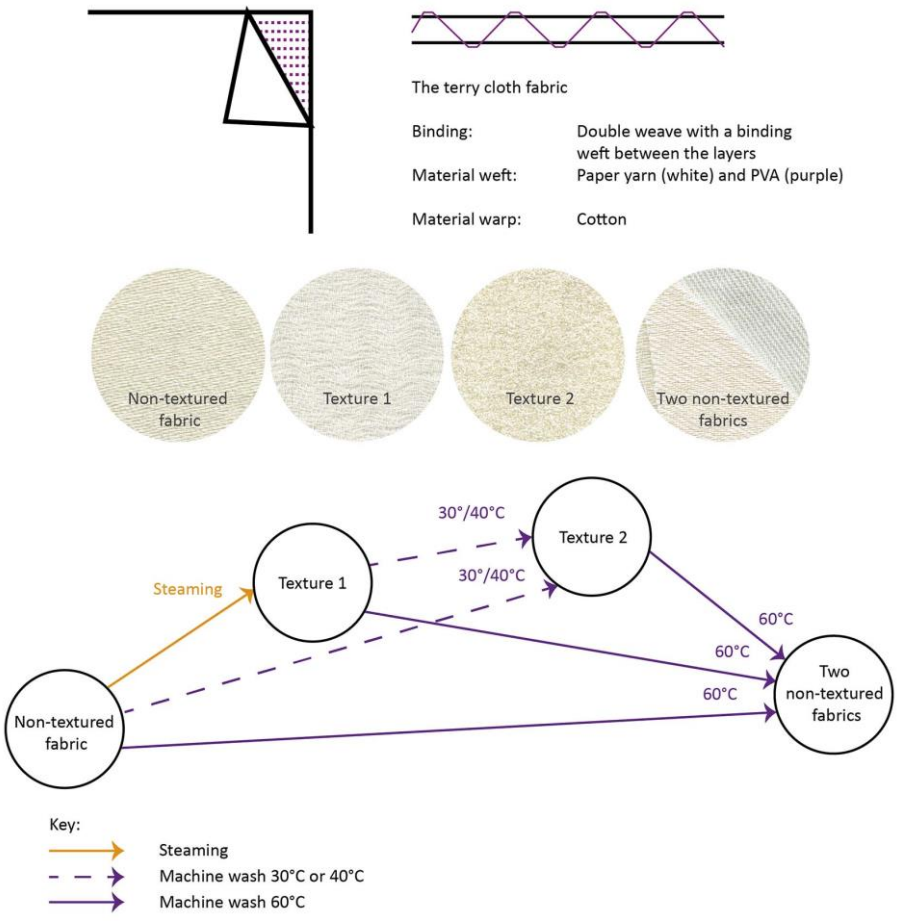

Figure 1. The different stages of transformation of Fabric 1, as well as how these were reached and the structure and materials of the fabric.

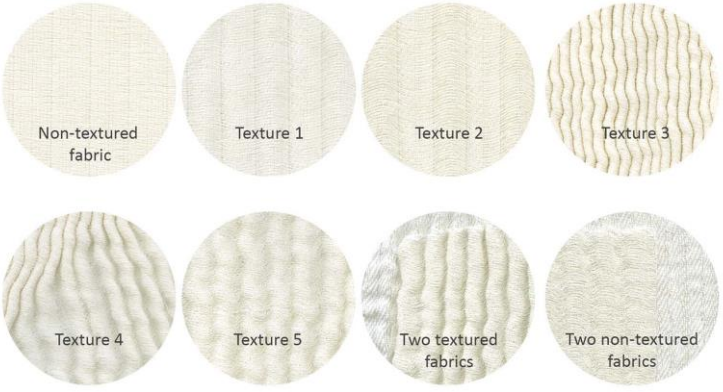

The terry cloth fabric (Fabric 1) was a flat, smooth double weave in paper and cotton yarn with a binding weft in PVA between the layers (Fig. 1). Water and steam shrank the PVA, making the fabric thicker and more roughly textured. When the PVA completely dissolved, the fabric separated into two parts. The fabric could be either shaped around objects or separated in specific places to create pockets.

The wavy-textured fabric

Binding:	Double weave with a binding weft floating on the reverse
Material weft:	Paper yarn (white) and PVA (purple)
Material warp:	Cotton

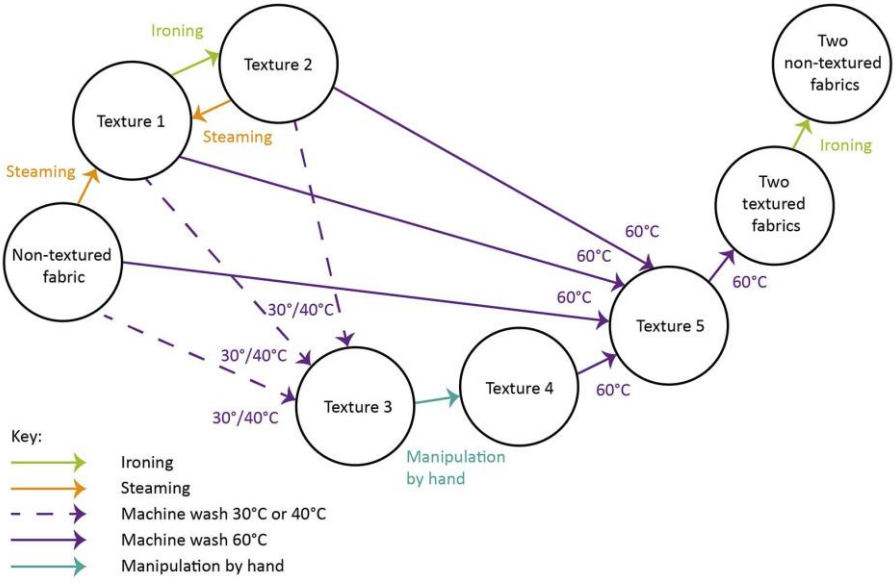

Figure 2. The different stages of transformation of Fabric 2, as well as how these were reached and the structure and materials of the fabric.

The wavy-textured fabric (Fabric 2) was a flat, smooth double weave in paper and cotton with a binding weft in PVA floating on the reverse side of the fabric (Fig. 2). Water and steam shrank the PVA, making the fabric thicker and wavier in texture. When the PVA had completely dissolved, the fabric separated into two parts. It was possible to move back and forth between some of the textured stages, depending on the stimulus applied to the fabric. The fabric could be either shaped around objects or separated in specific places to create pockets. The lines of the texture gave the fabric direction and support. Applying water to specific lines of floats could be used to make the fabric curl inwards on itself.

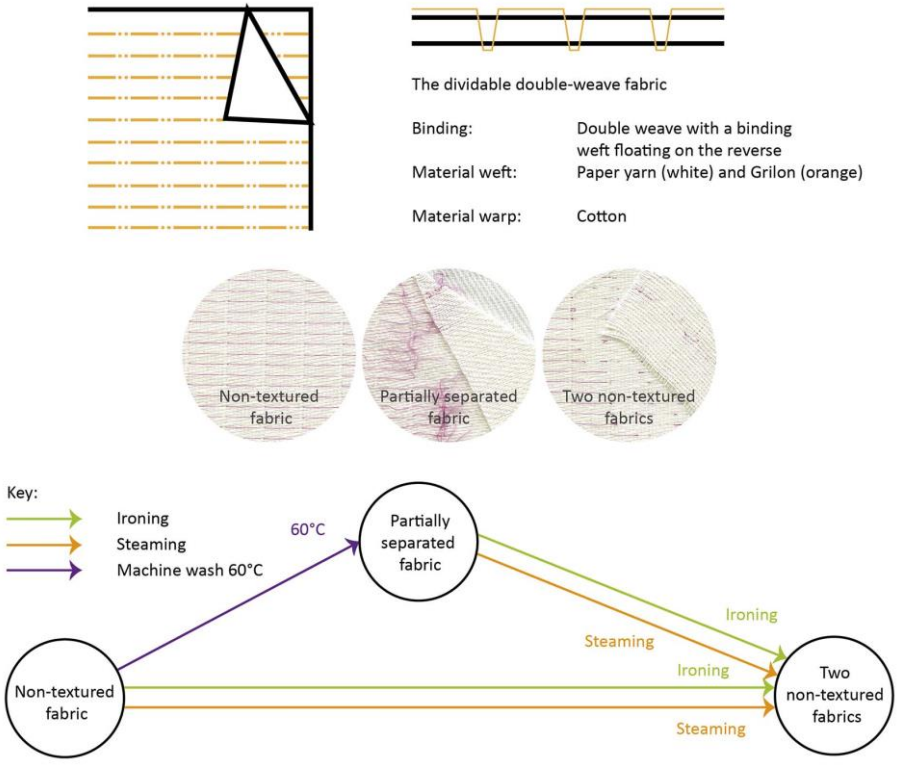

Figure 3. The different stages of transformation of Fabric 3, as well as how these were reached and the structure and materials of the fabric.

The dividable double-weave fabric (Fabric 3) was a flat, smooth double weave in paper and cotton with a binding weft in Grilon floating on the reverse side of the fabric (Fig. 3). Heat and steam caused the Grilon layers to separate to different degrees (into pockets or channels, or completely). When machine-washed at 60°C the Grilon shrank and the layers partially separated.

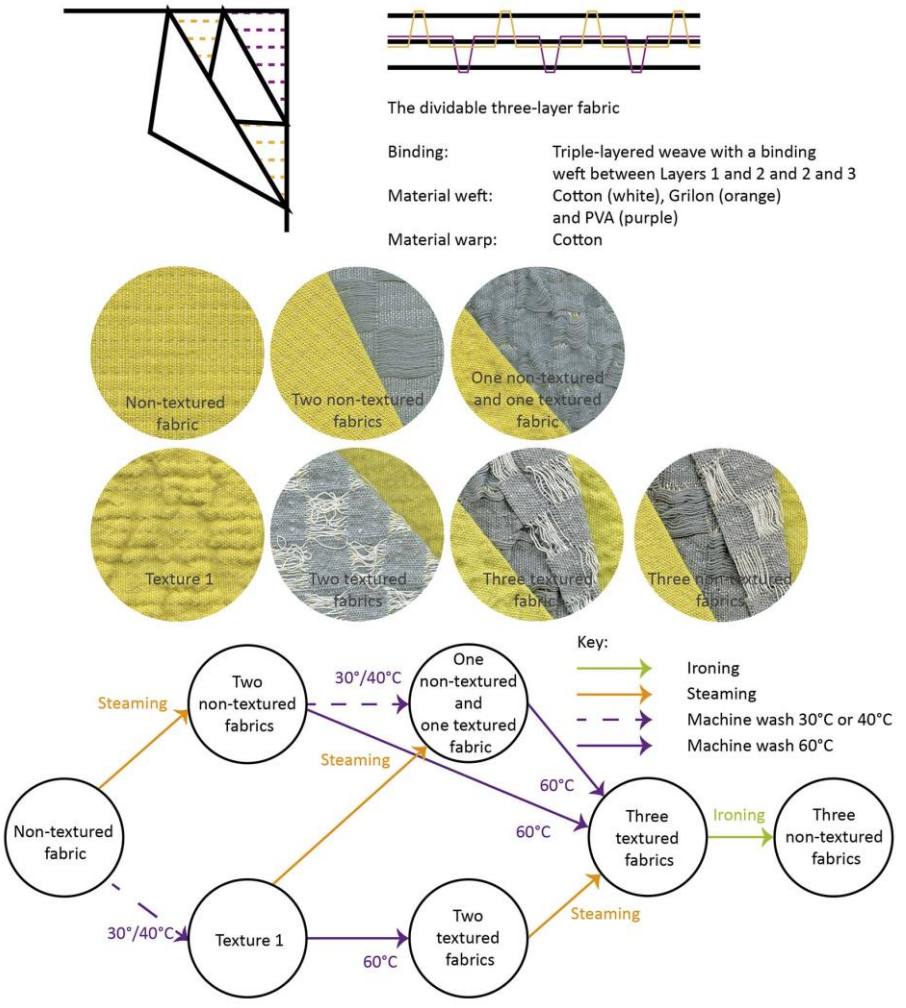

Figure 4. The different stages of transformation of Fabric 4, as well as how these were reached and the structure and materials of the fabric.

The dividable three-layer fabric (Fabric 4) was a three-layered fabric in cotton with a binding weft in Grilon between Layers 1 and 2 and a binding weft in PVA between Layers 2 and 3 (Fig. 4). The middle layer had a different colour and surface design than the others. Water shrank the PVA, giving the fabric texture. Repeated machine-washing at a high temperature dissolved the PVA and separated Layers 2 and 3. Heat and steam caused the Grilon thread holding together Layers 1 and 2 to dissolve, dividing the fabric to varying degrees (into pockets or channels, or completely).

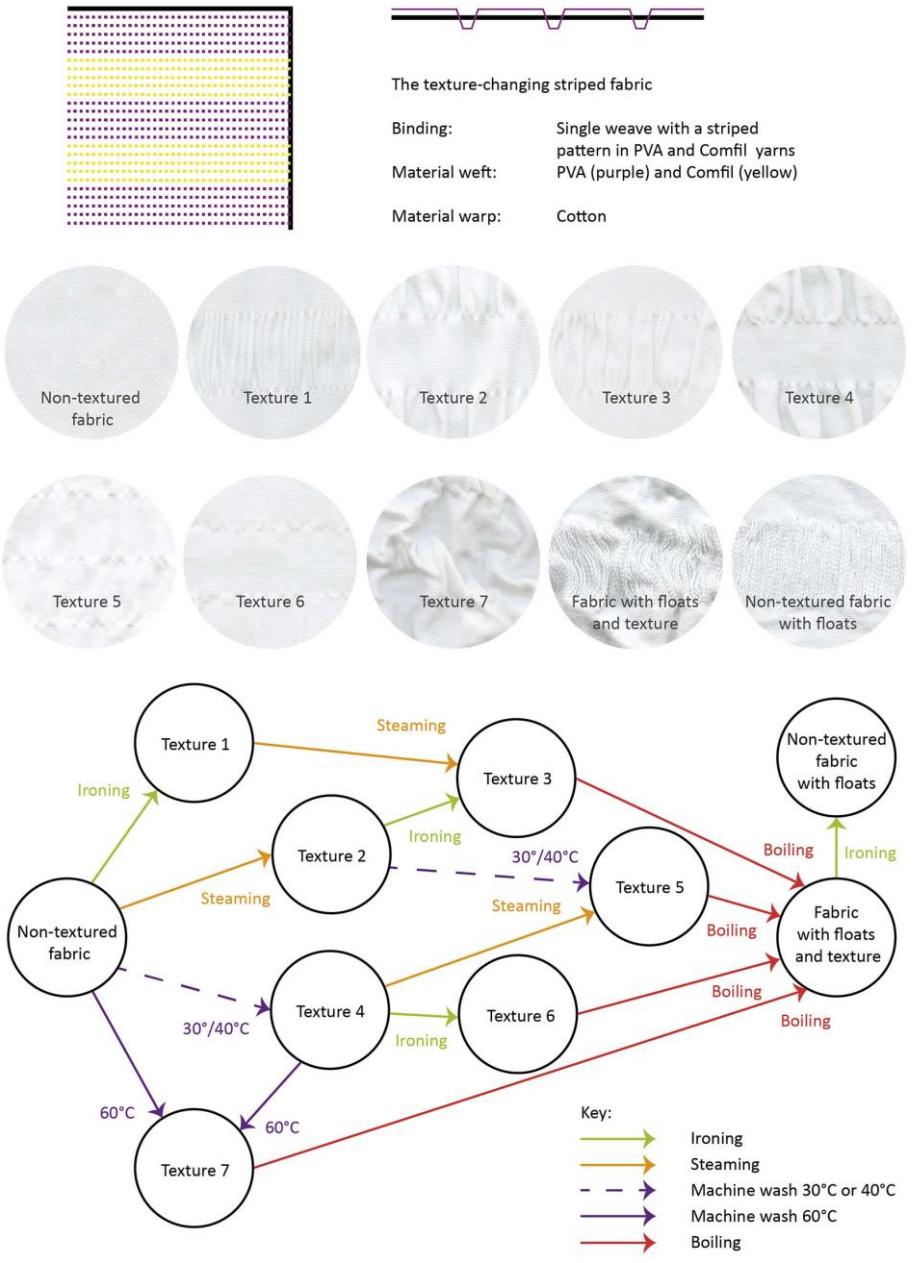

Figure 5. The different stages of transformation of Fabric 5, as well as how these were reached and the structure and materials of the fabric.

The texture-changing striped fabric (Fabric 5) was a flat single-layer woven fabric in cotton, with a white-on-white striped pattern in PVA and Comfil yarns (Fig. 5). Heat and steam shrank the Comfil, changing the size and texture of the fabric. Water and steam shrank the PVA, which also changed the texture and size and created floats by dissolving the PVA completely. The fabric could be shaped around objects, and its texture could be changed several times within a sequence by alternating between washing and ironing treatments (Fig. 5).

3. Workshops

In order to explore the possible applications of the materials, Fabrics 2–5 were woven out and used in two one-day workshops at IKEA of Sweden in Älmhult, Sweden. Each had four participants, who were a mixture of product developers and designers. The collection of fabrics and their stages of transformation were introduced to the participants, who were able to explore them using spray bottles, hair dryers, and clothes irons. The main questions asked during the workshops were: 1) What challenges do you face in your projects in relation to textiles? and 2) what expressions or functions are you looking for?

The participants came from fields including design management, childrens' textiles, and home textile design, and had different perspectives on the design process. Accordingly, the discussions involved a broad range of ideas for the materials and their applications. With regard to using dynamic materials in the product development process or embedding changeable qualities in products, understanding and communicating change were seen as the main obstacles. This likely stemmed from that fact that, from the perspective of a designer, one often starts with a problem or an idea for a product and chooses a material that fits the idea.

The ideas for using the changeable qualities of the fabrics in the production process included form-fitting fabric for a lampshade and shaping fabric onto furniture for easier upholstering and less work-intensive production processes. This latter could be achieved by adding shrinking yarn to a double weave and washing it to create a quilted effect, rather than using the time-consuming method quilting by sewing. Other applications included furniture upholstery in order to create up-to-date expressions, a baby blanket that can change size or be separated into several thinner blankets, curtains with adjustable lengths, and room dividers or wall hangings with optional storage pockets.

4. Prototypes

In order to further explore applications, some of the workshop ideas were created as prototypes; these included a bedspread, two lampshades, two curtains, and a pillow (Figs. 6–9). The pattern shop at IKEA of Sweden in Älmhult made the prototypes. The prototypes

explored changes in the function, form, and expression of everyday textiles by e.g. using the shrinkage of a fabric as an after-treatment when forming the textile, and using the shrinkage of a fabric to fit it to a product and adjust a textile product during its use phase.

The textured surface of the bedspread was created using the shrinking behaviour of PVA rather than the quilting technique; the pattern of the middle layer of the fabric defined the texture on the outside of the fabric (Fig. 6). The lampshades explored the idea of using the shrinking behaviour of PVA to fit fabric around a frame. A length of Fabric 4 was pre-shrunk with water and sewn into a lampshade (Fig. 6). Fabric 2 was sewn into roughly the right shape, then shrunk using water and fitted onto the frame (Fig.7).

The curtains and pillows explored ways of forming a textile product after its production by adjusting its length and width using heat and water. The pillows could be adjusted in terms of size in stages through washing and steaming, while the curtains were not planned to change from one specific size to another; instead, they could be freely adjusted (Figs. 8–9). As most of the changes were irreversible, a potential user would need to learn new ways of treating and maintaining their textiles in order to take advantage of the different stages of transformation and prevent unplanned changes.

Figure 6. Two prototypes that explored the shrinking behaviour of Fabric 4 to create texture through machine washing: a bedspread and a lampshade.

Figure 7. The process of fitting Fabric 2 around a lampshade.

Figure 8. Prototypes for pillows that can be adjusted in increments through steaming or washing: from bottom to top, non-treated, steamed, machine washed twice at 60°C, and machine washed at 30°C. All of the pillows had the same amount of filling.

Figure 9. Two pairs of curtains. Left: a curtain in Fabric 2 before and after shrinking. Right: a curtain in Fabric 5 before and after shrinking.

The prototypes, while very basic in their scope, showed the importance of developing materials alongside products. Some of the ideas for prototypes were not possible to achieve with the developed fabrics. The details of the textile products, such as stitching thread, lining, and trim, would have to be matched to the planned changes. The original idea behind the bedspread was that it would be suitable for a single bed in its shrunken textured state and, after being washed at 60°C, would fit a double bed. This was facilitated by the textile, which shrank by 50% at most, but was hindered by the fact that the trim and stitching would not have expanded with the fabric. Ultimately, the shrinkage of the fabric was effected through an after-treatment, giving the bedspread a heavy, textured surface before the material was stitched to create a more static prototype.

5. Discussion

The main question, which was explored from several different perspectives through experimental work with materials and weave structures, development of prototypes, and discussions with practitioners, was how changes or sequential stages of transformation can be embedded in the structure of a textile; a secondary aspect was at which stages of the design process textile materials can be utilised to achieve this, and what possibilities such changes open up for with regard to applications and designing several product lifespans in one textile.

Designing textiles with embedded changes means that the effects of these changes have to be considered when using the materials in different products or applications. Nilsson (2015)

argues that textiles can be incorporated into product design processes at several points, from constructing a new material to choosing an already existing fabric, and that their influence varies depending on where in the process they enter. Choosing a material based on an existing product idea was a common method among the participants of the workshops. The discussions highlighted a lack of awareness of the existence of changeable materials, and in some cases uncertainty regarding the need for them. The participants often started with a problem, came up with a product that solved that problem, then picked a material as the final step.

This method of choosing materials for products is challenged when it cannot be assumed that the textile will remain static after the production of a product. Changeable qualities invite a more active role on the part of textiles, wherein materials enter the design process at an earlier stage and their properties are developed alongside the intended expression and functionality of the product. This is a concept posited by Nilsson (2017). Such a method has consequences for the overall design and production process; for example, if a bedspread is designed such that its size can be adjusted through shrinking or a blanket can be divided into two thin shawls, the trimmings and sewing thread must be adjusted to allow for these changes. This suggests that there is a need for alternative ways of designing textiles and textile products that have such abilities, requiring textile and product designers to work in dialogue while developing both a product and its materials.

Textiles with embedded changes can propose alternative solutions to existing issues or be developed with a specific product in mind. Thus, time and the way a products is handled shape the exact changes that take place. Different properties of changeability lead to different types of change and various applications. For example, a fabric with the ability to gather and shrink in one direction suggests an alternative method of shortening a pair of curtains through shrinkage, which can later be reversed through washing. A fabric that can be separated into two fabrics, on the other hand, suggests an alternative method for hanging curtains by opening channels for the curtain rods, rather than sewing.

However, the design of such fabrics is challenging in that this will require users to learn new habits with regard to how they handle their textiles. On the other hand, methods such as ironing, washing, and steaming are familiar and easily accessible methods of textile maintenance. Using such methods to shape textiles opens up the idea of customising, adjusting, and taking a DIY approach to textiles without the need for advanced sewing, pattern-making, and textile construction skills and equipment. Another challenge is that consumers expect a product to maintain the same expression and function throughout its lifespan. They would thus have to understand the changeability of such textiles and ‘buy into’ the concept of change, and this would need to be communicated to them in a clear manner before a purchase is made.

Changeable qualities in textiles could also be used to replace more costly production processes. The fabrics presented in this paper were all woven on an industrial Jacquard loom for the purpose of flexibility in terms of development. They could, however, have just as

easily been woven in greater quantities on a shaft machine. If produced on an industrial scale, the intolerance of textiles to heat and moisture would require the preparation process and after-treatments to be rethought, as the materials cannot be washed without changes occurring. This could open up for reducing the amount of chemicals used in production processes.

6. Conclusions and future work

The textiles presented in this paper exemplify the idea that it is possible to design textiles that are able to undergo multiple sequential changes as a result of inherent changeability and the placement of materials in a textile structure. The number of stages of transformation did not automatically correlate with the versatility of the possibilities that were created in the fabric. Fabric 2, with its ability to change in terms of size, thickness, and texture and be divided into several layers, had multiple different stages. In comparison, Fabric 3 offered relatively few stages of transformation. However, when the possibilities of the materials were discussed during the workshops, an equal number of possible uses and applications were posited for both fabrics.

Using the inherent material property of changeability to design textiles could suggest alternative approaches to designing the lifespans of textiles, wherein a textile's qualities are connected to the material's properties and the material's properties are better matched to the textile's lifespan. The ability of a textile to undergo multiple changes in a sequence could open up for the design of several product lifespans using the same material, not by reusing the textile for a new product but by changing its structure and qualities. This would imply the need for textile and product designers to come together earlier in design processes in order to gain an improved understanding of the possibilities and limitations of materials and the requirements of the product. Further research is needed with regard to the various properties of changeability in materials and their uses and functions, and how to combine the knowledge of textile and product designers such that the development of textiles becomes an integrated part of design processes.

Architectural Design Education as an Agent of Change: The Case of the Ultra-Orthodox Branch, Jerusalem

Elissa Rosenberg

Bezalel Academy of Arts and Design, Jerusalem.

Abstract | Three undergraduate degree programs—in Art, Architecture and Visual Communications—were recently established as satellite programs of the Bezalel Academy of Arts and Design to serve a single, distinctive community: ultra-Orthodox women. This paper examines the unique design culture that has taken root in the "Ultra-Orthodox Branch" of Bezalel's undergraduate Architecture program through an intense meeting of diametrically opposed worlds. The program is a laboratory for a dialogue that almost never occurs in Israeli society. Through in-depth interviews with students and faculty, this research examines the role of design education as an agent of change in this unique setting of religious women within a traditional community that is currently undergoing social and economic transformation. It also considers the bridging potential of design to advance broader cultural understanding, as well as the limitations of design discourse to cross cultural divides.

KEYWORDS | DESIGN EDUCATION, BEZALEL, HAREDI, ULTRA-ORTHODOX, GENDER

1. Introduction

Three undergraduate degree programs—in Art, Architecture and Visual Communications—were recently established as satellite programs of the Bezalel Academy of Arts and Design in Jerusalem to serve a single, distinctive community: ultra-Orthodox, or Haredi women. Their curricula almost entirely mirror the main Bezalel curriculum, with minor adjustments to accommodate the community's religious mores; courses are taught by Bezalel faculty members (male and female). The first crop of women architecture students graduated in 2019 with a 5-year B. Arch degree.

This paper examines the unique design culture that has taken root in the "Haredi Branch" of Bezalel's undergraduate Architecture program through an intense meeting of diametrically opposed worlds. The program is a laboratory for a dialogue that rarely occurs in Israeli society. It is one of the numerous experiments in creating new educational opportunities for ultra-Orthodox women, yet, unlike other new programs, for example, in computer science (Genut & Kolikant, 2019) or social work (Baum, et al., 2014) the study of art and design in this community has received no scholarly attention. This research examines the role of design education as an agent of change in this unique setting of religious women and focuses on design education as an agent of change within a traditional community that is currently undergoing a social and economic transformation. It also considers the bridging potential of design to advance broader cultural understanding and the limitations of design discourse to cross cultural divides.

2. The Ultra-Orthodox Community in Israel

The ultra-Orthodox, or Haredi Jews, are fundamentalist Jews that live by a strict interpretation of Jewish religious law that governs all areas of life, from study, prayer, ritual observances, and diet, to family relationships (Baum, et al., 2014). The Haredi community is an enclave community that defines itself as a "counter-culture" that rejects Israel's dominant secular culture (Davidovitch, 2014) and live in segregated neighborhoods with their own religious, cultural, and educational institutions. The Haredi educational system is gender-separated, and the Haredi lifestyle is characterized by increasing gender separation (Indursky, 2020), rigid codes of modesty for women, and strict rules governing the encounters between men and women.

In 2018, the ultra-Orthodox population in Israel reached one million, or just over 11% of the total population (Malach & Cahaner, 2018). The Haredi lifestyle emerged during the eighteenth century to safeguard traditional Jewish religious practice in the face of rising modernization and secularization. Today, this traditional society has developed a unique social structure. Because of the high value placed on the study of the Jewish religious texts, ultra-Orthodox men typically devote themselves to a life of study and do not participate in the labor force. Women support their families, and they are also expected to marry young

and have many children—today, the average Haredi family includes 7.1 children (Malach & Cahaner, 2018). In 2017, the employment rate was slightly over 50% among ultra-Orthodox men and 73% among ultra-Orthodox women (Malach & Cahaner, 2018).

This reversal of traditional gender roles is reflected in and supported by the distinct educational systems for women and men. Boys learn general studies until the age of 12 and then move on to full-time Jewish study. On the other hand, girls receive a more well-rounded education that includes the core general studies curriculum. Women marry between the ages of 18 to 21 in arranged marriages. Their employment opportunities are often limited by a lack of training and childcare. Ultra-Orthodox women's average wage is only 70% of the Israeli average (Raz & Tzruya, 2017). Traditionally, their employment has been in the fields of education, childcare, and services in their communities. This pattern has begun to shift dramatically in the two decades, as ultra-Orthodox women have become increasingly integrated into the general labor market. Several factors have accounted for this shift. The main factor has been the growing economic pressure caused by the growth of the Haredi population alongside the reduction of government support. Data from 2007 indicated that most families in the Haredi sector in Israel lived under the poverty line (Ouziely & Ifrach, 2007). More recent data shows that poverty levels are dropping from 58% of the Haredi population in 2005 down to 45% in 2017—compared to 11% in the general population (Malach & Cahaner, 2018). The academization of the labor market has also made higher education a basic requirement for employment, leading to “some acceptance, albeit grudging, among the rabbis that women have to receive higher education that will better enable them to support their families” (Baum, et al., 2014, p. 165). And finally, the teaching market, long considered the traditional occupation of Haredi women, became saturated, so that new career options began to be considered acceptable for the first time, such as computer programming, social work, paramedical fields, and others.

Several government initiatives emerged in the late 1990s in response to these issues to encourage the Haredim to enter the workforce. To this end, Israel’s Council for Higher Education set out to establish academic frameworks that would meet the Haredi community's unique needs (Baum, et al., 2014; Malach, 2014). This led to the establishment of a number of colleges for Haredi women with a focus on practical occupations that could provide gainful employment while avoid challenging the values of the Haredi community (Baum, et al., 2014). Special features of these colleges included an in-house rabbi who was employed to vet the study materials and advise the students and daycare facilities for students who were already young mothers. In the colleges that also admitted male students, strict gender separation was maintained—in classes, in the library, and even in the routes walked through the campus (Baum, et al., 2014).

In 2012, a new model of higher education programs was developed by the Israeli Council of Higher Education (CHE) in which parallel satellite programs adapted to the needs of the Haredi community would be set up as branches of recognized academic institutions. The goal was to provide a broader range of disciplines, greater geographic diversity, and offer a

model in which the Haredi branch campus and its parent institution could share resources. The curricula would be identical to the parent institution from which the academic degrees were awarded, yet social and cultural modifications could be made on the branch campus appropriate to the Haredi needs. (Malach, et al., 2016). Fourteen of these programs were established between 2012 and 2015.

This trend must be looked at within a wider narrative of the "Israelization" of the Haredi community in Israel, whereby some have argued that "recent socioeconomic changes have forced that Haredi community to accommodate itself to Israeli reality and culture" (Finkelman, 2014, p. 286). Various scholars, often referring to the educated "New Haredim," have maintained that "models of isolationist fundamentalism no longer apply to more Israelized and acculturated Haredim" (ibid.). Yet paradoxically, while certain practices, such as internet use, academic study and participation in the workforce indicate growing liberalization, other realms of Haredi life attest to an opposite trend of increasing extremism (Finkelman, 2014). This is especially true of gender separation. As the activist Esty Rider Indursky writes, "It's hard to remember exactly when it happened, but suddenly partitions (between men and women) are everywhere" (Indursky, 2020), referring to the growing separation between men and women in the public realm and its effect on erasing and silencing women.

3. The Haredi Branch

As a child, Rivka Vardi dreamed of becoming an artist, but there were no art schools for young Haredi girls like herself. She was lucky to receive private art lessons, and she began her career as a young art teacher at the Haredi school, Oman, which was established in 1992 by the Municipality of Jerusalem. When the director of the school suddenly died two years later, Vardi succeeded her as the school's director at the age of 21. She developed a rich certificate program to train Haredi women art teachers and extensive community classes and workshops, including mobile art programs that served Haredi children city-wide. The Council of Higher Education's new policy for new Haredi academic satellite programs led the City of Jerusalem to put out a Request for Proposals in 2012. As Rivka Vardi, the founder and current director of the Bezalel Haredi Branch, tells the story, the call struck a deep chord. For years, she had a vision of creating a Haredi Bezalel, referring to Israel's prestigious and historic art school, founded in 1906. Vardi worked with Bezalel to submit a joint proposal and did extensive outreach in the Haredi community to prepare the ground and gain support for the programs. In 2014, the Bezalel Haredi Branch opened two undergraduate programs: in Fine Art and Architecture. Today there is a third program in Visual Communications.

Currently, there are approximately 125 students in the three programs. A considerable number of these students did not grow up in the local Haredi community but emigrated to Israel from the United States, France, and elsewhere. Describing the student body, a former

student explained that these women are not “mainstream” but rather “on the edge”; they have all made a path-breaking decision to study architecture, art, or design, a pursuit that is still not fully accepted in their communities. The women typically begin their studies as single women, at age 18 or 19, then get married and have children in the course of their studies. It is very common to see babies in the classrooms. A nursing room has been set up in the school. The other necessary accommodation is the inclusion of a rabbi on the staff whose role is to oversee the curriculum and advise on the myriad conflicts that arise throughout the course of study. Vardi has noted that the rabbi plays a crucial role in community relations and provides the necessary religious stamp of approval for the program.

While the program's concept is to mirror the parent institution's curriculum directly, there are some notable adaptations. Students study art history without looking at nudes: library books are bowdlerized. They study architectural history without entering a church or a mosque. As Vardi has said, "Every day and every minute we are questioning where the boundaries are, and who sets them. We are constantly falling down and getting back up” (Riba, 2018). The faculty is drawn from the standing Bezalel faculty, though not all faculty members are willing to teach in this setting. Interestingly, the faculty is composed of both women and men, a mix that is not acceptable in many other Haredi programs. And the peculiar intimacy and informality of design education—the one-on-one critiques, the intense discussions that arise within the studio setting's group dynamics—occur here too, sometimes triggering unanticipated conflicts. A student described a range of dynamics between the secular faculty and the Haredi students. Many instructors, she claimed, reveal surprising ignorance about the Haredi community. The discourse is filled with stereotypes that do not reflect the complex realities and heterogeneity of these communities, which are often defined more sharply by their differences than their commonalities. But, as she noted, the most vociferous debates occur in the classes where the instructor is open and able to listen. When the instructor does not listen, the discussion simply shuts down. Another student noted that an important advantage of the program’s small size is the access students have to their instructors. The intimate and informal atmosphere of the relatively small classes, she claimed, provided a setting for remarkably open class discussions.

The meeting of the secular and religious worlds can be productive and eye-opening—for both. One student described her sense of colliding worlds through a poignant image that left a strong impression on her: a traditionally-garbed Hasidic man engaged in a heated discussion with a heavily tattooed instructor in the art department. However, in some cases, the division of values between faculty and students has been problematic. Friction of this kind has surfaced, for example, in the students' choices of topics for their final thesis project. In one case, according to an alumna of the program, a student identified a problem related to a highly specific social pattern in the community, and her choice of topic was rejected by her thesis advisor. She claimed that the advisor simply wasn’t familiar enough with the Haredi community to understood the relevance and significance of the topic.

There is a certain ambivalence among the students regarding their professional roles towards the Haredi society. On the one hand, they have an in-depth knowledge of their communities and a deep moral engagement with them. Their studio projects and their chosen thesis topics tend to reflect a heightened sensitivity to their social environment. Many thesis projects, for example, shed light on issues on social patterns and spatial cultures that are unique to the ultra-orthodox community. On the other hand, some students don't want to "lean into their identities", as one student put it. Many don't want to be pigeon-holed into designing only for the Haredi community. This problem became evident in a discussion I held with another student regarding a potential thesis topic, in which she expressed her interest in the problems of high-rise living. I advised her to use her unique knowledge to explore the issues that are highly specific to her community, noting how little research exists on this topic. However, she felt that I was clipping her wings and replied, "but that's why I am here! To learn about the world". This tension characterizes the learning process as a whole. As Rivka Vardi notes, "some of the students are looking to open up to new worlds in the course of their studies, while others prefer to maintain their clearly formed identities throughout" (Riba, 2018).

According to one studio instructor I interviewed, the students bring greater emotional depth and complexity to their work than their secular counterparts at Bezalel. Many thesis projects are characterized by their focus on social or community-oriented issues. Several projects addressed the extremely crowded conditions in the Haredi neighborhoods of Jerusalem. Miriam Tznoiret proposed a new elevated circulation system in her Jerusalem neighborhood of Beit Israel, along with the conversion of ground-floor commercial space into public community space when it is closed on the Sabbath. Another student, Malki Kessler Ben-Ze'ev, proposed a light-filled underground system of living spaces in the neighborhood of Romema, based on the existing conversion of many underground parking lots to illegal apartments. A speculative project by Liron Aharonson imagined a new temporary city that could arise around Jerusalem, based on a scenario of mass pilgrimage to Jerusalem during the traditional pilgrimage holidays (Riba, 2018). A project by Rivka Porush addressed the political situation by proposing a series of connections linking neighboring Arab-Jewish villages that have been disconnected by the Green Line (Figures 1 and 2), taking a political position that is hardly mainstream.

Figure 1. Rivka Porush, Connecting Tzur Hadassa and Rosh Tzurim - a project that links Jewish and Palestinian villages across the Green Line.

Figure 2. Rivka Porush, Connecting Tzur Hadassa and Rosh Tzurim- section through Beitar Ilit (an ultra-Orthodox settlement) and Nahalin (a Palestinian village).

A second theme evident in the students' work is the difficult relationship between spirituality and materiality. This tension—which is perhaps central to architecture as a discipline— has particular resonance here. For example, several projects attempted to grapple with the dissonance between the two aspects of Jerusalem's dual identity as both a celestial and an earthly city. Yaella Silverman's project "A Path to Jaffa Gate" creates a connective, liminal space between the city's commercial space and its holy sites by celebrating its materiality (Figures 3 and 4). The space is excavated to expose its bedrock's earthly reality, associated with quarries and cisterns, rather than the symbolic meaning of Jerusalem stone. Yael Feldinger-Kalir's project for a train station that connects Tel Aviv with the ultra-orthodox city of Bnei Brak also addresses the need to bridge these worlds (Figures 5 and 6). Her project introduces diverse programs into the seemingly quotidian space of a commuter train station to speculate on the possibility of overlapping ritual and functional spaces in the city. She develops the themes of the duration of time, its sequences, and the sanctity of the everyday.

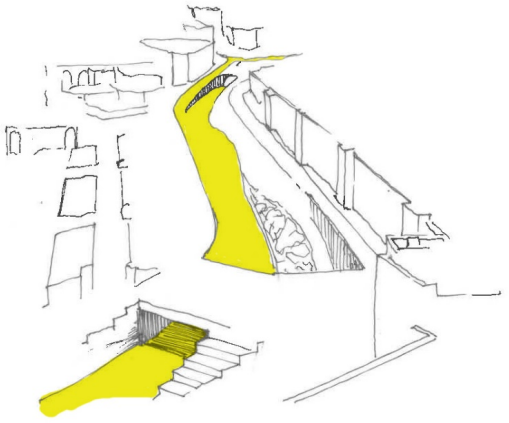

Figure 3. Yaella Silverman, A Path to Jaffa Gate, showing the descent to an excavated path along the walls of Jerusalem's old city where the exposed bedrock can be experienced.

Figure 4. Yaella Silverman, A Path to Jaffa Gate. Stones are reused from a demolished hotel to form a flowing paving pattern.

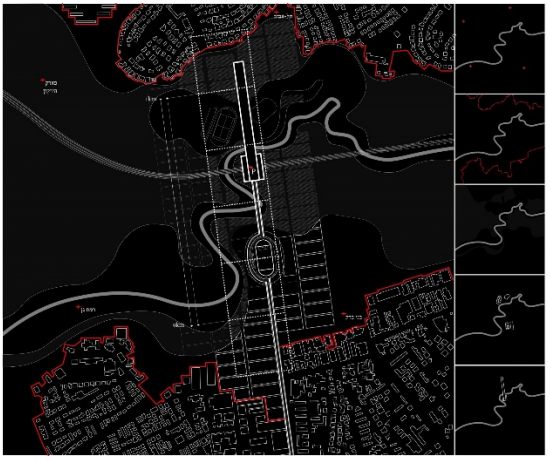

Figure 5. Yael Feldinger-Kalir, Train Station: Tel Aviv-Bnai Brak—bridging two worlds.

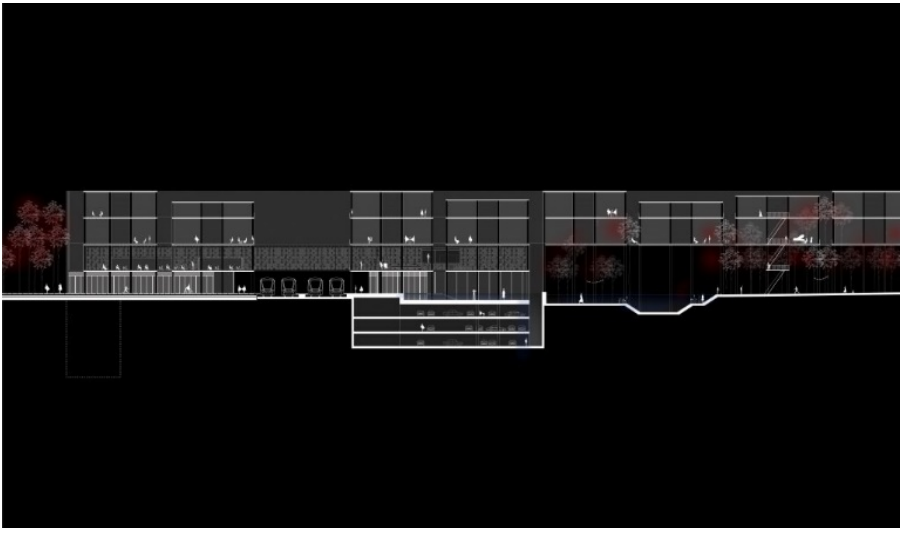

Figure 6. Yael Feldinger-Kalir, Train Station: Tel Aviv-Bnai Brak – section showing diverse programs that occur at different times of the day, including study and prayer

4. Discussion

To date, only three cohorts have graduated from the Architecture program at the Bezalel Haredi Branch. Almost 100% of the graduates are working today in the profession. Although the program is growing quickly, with increasing enrolments every year, it is difficult to predict the long-term impact of the program on the architecture profession or the Haredi community. The broader picture of Haredi integration in the workforce is less encouraging. In 2018, "The Statistical Report on Ultra-Orthodox Society in Israel" stated that "the findings show that the trend towards the rise in the rate of employment and academic studies has come to a standstill" (Malach & Cahaner, 2018).

The problematic relationship between religious and secular cultures is one of the key issues in Israeli society. This program may ultimately have an impact on the Israeli built environment by laying the groundwork for more innovative and subtle solutions to the pressing problems of ultra-orthodox housing and urban form. The Bezalel Haredi Branch is but an intriguing experiment of cultural change that is empowering Haredi women through the study of architecture. Perhaps, in the words of Director Rivka Vardi: "[…] art can be a catalyst for change. Maybe a kind of change that nothing else can bring about".

"But I'm a lecturer not a therapist": Educational Coaching – a proposed alternative approach to supporting students through their creative education

Gary Pritchard[a]

[a]Ravensbourne University London
g.pritchard@rave.ac.uk

Abstract | This paper argues for the potential of coaching as one element of transforming how we support students. Although limited in scope, there is enough evidence in the literature to suggest that coaching can supplement many of the historic and noble ambitions of creative educational institutions. More research is required to explore the most impactful models of coaching support and how it becomes embedded into the fabric of creative education. Coaching could sit alongside existing teaching models as an ancillary support system (Peng and Wang, 2019). Or it could be offered as training to academic faculty as another instrument from the teaching toolbox. It could also be used to train students as peer-coaches – that in turn could prove to be another powerful competency in their employability portfolio. Whatever models we employ, we should be brave, disruptive and radical in our attempts to address the challenges we face.

KEYWORDS | COACHING, CREATIVE, HIGHER -EDUCATION, STUDENT-SUPPORT, SKILLS

Introduction

We have arrived at a moment where the business world is incorporating the language and utility of creativity and creative education. As Ladkin and Taylor (2010) suggest: "… we live in a complex world, which cannot be fully understood solely by reference to scientific forms of logic and sense-making. The arts, and arts-based practices, provide different ways of both describing and relating to that complexity, thereby offering novel ways of responding to it" (p.235). Conversely, the university sector, especially creative education, is often criticised by both politicians and the corporate world for failing to adequately prepare graduates for the world of work. A 2013 study by the Association of American Colleges and

Universities highlighted employer priorities when it stated that a capacity to employ critical thinking, clear communication and problem-solving prowess was more important than a job candidate's degree subject or classification (Association of American Colleges and Universities, 2013). Alongside this, new thinking on curriculum development and delivery is required to address the rapid transformation of the workplace via the Fourth Industrial Revolution (Schwab, 2017). In 2018 the World Economic Forum published the 'Future of Jobs Review' (Bhatti, 2018), which identifies what they consider to be the '10 Skills You Need for the Future of Work'. The report predicts that in five years, one third of the skills we currently state as essential for today's workforce will have changed. The 10 new skills required were reported as: Creativity, Emotional intelligence (EQ), Analytical (critical) thinking, Active learning with a growth mindset, Judgment and decision making, Interpersonal communication skills, Leadership skills, Diversity and cultural intelligence, Technology skills, and Embracing change (Bhatti, 2018). This highlights the challenge universities face in preparing graduates for a future workplace with many unknowns attached to it – including student attributes that are interdisciplinary in nature. As a result, while many higher education institutions may choose to double-down on the 'proven' historic classic academic framework of subject-specific: lecture, seminar, and tutorial, others are questioning the ongoing relevance of such pedagogy. As Kosslyn and Nelson 2018 comment on the USA context, "… higher education is facing four overarching problems… students are leaving college woefully unprepared for life after graduation… college is too expensive… more than half of students don't graduate. And even when they do, they have often been intellectually absent during much of their time in college" (p. 6). It is perhaps ironic then, that this paper proposes the appropriation of coaching methodologies originating from the sports sector, which has in recent times been fully embraced by business, as a solution to some of the challenges that higher education faces. This paper proposes coaching as a means to assist students through their academic journey, impacting positively on their graduate exit velocity and their wellbeing.

1. Historic context

The original meaning of the term 'coach' is a conduit that carries someone from one point to another (Evered and Selman (2001). It evolved as a term for 'instructor' or 'trainer' from a 19th Century Oxford University colloquialism meaning a private tutor who 'carries' a student through an exam (Online Etymology Dictionary, 2019). The term 'coaching' however, took on its contemporary meaning at the end of the 20th century. The book The Inner Game of Tennis (1974) by Timothy Gallwey is credited with launching the sporting origins, while John Whitmore's Coaching for Performance (1988) built upon the growing appetite for increased elite sports development. Whitmore introduced the GROW model that is still used in many coaching models today. GROW in an acronym that utilises: 'G' as goals and aspirations; 'R' as reality or current situation, internal and external obstacles; 'O; as opportunities, possibilities, strengths and resources; and 'W' as will or actions and accountability (Whitmore, 1988). This legacy has evolved into performance psychology and coaching that dominates contemporary professional and wider sports environments (Mageau, G. & Vallerand, R. 2003).

The corporate world's adoption of coaching as a management and executive development framework is credited to financial advisor Thomas Leonard in the 1980s (Brock 2014, Grant and Stober, 2006). It is suggested that this came in response to outmoded top-down corporate management models that had constrained rather than supported leadership training (Evered & Selman, 2001). Since then, professional coaching has evolved into a billion-dollar industry in the USA alone (Sherman & Freas, 2004). Contemporary definitions of the term coaching are diverse. Evered & Selman (2001) suggest that coaching is defined by its genuine attempt to develop leadership interventions as 'trusted partnerships' as opposed to controlling performance management. Moen and Skaalvik (2009) define it as, "… a method which aims to achieve self-actualization by facilitating learning and developmental processes to promote the resource base of another person. The method is characterized by its active involvement of the coachee through powerful questioning and active listening" (p.31). Most definitions include as their essence, the role of the coach in supporting the coachee to develop to their maximum potential (Brock, 2014).

2. Coaching and education

From this definition of developing human potential, it is not difficult to imagine how such a motivation could be translated into the educational context. However, research into the use of coaching within education is relatively scarce – and even more so within creative higher education. The majority of studies refer to using coaching CPD methodologies to train and support teachers within the school-level contexts (Anderson and Gristy, 2013, Casanova, M. P., et al. 2014, van Nieuwerburgh and Barr, 2019, and Tschannen-Moran & Tschannen-Moran (2011) 2011). In the American context the culture of school-level K-12 coaching has been promoted via national and state-level policy pressures to improve teacher training support (Tschannen-Moran, and Tschannen-Moran, 2011). Again, in the USA the driver that

has promoted coaching modes in the higher education sector has been via attempts to improve student attrition rates degree attainment figures (Webberman, 2011). Webberman takes care to identify coaching as different from historic 'academic advising' which has long been the staple in US higher education student academic support.

Other studies include Australian research that explored coaching to support engineering undergraduates (Puji & Prasad 2013), and coaching in nursing education (Hayes & Kalmakis 2007). In the UK Moore, Westwater-Wood, and Kerr's, (2016) published an analysis of a successful peer-coaching intervention with undergraduate physiotherapy students. Coaching has increasingly grafted itself into the CPD culture of many universities, raising the question as to why it is not utilised more widely. As Lordanou, Lech, and Barnes (2015) suggest, "Taking into account that coaching is increasingly seen favourably as a developmental tool for university staff of all levels, one might be inclined to consider its usefulness for students" (p.4). Anecdotally, there does seem to be resistance from some academic faculty when the subject of coaching is raised. This could stem from the fact that the root origins sit outside of the academy, or possibly from some of the 'fist-pumping' stereotypes of coaching projected via popular culture media. Geber, 2010 points to such scepticism when she states, "… surely well-qualified intellectuals do not need 'touch-feely' life coaching…" (p. 64). Arguably there is however, an evolving notion of the teacher role in educational settings away from 'sage on stage' to more of a constructivist facilitator role (Griffiths, 2005).

"Mentoring" as a term for an academic support mechanism seems to be a more acceptable label within higher education. However, Showunmi (2014) suggests mentoring is 'person development centred' while coaching leans towards a more performance-oriented motivation with students. However, this is not an agreed position. Ramos-Voltz (2018) describes a complex process that students traverse via coaching including self-reflexive motivations as well as deep learning.

She states: Reflecting on one's own experiences is a powerful method for learning and allows the learner to leverage personal strengths and address critical development needs. The key element of (promoting sustainable learning from experience) is helping the coachee move from awareness to action in order to sustain learning. The process of reflection creates a developmental feedback loop to continually fuel a learning cycle. (p. 143)

In a study of a coaching intervention at the University of Salzburg, Losch et. al (2016) assigned students into four categories: a self-coaching group, individual one-to-one coaching, group training, and a control group. Results showed that group training and individual coaching and were effective in facilitating goal attainment and reducing procrastination in students.

They state: Individual coaching created a high degree of satisfaction and was superior in helping participants attaining their goals, … Moreover, mediation analysis show that a coach's transformational and transactional leadership behavior influenced participants'

perceived autonomy support and intrinsic motivation, resulting in beneficial coaching outcomes." (p.1)

A study by Orr and Sonnadara (2019) on a coaching intervention with medical students (that included faculty training in coaching techniques) concluded that there is evidence of the positive impact on students' well-being, self-regulation, resilience, self-efficacy and goal attainment. Bettinger and Baker (2014) tracked the performance of 13,555 students, in eight different higher education institutions (HEIs) in the USA, who had been exposed to coaching interventions over two academic years. These students had been enrolled as part of a programme where each of the HEIs had employed the services of an external coaching agency to deliver the training. The coaches communicated with the students via phone and text messages. The project resulted in a 15% improvement of the coached students in their ongoing enrolment over the control group, which led to stronger degree completion. The study also reported a 9 % improvement in student retention, and the overall positive impact persisted even after students no longer received communication from their coaches. In another US study using a coaching intervention to teach biology undergraduates creative thinking, the project group demonstrated increased exam scores (particularly with lower achieving students), increased self-confidence and an improved ability to 'do' science." (p.6) (Chaplin, 2007). Another US-based university undergraduate mixed-methods coaching study had a broader approach that set out to positively impact 'professional and personal thriving'. The results reported an increased awareness of individual values and strengths, but the largest positive effect was upon student selfconfidence (Lefdahl-Davis, et al.2018).

Peng and Wang (2019) designed an undergraduate intervention to develop what they referred to as students' 'positive learning dispositions'. A key element of this study was in using mindfulness training as the intervention lever. The study concluded that 'mindful agency coaching' and 'motivational interviewing' were potent strategies in supporting students to become resilient, mindful, and self-determined learners. Bettinger and Baker (2014) state in their study that, "The coach contacted students regularly to develop a clear vision of their goals, to guide them in connecting their daily activities to their long-term goals, and to support them in building skills, including time management, self-advocacy, and study skills" (p.2).

A study, using PhD students at a London university as its sample group, exposed them to a coaching programme to supplement their research obligations (Lane and De Wilde, 2018). The results concluded that students reported a positive impact as result of the programme, including enhanced self-awareness, confidence and assertiveness. A practical benefit to the ongoing development of the students was also suggested; "Improvements in self-awareness enabled participants to adjust their approach when communicating and working with their supervisor." (p.63) Other interventions have also focused more specifically on what traditionally might be referred to as study skills. For example, Zeidenberg, Jenkins and Calcagno (2007) noted that coaching support around note taking, time management, and long-term planning, resulted in an 8% improvement in persistence rates. Thaler and Sunstein

(2008) suggest that coaching in a higher education context does not necessarily need to be delivered as a large-scale intervention. They argue that simple coaching 'nudge' techniques, where subtle but directional hints are employed, can make the difference between students becoming motivated to complete academic tasks or not.

3. Creativity, coaching and 'quality of mind'

As stated above, there is little if any specific published research of coaching within creative education. This may be related to the contested question of whether creativity itself can be taught. In a study of its UK National Teaching Fellows, the

Higher Education Academy (HEA) 92% agreed or strongly agreed that developing creativity is possible (Wyse and Ferrari, 2014). In defining the term "creativity", the group suggested the following categories as useful: 'thinking' (solving illstructured problems in ways which show initiative); 'doing' (developing, implementing and leading new things); 'thinking and doing' (the cerebral and the practical); 'the arts' (artistic version of innovative); 'self-expression' (ability to express an innate aspect of your psyche); 'creativity as a continuum' (acknowledged artists and scientists through to ordinary people); and 'context' (contextually-based innovation inspired by responding to specific and challenging problems). Runco and Jaeger (2012) suggest that creativity is 'an everyday human activity' that is both proactive and reactive. From such pragmatic definitions of the creative process, it is arguably possible to see how coaching could support some if not all of these processes. Mezirow's (1998) Theory of Transformative Learning emphasises the importance of another cornerstone of the creative process - critical reflection. Here the coachee reflects on an experience or behaviour, examining carefully what they would like to change in order to transform a situation in a more positive way. Transformation or change involves a process of exploring the old and looking towards the new (Scott, 1997). Mezirow argues that learning to think for oneself involves such critical reflection. From a coaching perspective, thinking for oneself is empowering and this is highly valued in the coaching process.

In sports coaching, one aspect that could be transferable into creative education is problem-solving motivation (Potrac et al., 2000, Jones (2000), suggests in the text 'Toward a sociology of coaching', the aim of coach education should be the nurturing in practitioners of "a 'quality of mind', so that they are equipped to dynamically engage the problem-solving and dynamic nature of their work" (p.183).

4. Peer coaching

Hooker's (2011) study of student-to-student academic support suggests that coaching with one's peers removes the stigma of asking 'silly questions' which students sometimes feel when engaging academic faculty. Such coaching also nurtures trusting relationships which

are recognised as foundational in providing the conditions that allow peer coaching to flourish, and includes non-judgemental and unthreatening listening. Anderson, et al.'s (2005) study of peer coaching amongst student teachers helped them "… develop mutually supportive bonds as the peers progress in their development" (p.98). Britton and Anderson (2010) used an online platform to facilitate peer coaching amongst student teachers and created four supportive contexts for the intervention: academic support, technical support, emotional support, and reflective support. This resulted in improved problem-solving and working strategies amongst its cohort.

4.1 Mental health and peer coaching

With universities and government bodies reporting huge challenges around student well-being and mental health (Office for Students, 2019), new strategies for meeting these concerns seem urgent. A Unite survey (2016) found that among students who had strongly considered dropping out of higher education, 76 per cent reported feeling stressed or worried, while 46 per cent reported feeling down or depressed. Apart from the obvious humanitarian crisis that this indicates, it also has an economic effect with student retention impacting university economic securities. In terms of wellbeing, RamosVolz, (2018) suggests that via a coaching paradigm, "Individuals create a personalised map to manage the effects of change and the accompanying emotions as well as to support new ways of looking at challenging situations" (p.143). This is not an expectation that such an approach will lead to a total resolution of student well-being and employability challenges, but that it could offer a methodology that could support and compliment the best historic models of creative education pedagogy.

In a study of psychology students by Short, Kinman, and Baker (2010), a peer coaching intervention was designed to test the impact on levels of psychological distress in the lead up to exams. A control group was also tested and the results revealed that stress levels were significantly lower in the students who had experienced the intervention. The study concluded that the programme had value in supporting students particularly during a stressful period of their studies. A recent wide-ranging literature review of coaching efficacy for medical students, exploring 21 studies, concluded positive outcomes in terms of the impact of coaching on well-being. The review also reported improved resilience, technical skill acquisition, reflective practice decision-making and teamwork. (Orr and Sonnadara, 2019). A mixed methods study at Western University in the USA, targeted postgraduate students over an eighth month period with peer-led coaching.

Participants reported a positive impact on their ability to cope with anxiety and stress levels and an increased sense of resilience (Fried et al., 2019).

5. Neurodiversity and Well-being

Evidence demonstrating the relationship between well-being issues and students described as 'neurodiverse' is increasingly compelling. While there is a contested range of definitions that cover this collective nomenclature, there are agreed categories within the more defined 'Specific Learning Difficulties' (SpLD) category. SpLD is the umbrella term for a number of conditions, including: Attention Deficit Hyperactivity Disorder (ADHD); Autism Spectrum Disorders (ASD); Asperger's Syndrome; Dyscalculia; Dyslexia and Dyspraxia. (Kirby, 2013). An example of how one condition can impact a student's educational experience (in reality it is usually a range of overlapping conditions), with ADHD, the executive functioning (EF) attributes of the individual are often impaired. EF can be defined as the range of skills related to attentionregulation necessary when requiring goal-related problem solving. As Zelazo et al. (2016) state, "This goal-directed control in turn is needed for various kinds of behaviour, including persistence, being able to focus on several things at once, shifting easily between tasks, and reflective learning" (p.3). Clearly this would impact with almost any educational endeavour, but more in creative education where there are often students with specific learning difficulties. A small study in a US university used coaches with specialist training in ADHD to support students in this category. Researchers described three themes to emerge from the study: students reported improved goal attainment skills, enjoyment in working with the coaches, and also a greater sense of self-regulation and well-being. They concluded, "It appears that coaching holds promise as an emerging type of academic support for college students with ADHD to promote improved executive functioning" (Parker, et al. 2011, p.115). A larger study of 148 college students over a 5-year period using ADHD coaching was conducted using novice coaches. The interventions consisted of an eight-week coaching course that combined cognitive-behavioural therapy (CBT) and educational support. Executive functioning was the primary focus of the assistance and resulted in improved self-esteem, reduced symptom distress and on overall student satisfaction (Prevatt and Yelland, 2015).

6. Coaching and its potential to increase academic self-efficacy

In an all-female university in Pennsylvania USA, a programme was designed to support students diagnosed as having SpLD and/or ADHD (Singley, 2017). Its focus was to test for increased academic self-efficacy as a result of the intervention, which the literature has confirmed is associated with academic success and increased attainment (Bandura, 1997, Zajacova, Lynch, & Espenshade, 2005; Khan, 2013). Students in the coaching group reported stronger self-efficacy than students in the control group. As Singley states, "… results show that Academic Coaching could be an effective intervention to increase the use and knowledge of learning strategies for students with LD or ADHD, specifically addressing the challenges in executive functioning skills often faced by students with LD and/or ADHD" (p.72). Nurturing academic self-efficacy in students then, seems to a key attribute in

supporting students to thrive. Bandura (1997) defines self-efficacy as "people's judgment of their capabilities to organize and execute courses of action required to attain designated types of performances" (p. 2). This judgment has a future-oriented motivation which is distinct from confidence with its primary focus on domain-specific historic success as its motivational resource. Confidence is derived from drawing upon successful experiences of past activities, where the ability to execute courses of action supported the attainment of specific goals.

Research has shown that self-efficacy has a positive impact on academic motivation, learning, and achievement (Pajares, 1996a). Although Pajares (1996a) questions some of Bandura's claims (highlighting, for example, the necessary qualification of other factors in educational success such as effective teachers and resources), he supports the general notion of self-efficacy as a positive indicator of an individual's potential to succeed in academics. Bean and Eaton (2000) suggest that success in one area can become habitual and promote attitudes that eventually translate into behaviour. As such, students who experience academic success in one area may be more likely to persist with a different task or subject area. This accumulative potential for the development of self-efficacy is particularly pertinent in considering support for students entering university for the first time.

Gore, Leuwerke, and Ladwig (2006) argue that one of the reasons that first year students are vulnerable to attrition is that they tend to overestimate their own abilities and underestimate the requirement for effort and persistence. While evidence suggests that this misperception generally corrects once they progress from this formative experience, the critical context of the first-year college experience remains of crucial importance. As such, using the first-year context may prove to be one possible consideration for any proposed coaching intervention in higher education. Bong and Skaalvik (2003) suggest that individuals who possess strong academic self-efficacy are also more likely to a) set higher attainable academic goals, b) persist longer on challenging tasks, and c) enjoy academic work more than peers who possess a negative selfconcept and weak academic self-efficacy.

Summary

The combination of factors forcing creative educators to re-examine how they deliver a strong student experience are considerable: the marketisation of higher education, the breakneck evolution of the Fourth Industrial Revolution, outmoded curricula and student mental health and well-being. We cannot expect academic faculty to become renaissance superhumans, delivering edge-of-the-seat teaching and up-to-the-minute pedagogy on technologically future-proofed courses while offering well-being support to frazzled socially mediated undergraduates. Having said that, the era of the academic whose simple trajectory is to deliver windows of robust research-informed teaching while returning research outputs to the Research Excellence Framework is over – at least in the majority of the new

universities. The time feels right for a radical review of how we deliver creative education, but in order to achieve this, old paradigms will need to be challenged. As McWilliam, E., Dawson (2008) argues, “The resilience of the ‘lecture’, the ubiquitous culture of ‘transmission’, the credentialing process, the hard-wiring of disciplinary boundaries, and so on. It is unlikely that these elements of ‘command and control’ pedagogy will be easily relinquished by those who have been rewarded for decades for what they know and their capacity to instruct as a ‘lecturer’. (p. 641)

This paper argues for the potential of coaching as one element of this essential conversation. Although limited and fragmented, there is enough evidence in the literature to suggest that coaching can support many of the historic and noble ambitions of creative educational institutions. What is required now is more research to explore the most impactful models of coaching support and how it becomes embedded into the fabric of creative education. Coaching seems to be a legitimate and exciting response to some of the challenges highlighted here. Coaching could sit alongside existing teaching models as a supplementary support system (Peng and Wang, 2019). Or it could be offered as training to academic faculty as another instrument from the teaching toolbox. It could also be used to train students as peer-coaches – that in turn could prove to be another powerful competency in their employability portfolio. Whatever models we employ, we should be brave, disruptive and radical in our attempts to address the challenges we face. As Jeroen Chabot, Dean of Willem De Kooning Academy Rotterdam states, “The art school … needs to rise to meet these new challenges, accepting and embracing the fact that knowledge is no longer the property of academies, universities, professors or tutors; nowadays, know-how and skills are increasingly distributed, networked and shared on a grand scale. Today’s art school should serve as a nucleus for these activities, yet it often fails to fulfil this role. Now more than ever, education requires forms of pedagogy and organisational structures that reflect these dynamics.” (Chabot 2019)

Decoding the birth of transcultural fashion

Shipra Kukreja

Indian Institute of Art and Design, New Delhi, India
shipra.kukreja@iiad.edu.in

Abstract | We have numerous types of attires, or parts thereof that have crossed cultures and boundaries because of immigration and geographical transitions such as the mandarin collar, Nehru jacket or the kimono sleeve amongst others. As designers, the earlier we accept this diversity and pluralism, the sooner we will be able to cater to this new culturally mixed society. Through case studies of the *burkini* and the Asian *Kurta*, this paper talks about non-identification of a garment from its social or political construct and its existing labels to look beyond the original cultural significance that it may have (had). There is a renewed need to re-evaluate the existing notions of pluralism and diversity that are not condoned by popular culture and a need to integrate the local with the global so that clothing can be democratised and be more accepted, accessible and made inclusive to this culturally diverse new society.

KEYWORDS | DEMOCRATIC, INCLUSIVITY, TRANSCULTURAL, MULTIPLICITY, DIVERSITY

1. Introduction

Fashion (and clothing), as we know today, has a lot of meanings and connotations associated with it. Within its varied layers, it has a language and a purpose to serve. Historically, garments and costumes have been solving the needs of mankind, as a covering for the body, as protection from the cold and extremes temperatures while, at times, also addressing modesty concerns. While sometimes dress and clothing divides society by class, race and gender; at others, it blends these boundaries via (world) garments such as denims, overalls, business suits etc. Dress, in the sense of clothing, has also been used for religious and ritual purposes, in different cultural contexts.

Fashion and dress have greater power than one can imagine. How one dresses can directly impact one's chances of getting a job, finding a date, making an impression on an audience and so forth. In the book "Dress & Identity", Roach-Higgins & Eicher (1995) state:

> "Dress helps announce (communicate) identities for persons who are socially situated […] Dress confers identities on individuals as it communicates positions within these structures" (p.13).

It is thus inevitable that a huge section of the population swears by popular brands and labels, and designers drop new styles on the runway twice or even thrice a year. Every season, new styles are churned out by fast-fashion brands and fashion magazines thrive on these representations with their commentaries. Although these magazines have been in existence for a long time, but in today's age, as Moeran (2010) said:

> "fashion magazines are both cultural products and commodities, that circulate in a cultural economy of collective meanings...they provide experiential and behavioural models — particularly in the realm of fashion and beauty — in which the reader's ideal self is reflected" (p.207).

In the present scenario of constant social media engagement, the millennials and GenZ are forming impressions from the campaigns and magazine reviews with every passing day. They discover new fashion terminology from fashion journals and existing literature available on the same. Designers and brands play a huge role in helping form these opinions with the fashion vocabulary they use to communicate.

As has been observed, most fashion is viewed so as to be consumed by western audiences with the majority of fashion and trade shows hosted across Europe and the U.S.A, whereas South East Asia is only a new entrant with the participation of primarily Japan and China in the global scene amongst a few others. "However, viewing fashion or dress (as an identity) through a western perspective only interferes with the ability to perceive fashion in other cultures" (Tortora, 2010, p.169). Tortora thinks that people from the Western countries often view local dress styles as "primitive". With the increasing of global trade, it has become easier for trends and styles to permeate from their local context to a larger global context. She further states that "[...] the fashion industry is constantly looking for inspiration eastwards as well as towards Asia, Africa and lesser explored places. As a result, Western

and non-western fashion designers incorporate elements of the dress of other cultures into the dress that they create/produce. Asian dress has contributed elements such as the standing collar called a "mandarin collar" and the kimono. Designers from India produce Western, ethnic and fusion lines."

If one observes individuals residing in developing countries such as India, Pakistan, Bangladesh etc. closely, they are often seen combining a western silhouette with their traditional attire. A typical example would be pairing a shirt with trousers, with a dupatta or a scarf or stole wrapped around the neck. Individuals have been doing so for years and there are many narratives around how migration has facilitated an intermix of styles, crafts, colours and aesthetics. With global shifts, there have been numerous crossovers such as the sari, the bright Iranian or Turkish scarves that may not necessarily wrap around the head but make a fashion statement when tied fashionably around the neck, bangles, *bindis, henna, tattoos*, etc. There are innumerable cultural clothing, accessories and visual references that have blended into mainstream (western) fashion scene. Although dress and fashion have largely been standardised to fit specific contexts, for example the business suit is more appropriate for corporate workwear while a looser fitted garment is suitable while working from home. Dress and fashion scholar Joanne Eicher echoed this point when she coined the term "world dress" as a commonly worn high volume clothing of both sexes such as jeans, athletic trainers, sandals, baseball caps and t-shirts etc.

Maynard (almost) on the contrary states "Despite this, a picture of global attire must acknowledge the crucial place of differing ethnic and personal preferences, philosophies and religious and moral attitudes" (Maynard, 2010, p.252). There are many more attires that have been exported from India and Southeast Asia such as the Nehru jacket, Indigo dyeing techniques like tie dye and Shibori, the jodhpurs, etc. Each one of these can become a case to state that it is possible to incorporate this fusion and cross-over of dress and identity while acknowledging a global consumer base.

In her book "Design, the key concepts", Catherine McDermott, a well-known writer, curator and professor writes:

> "Cultural diversity in design involves understanding how people live in different cultural and social contexts. This works on two levels: the first to increase the potential market for products and services; and second to help local economies [...] Any contemporary discussion in design creativity in the 21st century has to take on board issues of cultural diversity [...] Cultural diversity reflects a uniquely rich history of multicultural settlement, immigration and movement in the (UK) society, and understanding and expressing this (cultural diversity) is now seen as a key asset for contemporary design […]"(2007, p.63).

She further adds that "Cultural diversity helps identify people's values, aesthetic preferences and lifestyles on a global basis". Understanding cultural diversity can help make design become truly inclusive and transgenerational. Keeping this as the underlying context, the paper puts forward a case for multiplicity of clothing. This is exemplified via two case

studies, of the *burkini* and the *kurta*, by emphasising the fact that designers need to integrate the local with the global in order to cater to this culturally diverse mix of people across the globe.

It is also important to enquire how dress can be termed as democratic, what are the factors that encourage similarity or diversity of dress within nations and across national boundaries, how clothing styles move from one context to the other, how they affect people's perceptions with just the use of a certain terminology to label the garment? Using primary and secondary research tools and interviews and data collection, through online surveys as research methodology tools, the paper lends an enquiry into these important questions.

2. Case Study of the Burkini

2.1 The Burkini as a metaphor of freedom and multiplicity

The burkini or a burqini (*Burqa + bikini*) is a "woman's swimsuit that covers the entire body, leaving only the hands, feet, and face exposed" (Lexico, 2020). Islamic girls have been observed wearing fully covered t-shirts and leggings to the beach long before the burkini was designed. This was seen as a huge gap in the market, which prompted Ahida Zanetti, a Lebanese- Australian designer to create the burkini in the first place.

Figure 1. Women and girls at Patara beach, Turkey. Image source: Huber, G. (2015, September). Patara - Beach, Retrieved from https://global-geography.org/af/Geography/Asia/Turkey/Pictures/Patara/Patara_-_Beach_2

Following her suit, eminent sportswear brands Speedo and Nike also saw this as a huge business opportunity and launched their modest swimwear targeting this segment, with different names. Speedo launched its “Delight Full Body Suit”, essentially a range of leggings and long rash guards that aren’t as form-fitting as conventional surfer styles. The brand representative stated that “The burkini has even been donned by women who simply seek protection from UV rays or aren’t comfortable putting their bodies on display”. On the other hand, Nike saw this introduction as a more creative pursuit. It’s creative director Martha Moore told the media “We’re excited to inspire more women to see themselves in sport by thinking creatively and designing inclusively.”

Figure 3. Nike’s Victory swim collection came through after their successful collection of sportswear hijabs (Independent, 2019). Image source: https://www.independent.co.uk/life-style/fashion/nike-victory-swim-hijab-collection-online-a9240481.html

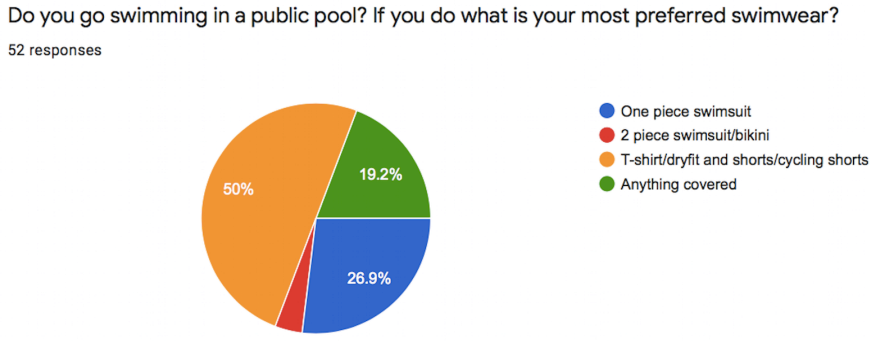
Figure 4. Famous hijabi model Halima Aden is the first model to wear a burkini in the Sports Illustrated swimwear section. Image source: https://www.bbc.com/news/48071948

Aheda Zanetti, who designed the first burkini posits:

> “I wanted to do something positive – and anyone can wear this, Christian, Jewish, Hindus. It’s just a garment to suit a modest person, or someone who has skin cancer, or a new mother who doesn’t want to wear a bikini, it’s not symbolising Islam”.

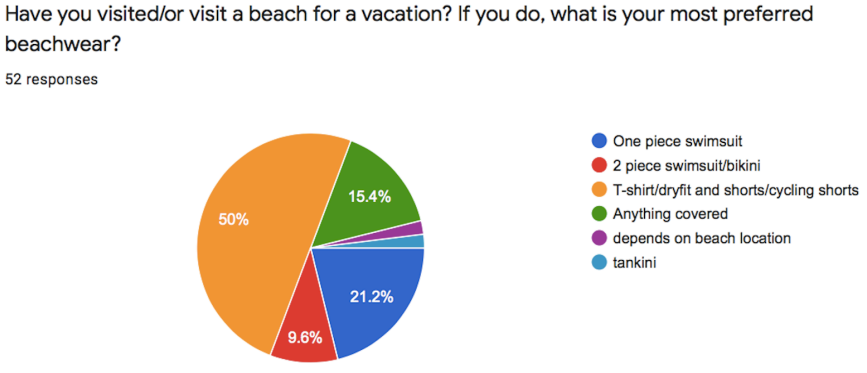
At a global level, the burkini has made it to “The Sports Illustrated” an American magazine, in its annual swimsuit issue (2019), with famous Somali-American supermodel Halima Aden gracing the cover page. This drew positive attention to the campaign as well as severe criticism. While many readers and viewers were thrilled, that inclusivity was finally coming of age, there were an equal number of respondents who felt it defeated the purpose of modesty, by posing in a magazine that has more male readership as known. Halima herself felt this was a huge step in normalising the burkini, as a freedom of choice. Before her quitting the fashion industry quite recently she had told the BBC (2019):

> "Young girls who wear a hijab should have women they look up to in any and every industry […] We are now seeing politicians, business women, television reporters,



and other successful hijabi women in visible roles and that is the message we need to be sending."

2.1 Modest Swimwear in India and the Burkini



On a typical beach in India, it's possible to find girls and women across different age groups in a certain assortment of swimwear, mainly consisting of t-shirts, shorts, cover ups and very rarely in a quintessential beachwear (the bikini or a swimsuit). They are dressed fully covered, the reasons for this are associated more with culture than religion. If provided with the alternative of a covered swimwear, like burkini, they are likely to sport this modest swimwear that is giving them the ease of a water-resistant fabric and that has less lag in water as compared to being fully clothed. This may be the case in a lot of countries where modesty concerns are still relevant. For the scope of this paper however, the primary base for the survey has been India, which deems itself as a secular country allowing freedom of speech and expression.

A survey was conducted with girls and women, in the age group of 18-30 years, who frequent beaches during vacation or holidays, usually Goa or further south of India. It is important to note that from over 50 people interviewed in Delhi and the nearby regions, most of them fall in the middle economic segment consisting of fashion-conscious individuals, young professionals and students who dress fashionably, spend mindfully and use public transport like rickshaws, buses and metros for daily commute. Most of them live independently, away from their families or with friends in a shared apartment and all respondents belong to either the Hindu or the Christian faith, which is an important factor in this survey to separate religion from functionality and requirements. Two important insights were drawn from the survey, as explained below:

- 50% of the respondents said they would be happy to wear a fully covered or a partly covered swimwear especially in India where modesty concerns are a major deciding factor when a woman dresses up to go to the beach.
- 36% of the respondents either did not know of the burkini or did not want to wear one, despite wanting to be modest, because they associate it with the hijab and burqa.

Appendix 1.

Appendix 2.

Thereby, it is pertinent to note that burkini, as a modest swimwear garment, has a demand but perhaps a little more knowledge about its name would have served a wider consumer segment and could have made this much-required garment more inclusive and transcultural. If perhaps the first garment had not been called burkini, there would have been a better chance of its acceptability in the market at large, as was the intention and the primary motive behind launching it in the first place. There is a case for its use which is not necessarily confined to a religious obligation.

Although sports, and in this case swimming, as recreational or competitive, has been practised for long time and in general there has been research and debate on sport's relationship to class, race, gender and sexuality, a cultural study of sport begins to emerge only in '80s led by feminists who sought to explore the male domination of sport in the construction of gender and sexuality (Edgar & Sedgwick, 2008, p.332). When we look at the burkini or a covered swimwear in this context, where it is trying to liberate rather than dominate, perhaps there is a renewed need to re-evaluate the existing notions of pluralism and diversity that are not condoned by popular culture.

3. Case study of the Kurta

3.1 The Kurta as a global symbol of versatility – The historical context.

The timeless Kurta, or the tunic, as it is known in the west, is defined as a loose collarless shirt worn by people from South Asia, usually with a *salwar, churidar, or pyjama* (Lexico, 2020). A late eighth century Sanskrit-Chinese dictionary gives the word Kurti for the chinese *shan*, shirt, although Kurti is not a Sanskrit word (Dhamija, 2010, p.21).

Krishna (2010) writes that while some of the scholars believed that stitched garments were introduced into India by central Asia tribes early in the Christian era, others maintained the view that they arrived when the Mughals invaded the Indian subcontinent (p.129). There are varied points of view, but what's important to note here is that the "History of the kurta in the Indian subcontinent goes as far back to the Shunga rulers as in the era 184-72 B.C.E, followed by the Sakas and Kushanas, central Asian peoples who wore stitched garments" (Krishna, 2010, p.129). He further adds,

> "By the end of the twelfth century, Muslim rulers had occupied Delhi, bringing with them traditions from other Islamic courts [...]There are references of *nimcha* or a short tunic, and a *jabah* which is an upper garment made of fine muslin" (p.130).

There are numerous other references from Akbar's time until the mid-eighteenth century when these garment adaptations continued in their original or modified versions, with some variations getting renamed in order to accommodate both Hindu and Muslim sentiments that were prevalent in those times. With the advent of colonisation during the nineteenth century, some Western influence on dress and clothing was evident, with sleeves being tailored and the kurta morphed into a simpler form with straighter cut becoming more popular than the previous *angarakha/jaba/peshwaz,* which have been versions of the kurta with more volume, length, details, etc. Apart from the Indian subcontinent, there is also evidence of the stitched garment in other South East Asian countries such as the Kimono in Japan and China.

3.2 Present day Kurta

Moving forward, the 20th century dress style evolved across the varied terrains of the country in myriad ways, adapting to different climes, from a cooler climate in Kashmir and Ladakh to the extreme heat in Rajasthan and Gujarat or the tropical climate of Chennai and Kerala. Despite these variations, the kurta has managed to stay as a staple garment in addition to other draped garments specific to the Indian subcontinent, notably the sari, dhoti, etc. The sari however, has been observed to be slowly losing out to the kurta as an everyday garment, because in addition to the latter's functionality, there is more scope for contemporising and variations.

Figure 5. Some modern-day versions of the kurta in India. Style courtesy: Saumya Pande, New Delhi, India.

In present times, the kurta is seen as the daily attire of women in India, Pakistan, Afghanistan, Nepal and neighbouring countries. It is a common sight to see women wearing kurtas with *salwars* (loose pleated trousers that are fitted at the ankle) or *churidars* (close fitted bottom gathered at the ankles). But the most common pairing is with ankle-grazing pants, styled with a stole or a *dupatta* for a traditional look or without one for a more contemporary style, more like a sort of dress. There are kurtas or tunics worn across the western part of the world and it is not unusual to find Americans or Europeans wearing longer shirts or dresses with pants, closely resembling the look of the kurta as seen in India.

3.3 Global comparison and contemporising in fashion

Another modern interpretation of kurta, as observed in the last few decades, has been a beach wear in the form of kaftans or loose slip on. Some of the famous designers who have used the kurta as an inspiration in the form of a tunic are Tory Burch, Johnny Was, Gucci, Kate Spade amongst others (Figure 6).

Figure 6. American chain of luxury department stores stocks designer swimwear & cover ups that replicate a kurta (Neiman Marcus, 2020). Image source: https://www.neimanmarcus.com

Japan has been on the forefront of innovative fashion and use of technology for a long time and some of the renowned designers, notably Rei Kawakubo, Issey Miyake and Yohji Yamamoto, amongst others, have done some ground-breaking work in bringing Japan's cultural context and aesthetics to the global fashion scene. While drawing inspiration from the East and the West, Japanese brands and designers have managed to bring the traditional and the ultra-modern together in mainstream fashion.

For their launch in India, Japanese brand UNIQLO tied up with Indian designer Rina Singh, from the label Eka, for an all exclusive kurta-dress range, to serve the Indian demographic. The kurta line was not only launched in India but also in Japan, Singapore, Malaysia, Thailand, Indonesia and the Philippines, thereby moving beyond a purely "Indian"

connotation of the same. Rina says “The kurta has been India’s daily dress for years now. It is timeless, democratic and functional - aligning it perfectly with the UNIQLO LifeWear philosophy. Through this partnership, we have pursued a contemporary version of the kurta as an elegant essential for women of all backgrounds, regardless of age, culture or belief” (IANS, 2019).

In a detailed telephonic interview with her, she talks about how the kurta has been one of her key silhouettes, how she sees it and why it is virtually the go-to garment for her and many of her clients. One of the reasons for the kurta’s popularity, as she identifies, has been the society’s shift to a more global outlook, which would require the wearer to switch between an everyday sari to a completely western outfit. This however has not happened in India which is still quite deeply rooted in its strong textile and handloom traditions. The kurta, as a tunic or a dress, offers more options of keeping this tradition alive, and yet can be perceived as a global silhouette. One of the reasons why Rina’s brand Eka (Figure 7) does so well globally is its mass appeal and versatility, everything the kurta symbolises.

Figure 7. Eka’s Spring summer 2020 collection at Ogaan, New Delhi. Image source: www.ogaan.com

Figure 8. The Sartorialist, https://www.thesartorialist.com/diamonds-stripes-solids-copenhagen

Figure 9. The Sartorialist, https://www.thesartorialist.com/mayfair-london/

Globally, while scanning through the western fashion scene, the tunic has been spotted across the spectrum. It has been seen on the streets across the world, outside fashion weeks, in resort collections, amongst others. Scott Schuman of “The Satorialist”, who is a street style photographer, has numerous images of people wearing the tunic, or a tunic as a dress across the globe. (Figure 8 and 9).

WGSN, the renowned global forecasting site has shown the kurta as a trend forecast for many seasons across product categories (Figure 10).

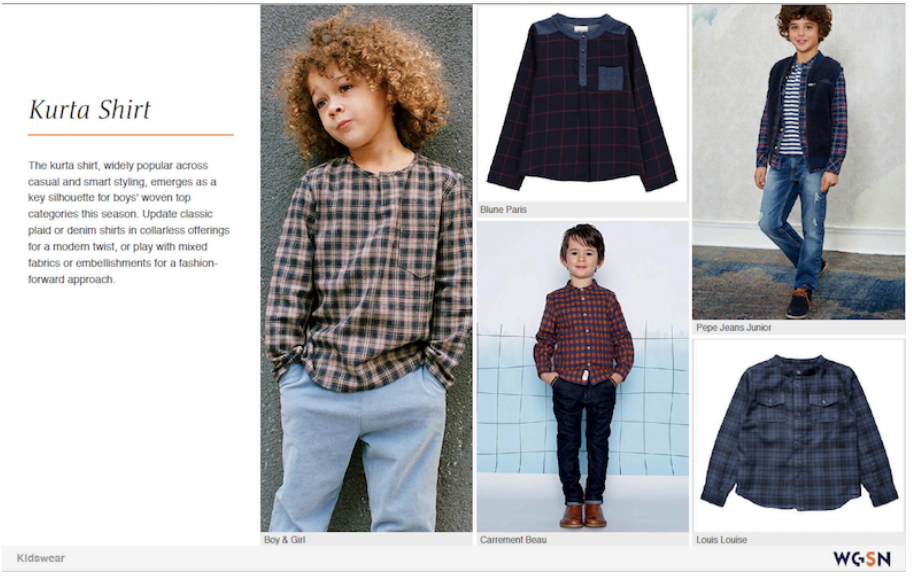


Figure 10: WGSN, the forecast site has shown kurta as an inspiration over time. Image source: www.wgsn.com

To gain a more personal insight, the author interviewed some of her friends and acquaintances across the UK, U.S.A and Australia. These women are mainly between the age groups of 35-50 years. They have been to India many times and are seen donning the tunic or kurta back home occasionally. I asked them how it got into their wardrobes back home, how many versions do they have and how often do they wear it.

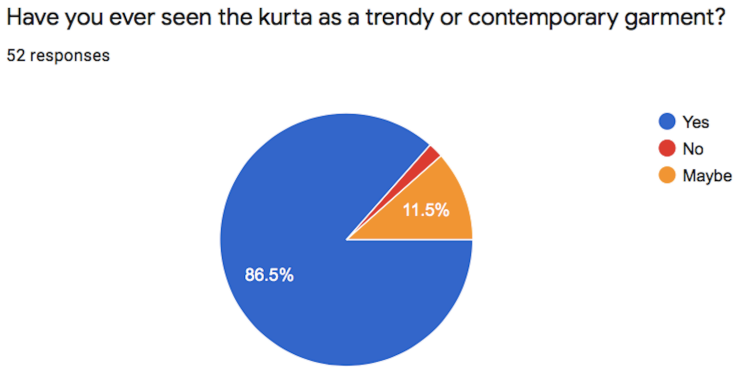
Julie Lantry, a designer and an academic in Sydney, Australia, has a very quirky, experimental dressing style and through her many trips to India in the past two decades, four tunics arrived in her wardrobe back in Australia. She says:

> "I generally wear them in India. When I first started traveling to India, I noticed most people wore them and I started wearing them as it felt more comfortable both physically and culturally[…] I do wear a tunic in Australia, but more as a resort wear (over swimmers etc)."

Niki, in Brighton, U.K who has been a senior designer for the brand Monsoon in the U.K, had a kurta that she wore till it fit her, and then she had to give it away. She says:

> "For me the kurta is a specific cut, not ever low cut. I think of it as made in cotton and a certain length with splits at the side and it has sleeves. Brands like Monsoon and East do tunics and use prints that come from India so these are so close to traditional Kurtas."

It would be safe to conclude that the kurta or the tunic is a widely known form of clothing which has had various adaptations across a western clientele.



3.4 Kurta in the context of dress and sexuality

In the book "Clothing: A global history" (2008), Robert Ross in the chapter "The emancipation of Dress" says:

> "There was, and remains, a complicated balance that has to be found between women overemphasising their sexuality, so that they are not taken seriously, on the one hand, and women dressing in such a masculine fashion as a threat to male egos" (p.147).

He said this in reference to the work and business environment, but in a patriarchal society, where women are still finding their space outside of their homes, this may be true in other areas of social and cultural life too. A kurta is versatile enough to seamlessly go from home to work to convert to a dress when required to go out for an evening. It also does not seem overly modest, with the way it is styled, it can be made contemporary when worn with trousers, linen pants, or leggings. A lot of younger office-going women wear it as a dress which is longer and less revealing. It has many ways of getting styled and there are multiple variations able to create a very traditional or a very contemporary look.

In the survey conducted with the young lot of girls and women in India, not surprisingly, over 50% respondents stated that they find the kurta "cool" and they would wear it, if styled interestingly. It would be important to note here that a majority of these young girls dress up in denim, shorts and dresses for their everyday college wear.

Appendix 3.

4. Conclusion

If fashion has to be truly represented as a global, vibrant, all-inclusive entity it is important to look beyond what we see at present as inclusive. While it is important and relevant to have body, gender, racial diversity represented in Fashion, and that it shouldn't have taken this long to come about; It is equally important to show diversity of garments that cross borders and boundaries just like the brand UNIQLO did.

It can be concluded that designers and brands are endowed with the larger responsibility of perpetuating this essence of integrating the local with the global. There have been many designers who have integrated this philosophy in their work, as discussed in the paper, but there is a huge scope for more such interventions. If brands could take up more local clothing examples such as the Asian kurta or the burkini, we would see a lot more diverse and multicultural fashion on the streets. Maybe some clothes need to be dis-identified from their existing labels to be democratised in order to be more accepted, accessible, used, inclusive. It is time for designers and its recipients to resist from identifying a garment only from its social or political construct and to look beyond its original cultural significance it may have (had). There is an even bigger need for designers to look at it afresh and to build on a culture of multiplicity and materiality. There would be more blending of people and identities, and certainly a lot more fun, amalgamating cultures using fashion as a medium.

Abstract | Digital technologies and social media frame an unprecedented scenario for learning, which is featured by simultaneous experiences, spontaneity, creativity, and action. In this learning context, the design approach is vital fostering communication and new technologies, self-production, and manipulation options, which provide new forms of knowledge. The design of *wayfinding* and information, play an important role in making any concept accessible, shaping diversity of stimuli in a network of tools, signs, and symbols, which enhance the learning process and make it more inclusive. This paper presents the research and development of a variety of visual, tactile, and acoustic elements to be part of an online platform, designed for learning different architectures. The aim of this project is to develop resources for hands-on learning, using different technologies more adapted to a diversity of learners and targets. During the learning process, the design engages different possibilities to build objects that gather amazement, satisfaction, curiosity, and inquiry. The next step will be, once this platform will be implemented, to validate the effectiveness of its design to provide active learning and, what is more, its possibilities for inclusive purposes.

KEYWORDS | DESIGN FOR LEARNING, ARCHITECTURE MODELS, TOOLS AND TECHNOLOGIES, HANDS-ON LEARNING, LEARNERS DIVERSITY

1. Introduction to autonomous learning

Last decade, digital technologies and social media have been and are still the protagonists of an unprecedent scenario for learning, which is featured by simultaneous experiences, spontaneity, creativity and action. The trends identified in learning and development (Haagh, 2017) show the crucial role of technologies and disruptive methods (learning paths, affinity groups, learner-contributed content, and coaching) (Dyger, 2017). There have been so many changes in both work and leisure, that it seems absolutely necessary for education to redesign most of the processes and contents generally used till now. This new educational panorama requires to involve the individual (de Jong, 2014) providing assorted resources and media elements developed with detail and rigor. These elements are mostly supported in drawings, graphics, and other elements that provide a variety of experiences by demand of the customers. The design approach is vital in this learning context, where communication and the discovering of other technologies concerning the self-production and manipulation options, are constantly providing new forms of knowledge (Puyuelo, et al., 2018). Furthermore, is a consequence for individuals to develop at the same time, their digital abilities (Jennings, et al., 2017) and the awareness of their own possibilities for learning autonomously (Olmos-Raya, et al., 2018; Puyuelo, et al., 2019).

Another critical factor in current education is fostering creativity as a sort of knowledge that has to be nurtured though learning experiences. So, design for education faces the current challenge of enhancing new inspirational ambiences. In fact, user experience is absolutely related to useful interfaces and design, where also counter intrinsically, the aesthetic dimension of visual design (Bollini, 2017). It is agreed that in any digital or real world context, design of information and *wayfinding* plays an important role in achieving the goal of making them accessible (García Moreno, 2011). In the case of an interface, which offers learning activities, the design of a diversity of stimuli can comprise an efficient and dense network of tools, signs, and symbols, which in one hand, enhance the learning process and make it more inclusive (Fernández-Villalobos & Puyuelo, 2018), but in the other hand, can make it more difficult. What is proposed is the research design of a website where you may get different elements representing a building. There you may experience as a maker, technologies such as 3D printing, blue prints, laser cutting maps etc. that can be used for producing other learning resources for people with special needs such as tactile surfaces for the blind.

This paper presents the research and development of a variety of visual, tactile, and acoustic elements to be part of a digital resource, an online platform designed with the purpose of fostering informal learning about different architectures. The aim of this project is to develop resources for “hands-on” learning, using different technologies that might be appropriate/suitable for a variety of targets. A gallery of architecture-based models provides both intrigue and educational opportunities for different stakeholders. These resources give them tools for improving inclusion and, at the same time, accessibility to potencial learners and visitors.

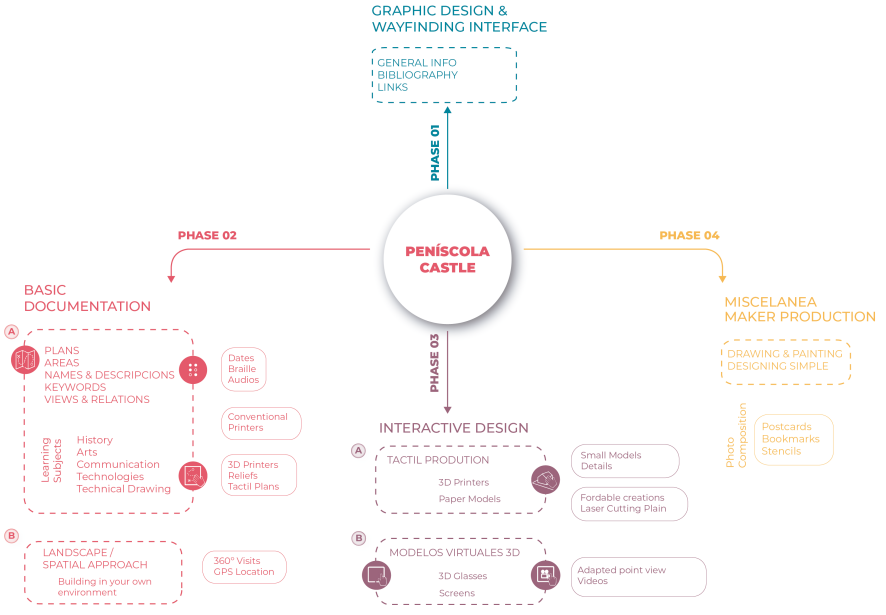
Both the elements designed to be the contents of use and the platform itself, aim to offer simple, direct and interactive experiences for the user. Following the idea of Kort et al. (2001) on the relation of learning and emotions, during the learning process, the design proposal engages different possibilities to build objects that gather amazement, satisfaction, curiosity and inquiry: good emotions which were associated with a higher level of learning.

O'Brien and Toms (2010) suggest to examine multiple factors of experience concurrently related to each other. These factors can be clustered into groups which include: affect, cognition, context, engagement, experiential learning, interactivity, narrative, self-concepts, and usability. Their co-presence during individual experiences will require design guidelines and addressing validation strategies in the future.

The first part of the paper presents the main ideas that guided the previous research, the objectives for modelling an ideal platform, followed by the methods, techniques and materials employed at the conceptual design. The second part, shows briefly the result as a prototype, which can be used in an open way, obtaining material and visual representations of the architecture presented. Finally, we discuss our findings from the design process point of view. The next step will be, once this platform will be implemented, to validate the effectiveness of this design to provide active, effective learning and what is more, in particular, for inclusive purposes.

2. Looking for an Ideal Model of Learning by Doing platform

Design surrounds us by shaping the way we live and communicate with the world, so design is somehow, a medium for a constant learning process and a tool to promote cultural knowledge. The evolving role of the cultural identity of places is reinforced most strongly by mediatisation, rather than through active and inclusive communication. Design spans boundaries and is shaped by disruptions, it continually evolves as it responds to the context in which it operates.



From the perspective of education and learning, to approach the representation of architecture in an autonomous way, should embrace thought processes, motivation, construction of spatial view, and a sense of flow in the activities proposed. As argued by Allen, a key to creating flow is matching challenge to skills, along with well-defined goals and rules (Allen, 2004). Thus, it is necessary to bring clear results and communication between unique features of the image of the building in our case, and the material results you will be able to reach doing the activities. According to Hennes, “constructing activity with continuity of experience in mind demands that we find a way to provide learners with a means of constructing the present experience out of what is already meaningful and important to them” (Hennes, 2002, p. 113). From this point of view, some of the activities proposed are simple objects that we can easily identified as desirable products that can be customized. Hennes also noticed that participants play an active role in a valuable way when they design

facing open-ended proposals. These sorts of hands-on activities trigger emotional experiences because they have not absolutely pre-defined outcomes (Hennes, 2002).

The main results are the open-ended enrichment and pleasure that discovering through action can provide. Following Leapers argument, some important factor groups to be included at any educational proposal will be fun, cognition, context, engagement, experiential learning, interactivity, narrative, self-concepts, and usability (Leaper, 2012).

These activities will bring motivation from a set of cognitive and emotional factors that are also suitable for educators, information designers and interaction designers when it comes to proposing informal learning experiences in interactive environments. In a typical human-centred design approach, designing experiences that trigger out affect and affinities in hands-on learning can be very challenging (Jordan, 2010, p. 8). Thus, around each building a variety of contents are displayed (Table 1) to give different inputs of information, activities, and also degrees of complexity and participation for the learner.

Table 1. General scheme of the proposal around a particular site (Peñíscola Castle); phases of approaching the contents proposed, and the models that can be obtained. Own elaboration.

The design proposal tries to explore the *Sense-of-Coherence* (SOC) theory and its concepts of comprehensibility, manageability, and meaningfulness claimed by the sociologist Aaron Antonovsly:

> "a global orientation that expresses the extent to which one has a pervasive, enduring though dynamic feeling of confidence that (1) the stimuli, deriving from one's internal and external environments in the course of living are structured, predictable and explicable; (2) the resources are available to one to meet the demands posed by these stimuli; and (3) these demands are challenges, worthy of investment and engagement" (Antonovsky, 1987, p. 19).

Since the point is to show relevant architectures, we raised three types of approaches, which are essential for a global comprehension: the contextual presentation as part of a particular landscape; the organization as a space to discover by moving around rooms, levels, etc.; and the volumes as in a building site. A repertory of representations designed and given as contents inserted at the platform, are the models to learn about the place experiencing while producing them. In all the cases, for the sake of simplicity, the different elements are presented using pictograms representing the sort of results to be achieved (Figure 2).

A specific work system has been designed for each building focused on implementing hands-on based teaching concepts and particular experiences. Looking for simplicity, all them are presented using pictograms connected with the result to achieve and its relationships with the human experiences as explained by the Gestalt Theory.

2.1 Objectives

The aim of this learning platform is to encourage the general public to enhance their knowledge for architectural items, designing and personalizing products and things, building models and resources, suited for them.

The design and development of this interface should reasonably accommodate a broad range of diverse users, favouring levels of appropriate training, including individuals with learning difficulties. Following this idea, a preliminary scheme with four layers/areas is proposed (Table 2), where each tool is independent from the rest, allowing the use of its deliverables and actions separately. Different action types within the inputs given and the object manipulation bouts proposed, are passive (video, audio), functional, sensorimotor, and social bids with objects. In this platform, only the video is completely visual and shows a short itinerary composed by five watercolours and drawings painted by hand, creating an effective result in a quite vivid style. As argued by Lunger and Scheiber (2010), film is a relatively flexible means of applying information to a substrate offering a variety of qualities to suit different requirements and purposes. In this case, in a simple way, this itinerary allows to entry this place that in reality, is not accessible.

From the design perspective, this education platform provides a sort of "cultural goods", that trigger experiences for the learner in a creative performance mode. In that way, the user is able to produce or re-produce elements that look like museums shops products, which usually generate desire among end consumers. This sort of performance is highly appreciated by certain publics or users such as designers, artists, architects, interior and fashion designers and engineers.

Table 2. Relations Inputs-Outputs and Phases of the learning platform proposed. Own elaboration.

Inputs	Learning Process	Activity	Outcomes
Audio/Texts Tables of contents/Video	Selection Pictograms and Wayfinding through the platform. Listening and reading	Attention and focus	Listening, storytelling. Pdfs and technical indications
Draws	Understanding scale and representations	Printing and hand-cutting	Flat simple elements
Blue prints	Building and producing paper models	Folding and making	Pop-up displays and fan formats
Engraved surfaces and volumes	Building and producing tactile reliefs and models	3D printing and building	Tactile floor plans, cut-out pieces, 3D volumes

Du Gay et al. have a broad understanding of the study of a cultural issue, text or artefact, and suggest that is significantly relevant taking together a sort of circuit around its representation, identity, production, consumption and regulation (du Gay, et al., 2013). Following this idea, most of the images and activities provided at this platform, invite the user to do things because they know the actions previously, and also understand the expected results. We are taking advantage or their informal social knowledge as explained:

> "Our heads are full of knowledge, ideas and images about society, how it works and what it means. Belonging to a culture provides us with access to such shared frameworks or 'maps' of meaning which we use to place and understand things, to make sense of the world, to formulate ideas and to communicate or exchange ideas and meanings about it" (du Gay, et al., 2013, p. 2).

The results invite the user to experience with and to use and evolve these designs for their own creations. Practitioners can obtain kinetic experiences of the space when they flip, pull or fold the paper in different directions. These models challenge the user's capacity to understand the place and the way to produce the model at the same time, conveying a range of spatial concepts, such as in/out, up/down, and high/low (Puyuelo, et al., 2019).

2.2 Methods, materials and techniques

Specific tasks were studied to design hands-on elements that could show relevant aspects of the architecture presented. We follow the guidelines proposed by Pappas (2018) for developing experiential knowledge and learning resources with AR/VR technologies, to make learning more productive, innovative and fun. We took this idea forward into the analysis of particular representations of each building, designing models related with their unique features. Fourteen hands-on activities and a visual animation are proposed. Some of them, such as the maps and layouts, are particularly suitable to help the user to identify routes and

to know about a site or building, in terms of distribution, proportions and wayfinding. Others, guide hand-made paper models ready to be used, painted or sized. The small book of sections requires more concentration for constructing and analyzing the space.

The designed elements aim to work and produce some models:

- Printing in 2 or 3D
- Cutting (scissors, laser cutting tech)
- Folding
- Assembling and building parts
- Moving to see and understand

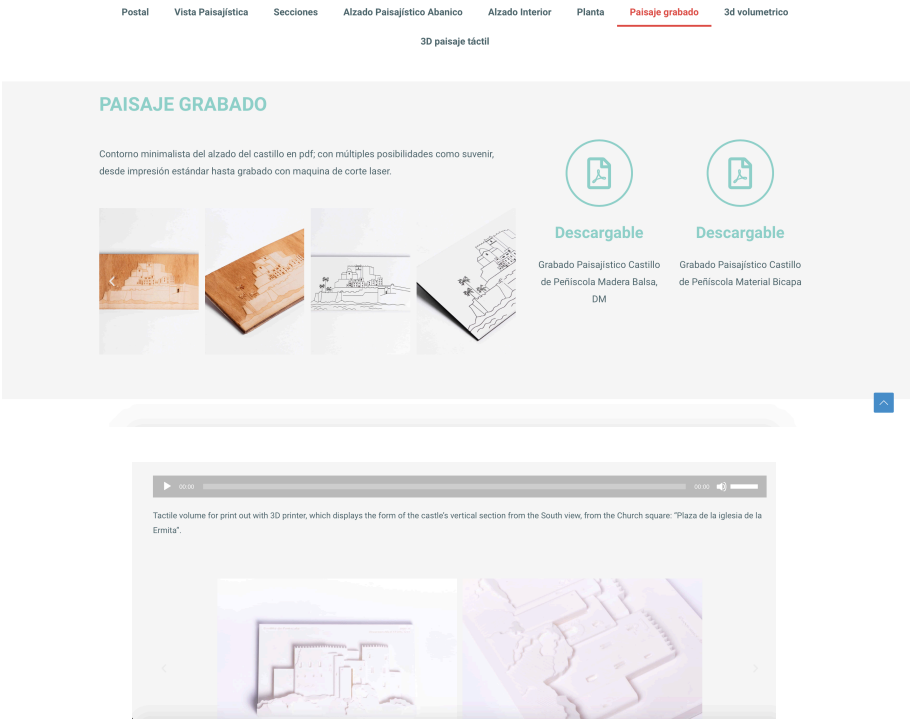


Figure 1. Screenshots. The activities are identified next to the pictures displayed in different materials, to give an open idea of the possibilities. The downloaded files might be produced in different techniques or materials (wood as relief or carved, 3Dprinted…). Own elaboration.

A previous pilot survey (n = 10) was conducted with a group of seven teachers and three professionals, to ensure the relevance and interest of the technologies proposed to allow new experiences about the topic. The data collected have the focus in some pedagogical

aspects and the utilization of the types of technologies and activities proposed (i.e. laser cutting and 3d printing).

After a short presentation of the learning platform, the technologies and the materials available at the workshop, the participants were asked to choose, between four of the activities, to produce one of them by themselves in one hour. Depending of their background, some of them were more attracted by the final result they can produce in that time while others were more interested in experiencing with the technologies. Broadly speaking, it was a satisfactory experience when, finally, the participants got their own product to bring home. After the exercise, participants were asked to delve into the cultural identity of this particular building, and were also asked to investigate their own perceptions about these designs, identifying in case its value as societal representations of that place.

3. Results and discussion

This preliminary discussion explores how cultural identity of a site/architecture, could be communicated and better understood using a hands-on approach to reveal its qualities and foster their image. This website prototype underlies through design, the educational value opening extensive opportunities for both traditional and distance education. It will be necessary to work step by step producing flexible developments that need time and research in their effectivity.

The interface enables the user to face a significant amount of easy-to-do activities and a wide range of interactions while allowing the tailoring to different learning needs. The impact of positive reaction on the user's engagement and what is called "multidimensional construct" (Reschly, 2008) is high.

The activities are described and included in an on-line system, where experimental models are made available on the *WorldWideWeb*. So, it can be used in an open way, reaching different publics and purposes, where obtaining material and visual representations of the architectures presented, might be useful. Users can choose their speed of action creating products (maps, layouts diagrams to identify routes and to know about a site or building, bookmarks, presents…) about the place, learning by doing.

According to the references selected during the research, design stakeholders should consider a range of interconnected, influential factors when facing informal learning experiences in different environments. As explained before, users can decide which of the proposals could fit better to their work, learning objective or simply what they feel like to do. From this perspective, this learning module is a means to create a flow situation and to experience the concept of "proprioception" (Mine, et alt., 1997), which has been recorded in different immersion and learning experiences (Puyuelo, et al., 2019). As explained before, manipulating an emotion effects on the participant motivation, accessibility and learning.

The possibility of self-producing our learning contents adds a value in the emotional scope for the stimulation of curiosity, focusing attention on the object.

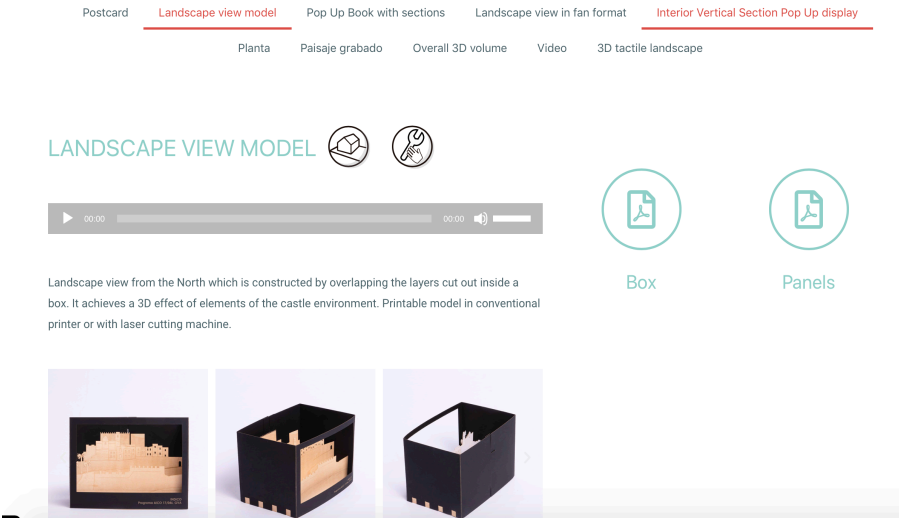

Figure 2. Screenshot. In this case the model is obtained from combining at different level of depth, three skylines of the main view of this site corresponding to the wall, the village around it and the castle on the top of the mountain. Own elaboration.

This website prototype is in phase of verification of accessibility requirements, errors found, and warnings. Once the prototype will be completed, it will be possible to verify its success online using evaluation tools that are web applications that allow to obtain an assessment report of different items. Experimental methods will also be used to address its usability with the different groups of potential users and also in formal and informal learning contexts.

The contribution of this project is stated since all its components give priority to the open design: from the interface, the elements that the user might produce, and the creativity of producing these challenging resources for different users and uses. The findings demonstrate important perspectives of cultural design and how to better understand places, motivation, and autonomy.

This ongoing platform gives an approach not solely to the issue of architecture design education, but of how to learn and teach experiencing design in a world of cultural silos, change, and diversity. The scalability of this prototype will be developed firstly, with the

stakeholders in the scope of the Comunitat Valenciana (Spain) to offer a panorama of buildings and singular sites.

Abstract | In UX Design, research about user provides design hints orienting the creation and development of innovative services and systems. The outcomes of these studies are postprocessed and transformed in maps and diagrams, such as the Mental Model and the User Journey maps, and in the description of paradigmatic users to act as reference in the phases of the project process. This work develops a discussion on the potential effects of cultural bias and stereotypes on the reliability and accuracy of the design-oriented user studies. The authors, being involved in UX Design research and practice, provide here a strategy to prevent bias effects especially in tests with users.

KEYWORDS | UX DESIGN, USER STUDIES, STEREOTYPES IN DESIGN, ENVISIONING EXPERIENCE

1. Introduction

The design of innovative services and systems is based on user studies providing insights on needs, requirements and values of the target users, and orienting the development of meaningful and usable solutions. In the years, user centered methods evolved giving rise to UX Design approaches, that are now vastly employed in every field of design (Hassenzahl, 2010; Garrett, 2011).

User studies provide a great amount of information and data that, in order to be suitably employed in the design process, need to be synthesized and transformed into convenient forms of envisioning and representation. UX Design tools such as the Customer Journey Maps (Følstad, 2016), the Mental Model Diagrams (Pillan et al., 2018), and the popular Personas are vastly employed to transform the outcomes of research on users into design hints and opportunities (Kalbach, 2016). Research on users includes primary research, i.e. investigation performed by observation activities, interviews and ethnography conducted by the researchers on field, and secondary research (also called desk research), (Buxton, 2007; Stickdorn et al., 2018; Tullis & Albert, 2013), based on data extracted from literature, reports and surveys previously conducted for other purposes. Primary research also includes experiments with users based on instrumental monitoring of biodata by eye-tracking, EEG, ECG, and others, aimed to collect evidences about the engagement of users in their interactions with applications, cyber-physical environments, digital services (Reali et al., 2017). These experiments provide insights about the cognitive efforts, the perception processes, the pleasure of use and the emotional involvement experienced by the people while they interact with the solutions under analysis; the outcomes of the tests support the analysis of usability, accessibility, engagement and the investigation of the variability of human responses and reactions (Plassmann et al., 2015).

In UX Design, the outcomes of the research on users need to be processed and condensed so to be effectively employed in the design and validation activities. Information about users are usually summarized in maps and diagrams representing the technological and organization system; the value proposition related to the user jobs, needs and expectations (Newbery & Farnham, 2013); and the timeline of the service delivery from the point of view of the users in their interaction with the system touch-points, also including pain points and design opportunities. Chronological maps - such as the User Journey Maps – report the logical sequence of activities performed by a person who is considered as emblematic of one typology of users to which the product or service is addressed, and provide paradigmatic storytelling that becomes the reference for the value proposition (Følstad & Kvale, 2018; Kalbach, 2016).

In fig.1, we represent the expected outcomes of the research on users within a UX Design approach. Methodologies for research on users, data collection and post-processing, have been amply investigated in the last decades, but, in the knowledge of the authors of this paper, little attention is paid on the importance of recognizing and managing potential bias

that could influence the researchers investigating on users and, in most cases, the studies concerned specific issues (Marsden & Haag, 2016; Cabrero, et al., 2016; Cabrero 2014).

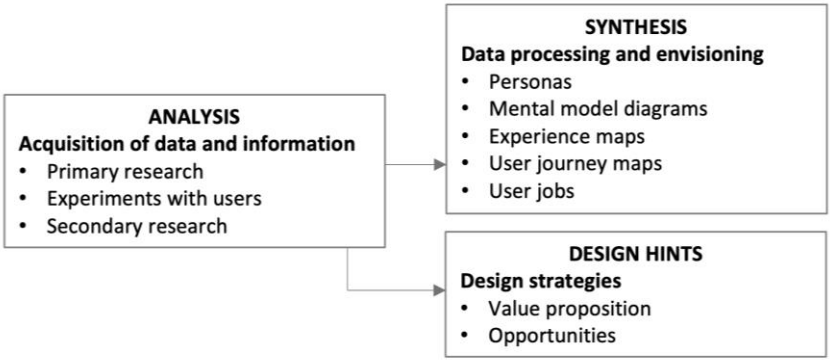

Figure 1. The outcomes of the research on users in UX Design.

The authors of this work are scholars and professor on UX Design methodologies, and members of a research laboratory at PHEEL - (PHysiology, Emotion, Experience Lab, Politecnico di Milano); the focus of the researches on users at the laboratory is the evidence-based investigation of user experience with respect to their interaction with services, interactive solutions and digital applications; the investigations employ different research methods, such as desk research, ethnography on field, interviews and experiments with users also involving instrumental facilities for the monitoring of physiological parameters, i.e. eye-tracking and others. The authors collaborate with companies in UX Design researches for a variety of application fields, such as digital media and services. With this work, they intend to give a contribution to the development of suitable approaches for the extraction of design hints from the user studies. The focus here is on how to prevent the potential influence of the cultural stereotypes on the outcomes of the investigation on users. Regarding this, the authors discuss in the following some issues related to the impact of stereotypes in design and present the strategy they have elaborated in order to reduce bias effects in their UX Design activity. The paper aims at offering a contribution to the complex topic of social prejudices and stereotypes in design, and strategies to be adopted in the design practice.

2. Clustering and definition of types in design

In UX Design, researches are aimed at providing a holistic understanding and modelling of the experience of users regarding a product, a service or a brand, a company or an

institution; the research investigates cognitive, emotional, cultural dimensions of the personal experience since all these factors play a role in shaping attitudes and decision processes. Studies on users are notably important in Interaction Design and in Service Design; the aim is the analysis and understanding of the How and Why of human activities, as an essential requisite to design meaningful What of novel solutions (Benyon, 2014). In Service Design, the investigation of the experience also aims at reducing the misalignment between the proposition of value offered by the service provider and the perception of value as it is perceived by the final user. The basic assumption is that "Organizations are out of sync with what the people they serve actually experience" (Kalbach, 2016). The purpose of user research is to orient the design and development of new solutions toward the most useful and advantageous implementation from the point of view of the final users. User studies in UX Design need to be vast and inclusive in order to be effective; on the other hand, in order to effectively orient the design process, data and information need to be synthesized and transformed into clear and easy to grasp guidelines.

The design of services and digital/physical systems focuses on the dynamic description of activities in terms of typical journeys, jobs and paths (Benyon, 2014). Human beings are all different but with respect to some specific characteristics or tasks, from the industrial point of view it is convenient to classify the members of a target group in types or cluster of people that present some similarities. In the fashion industry, as an example, the production of clothes of different sizes represents a good compromise between the standardization of the products and the variety of the dimensions of the human bodies. The same happens in the design of services for all application purposes and the identification of suitable clusters of users is a way to cope with the complexity of the human diversity. As an instance, in health care services (Moody et al., 2018; Kokorelias et al., 2019) the investigation of the variety of human physiological and cultural characteristics is a key issue in the development of person-centered approaches to medical treatments and services. In marketing, the identification of recurring paths of behaviors and attitudes is carried on together with the quantification of segments of populations so to produce the market segmentation and the consequent strategies for value proposition and communication (Fonseca, 2011; Arora, et al., 2008).

The definition of types of users is a tricky task and it depends to the object of the design process. As an instance, in the development of a new operating system for smart phones, in order to effectively evaluate the relative impact of the new on the potential users, it could be convenient to consider groups of users that are familiar with different existing operating systems. In the test of a new driving control system, it should be important to make user tests involving drivers with different expertise and styles of driving.

In some cases, the clusters of users also share some similar social or anthropologic characteristics, such as age, gender, or the belonging to an ethnic group. In other cases, there is no tight correlation between the elements of social identity and the specific attitudes and behaviors that are the focus of the design. As an instance, in a previous work

(Pillan et al., 2019), the authors reported the research performed to develop a sustainable system for home automation; this study identified three main cluster to be taken into account in order to provide suitable personalization of the interfaces: i) users requiring a full automatic system; ii) users willing to have a total control and understanding of the system; iii) users willing to adopt a behavior apt to minimize the consumption, provided that the interface is very usable and efficient. The study also demonstrated that the correlation between the three group and the social characteristics of the users, especially in terms of age and gender, are not simply correlated. As an instance, group i) included both ageing people with scarce abilities in the use of digital interfaces together with young residents with interest for sustainability and cost reduction.

The identification of reliable types of users, effectively representing the variety of attitudes and needs of the users, is a delicate task that could be affected by simplified interpretation of the information provided by the research.

The most common way to synthesize knowledge on users is Personas. More than twenty years ago, in his book 'The inmates are running the asylum', Alan Cooper presented his Personas (Cooper, 1998) as an effective way to summarize the knowledge about the potential users of innovative solutions. Personas work "because a persona gives us an operational mental model of a particular kind of user." (Floyd, 2008) The success of Personas and of the more recent envisioning tools and maps corresponds to the need of designers to have an agile tool to use in the project process that take into account the needs, preferences, attitudes, and ways of thinking of the prospect users.

> "It is difficult to design for another person. One must develop an empathetic internalization of their understanding of the world, their experiences in it, etc. It is even harder to design for a collection of other people with all their subtle variations. Thus, designers revert to designing for themselves without really thinking about it, which is facilitated by humans' natural tendency to assume that other humans think exactly like they do, until there is evidence to the contrary. At best, designers may design for their personal stereotypical conceptualization of the "user". Personas help avoid this tendency because they make a group of users concrete in the form of a fictional, single user for whom the designers are designing; thus, they are a handy tool to facilitate user-centered design." (Floyd, 2008).

These characters are not real but should be realistic, so to allow a prediction/projection of behaviors and preferences; when they are not realistic, the design can fail the goal of providing a satisfactory solution due to functional or cultural inadequacy. Turner & Turner (Turner & Turner, 2010) discussed the limits of the approach that has become so widespread:

> "Despite placing the user at the center of the design process, UCD by necessity must involve at some stage a representation of the different aspects of users and

> what they want. And, a representation is, by definition, less rich and detailed than the thing itself.
>
> … Despite simplified representation of users is a necessity in the design process, designers should always be quite aware of the limits of these descriptions".

The two authors reconstruct the history of user studies in Interaction Design, and pointed out the complexity of user studies in design without involving prejudices and stereotypes; they discuss the intrinsic biasing of design research pointing out that "we call people users, which implies that we are primarily, and perhaps only, concerned with those aspects of their psychology and behavior which is directly relevant to the use of interactive technology."

As these authors point out, Personas, as all the other envisioning techniques based on the identification and description of types, can reflect stereotyped thinking.

A stereotype is a convincement or a 'fixed idea that people have about what someone or something is like' (Cambridge Dictionary). Stereotypes, therefore, can be based to knowledge that is not necessarily false, but that can be used in a misleading way and producing fake assumptions and projections. Typical socio-cultural stereotypes involve gender, age, culture, technical capabilities, economical availability. Having simplified cognitions is natural for human beings, also responding to the need of an efficient use of the limited capabilities of human mind and operation memory. The problems with stereotypes arise when limited knowledge is employed as absolute truth, and when phenomena and characteristics associated to some samples of a human group are extended to all the members (Bordalo, et al., 2015). Furthermore, bias in judgement and research arise when a limited knowledge about a group of individuals sharing some specific characteristics (as an instance, gender, age or belonging to an ethnic group) is considered as capable to predict trends, behaviors and attitudes, so producing prejudices, biased judgement and rejection. On the contrary, empathy with users feeds creativity (Van Boeijen & Hao, 2015).

3. Tricky activities in managing tests with users

The researches on the user experience that we perform at the XXX lab integrate a variety of methods, including traditional ethnography on field, focus groups and interviews, tests with instruments such as eye-tracking. Tests are aimed at an in-depth investigation of the user experience during their interaction with physical environments, digital services and applications or while performing complex activities such driving a car. Usually, we perform investigations on existing solutions or on prototypes of innovative ones, within collaborations with companies and other institutions. Our approach is based on the triangulation of information about behaviors with those obtained by the monitoring of biological parameters, and the self-reported experiences collected through interviews.

In figure 2 we represent the main steps of a typical experimental process at XXX; it includes four phases. In phase 1, the team in charge on the experiment collaborates with the external

partner to define the goals of the investigation and the methods to employ in the tests with users, depending on the expected outcomes and on the characteristics of the artefacts under analysis.

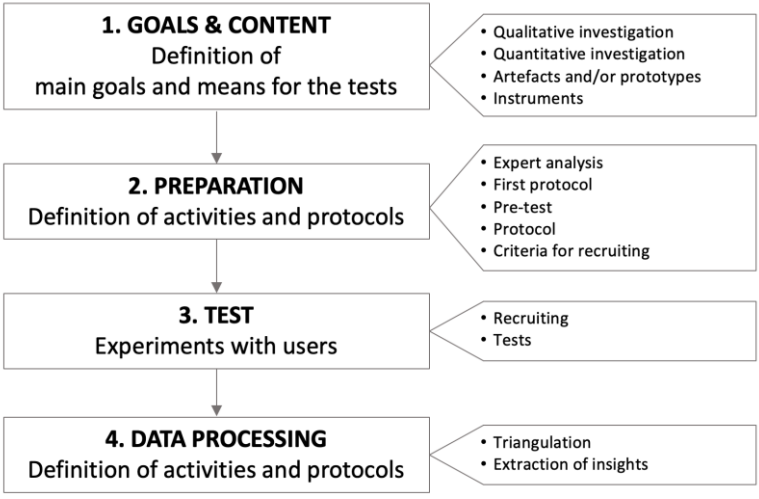

Figure 2. The main phases of the process adopted for tests with users.

Phase 2 is dedicated to the detailed organization and assessment of the experiments with users; to the definition of the characteristics of people to be involved in the test and of the consequent criteria for recruitment; the creation of the experimental protocol, including the context and the tasks. Such activity is based on the access to the artefact to be tested and the performance of a deep study of its structure, interaction paths, and possible action options, that is a simulation of the concrete context of use. The artefact is then tested by researchers as experts of technologies and provides a sort of baseline on modalities and time of interaction. Defining possible criticisms and bottlenecks in the interaction support the research path in the estimation of an effective set-up, allowing to direct the definition of the sample and the recruiting features. The aim is to identify small but very representative selected groups of users, opening the way to a deeper understanding of the delivered experiences elicited by the interaction with the artefact under test. Furthermore, we perform a pre-test, involving the participation of 1 or 2 users in line with the target audience. This process supports the development of the whole project, and the identification of possible further bias and stereotypes that could have missed the previous study phases.

While phase 3 is dedicated to the recruiting and experiments with users, phase 4 is for the processing of data and the extraction of design insights and opportunities.

With respect to the possible influence of cultural stereotypes on the outcomes of these experiments, we consider all the four phases as crucial.

In phase 1, the team collaborates with representative of the external partners (UX designers, interaction designers or marketing experts) so to define the reference population and share previous knowledge about the target users with its relative segments or clusters; this produces a common ground of assumptions that will orient all the following phases. As a case study, in our collaboration with a television broadcast company, the research aimed at developing a new platform for web-tv broadcast. The initial inputs by the company indicated the minor availability and technological skills for elder generations and assumed a correlation between type of contents, age, gender and attitudes toward digital solutions. In the collaboration with a company that produces sports cars requiring advanced driving skills, the involvement of female drivers in the tests was not initially taken into consideration. In the studies commissioned for innovative services for banking and payment, the attention of the company collaborating with us was focused on GenZ and on younger users, since they are considered the trend-setters for future behaviors and attitudes. The preliminary information provided by companies that have a long term relationship with users is certainly valuable and provides a strategic start for research, on the other hand, the role of UX designers is to offer a refreshed and hopefully more realistic representation of the target users, and research activities should also be capable to provide new perspectives and interpretation of information.

With respect to phase 1, we consider the importance of detecting convincement and assumptions that could be related to stereotyped representation of the reality instead then on sound knowledge. As stated by Floyd, we believe that

> “Our social intuitions consist of many parts; some are hard-wired, some are developed from the experiences we have in our life, some are developed from our conversations with others about how other people think and act, and most are some combination of all three.”

In order to manage the risks related to the influence of potential stereotypes, we consider the importance of recognizing all the explicit and implicit assumptions and to make them emerge in the collaboration so to challenge them either to verify their reliability or to rebut it since

> “It is important to be cognizant of the stereotypes which are selected, and the implications of selecting them, in order to avoid ethnic, gender, or status profiling. Properly used, however, they can still serve as a powerful mental "subroutine" encapsulating a significant amount of shared intuitive understanding of the world between designers.” (Floyd, 2008).

About phases 2 and 3, we remark the delicacy of the activities dedicated to recruiting. The search and selection of the people to involve in the tests is based on a description of the target users and on his preliminary segmentation into clusters created to represent the

variety of the people included in the target, so to cover with the tests all the types that appear as relevant for the research goals. The recruiting is therefore performed by preliminary interviews aimed at verifying the affinity of the interviewed subjects with the types that we intend to focus on during the analysis. During the tests the different types of users can be involved in different experimental protocols, depending on the goals and topic of the investigation. As an instance, in the research focused on different technological solutions for tv-broadcasting, the company asked us to focus on younger users while analyzing the interactive experience with more recent solutions as Google Chromecast. Our experiments revealed that the acceptability and desirability of a specific technology is not trivially related to social characteristics such as age. Test with users are expensive and time consuming; in most cases, these analysis aims at providing qualitative insights, while quantitative data are collected with more traditional methods on a statistical base.

Generally speaking, we consider recruiting as a very tricky activity, since a wrong selection of the people involved in the tests can evidently influence the outcomes of the study, and it could produce a mirroring or bubble effect, reflecting cultural stereotypes instead than creating objective knowledge. A further check is performed during the test sessions, adopting non-participative observation techniques. Such activity allows researchers to perform an in-time evaluation of the correct labelling of each user, and their belonging to the specific group she/he was assigned to. In fact, even when the recruiting phase is performed with strong care and attention, people can lie or mislead a self-evaluation of their own characteristics or level of familiarity and proficiency. For this reason, the further validation performed during the tests supports a correct interpretation of the data gathered through the experiments, and a final check of possible bias and stereotypes to be considered in the results interpretation.

3. Strategies to manage bias in research with users

In UX Design, the integration of information provided by different research methods is constantly evolving, also including approaches based on data mining for design. On the other hand, we point out the importance of developing techniques apt to extract design hints out of data, also capable to prevent misjudgment and interpretations conditioned by cultural stereotypes. As a contribution to this purpose, we propose here the strategy we take now as a reference in our UX Design activity and teaching.

In our approach, we consider that the interpretation of data for design purposes should be based on a suitable framing of the complexity of human mental processes; from brain sciences, we extract models and theories about perception, cognitive and emotional processes that provide a framework for the interpretation of the data and the limits of the methods of investigation. Furthermore, we point out the importance of recognizing those results of the tests that are strictly related to the evidences based on the experiments, making a difference with abductions and intuitive interpretation of the phenomena.

We point out the importance of developing awareness about personal prejudices and stereotypes in the team engaged, in the preparation and deployment of the test with users and in the data-analysis. To this purpose, we include in the test process some discussions on possible bias that could influence the test preparation and the data-analysis so to recognize implicit stereotypes and bring them explicitly in the conversation. In an analog way, in the collaboration with a company, we list and discuss the validity of the preliminary assumptions on users and on the context under analysis; the validation of this assumption can become one of the issues to be investigated in the analysis.

In the definition of the test protocols, we take into account possible interferences produced by the environment (due to the artificial characteristics of the test context) with the suitable development of the experiments.

We constantly discuss the limits of the knowledge about users that can be extracted from the experiments. We refrain from abductive extraction of information, from generalization of results, and from deduction that are based on a limited sample of users; this is done by collecting insights and crosschecking them before generating design hints.

In the postprocess of data, we base the extraction of clusters of users on the patterns of their interaction with the product or service under test regardless to their demographics. We assume that the correlations between the results of the experiments and the main characteristics of the users recruited in the test, such as demographic attributes, education, social status, gender and others, can be accidental or produced by bias effects in the recruitment.

We also assume that motives for personal behaviors, preference or attitudes are never trivial and should always be derived ex post the research with users.

In the case experiments show consistent correlations between some socio-demographic characteristics of users and the patterns of their experience, we suggest further inquire for a deeper understanding.

4. Conclusions

While UX Design is becoming pervasive, we point out the importance of developing a critical discussion on the possible influence of cultural stereotypes on the researches that are supposed to provide the design hints and indicate the space of opportunity. Clustering users into types is considered now as a common activity, we argue that designers adopting a UX Design approach should be capable to manage the creation of the reference types with sense of critics and awareness of the potential consequences of dealing with bias effects.

The design of products/services based on clustering of users produces and promotes new social stereotypes capable to broadcast and influence cultures. In order to obtain knowledge suitable to orient the development of innovative services and systems, user studies should

be performed having well in mind the limits of the existing tools with respect to their capability of representing the human needs and convenience.

In our opinion, user studies should always consider humans as evolving entities, and we consider this as ethic assumption of design as a discipline. The envisioning tools we currently use to describe the virtual scenarios we are designing should be interpreted as a means of social and political conversation on their desirability and not just as mere guidelines to ensure the success of memes.

Framing diversity: designing hearing aids from a deaf culture perspective

Patrizia Marti*[a]

[a]Department of Social, Political and Cognitive Sciences, University of Siena, Siena, Italy
*marti@unisi.it

Abstract | Deaf people are proud of their culture and not being able to hear is secondary to the positive experiences created by their social lives and 250-year-old history and culture. This reality is often misled by the adoption of medical criteria which regard Deafness as a medical condition measured against the "norm" of hearing people. This paper presents a research-through-design project which developed smart jewels to counteract the stigma of disability addressing functional and cultural needs of Deaf people. Workshops were organised involving Deaf people, makers/engineers, designers and Italian sign language interpreters who were engaged in a *Thinking-through-making* process where the experience of Deaf participants was exploited to drive embodied explorations of future hearing aids. The design case calls for a participatory design model in which designers and users can co-create solutions addressing not only the (dis)abilities of the body but and more importantly, the human experience.

KEYWORDS | DIVERSITY, DEAFNESS, HEARING AIDS, SMART JEWELS, PARTICIPATORY DESIGN

1. Introduction

According to the World Health Organization (WHO) (WHO, 2018), 466 million people worldwide, over 5% of the world's population, have moderate to profound hearing loss (HL) in both ears (Tucci, et al., 2010). Disabling hearing impairment in adults refers to hearing loss greater than 40dB. It is estimated that by 2050, over 900 million people will have disabling hearing loss.

The numbers are impressive, and reflect a very complex and nuanced reality where deafness and hearing impairment are often misunderstood.

First of all, it is necessary to distinguish between the terms physically deaf and culturally Deaf. A small 'd' is used when referring to people from a medical perspective, while a capital 'D' is used when referring to people culturally defined as Deaf (Woodward, 1972).

Deaf people (with a capital "D") have little or no hearing ability. They use the Sign Language of the country where they live as their primary language. Even if some of them may hear environmental sounds and understand some speech, they identify themselves as a linguistic minority.

Deaf people feel that they belong to the "Deaf Culture", an ethnic minority with a defined language composed of verbal (signs) and non-verbal elements (facial expressions and postures), communication and social protocols, forms of artistic expression, entertainment and recreational activities (e.g., sports, travel, and Deaf clubs). Being part of a cultural community means that they do not feel impaired or disabled.

Oral and late deafened deaf (with a lower case "d") also have little or no hearing, but, unlike Deaf people, they typically do not use Sign Language as their primary language. Oral and late deafened people do not identify with the "Deaf Culture".

Despite the benefits that people with HL can obtain from use of hearing aids and assistive technology, many of them refuse to use them (Vernon & Pratt, 1977). The main reasons for not owning/using hearing aids are the denial of the problem, discomfort, a sense of foreignness, and aesthetics ("it is a foreign object deep in the ear", "it pinches", "it hurts", "it is too big"), shame, social rejection and stigmatisation. This suggests that the hearing aids address HL in a way that is technically efficient but does not take the user's experience into due consideration.

Considering deafness from a sociocultural perspective, rather than a medical problem or insufficiency to be compensated, implies addressing a complex tangle of needs of D/deaf people that go beyond hearing compensation. We argue that disability should not be regarded as a problem to solve or a lack to compensate but as a design opportunity (Pullin, 2009).

In this paper, we introduce the design case, describing the methodological approach that resulted in development of an interactive jewellery system composed of interactive modules

which continuously sense the acoustic qualities of the environment and notify the wearer of the occurrence of specific sounds through micro-movements, vibrations and light patterns (Marti & Recupero, 2019). The paper concludes with a set of recommendations that can support designers of future assistive devices in engaging vulnerable stakeholders, in particular Deaf people, as equal partners in the design process.

2. The Design Case

Quietude (www.quietude.it) is an EU project which develops assistive devices for people with hearing impairment and HL. It was funded within the H2020 WEAR Sustain (https://wearsustain.eu/) programme.

The project adopts a participatory design approach (Bjerknes, et al., 1987; Smith & Iversen, 2018) to learn about inspirational and actionable insights into the socio-cultural practices and expectations of D/deaf people.

Participatory approaches to design (Sanders, et al., 2008) engage stakeholders in co-creating artefacts destined for them, ensuring that their viewpoint and interpretations are considered in research throughout the design process. These methods are pursued throughout the entire research project with the goal of not just empirically understanding the problem at stake, but also envisioning, shaping, and transcending it in ways users find satisfactory (Spinuzzi, 2005).

2.1 Workshop series

The project included two workshops which were adapted to respond to different forms of expression (Sanders & Stappers, 2008). Activity based on visual expressions, material exploration and hands-on techniques intertwined with verbal discussions mediated by Italian sign language interpreters.

Workshop 1

The initial inspirational workshop took place over six days in the Fab Lab of the University of Siena (Italy), with the involvement of four women who had been Deaf since birth, two sign language interpreters, an ethicist and a mixed group of designers, technology experts and makers (Marti, et al., 2018). The group of Deaf participants was composed of an architect (40 years old), a psychotherapist (41 years old), a special education teacher (30 years old), and a university student (21 years old). A free and informed consent form was signed by all participants.

The aim of the workshop was to inspire each other, encourage empathic understanding of Deafness and HL, and start developing concepts of hearing aids to address some concerns of the current devices.

On Day 1, participants were prompted to reflect on feelings of Deafness which were mapped on body maps using simple post-it notes (Figure 1).

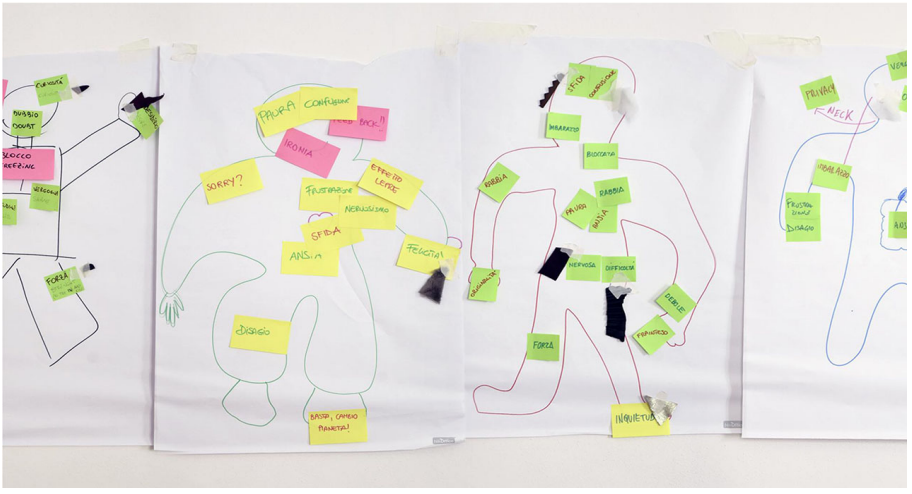

Figure 1. Body maps.

For example, embarrassment and shame were located around the ears and referred to hearing devices. Originality was located on the hands to underline the unique features of sign language.

Day 2 focused on selecting forms and materials (Figure 2) and experimenting with simple vibrations motors (Figure 3). Deaf and hard of hearing people are familiar with the use of vibration. Though not all participants perceived the vibration in the same way, the neck, the bones around the ears and the wrist seemed to be the parts of the body most sensitive to vibration.

Figure 2. Exploration of materials.

Figure 3. Experimenting with vibration motors.

Day 3 focused on developing concepts; Days 4–5-6 were devoted to materialising ideas and developing low-fidelity prototypes (Figure 4):

- A bobby pin with parts that move according to the ambient sound detected by directional microphones embedded in a brooch. This object signals deafness to others and notifies the wearer of crucial sound events.
- An armband that translates different sonic qualities in the environment, including range, volume and direction, into vibrations.
- A 3D shape-change necklace that expressively enacts live or recorded sounds, translating the sounds into micro-movements.

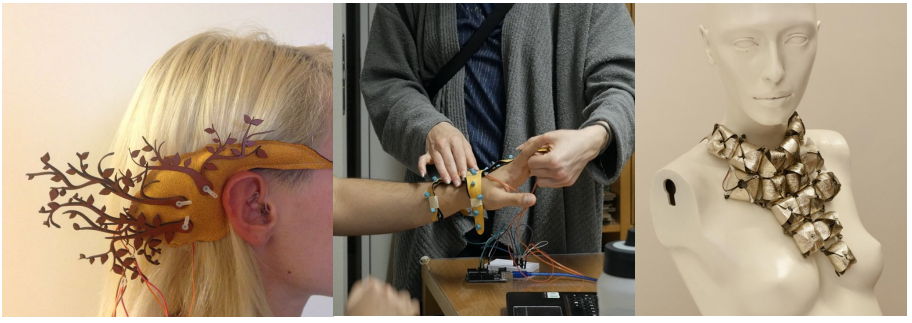

Figure 4. Bobby pin, armband and 3D shape-change necklace.

In this activity of thinking-through-making (Ingold, 2013) the prototypes served as a vehicle for generating research questions and collecting complex needs/requirements in a research through design process. Discussion topics included:

1. Awareness about personal sounds (e.g., doorbell, name, etc..) and public notifications, such as alarms, announcements in public spaces, and more.
2. Safety to prevents sounds requiring a quick response from going unnoticed.
3. Personalisation according to individual preferences and sensitivity.
4. Cross-modal experience of sound through sight, touch, on-body vibrations.
5. Aesthetics: hearing aids should be beautiful, smart and comfortable to wear.

Workshop 2

The second workshop was hosted by Mason Perkins Deafness Funds Onlus, a non-profit organisation which provides services and training for the deaf community in Siena (Italy). The organisation supported the project, facilitating contact with the local deaf community and providing interpreters. In this second workshop, we tried to balance the number of Deaf

and hearing participants and also to propose a place that was familiar to the Deaf experts, to give them more confidence in their ability to contribute. The workshop lasted 1 day, in consideration of the difficulties that the Deaf participants had encountered participating in the previous workshop for several days.

Five participants who had been deaf since birth and used the Italian Sign Language participated in the session: 4 women from 20 to 50 years of age and one 17-year-old boy. A free and informed consent form was signed by all of them. The group of hearing experts was composed of a psychologist, a designer and two technology experts. Two design researchers facilitated the workshop, supported by a sign language interpreter.

The aim of the workshop was to reflect on the needs and desires that emerged during the first workshop, engage the participants in a thinking-through-making activity and evaluate the prototypes developed during the first workshop.

Thinking-through-Making

After a card sorting activity aimed at identifying desires and prioritising the needs emerged during the first workshop, participants were involved in a making activity based on a desire selected from the previous phase. Various materials including textiles, paper, cardboard, tape, pens, glue and hooks were put on the table. All participants were encouraged to fabricate their own personal accessory, give it a name and present it to the others. The idea was to transform what had been discussed verbally in the previous phase into design probes, moving from abstract to concrete, to invite all participants to be kinaesthetically engaged and to reflect together (Luck, 2018).

One Deaf participant made an accessory named “Alive”, a shape-changing jewel that moves like a living object in response to sounds (Figure 5 left).

Figure 5. The probe "Alive" (left) and "Stella" (right)

Another Deaf participant developed "Stella", a bright necklace that looks like a shining star to underline how important it is for hearing aids to be able to express a personal sense of style (Figure 5 right).

The young boy developed an armband, explaining that he would like to wear an accessory that can notify him of sounds that would otherwise go unnoticed (Figure 6 left). A Deaf girl developed a belt to be placed around the shoulders or chest. The belt acts as an undergarment that allows the wearer to feel sounds through vibrations (Figure 6 right).

Other probes were developed by the hearing participants to underline equality in the participatory process.

Figure 6. Armband and belt probes

Evaluation of prototypes

The third part of the workshop was devoted to presenting the prototypes developed during and after the first workshop, trying them out and collecting feedback. The evaluation regarded both the jewellery and an early prototype of the App. The bobby pin, armband and necklace were put on the table along with other prototypes developed at the Fab Lab after the first workshop, including an interactive ring which translates sounds into lights in continuous listening mode (Figure 7).

Figure 7. The interactive ring prototype lighting up with sound

Participants were free to try out the jewels and comment on them. One of them who had participated in the first workshop was amazed to see that most of the comments raised previously had been integrated into the prototypes. These included the aesthetics of the jewels, the possibility of exploring the sonic qualities of environmental sounds and therefore addressing Deaf people's curiosity about sound, and the possibility of choosing the accessory that best suits their preferences.

The ring was criticised because it interferes with the use of sign language, in which the hands must be used only to sign. The light could confuse the interlocutor.

The hair clip was discarded because the vibration produced by the embedded motor could interfere with a hearing aid located behind the ear.

The necklace and the armband were considered the most interesting accessories. Deaf participants stressed the importance of being aware of the environment (quiet or noisy) and of recognising specific sounds of interest.

The last part of the workshop was devoted to the evaluation of an early prototype of the App. Before the workshop, the App had been demonstrated to one of the participants who usually plays a leading role in the group. She drove the evaluation session by explaining the functionality and performing a live demonstration of the service. Her mediation was essential. She was able to create an atmosphere of trust and empathy which greatly

facilitated engagement of the other participants. No major defects were identified in the App. The participants appreciated the ease of use, the possibility of customising the intensity and type of feedback on the accessory, and the idea of creating a personal library of sounds to be recognised by the jewels, alerting the wearer.

In summary, the two workshops marked important milestones in the design process in terms of exploration of the complex needs of Deaf people, elicitation of requirements and preliminary evaluation of early prototypes.

3. The jewellery system

After the second workshop, a suite of jewels was designed as a modular system to allow different types of formal configuration and personalisation of use. The modules embed sensors and actuators allowing self-actuation and kinetic modifications in the presence of particular sounds.

The suite of jewels includes three necklaces which notify the wearer of incoming sounds with different behaviours: dynamic light (Figure 8), vibration (Figure 9) and a change in shape (micro-movement of the modules) (Figure 10). A video of the system's behaviour can be viewed at: http://www.quietude.it/wp-content/uploads/2018/03/Quietude_DemoHD.mp4?_=1.

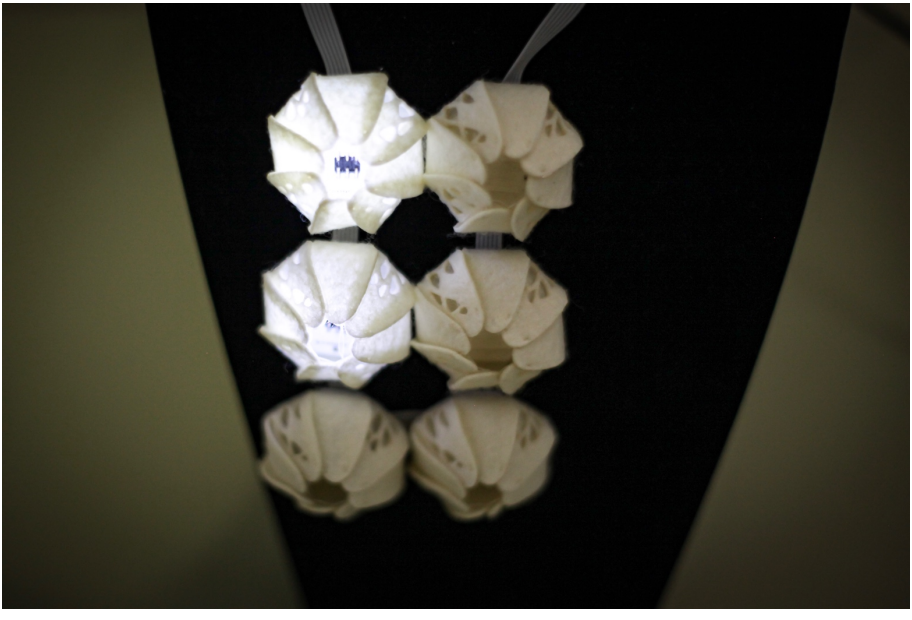

Figure 8. Necklace with dynamic light

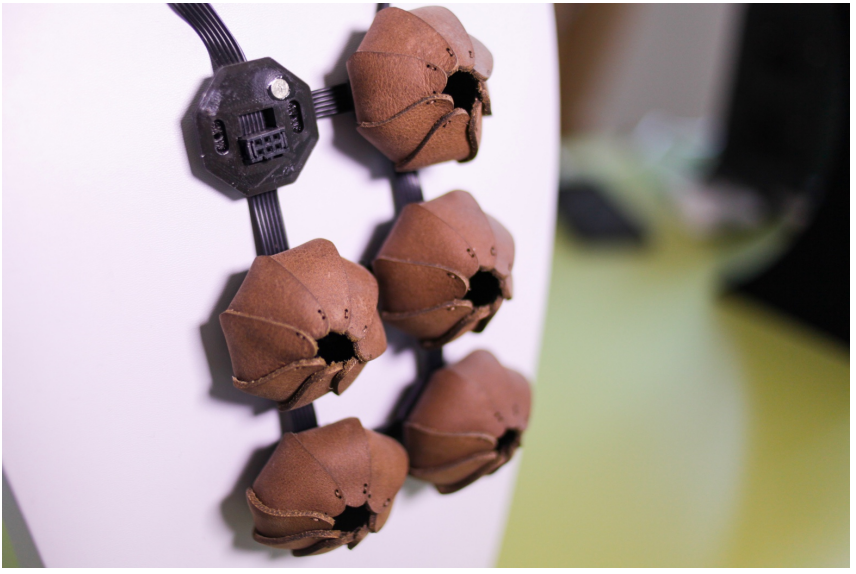

Figure 9. Necklace with vibration

Figure 10. Shape changing necklace

The formal design of the modules was inspired by a powerful metaphor that emerged during the first workshop. One of the participants used the expression “feeling under water” to describe deafness as hushing of the perception of sound.

Drawing on this metaphor, the suite of jewels was inspired by the undersea world. The modules resemble sea urchin shells, and the colour palette reflects images of sand, deep oceans and coral. The jewels were conceived as modular structures which can be assembled to create the wearer’s own personal jewels. Modularity addresses the need that emerged during the workshop for placing and playing out the jewellery on the parts of the body which are most sensitive to vibrations and micro-movements.

The jewels are handcrafted: modules are sewn by hand, connectors are fabricated by recycling flat connectors from obsolete computers, and, most importantly, no glues or adhesives were used. In this innovative design, modules are connected through 3D-printed interlocked supports. The system’s behaviour can be defined and fine-tuned through a smart phone app that works with the accessories.

Modules are made using laser-cut eco-leather, felt or fabric petals which are folded and sewn to create a shell-like shape (Figure 11).

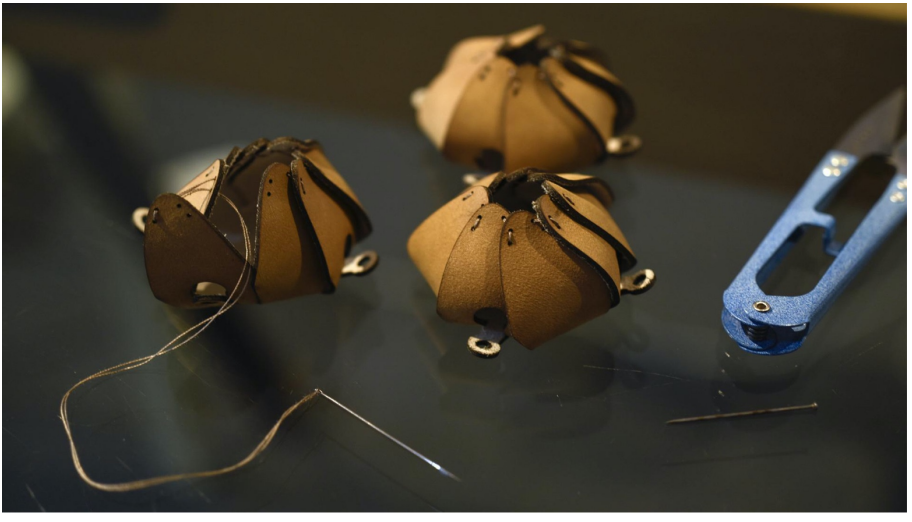

Figure 11. Sewed eco-leather modules

The electronic components are placed in an octagonal PCB that keeps the modules fixed and stable in a horizontal position (Figure 12). Some modules contain electronic boards and sensors (e.g. the Bluetooth communication board and microphone), some contain actuators (e.g. LEDs, servo-motors, vibration motors), and others are empty, simply used as part of the

aesthetic value of the system. This modular system permits creation of a variety of fashionable jewels, including necklaces, armbands, brooches, etc.

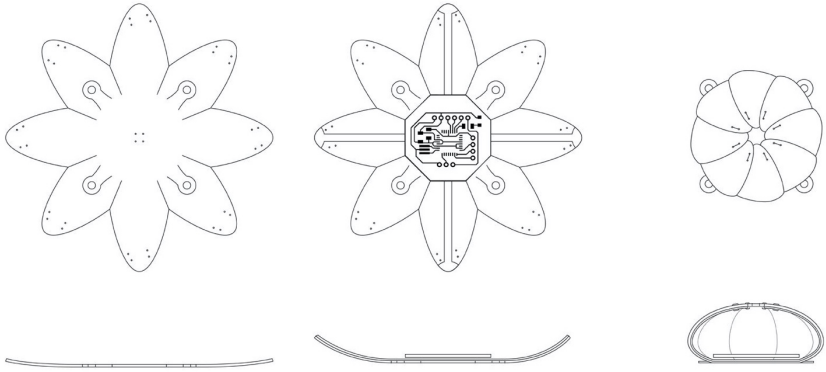

Figure 12. Laser cut module, electronic components and final seam

The jewels can sense sounds in two different ways: through real-time continuous monitoring, to notify the wearer of the frequencies and amplitudes of sounds in the surrounding area; or upon occurrence of certain specific sounds, defined by the wearer using the mobile app.

The necklaces with light and vibration behave differently. Instead of using simple on, off, and blinking behaviours, we have adopted a richer vocabulary. Drawing on Harrison's study (2012) of what kinds of information are typically communicated by point lights, we designed light and vibration patterns that follow the spectrogram of the incoming sounds (Figure 13).

The 3D shape-changing necklace performs micro-movements in response to external sounds. The actuators embedded in the three necklaces are directly mapped to the intensity and amplitude of incoming sounds bending them towards the lower centre of the module.

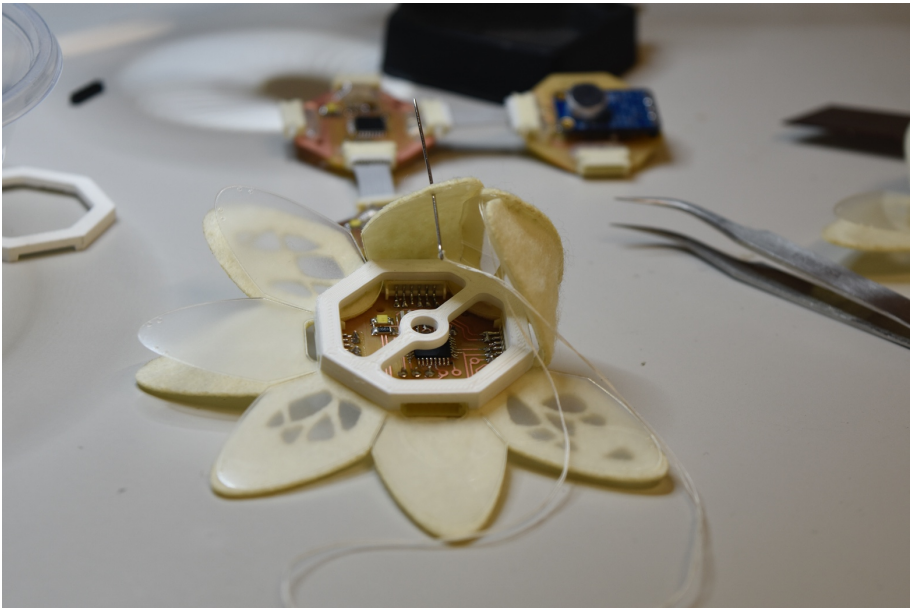

Figure 13. Embedded electronics

The combination of the micro-movements of the petals of different modules results in a coordinate and expressive movement of the overall structure (Figure 14).

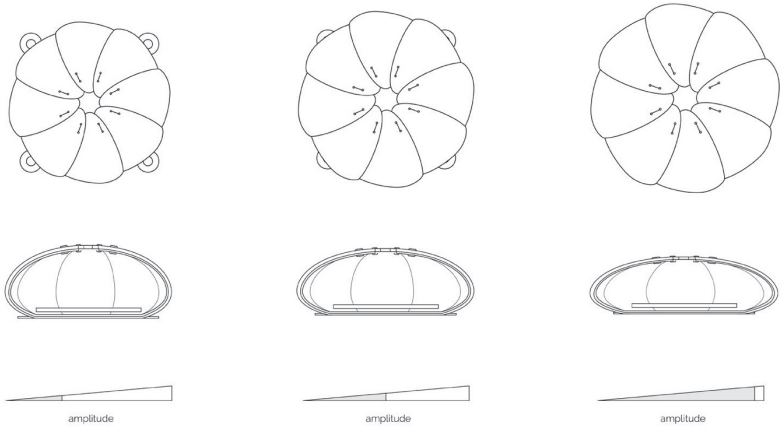

Figure 14. Micro-movements of the shape-changing modules

3.2 Smartphone application

The jewellery system is connected to a smartphone application (Figure 15) permitting personalisation of sound recognition in input and kinetic transformation and shape change in output. The jewels and the smartphone communicate via Bluetooth.

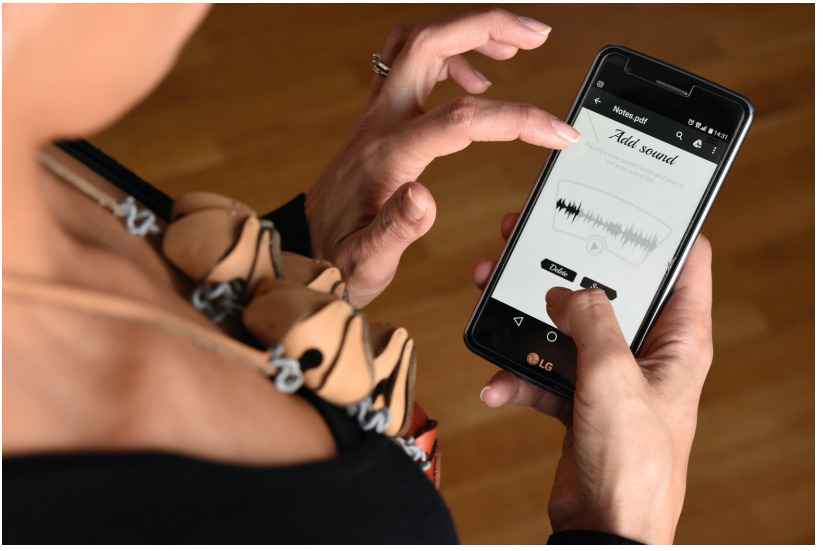

Figure 15. Smartphone app

The app permits customisation of both input and output, with construction of a personal library of sounds that can be monitored and replayed on demand through the accessories (Figure 16). The key feature of the application is the management of the kinetic, light or vibration output on the basis of a comprehensive sound recognition process.

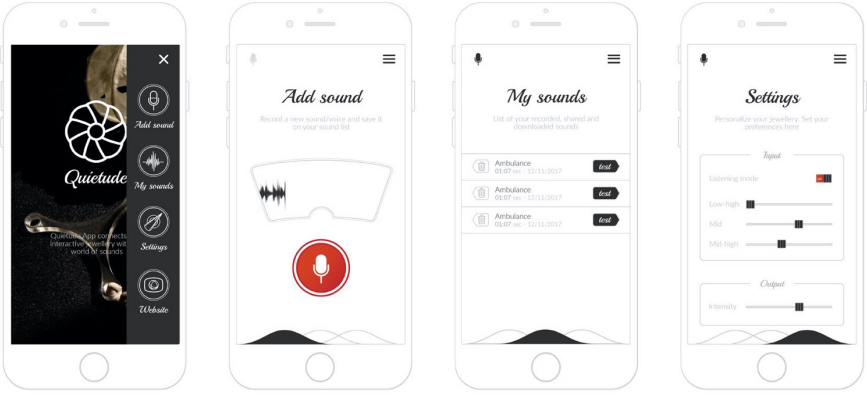

Figure 16. Smartphone app screenshots

The user can create a library of sounds by recording personally meaningful sounds through the microphone embedded in the jewels. These sounds are then labelled and stored in the app, permitting real-time sound monitoring and on-demand playback.

4. Conclusions

This paper moves from an analysis of Boys's (2014) research calling for a shift in the attitude toward disability from a medical model to a sociocultural model.

Transforming hearing aids into fashion accessories is an attempt to stimulate reflection on diversity and provoke a cultural shift, reconsidering the continuous entanglement between disability and ability beyond the tendency to standardise or normalise human skills.

The design case described in the paper highlights the importance for the designer to understand the sociocultural context of use as well as the meanings people give to the designed artefact. In the project, this led to adaptation of participatory design methods that engaged with the community and allowed people with diverse auditory skills to contribute and co-design solutions.

The proposed approach poses several challenges, due to cultural differences and understanding of experiences of the participants, and due to suitability of methods and techniques that may not be appropriate or need adjustment as highlighted also by Slegers et al. (2014); Hendriks et al. (2015); Tucker (2015); Marti & Bannon (2009).

The challenges that emerged during the project are summarized in the following.

Prior knowledge of the deaf culture

Researchers and designers often have limited knowledge of deaf culture which is sometimes confused with hearing impairment. They often rely on the reported experiences of their stakeholders that are individual and sometimes fragmented or conflicting due to the specific level and typology of deafness. To minimize this problem, some researchers suggest to assign to the impaired participants the role of experts, hiring them as paid team members (Hendriks, et al., 2015). In our project, we learned the importance of forming a solid prior knowledge of deaf culture before involving deaf people in participatory design. Deaf culture includes practices related to a suitable arrangement of the working space that hosts the co-design activities. In the DeafSpace project (https://www.gallaudet.edu/campus-design-and-planning/deafspace) Hansel Bauman developed a catalog of architectural elements to design built environments for deaf people (Hope, 2017). These include: ensuring proper sensory reach (visual and tactile) in 360 degrees to extending Deaf people's awareness and making spatial orientation easier; arranging space and proximity to allow signers maintain enough distance to accommodate each other's signing space when conversing; maintaining clear visual communication while walking and conversing; avoiding shadow patterns and backlighting that disrupt visual communication; preventing acoustic reverberation that can be only distracting and also painful to deaf people use hearing aids or cochlear implants. All these architectural elements have to be accommodated in any comfortable co-design space for deaf people.

Choosing appropriate spaces for participation

Spaces of participation should not only comply with the guidelines reported above. They should be also familiar to the deaf participants. The second workshop worked much better than the first one since it was hosted at the Mason Perkins Deafness Fund Onlus, a familiar place for the participants where the deaf community is used to meet and socialize.

Using the appropriate language

"Hearing impaired" is an equivocal term which mixed up people with different levels of hearing loss, communication modes and cultural identities under one definition. Some deaf people don't like to be defined as "hearing impaired", some others object to the word "impaired," which implies, for them, that a person is flawed, deficient or imperfect. Using an appropriate language is quintessential.

Choosing the right methods

In the project, we experimented with different methods for engaging deaf people in the design process. However not all of them were equally successful. Activities involving abstract

thinking were less engaging, like the one focused on reflection on ways of accessorising the body performed in the first workshop. Drawing from this experience is advisable in order to avoid situations distant from the Deaf participants' experience and imagery.

The mediation of interpreters

The co-design team has to include professional sign language interpreters to bridge the communication gap between the deaf/hard of hearing and the non-signing language users. The sign language interpreters are fundamental intermediary to create an atmosphere of empathy and collaboration. They have to be professional, skilled and certified.

Equivalence in participation

All stakeholders have to be equal partners in participatory design. In our project, some methods proved to be particularly successful in achieving equality like thinking-through-making during the second workshop. This stimulated creativity and joint reflection.

Encourage the role of leader

Even if in the co-design team there is not an assigned leader and the group dynamics are free-flowing, leaders can show up in different ways. In our project, a deaf person spontaneously took the responsibility of stimulating the activity showing integrity, empathy for others, and promoting joint reflection. This happened in particular during the second workshop, where a deaf person accepted to take the responsibility to drive the evaluation of the App. She was able to understand the main goal of the activity and act accordingly. This was tremendously successful. It is advisable to let deaf people drive informal evaluation activity to facilitate the participation of the other deaf participants.

Ethical challenges

Beside practical ethical issues concerned with co-designing with vulnerable people (e.g. managing the informed consent), there are other challenges related to the fact that researchers and designers may feel insufficiently prepared for dealing with disable participants. In our project we involved an ethicist who supported us in facilitating the activity by ensuring an appropriate use of time (sessions were in total not longer than two hours with several short breaks), selection on the sign language interpreters and space set up. This turned to be a precious support.

Acknowledgements

Quietude has been developed in collaboration with a multidisciplinary team. I would like to thank Iolanda Iacono, Michele Tittarelli, Simone Guercio, Matteo Sirizzotti and Annamaria Recupero for their invaluable work on the human-centred design and system prototyping at the Santa Chiara Fab Lab of the University of Siena. I would also like to thank Gianluca Daino and Riccardo Zambon from T4All s.r.l. who developed the App. A deep gratitude goes to the Deaf people who participated to the workshops and to Miriam Grottanelli De Santi, president of Mason Perkins Deafness Fund Onlus who facilitated the contacts with the Deaf community.

Gazes and Gatekeeping: Reconceptualising the entrance portfolio in the post-colony

Diane Steyn

Department of Applied Design, Cape Peninsula University of Technology,
Cape Town, South Africa
steynd@cput.ac.za

Abstract | In South Africa, entrance portfolios and tests are widely used in student selection, as academic proficiency is considered an insufficient predictor of success in Design studies. These socially constructed conventions are powerful components of Design Culture and their frequently tacit criteria serve as invisible gatekeepers to the knowledge field.

Understanding these conventions require prior knowledge of Design. However, due to the distributive injustice of apartheid, many of the "born free" generation, who apply to study design at the University of Technology where this study is based, have had little or no formal art education.
This paper describes recent interventions made to facilitate a more inclusive and socially right student selection processes within the context of, and in response to, student protests demanding free and de-colonised higher education. Legitimation Code Theory provides the 'conceptual toolkit' to uncover and contest the knowledges and gazes most valued in entrance portfolios and tests.

KEYWORDS | HIGHER EDUCATION, DECOLONISATION, ENTRANCE PORTFOLIOS, LEGITIMATION CODE THEORY, GAZES

1. Introduction

In South Africa, where this study is based, entrance portfolios and tests are widely used to select students applying to study Design at university. These selection instruments are considered necessary, since academic proficiency alone is not considered a sufficient predictor of success in design studies. The socially constructed convention of the entrance portfolio is a powerful component of design culture and is widely used throughout Europe and North America (O'Donoghue, 2009). Its gatekeeping function determines which students are provided or denied access to instruction in the knowledge field and ultimately to the field of practice.

Prior to the dismantling of apartheid in 1994, the validity of entrance portfolios was premised on applicants' familiarity with these conventions, since art or design were part of the school curriculum for most white learners. The distributive injustice of apartheid ensured that the majority of black learners were denied this privilege. Twenty-five years later, the long shadow of this injustice still haunts the selection process. Many of the "born free" generation who apply to study design at our university, have had little or no formal art or design education.

This paper discusses recent interventions to address the unequal distribution of formal design knowledge amongst students applying to the Foundation year of an Extended Curriculum Programme (ECP) in Design, based at a University of Technology (UoT). The aim of these interventions was to make the selection process more transparent, inclusive and socially right. They were made within the context of country-wide student protests demanding free and de-colonised higher education, and in direct response to criticism of the selection instruments by members of the Student Representative Council (SRC) at the time of the protests. The SRC criticised the selection instruments of all the design courses, which they viewed as exclusionary instruments that discriminate against black students with little or no formal art or design education. This paper is a reflection on, and a response to, their question: *How can you test knowledge that has not been taught?*

To respond to this question, I will contextualise the ECP entrance portfolio and test within the discourse of decoloniality. I will then use Legitimation Code Theory (LCT) to establish what knowledges, which knowers and whose gazes are most valued in the ECP selection instruments and processes.

2. Context

This study is based at a UoT that offers vocationally oriented diplomas in Fashion, Jewellery, Product and Visual Communication design. It has deep roots in colonial- apartheid history

and racist ideology and is the result of a post-apartheid merger of two previously segregated Technikons, both established during the height of apartheid (CPUT, n.d., b). Unlike the predominantly middle class constituency served by research-intensive historically white universities (HWU), UoTs tend to attract students from middle, to low, income families (Badat, 2016).

Between 1994 and 2013, the number of black students enrolled at universities increased to almost 75% of the total student population (Cooper, 2015). However, graduation rates lagged far behind increased participation, largely due to the entrenched inequality of the school system inherited from apartheid. To address the articulation gap between school and university, Government-funded Extended Curriculum Programmes (ECPs), which extend three-year qualifications by a year, were tasked to provide "underprepared" students with "epistemological access" (Morrow, 1993) to disciplinary knowledges and practice (Luckett & Shay, 2017). Prior to the de-colonial student protests, the coloniality of many of these knowledges and practices, and of ECPs themselves, were not closely scrutinised by many academics working within ECPs (Luckett, 2019), myself Included.

The multi-disciplinary Design ECP, in its current form, dates from 2018, when two discrete Design ECPs merged. It accepts about 80 students annually. Most applicants apply directly to the ECP foundation year but some unsuccessful applicants from the mainstream first year design courses are referred. According to statistics obtained from student questionnaires from the past 2 years, 68% of ECP students have no formal art or design education, 85% rely on Government scholarships to study and only 35 % consider themselves proficient in English, the official language of instruction. The selection instruments for ECP, as for all four mainstream design courses, include a prescribed entrance portfolio and, in some cases, a practical test. All applicants thus respond to the same set of assignments, ostensibly to promote equality of opportunity. These are the selection instruments that student leaders found exclusionary and unjust.

At this UoT, no statistics are available to prove a positive correlation between entrance portfolios and first year scores. According to O'Donoghue (2011), the predictive validity and continued relevance of this widespread selection practice is under-researched. His longitudinal studies of entrance portfolios found that the strongest predictor of success in first year was the school-leaving certificate art/design score rather than the portfolio score. Since less than a third of successful Design ECP applicants have art as a school graduation subject, the validity, fairness and contextual relevance of the entrance portfolio and test take on increasing significance.

Between 2015 and 2017, students from this UoT joined country-wide protests demanding free and decolonised higher education. Although the Government met the students' demand for free higher education in 2017, the process of decolonising curricula and other forms of institutional culture is a work in progress, to which this paper hopes to make a small contribution.

3. Decolonisation

When student protests ignited around a statue of an arch imperialist on the campus of an elite historically white university (HWU), 20 years after political liberation, the entrenched coloniality and whiteness of the institutional culture of this university, and many other like it, were unmasked. According to Mbembe (2015), the real question was not about whether to remove the statue of Rhodes, but why it took so long to do so. The slow pace of transformation at South African universities is indicative of prevailing attitudes amongst many academics, whose arguments in defence of "academic excellence" and "equal opportunity" frequently mask entrenched racism and coloniality (Luckett & Shay, 2017). Coloniality and colonialism are not the same:

> "Coloniality …refers to longstanding patterns of power that emerged as a result of colonialism [and survives in] books, in the criteria for academic performance, in cultural patterns, in common sense, in the self-image of peoples, in aspirations of self and in so many other aspects of our modern experience" (Maldonado-Torres, 2007).

Students responded to these "patterns of power" in different ways, but common demands were for the decolonisation of the predominantly Eurocentric curriculum, for a pedagogy that embraces the diversity of students' life-worlds, for the transformation of skewed staff demographics and for the dismantling or re-structuring of many institutional practices and spaces experienced as alienating, exclusionary, racist, demeaning, and oppressive by black students and staff. "We can't breathe" became a much repeated refrain and alluded to the "suffocating" institutional culture of HWU in particular, where success for black students is premised on assimilation into an institutional culture that does not recognise or affirm the plurality of other languages, cultures and ways of knowing, doing and being (Badat, 2016).

To articulate their demands, students drew from a rich tradition of Black Consciousness and anti-colonial literature. Within the constraints of this paper, I shall foreground only those most salient for reconceptualising the ECP selection instruments from a de-colonial perspective.

Key for de-colonial scholars is how to epistemically re-frame hegemonic Eurocentric epistemic disciplines , canons and interpretive frames that constitute the curricula and institutional culture of post-colonial universities (Heleta, 2016; Mbembe, 2015). In Africa, these universities and their curricula were modelled on the modern 19th century European university, imported to the colonies as part of the colonial "civilising mission" (Mamdani, 2016). Thus, for Ngugi wa Thiong'o (1981), de-colonising the African university requires "re-centring" marginalised indigenous knowledges, knowledge practices and vernacular languages in contextually relevant curricula. This process of re-centring African epistemic traditions does not entail "closing the door" to epistemic traditions from Europe, but their de-centring in favour of a more diverse, epistemic pluralism (Joseph Mbembe, 2016; Ngugi, 1981).

Furthermore, the Western epistemic tradition is premised on the separation between the knowing subject and the object of knowledge. From this ostensibly neutral position, the knower claims to generate objective, "universal" knowledge (Mignolo, 2009). Castro-Gómez (2007) describes this position as *the hubris of the zero point*, a position from where, according to Mignolo, the knower "controls the disciplinary rules and puts himself or herself in a position to evaluate and dictate" (2009, p.4). To de-link from this hegemonic interpretive frame, Mignolo proposes engaging in *epistemic dis-obedience* by shifting the focus from the known to the knower, whom he assumes is always implicated geo-and body-politically in the known.

As is well documented, Western models of art education have their roots in Renaissance Europe, when the art academies wrested power from the craft guilds as centres of teaching and learning (Macdonald, 2004).This development marked the start of a separation between art and craft and between the conception of the artist as genius, superior in social status to the skilled craftsman, and requiring an education that the craft guilds could not provide. What is lesser known is that these novel concepts of art and the artist arose concurrently with the colonisation of the Americas in 1492, followed by the colonisation of the East end of Africa, heralding a modern world driven by capital accumulation and progress. Colonialism therefore constitutes the "darker side" of this modernity, which includes the violent dispossession, racist negation and enslavement of colonial subjects. Seen from a de-colonial perspective, modernity/coloniality are two sides of the same coin (Dastile & Ndlovu-Gatsheni, 2013; Grosfoguel, 2013).

The Rome Academy, established in 1633, remained the leading centre of art education in Europe for 300 years. During this time the academic model of art education spread from Europe to England and its colonies, followed in the 20th century by the teachings of the Bauhaus (Macdonald, 2004). Imported along with these pedagogies were hegemonic conceptions of art and design, of beauty, of the canon and of ways of visualising and representing the world. This euro-centric cultural heritage was and still is "pervaded with by the inequalities of class, gender, race and ethnicity" (Wolff, 1990). The entrance portfolio, with its gatekeeping function, is part of this heritage.

In order to conceptualise the "disciplinary rules" or knowledges and gazes privileged in the entrance portfolio/test I turn to Legitimation Code Theory (LCT).

4. Conceptual framework

LCT is a social realist sociology of education, developed by Karl Maton, which builds on Bernstein's code and Bourdieu's field theory (Maton, 2013). From the global north, LCT nevertheless provides useful conceptual tools for analysing socially constructed knowledge-

knower practices, including design (Dong, et al., 2015; Giloi, 2017; Shay & Steyn, 2016). In this paper I draw on one dimension of LCT: Specialisation.

Specialisation is used to determine the basis of achievement in knowledge fields and practices, the "rules of the game" (Bourdieu & Wacquant, 1992). According to Maton (2006, p.58) "knowledge is always about something and by someone". All knowledge fields consist of both epistemic relations to the object of knowledge and social relations to the knowing subject or knower. These knowledge-knower structures combine to create four specialisation codes, determined by the relative strength and weakness of the social (SR) or epistemic (ER) relations of knowledge: The specialisation codes thus enable the analysis of what counts as legitimate knowledge (ER) and who is affirmed as an ideal knower (SR) in a field of practice (Maton, 2006).

A *Knowledge code* (ER+/SR-) legitimates specialist knowledges of an object of study. *What you know is valued more than who you are.* In design, knowledges that can be communicated and evaluated reasonably explicitly conform to this code. A *Knower code* (SR+/ER-) legitimates *who you are* and privileges attributes and aptitudes, such as gaze. A designer's gaze is integral to the design process and to professional identity and refers to the designer's "voice", values and "eye". An *Elite code* (ER+/SR+) legitimates social and epistemic relations in equal measure whilst a *Relativist code* (ER-/SR-) privileges neither (Maton, 2013).

Acquiring a "gaze" enables the recognition of the legitimate evaluative criteria and the ability to realise these in legitimate texts (Bernstein, 2000). Maton (2013) extends the conceptual reach of Bernstein's understanding of gaze by distinguishing between four knower gazes: the born, social, cultivated and trained. These gazes are generated by the relative strengths of their subjective relations (SubR +/-) and interactional relations (IR+/-) to knower practices. Simplifying, gazes are social practices that specialise kinds of knowers in terms of both *who they are* and *how they know* through interaction with significant others. This study does not use the trained/blank gaze.

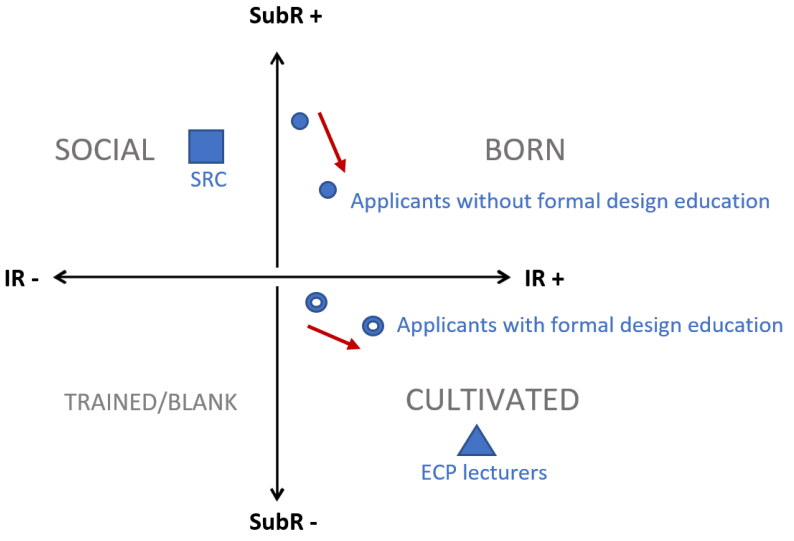

Figure 1. The social pane – gazes (Maton, 2013). Relative positions of the SRC, ECP lecturers and applicants, with and without formal design education.

A *Social gaze* (SubR+, IR-) is determined by social category such as race, class, gender or sexuality, where they are socially constructed as categories. Which *kinds of knowers* can claim legitimacy to this gaze matter more than *their ways of knowing?* The **social gaze,** within the context of this study, is shared by the SRC whose question challenges the "whiteness" of selection instruments that discriminate against black applicants with little or no formal design education. *Cultivated* gaze (SubR-, IR+) is an acquired disposition that strongly privileges legitimate interactions between significant others or ideal knowers (ways of knowing), but minimizes who you are (kinds of knowers). It is inculcated by an "ideal knower" through participation in communities of practice or acquired through sustained exposure to canonical works. Maton describes this gaze, which "resides in the mind's eye", as a "canon introjected" (2013, p.99). This gaze is shared by design lecturers responsible for student selection and applicants with formal art or design education. A *Born gaze* refers to inborn, "natural" talent and is a result of a genetic deposition. However, all gazes are socially constructed. This gaze therefore equally legitimates *kinds of knowers* and *ways of knowing* (SubR+, IR+). The ECP entrance portfolio requirements call for "some evidence of visual aptitude/ability… to study design"(CPUT, n.d., a), a **born gaze.** However, the legitimate "ways of knowing" attributed to the born gaze remain tacit in these entrance requirements.

5. Methodology

The practical component of the ECP portfolio, including recent interventions, provided the data for this study. Being a multi-disciplinary course, lecturers responsible for choosing the portfolio requirements, myself included, eschewed discipline-specific tasks in favour of observational drawing, to assess students' visual aptitude, visual communication skills and level of technical proficiency. These drawings included a self-portrait, a simple still life, a view of an interior, and a six-frame storyboard. For example, the self-portrait required that students "look in a mirror and make a carefully observed, freehand drawing of your head and shoulders (do not draw from a photograph or from your cell phone)". The still life, described as "an arrangement of objects on a surface", called for making "a freehand drawing from direct observation of three objects on a table top" (CPUT, n.d., a).

The ECP entrance test, to which local applicants were invited to attend instead of doing a portfolio, consisted of a still life drawing, paper construction exercises and an exercise to assess the imaginative use of colour and pattern. After a detailed briefing, students were left to work un-aided.

During the selection of students for the newly merged ECP in 2018 certain common mis-readings of the portfolio and test requirements came to light:

- *Portrait:* Drawings were either too small or too large for the page, stylised or lacking in closely observed detail, or they were drawn or traced from photographs.
- *Still life:* Lack of familiarity with the still life genre was evident in drawings where objects were either randomly placed on the page, arranged alongside each other, or drawn individually on three separate pages. Many applicants erroneously privileged the table/surface on which very small, out of scale, objects were arranged, devoid of closely observed detail.
- *Interior:* Poorly proportioned drawings of furniture, flat or floating in space, revealed lack of familiarity with canonical convention and the basic rules of perspective. Some interiors were evidently copied from the internet or invented with or without the aid of technical drawing.
- *Storyboard:* Ignorance of the conventions of storyboarding was evident in drawings depicting a continuous narrative instead of the required six-frame format and the use of text to explain the story.

Misunderstandings such as these are familiar to selectors and some of these admittedly indicate genuine lack of aptitude. But within the context of de-colonial protests, and the SRC's critique, they could no longer be ignored. This led to the three interventions aimed at making the gazes, valued in the entrance portfolio and test, more explicit.

The first intervention involved turning the entrance test into a lesson. Instead of the customary practice of leaving students to complete assessment tasks un-aided, lecturers remained in class to teach after briefing the students. This created an opportunity to make

the tacit conventions of drawing, composition, and construction more explicit. It also broadened the customary merit-based assessment criteria to include students' capacity to respond to being taught. To improve comprehension of the portfolio requirements, the second intervention entailed translating the entrance portfolio requirements from English into two vernacular languages widely spoken by students. The third intervention, aimed at making the tacit rules of portfolio more explicit, was to use visual examples of past applicants' work to illustrate desired criteria and mistakes to avoid.

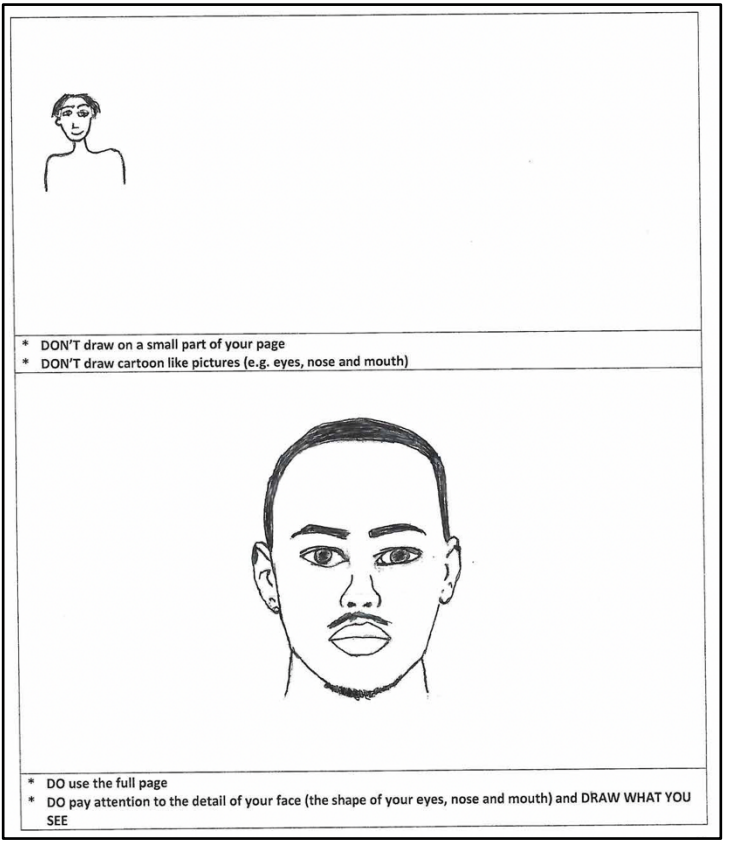

Figure 2. Poor and average examples of past applicants' drawings of a self-portrait included in the ECP portfolio.

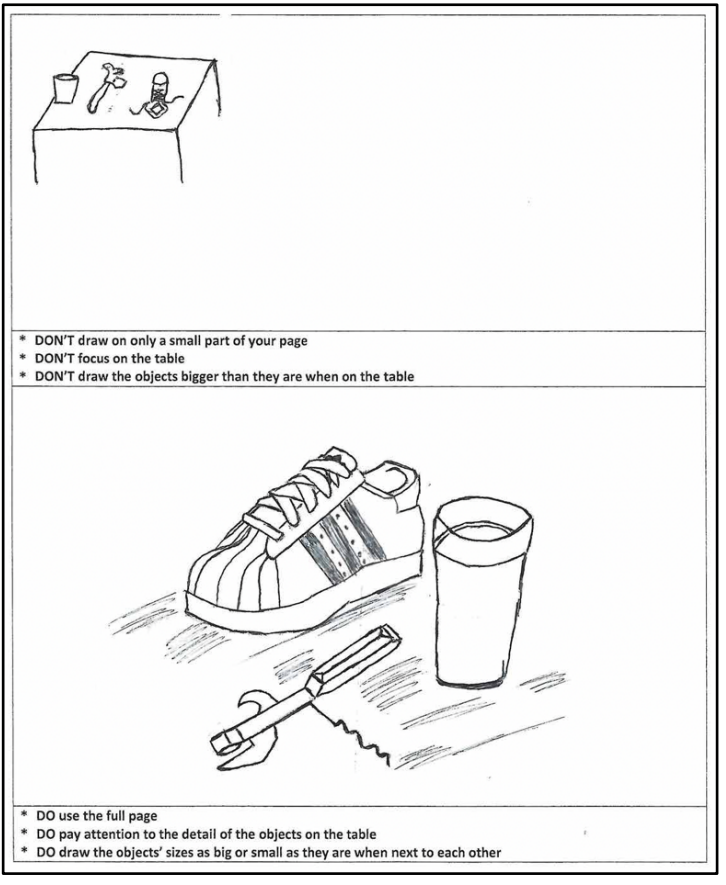

Figure 3: Poor and average examples of past applicants' drawings of a still life included in the ECP portfolio.

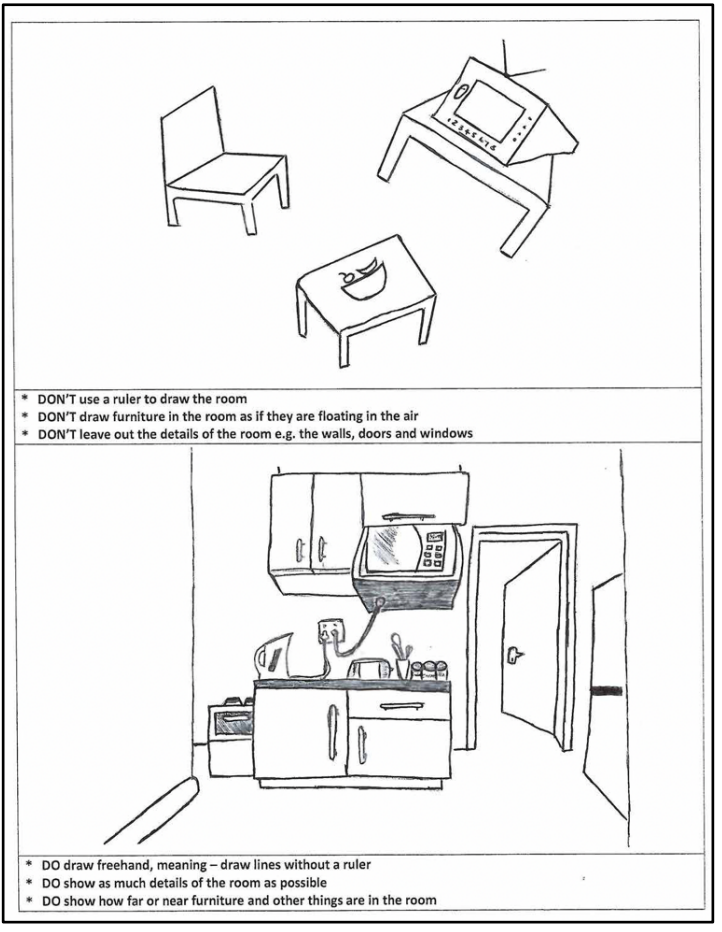

Figure 4: Poor and average example of past applicants' drawings of an interior included in the ECP portfolio.

6. Analysis

Analysis of the data starts with unpacking **the SRC's question**: How can you test that which has not been taught?

One possible answer to the SRC's question is that entrance tests and portfolios do not assess prior design knowledge but evidence of visual aptitude: a born gaze, that you either possess by way of birth, or not at all. This a-social and a-historical understanding of a born gaze places all applicants on an equal footing, regardless of their access to a cultivated gaze, to

ideal knower practices or whether their cultivated gaze is shared by the selectors. This position is not unique to South Africa. O'Donoghue' (2011) describes how, by appearing to privilege inborn talent over familiarity with and access to the cultural capital valued by art and design schools, the entrance portfolio creates the illusion of equal opportunity whilst maintaining the status quo. What is significant in this familiar response, is that the born gaze is associated exclusively with a biological disposition and that the social construction of this gaze by means of interaction with significant others is ignored.

The SRC's question is rhetorical. Implicit in it is full awareness that "which has not been taught" refers to a cultivated gaze that assumes familiarity with the hegemonic Euro-centric canon and ways of visualising and representing the world. Adopting social gaze, the SRC's question thereby challenges the coloniality and exclusionary whiteness of selection practices that discriminate against black students with little or no formal art/design education. Their question exposes a discriminatory practice masquerading as equal opportunity, a practice that downplays the significance of a cultivated gaze by claiming that a born gaze is all that matters.

The first of the three interventions, made in response to the SRC's question, was to turn the entrance test into a lesson.

Significantly, this is an acknowledgement by selectors that using a born gaze to justify withholding instruction is an exclusionary practice. It is also an attempt to address the unequal distribution of formal design knowledge amongst applicants attending the test. By acting as ideal knowers, the lesson provides lecturers with an opportunity to engage with applicant and to make the legitimate ways of knowing, that structure the test, more explicit. It strengthens interactional relations (IR) of the gazes of applicants with and without formal art education (Figure 1).

Using examples of past students' work similarly attempt to "teach" applicants which kinds of knower and ways of knowing are considered legitimate by the ideal knowers who evaluate portfolio submissions. Visual examples provide some access to the tacit conventions imbedded in the portfolio. As with the taught test, they strengthen the interactional relations (IR) of the gazes of applicants.

Although it is too early to quantify, these interventions appear to have increased the number of successful applicants. Unfortunately, the values of these interventions are limited by their failure to address the hegemonic canons and interpretive frames that constitute their content. The portfolio's capacity to elicit evidence of visual aptitude is particularly constrained. All three drawings and the storyboard assume some exposure to the hegemonic canon and call for very particular and culturally specific forms of visualisation and representation. Furthermore, the choice of prescribed portfolio content doubly disadvantages applicants without formal design educations, since they lack familiarity with the legitimate gaze, and they are denied of the opportunity to demonstrate their aptitude to study design in more diverse and contextually relevant ways.

Re-centring marginalised vernacular languages are key to the decolonisation project. Considering that English is the mother tongue of only 35% of applicants, it is not surprising that the portfolio requirements are frequently misunderstood. Translating the portfolio into two widely spoken vernacular languages is therefore a significant act of decolonisation that affirms the life worlds of applicants.

Finally, by recognising that more than 60% of applicants to ECP have little or no formal art or design education, these interventions de-link the ECP selection instruments from the ideal student (Luckett, 2016) of the past, middle class, English-speaking, probably white and in possession of the privileged cultivated gaze.

7. Conclusion

The analysis of the ECPs selection instruments, with the help of the specialisation codes, makes visible how the gatekeeping function of this this socially constructed knower practice is constructed and maintained.

From a decolonial perspective, the analysis demonstrates how hegemonic patterns of power, brought from Europe during the colonisation of South Africa first by the Dutch and later by the British, can persist, uncomfortably and at times unnoticed (like the statue of Rhodes) in "common-sense" practices of design culture like entrance portfolios and tests. Common misunderstandings of entrance requirements demonstrate the marginalisation of applicants who are not familiar with canonical genres and practices and for whom English is not their mother tongue. The analysis reveals how conceptualising portfolio from a point zero position can mask cultural bias and negate the life worlds of applicants who do not conform to the normative, "ideal" student, well versed in the "right" kinds of design knowledge. Finally, the analysis shows how the narrow forms of visual representation favoured by the prescribed ECP portfolio exclude other, more diverse ways of demonstrating aptitude for design studies.

In conclusion, the interventions discussed in this study can be understood as examples of a social realist perspective, intent on providing applicants with "epistemological access" to disciplinary knowledge. Providing epistemological access to the cultivated gaze of the discipline is a valid response to the SRC's question. But from a de-colonial perspective, these interventions, with the exception of the translations, could be viewed as an erring on the side of assimilation into the normative euro-centric gaze (Luckett & Shay, 2017). Decolonising the selection instruments require de-linking from this gaze, re-reading the canon, re-centring marginalised design practices and ideal knowers, and affirming plurality of expression. Such a de-linking does not entail doing away with entrance portfolios and tests but rather provides an opportunity to re-imagine more diverse, inclusive, and contextually relevant ways of predicting success in design studies.

For me, as a white academic involved in student selection, this study is both an admission of having been implicated in a discriminatory practice and an act of abandoning the hubris of the zero point. This study was motivated by a question, and I conclude with another, which may have resonance beyond the post-colonial South African context: how can we further re-frame an exclusionary and under-examined practice of design culture?

Hybridity as a culture of making

Maya Ober*, Nicole Schneider

FHNW Academy of Art and Design, Basel, CH
*maya.ober@fhnw.ch

Abstract | Using an experimental design course for industrial design undergraduate students as a case study, this paper explores which new approaches towards design education can be applied to foster a contextually-based practice. Understanding design as a fundamental trait of being human (Heskett, 2002, p.4) and a key factor influencing the quality of life, the authors argue for design education informed by both practical and theoretical research in order to encourage cultural hybridity.

KEYWORDS | DESIGN EDUCATION, EXPERIMENTATION, HYBRIDITY, INDUSTRIAL DESIGNDESIGN METHODS

1. Introduction

In the second decade of the 21st century, Design education poses multiple challenges, especially on the undergraduate level, that is still perceived “as a means to achieve financial security and upward mobility” (Ilhan, 2017, pp. 17-21). Given the background, the industrial design field has been in a turning point for many years and is in the ongoing process of defining itself anew between rapid technological, environmental and societal changes (Richardson, 1994). Within this context, we believe that design education must move beyond skills-based one and service-oriented, in which the role of the designer is mainly defined as problem-solver, towards a more manifold approach, fostering a contextualized practice (Abdulla, 2018). We understand contextualised practice, as one that is connected and relevant to the milieu (Abdulla, 2018, p.156). In order to achieve it, the content of design education has to be connected to the reality of the students and has to encourage them to look for their narratives and contribute to the plurality of design expression. Consequently, to challenge the outdated epistemology of design practice and distort – as decolonising design (Abdulla, et al., 2018) puts it – “a hegemonic discourse of design centred around functionality and the rhetoric of neutrality”, we must develop new ways of teaching, learning and thinking about design that explore “other ways of worlding” (Escobar, 2018, p.65). This paper examines how hybridity can contribute to developing practice-based design curricula that foster experimentation, interdisciplinarity and dissolve the polarity of theory and practice (Findeli, 1994). “La Cultura del Fare” (from Italian: the culture of making) a course in which we have taught, serves as a case study, opening a wider reflection upon design education. In this text, we do not want to offer a universal solution, or a recipe, we rather describe the method and structure, as part of our ongoing practice-based research on design education. The course was held as a one-semester main long studio class within industrial design undergraduate course for the fifth-semester students.

2. Hybridity as Approach

Conceptualising the syllabus for the course, we use hybridity as a starting point. Perceiving design as a modality, we explore hybridity as an inherent part of cultural expression. Even though, as stated by the Palestinian philosopher Edward Said, since the Enlightenment, the West has been trying to separate “cultural and aesthetic realms from the worldly domain” (Said, 1993, p.68) , we believe that they have to be rejoined. Within this context, design education, as an intrinsically cultural practice, offers an opportunity to explore the ways of developing practices beyond current boundaries of methodology and aesthetics employed in the field of product/industrial design. We understand hybridity not only as merging of different and contradictory entities (Davendorf & Rosner, 2017), rather as a fluid category that allows exploring new ways of making design, as well as transcending the static idea of product identity. Here we draw from Jamaican cultural theorist Stuart Hall, and his idea of fluid identity that is never-completed, always in the “process of becoming – a process of

shifting identifications, rather than a singular, complete, finished state of being" (Hall, 2017, p.16). Within the course, we wanted to see how we can encourage students to reflect upon their diverse identities, the cultural, historical identities of used materials and technologies, and product identity in general. Therefore, unlike many industrial design courses, we decided not to work with a product-brief or established guidelines that limit and hinder experimentation, rather we explored and developed methods fostering reconfigurations, blending modes of designing and producing. Drawing on Paola Antonelli's concept of "thinkering"[1], we focus on maker experimentation as a device for innovation, encouraging hybridity. Within this framework, we understand hybridity as inherent cultural expression, questioning universalism and modernist tradition, that still form some of the most important references of design. Hence, we wanted to explore how this way of working can contribute to different ways of thinking about products and teaching design.

Believing that "it is impossible today to act without knowledge, or to know without doing" (Maldonado, 1967, p.12) as stated by designer and educator Tomas Maldonado, we examine how to unify the theoretical and the practical framework within the course, in terms of both what we design and how we design and teach. The how is as important– in our approach– as what. Within our model, we are researchers and, according to design educator Danah Abdulla, the test theory in practice, studying and evaluating our work, in order to refine our understanding and improving it (Abdulla 2018, p.89).

In assuring that students know exactly what this course builds upon, we created a structure that was presented to them at the beginning. Defining a structure and methods was also crucial, on the one hand, to organise our aims and goals, on the other to be able to analyse the process. As an educator, Johanna Lewengard eloquently puts "Focusing on methods that help us to identify gaps between intention and outcome, and using a broad set of tools for analysis [...] creates a more holistic view (of design)" (Crippa, et al., 2019).

Traditional design methodologies, especially within a market-oriented field as industrial design, use applied science as main logic and involve working with a product-brief that predefines a set of questions and problems inquired and looks to find solutions. Within this model "good design is the outcome of an inspired syllogism" (Antonelli, 2012) and design education often aims at ensuring that this linear process takes place. Questioning this approach, as it limits design outcomes and aiming at educating reflective practitioners (Schön, 1987), we focus on fostering situated, relevant, research-informed design practice.

So, hybridity also refers to our pedagogical outlook. On the one hand, we have the transformation method, the starting point for experimentation, on the other, we examine to what extent the design research, conducted in parallel with the practical hands-on one, makes it possible to contextualize projects regarding their historical, social, and

[1] Thinkering – «combination of design thinking and tinkering that involves strategic disruption, realistic application and maker experimentation». (Walker, 2015)

technological dimensions, thereby supporting the development of the concept and the making of design decisions. Within the course, we analysed how choosing an integrated educational approach, instead of separating design history from design theory and research from praxis, extends product development through varied dimensions and perspectives, opening up a forum for discussion on the future of design within the industrial design field.

3. Conceptual and theoretical principles

3.1 Background

The research on hybridity as a method started in 2002 with the project "If we could knit wood: Transformation in arts and crafts." The project analysed the processing techniques in the traditional craft workshop and formulated new approaches using digital processing methods. The idea was to pair processing methods with materials that are not processed this way (e.g. knitting wood). Further iterations included different workshops and enabled to quickly test the pairing method and see its potential for further application. The formal results were promising, but due to time restrictions, they stayed on the stage of the material experiment as a sample, rather than becoming a product or an object. Therefore, it was clear that, to fully explore the possibilities behind the method, a longer project was needed, ideally within a design education framework. This was possible in the "La Cultura del Fare", a course offered as the main studio to the fifth semester undergraduate students, that we discuss in this paper.

3.2 Method

Traditionally design is understood and taught as a problem-solving practice (Abdulla, 2018; Escobar, 2018; Findeli, 1994), in which designers choose from a set of practical methods and procedures that adapt to the problem. Designers often rely on their visual and cultural memory, that guide them exploring possible solutions. Traditional methods and processes are deeply embedded in the designer's tacit knowledge and can be therefore limiting.

Aiming at challenging the implicit solutions and normative visual and form languages, we developed a new approach to tackling product development. The rationale behind was to enhance the experimentation beyond the known ways of making and its visual, tangible representation. This approach poses particular challenges as people generally prefer to choose familiar systems and procedures that give them security rather than face new, unfamiliar ones. Even though designers pride themselves to be innovative, design still reproduces consciously or not "universal" norms and adheres to specific Modernist aesthetics. (Ahmed 2019; Escobar 2018).

"The culture of making" course explores the notion of cultural hybrid, through hands-on research of materiality, tactility and fabrication processes, going beyond the generic

understanding of what “making” and just “experimenting” means. Instead, it focuses on cultural and historical narratives embedded in processes, materials and their visual, formal, utilitarian manifestations as products of industrial design. In this context, the emphasis of the course was on hybridity, using advanced digital manufacturing methods and the transformation of traditional production modes, in order to create culturally and technologically determined hybrid artefacts. Introducing “Hybridity as a culture of making” we believe to facilitate the design of products , that go beyond only formal considerations and rather are rooted in the cultural experiences of the students. It also brings a framework for expanded creativity and experimentation and enables a disciplined way of working.

The developed design method applied in the teaching process separates material and processing method, by the unorthodox pairing of ubiquitous materials (metal, wood, clay etc.) with action verbs (baking, blowing, weaving, melting etc.). The term “sawing wood”, for example, implies a clear image of the material and processing/treatment of the surface, without the students having ever had sawed wood themselves. This tacit knowledge is based on memories, experiences, and personal value systems. In contrast, the term “knitting wood” cannot be assigned to a stereotype. It has to be interpreted through a creative process or reframing. This approach allows students to avoid their processes becoming restricted by culturally conditioned or stereotyped strategies, during experimental phases.

Working with digital production modes played an important role in the process, as with the help of computer-aided design and production, we can radically question the basic typologies that have emerged in the history of design and work with new ingredients, often using form languages and expressions (e.g. ornamentation) countering dominant visual narratives. We do not employ “hybrid craft” as a way of mixing analogue and digital modes in order to extract “the best aspects” from both processes (Davendorf & Rosner, 2017), rather first we immerse ourselves in the experimentation phase, allowing to fully explore the creative possibilities of different fusions and this implies that the mixed categories are not fundamentally opposite. Therefore, we envision the hybridity as a culture of making, being a process of binding categories together, instead of emphasising the differences. The beginning of the process should be playful, without rigid rules on what is right or wrong, and be an interaction between media and experimental techniques.

3.3. Course

The starting point of the course was an intensive one-week long workshop “Transformation 01” that set, in many respects, the groundwork for further explorations in the studio class.

In a series of 1:1 design exercises, students experimented with familiar materials through challenging, unorthodox operations (e.g. baking, knitting, cooking, weaving, melting etc..). Through surprising pairing (material – action verb, see Table 1), the goal is to provoke the students to go beyond their familiar perception of materials, traditional manufacturing/processing methods and to reinvent the notions of known and familiar to produce unexpected results. Students worked in pairs or small groups defining together

hypotheses and goals, moving fluidly between making activities that allow releasing of thoughts and rational calculations of ideas to be tested by making. The interchange between intuitive response (hands-on modelling) and conscious assessment (discussion and analysis within the team), creates the crucial balance that enables to progress to new findings.

Table 1. Transformation 01

Action Verbs	Material
Sawing, bending, folding, embossing, knitting	Metal
Binding, cutting, casting, moulding, scrolling,	Wood
layering, weaving, embroidering, carving, cooking, impregnating	Paper
	Casting Materials
Pressing, stretching, spanning, knotting, perforating, breaking, heating, cleaning	Leather
Milling, binding, boiling, splash, coloring, peeling, wrapping, chopping, melting, soldering	
Bloating, cutting, carving, etching, sticking	
Refining, welding, shrinking, grinding	

The inherent qualities and properties are experienced on a 1:1 scale, stripped of their conventional context, and set within the new framework of knitting, casting, dipping, coating, blowing, coiling, revolving, pleating, weaving, spinning etc. Through experimentation with surfaces, volumes, colours, states of matter, students translated the given material, through their lens, and transformed to three-dimensional units, specimens and objects (not yet necessarily functional), following the logic of the assigned operation/action verb (e.g. knitting).

After this intensive experimentation process, a common “bank” of experiments was created, out of which students could freely choose those for further development. Within this process, it was important to dissolve the individualistic, possessive approach towards the work and to open it for everyone. Consequently, students could engage in collaboration and co-creation of knowledge in a more horizontal way.

Figure 1. Folding + Casting Material: an example of experiments from Transformation 01 exercise.

Figure 2. Cooking + Wood: an example of experiments from Transformation 01 exercise.

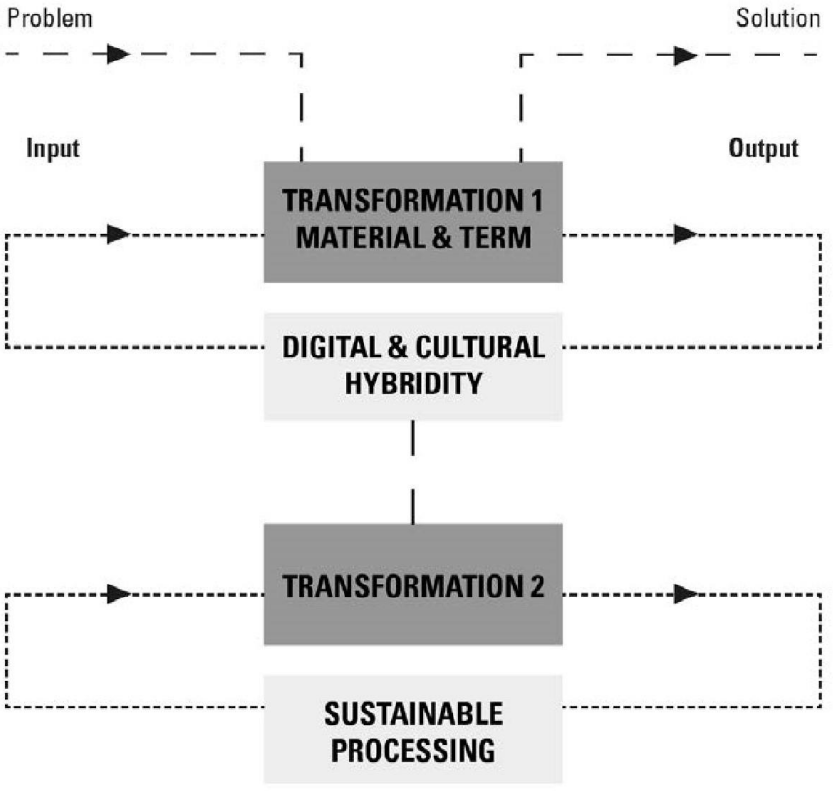

Figure3. Scheme showing the ways of working within the course.

In the following steps of the process, students had to translate the experiment into an object/product. In order to achieve it, students were asked to develop a research question, rooted in the chosen experiment, to guide them through the process. They were also encouraged to research the history behind materials, production processes and to locate and relate them to their own positionalities and identities. This process, working with a research question and investigating instead of just "simply" making, was challenging for undergraduate senior year students, who in the course of their design education got used to working with a product-brief, responding to clearly defined problems. Suddenly, we asked them to completely change their way of working and designing, as well as we required a research layer to inform their projects. Informing their practice through research, not focusing on solving problems, rather infusing with knowledge and at the same time interrogating their own position, culture and identity, opens diverse possibilities for the

pluriverse (Escobar, 2015). Below we will describe two projects that in our opinion show how this method is useful for creating contextualised design practices.

4. Projects Examples

Both examples show two radically opposed design approaches that emerged within the course and informed pluriverse way of designing, enabling students to find their voice within the practice. One informed by a historical research, the second by material and form research through designing and experimenting. We believe that this way of teaching design, applying hybridity in the process, enables a lot of flexibility and at the same time provides students with a structure fostering contextualisation of their practice.

4.1. Knitting Metal – an example of creating a history-informed practice

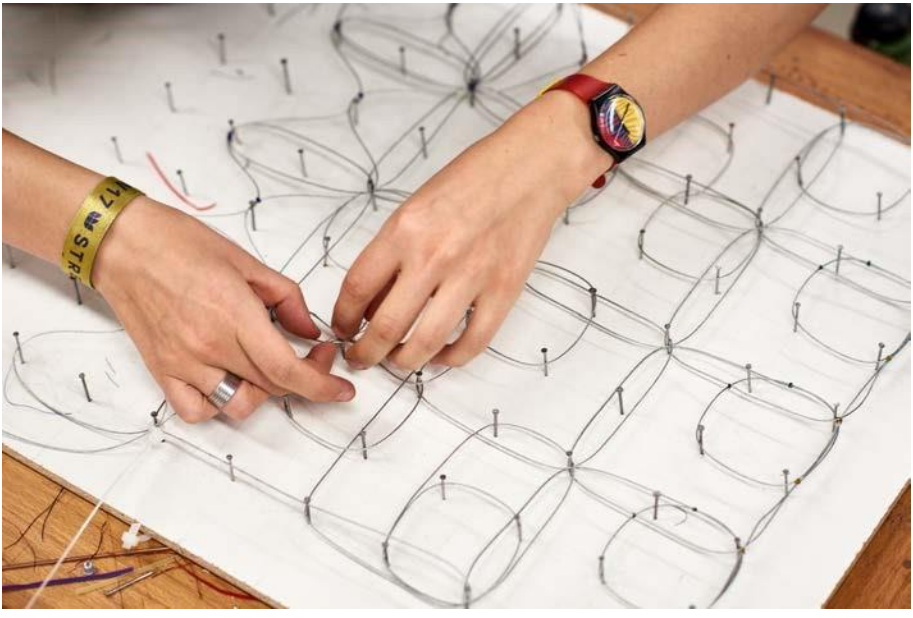

Figure 4. Knitting metal: an example of experiments from Transformation 01 exercise.

Starting the experiment with metal and the verb “to knit”, one group of students created a myriad of different samples, knotting, twisting, weaving wires, cables, rods, eventually achieving surfaces very similar to the actually knitted wool. In order to continue further with the project, they stopped the process of experimenting and researching by designing and focused on the history of knitting. By reading the history of this craft, they observed how the position of knitting shifted due to the industrial revolution. Before, hand knitting was a

highly valued craft performed by trained craftsmen part of a guild, often performed in the public space. The mechanisation of knitting, changed craft's status, and hand knitting became mostly a feminine activity bound to the domesticity. This information was interesting for these two students, as they looked at the internal hierarchies within design and how some forms of making are highly valued, and therefore categorised as design, while other practices are made invisible and excluded (knitting being one of them) (Buckley, 1986). They analysed the transition of knitting from the public to the domestic sphere and then its re-claiming by the feminist movement and the Women's March in form of a "pussyhat". Studying the history of knitting they formulated a question "How to bring knitting from the domestic to the public? How do we let the emotional to influence the mobile character of the object?". These questions guided their further design process. Aiming to bring knitting to the public sphere, they decided to work on a structure that could be implemented outdoors. Therefore, they chose a thicker metal rod that they knitted, to create both stability and flexibility. Knitted meshes enable bouncing back and forth and the rocking and its playfulness, induce an emotional response and become part of the project. At this point the function is defined as a rocking stool for outdoors. Trying to blend between the domesticity of knitting and the material landscape of urban space, the designers decided to use cast concrete, that got reinforced with the metal knitted rods, to create a sitting surface of a rocking stool. The project goes beyond the dualisms of public/private, urban/domestic, soft/hard, feminine/masculine, rather focuses both/and. Using hybridity as approach enables to dissolve the dichotomies and to mesh the categories together, creating a playful object, which identities are narrative, rather than pre-defined. Looking at the design process, we can also assert that theoretical considerations directed experimentation and the other way around, so the proposed methodology enabled both theory and history-driven exploration as well as free material-based experimentation. This helps add another layer of knowledge and allows students to use their positionality and their lived experiences as women to influence the design process.

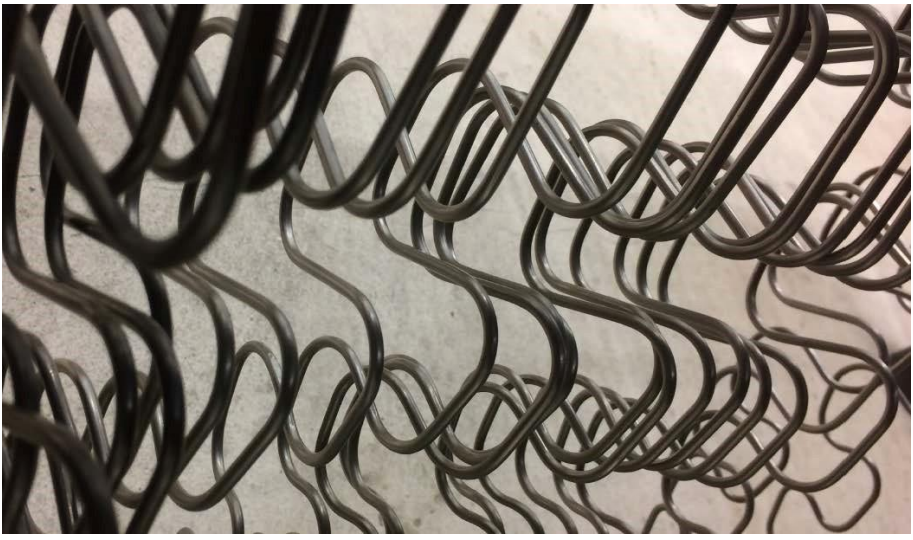

Figure 5. Knitting metal: work in progress.

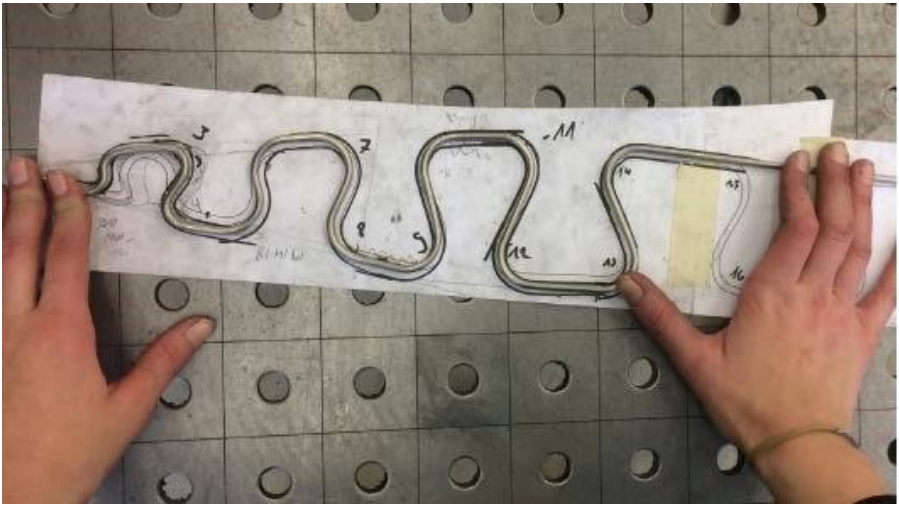

Figure 6. Knitting metal: a stencil to knit a metal rod.

Figure 7. Knitting metal: the final result, a rocking stool for a public space.

4.2. Printing textile – sustainability in experimental context

We believe that this method can also help to enhance the sustainability of the production process. While conventional design methods create products and this dictates lifestyles, the experimental phase inherent to hybridity enables deeper comprehension of manufacturing processes. Speaking about sustainability we are not interested in the superficial understanding of the term as “green materials”, avoiding production waste or separating product parts at the end of the life cycle, rather we explore the possibility of redesigning the whole design process in a sustainable way.

Printing textile was a starting point for one of the students, who after the experimentation phase in which he worked with textiles, focused on merging printing with felt. The student who was a 3d printing tutor during his studies, challenged himself working with fabrics, material not necessarily present in industrial design curricula. He explored what happens when we 3d print directly on felt, creating joints connected to the material, without any additional elements or adhesives. In the process, he developed joints 3d printed with the PLA filament on felt. Their geometry enables to insert easily wooden legs and therefore shaping felt into a three-dimensional ergonomic seating surface of a stool. He drew from his technical pre-university education as draftsman and his experiences as 3d printing tutor. In the process, he defined his visual background as a technical one and let this aspect inform his design. Instead of working hands-on with materials, he sketched using a CAD software different possibility, and then printed them and tested out. A multimaker printer was used in the process, which shows how this design could be easily reproduced using home or semi-professional 3d printers, opening the accessibility and production for a wider group of users, avoiding transportation costs and its environmental footprint. The concept can be also scaled on the commercial scale, enabling a producer to manufacture the stool at the retail points, without being bounded to a specific production facility, producing the furniture in-store on demand, rather than having a stock. So, applying hybridity, the student discovered new potentials for the design and included sustainability as an inherent part of the process, thinking as well about potential business models for the further development of the project.

5. Conclusions – towards a contextualised design practice – why is there a need for new methods?

Traditional design methods focus purely on solving pre-defined problems, leaving some possibilities unexplored, and limit design practice. We argue that methods, focusing on the strategic role of experimentation in the design process, informed by theory, history and research, open up alternatives to the solutionist understanding of design and foster innovation, outside of the established traditions. Experimentation and research, in this view, are not contradictory, polar categories, rather mutually shaping ones.

Design education is in our opinion a crucial framework to research and explore new design methods for industrial design, that is difficult to achieve within the industry-based structure, driven by free-market considerations. In this respect, the undergraduate studies are fundamental as they give the first insight and lay the ground for future design practice. Therefore, within our course, we wanted to create an environment in which students can explore their respective cultural identities, their memories, their experiences, their backgrounds not in a theoretical way, but in a practical one. Reflecting on how who they are, what they know, influences what they do.

Even though reflexive design practices are fostered in many other design courses (Levengard, 2019; Abdulla, 2018; Escobar, 2018; Ahmed, 2019) industrial design education is still very service and market oriented. The contribution of "Hybridity as a culture of making" methodology sheds light on how we can shift the ways of teaching design practice, creating a framework that is student-centered, history and theory informed and experimental at the same time. The novelty of the course, within the industrial design undergraduate studies, is the way of how this pedagogical approach, together with the developed design method, foster enquiry and innovation and enable students "to become active learners who engage with the world around them" (Abdulla, 2018, p. 292).

The presented approach is not an easy one, it demands from the educators and from the student's commitment to contribute to the process. This way of teaching is also much more time-consuming as students were challenged by the new way of working, radically different from what they have learnt so far. As the example of two students who looked at knitting shows, using their positions as women and their experiences working with male-dominated discipline (one is a carpenter), motivated them to inform their project through gender perspective. Investigating the history of this production method, helped them to contextualise the project and ultimately guided further design decisions. Offering a space that merges theory and practice, examines to what extent the design research conducted in parallel with the practical hands-on one, makes it possible to scrutinise projects regarding their historical, social, and technological dimensions, thereby supporting the development of the concept and the making of design decisions. Within the course, we analysed how, instead of separating design history from design theory and research from praxis, choosing an integrated educational approach extends product development through varied dimensions and perspectives, opening up a forum for discussion on the future of design and design education, within the industrial design field.

Abstract | This paper focuses on the activities undertaken by the Global Futures Lab Observatory in Mexico City (GFL/MX). The Observatory aims to provide hyper-contextual future visions through techniques and methodologies that range from critical design and traditional future forecasting to speculative anthropology. The core of the initiative is the will to address the lack of diversity within the speculative design field, heavily based on Northern European and North American perspectives. Since the start of the GFL/MX initiative in 2017, different cohorts of Mexican students have been invited to develop future scenarios in which identity and cultural factors have priority over technology and the dominant ideas of progress. In these pages, we will analyse the pedagogical model of the GFL/MX workshops. We will also illustrate some best practices for culture-based future thinking and finally, we will reflect on the students' outcomes and how they relate to specific cultural nuances.

KEYWORDS | SPECULATIVE DESIGN, DESIGN DECOLONIZIZATION, SPECULATIVE ANTHROPOLOGY, MEXICO

1. Introduction

Critical design, speculative design, design probes, and design fiction are some of the interchangeable terms that describe a particular type of design that merges product design, future forecasting, and scenario building to create fictional but credible/plausible objects, presuming certain technological, sociological, political or economic hypotheses were confirmed. The lack of diversity of most of the future visions depicted in the last decade is one of the main problems associated with these specific design disciplines. “Do we really want to foist our hates and fears on the rest of the world? Aren’t there many alternative futures out there, in the hearts and minds of silenced cultures worldwide, that we should seek out and nourish?” (Dator, 2019, p.162).

The Global Futures lab Observatory in Mexico City is a spin-off of the research project Global Futures Lab (GFL) started in 2016 by Rhode Island School of Design, Professor Paolo Cardini. The GFL aims to collect “souvenirs from the futures” from different parts of the world, celebrating different dreams, dreamed through the lens of deeply contextual and subjective speculative design exercises. The implied universality of most of the speculative design proposals produced between northern Europe and the United States in the last two decades, together with an omnipresent western technological determinism, failed in creating a pluralistic dialogue around different cultural identities and their ideas of the future.

The specific relation between temporality (time) and cultural context (space) applied to future thinking defines the boundaries of the research framework analyzed in this paper. The future can relate to space and time in four different combinations:

- **Undefined time and undefined space**
  When either time and place are unknown, we usually observe the presence of Utopias and Dystopias. Whether they picture idyllic green skyscrapers or dark underground worlds, those representations tend towards stereotypical ideas of future, often lacking cultural representations and always too far from any tangible reality.

- **Defined time and undefined space**
  Future scenarios in which the timeframe is set but lacking of any contextual information, could give birth to dominant perspectives. Different cultures have different perceptions of time and this eventually leads to different definitions of progress. The linear perception of time, for instance, is merely a Western position, while in many cultures time has a cyclical form.

- **Defined time and defined space**
  When we work within a defined time/space dimension, we usually observe a more rational exploration of implications, risks, and opportunities related to plausible future events. This is the case for foresight methods which have been used since

the first half of the twentieth century and utilize systematic and pragmatic analysis of data to extrapolate credible future projections.

- **Undefined time and defined space**
  Finally, when we have an absence of time constraints but within a defined space, we are dealing with concepts like Eutopias or Eupsychias. The first ones are attainable futures in the real world while the second is an aspirational state or inner "utopias". In the presence of a clear context definition, "If we release future from its temporal constraints, we can open a fruitful analytical path that demonstrates the role of "future" in creating everyday social worlds" (Salazar, et al., 2017, p.127).

Global Futures Lab Observatory in Mexico City (GFL/MX) is based on the last two concepts. The clear definition of the "place", or more specifically the cultural context, has been set as an indispensable condition to the various design briefs. Time, on the contrary, could switch between determined, as in traditional future forecasting methods and undetermined, as in critical design practices.

Together with Future Studies and Critical/Speculative design, speculative anthropology is the third discipline completing the pedagogical framework of the GFL/MX. In particular, the study of societies' material culture is of great interest in this research context. The creation of fictional artifacts, or diegetic prototypes (Kirby, 2010), belonging to specific future cultural contexts, can help the understanding and familiarization with those scenarios, often very difficult to grasp without any tangible representation: "Objects and tools represent a particular field of investigation; they land themselves much better to be used as keys in the interpretation of complex relationships" (Poli, 1973).

The creation of "new and fantastic" artifacts rooted in a strong cultural framework is a key element to mitigate a ruling capitalist technological determinism. Objects and products, as well as technology, when not indigenous but adopted, can be dangerous imperialistic and colonizing entities. Across design history many projects, like Papanek's low-tech radio receiver for "underdeveloped" countries (Clarke, 2018), or Negroponte's One Laptop for Child project, have sent the problematic message that everyone can't wait for the blessing of the Western culture and technology to start envisioning their future (Srinivasan, 2017, p.3).

The central concept of the GFL/MX is the search for hyper-contextual futures and the rejection of universal concepts as "commonality" or "humanness" being historically tools of white, European epistemological and territorial colonialism (Valentine & Hassoun, 2019, p.245). Moreover, fostering the creation of future visions strongly connected with specific cultural identities will encourage the passage between the passive condition of "waiting for" a pre-packed universal future to the active condition of "waiting to" the one locally thought and built (Appadurai, 1990, p.127).

2. The Global Futures Lab Observatory in Mexico City

In 2017, students from the CENTRO Advanced Design Institute in Mexico City have been invited, together with many other international institutions, to take part in the Global Futures Lab initiative participating in a series of workshops titled “Souvenirs from the Futures”. After that first collaboration, Paolo Cardini, Professor at Rhode Island School of Design, and Karla Paniagua, director of Centro’s master program in Future Studies (Diseño del Mañana/Design of Tomorrow), decided to establish a permanent Observatory in Mexico City and to include the Global Futures Lab workshops as an integral part of master's curriculum.

CENTRO Advanced Design Institute has a Futures Studies graduate program since 2015. The framework of this program provided an adequate territory for this experience, considering

> “The purposes of futures studies are to discover or invent, examine, and evaluate and propose possible, probable and preferable futures. Futurists seek to know: what can or could be (the possible), what is likely to be (the probable), and what ought to be (the preferable).
> In the words of Toffler, futurists try to create new, alternative images of the future —visionary explorations of the possible, systematic investigation of the probable, and moral evaluation of the preferable.” (Bell, 2003, pp.73-74)

The Futures Studies program consists of 2 semesters during which students learn and practice methods and techniques including Futures Wheel, Trend Impact Analysis, Structural Analysis, Causal Layered Analysis, and Personal Futures, among other pathways (Glenn & Gordon, 2009). Students learn how to choose and combine these resources, taking advantage of each one to accomplish the different tasks of the professionals futures studies (Bell, 2003, pp.80-95): the study of possible futures; the study of probable futures; the study of images of the future; the study of the knowledge foundations of futures studies; the study of the ethical foundations of futures studies; interpreting the past and orientating the present; integrating knowledge and values for designing social action; increasing democratic participation in imaging and designing the future; and communicating and advocating a particular image of the future.

The idea of setting a permanent observatory of speculative design futures at Centro, came from the interesting possibility to overlap the traditional Future Studies education offered by the program with speculative design practices and methods that usually belong to art and design environments. Although speculative design has roots in traditional forecasting techniques, it diverges substantially in means, tools, and intention. Forecasting methods, characteristic of Future Studies, use systematic and pragmatic analysis of data to extrapolate credible future projections. On the contrary, speculative design practices typically utilize a less scientific and more humanistic approach, their messages are less affirmative and more critical. Moreover, through this long-term collaboration, we aimed to use the Global Futures

lab approach, which forces the focus on local identities, to help students to avoid future stereotypes and inspire deeper attention to the Mexican context.

2.1 Activities and Pedagogical Model

Before going through any process or pedagogical strategy, is important to highlight the profile of the students involved in the workshops. The Future Studies program at Centro is highly multidisciplinary and only some of the students have design skills or capacity to use design tools. Their background can vary from marketing and strategic consultancy to design or governmental administration. This factor was crucial in planning and crafting the workshops' activities in a way to allow students to include design as part of the creative process but without limiting their visions to their actual design skills.

The Global Futures Lab workshop, led by Paolo Cardini and Karla Paniagua, takes place at Centro once a year for three days. However, after the end of the workshop, the students keep developing their design proposals with the support of the program's faculty. Each workshop is organized into three main phases: Stories, Scenarios and Products.

During their first session, students are challenged with the writing of a short fictional story. Everyone is invited to write about a hypothetical situation happening in Mexico, in an undefined future. The frame of the exercise is intentionally kept very loose and the only constraint is about the fact that the stories shouldn't talk about major systems or society at large but rather focus on everyday events in someone's life. Within this exercise, it's fundamental that the students use their first language to populate their stories with words, expressions, and behaviors, typical of their culture.

The second session is based on the exploration of details and nuances from the short stories, to better define their scenarios. This process starts with the reading of everyone's text and subsequent debate. The stories' conciseness leaves plenty of blank spaces to be filled by the creativity of the rest of the group who contribute to expanding each scenario with new and unexpected elements. Future casting techniques, as Glenn's Futures Wheel, can be utilized to help students navigate all the implications and consequences related to their future visions.

The third and final session focuses on the ideation and materialization of the diegetic prototypes. Students are asked to populate their future scenarios with fictional objects or services. Students design what the products do, how they work, who they are for, and where they exist. The final goal of those fictional artifacts is to carry the essence of their narratives and act as facilitators for conversations around students' future speculations.

2.2. Pedagogical guidelines

All the activities developed during the workshops are crafted in a way to foster original thinking and avoid pollution from pre-built ideas of future. In the following paragraphs, are listed a few pedagogical guidelines to facilitate the creation of hyper-contextual futures.

- **Preference for a loose methodological framework.**
  Nor Critical/speculative design or Future Studies methodologies are set as a rigid frame for students' creativity. The information provided about this kind of practices is mostly around their conceptual meaning and the illustration of future stereotypes created by non-contextual thinking. Students are left free to adopt whatever tool they feel comfortable with for the development of their design proposals. The soft methodological approach also helps mitigating any instructor-pupil power dynamics that can influence students' ideas.

- **Development of future visions starting from micro individual narratives.**
  Future scenarios are often a representation of system thinking and they help us understanding the complexity of the "big picture". Differently, in the GFL workshops, students start their speculations at an individual scale, they are invited to reflect on very subjective future experiences and look first at changes in people's lives rather than what we can find in the macro structures of our society. This approach promotes a human-centric perspective and alleviates the risk of cultural homogenization (Hugenberg & Sacco, 2008).

- **Use of dialectics as a tool to unveil contextual clues.**
  Group debates are crucial elements to build a solid contextual framework. Before engaging with any tangible design or forecasting activity, students are invited to "talk" about their scenarios. The conversation happening around the students' short stories represents a rich exchange of opinions about the current status of their society and it enhances reflections on identity and culture; as mentioned previously, language is a strong cultural element and one of the purest expressions of someone's identity (Bucholtz & Hall, 2004, pp.369-372).

- **Use objects as representations of identity.**
  Once the students start engaging with the creation of their artifacts, is extremely important to facilitate a semiotic and anthropological analysis of the objects. The goal is to identify the cultural elements that informed their functional and aesthetic decisions, and to detect alien features that reveal themselves to be "too generic" or "imported from other cultures". Students are invited to see objects as a direct representation of human behaviors and to culturally locate the artifact within the cultural context of reference.

3. Results: Looking for patterns

In Table 1 we present a breakdown of the results achieved by the first three cohorts of students who took part in the Global Futures Lab workshops. It should be noted that, as mentioned above, not all the attendees are designers, so a consultant on design and fabrication is assigned to accompany the process during and after the workshop.

Is fascinating to observe the variety of topics selected by the students who, let free to express their creativity beyond any rigid framework, gave voice to hopes and concerns about their future. Technology and its new dilemmas; magic, religion and spirituality; memory and identity; scarcity of resources, constitute the focus of interest and concern.

Table 1. Artifacts breakdown

Project & Authors	Description	Prototype	Main topic	Subtopics
The Arc of Life, Matilde Breña	Individual use box containing pill to assist voluntary suicide	Jewelry Box, Cardboard and fabric	Technology and new dilemmas	Civil rights
Ovotril (patented egg), Alan Sáenz	An industrial version of the chicken egg remedy used in traditional Mexican medicine to cleanse the body from the "evil eye."	Packaging Design, printed paper, cardboard and plastic	Magic and religion	Cultural heritage
Anima 1, Ana Gutman & Lizah Pesah	Synthesis of the "digital being" of a person condensed in a resin cube. The cubes are spiritual mementos of digital deaths.	Epoxy resin cubes containing various personal belongings	Technology and new dilemmas	Identity, memory, permanence
Anima 2, Alejandro Ruiz	Synthesis of the "digital being" of a person, 3D printed version.	3D printed ring	Technology and new dilemmas	Identity, memory, permanence
Spiritual fluid, Édgar Flores, Lourdes Serrano, Vicente Martínez	An application that allows practicing any belief at any time, with the corresponding rituals and paraphernalia.	UX/UI, Digital prototype	Magic and religion	Identity plasticity
Memories scavengers, Abril Chimal & Julián Flores	Plant and pot with computing device that, activated with water, tells stories about the traditional neighbourhood of Tepito.	3D printed vase and physical computing interaction	Memory and identity	Cultural heritage

Seed ring, Alejandra Rosillo	Jewelry piece inspired by the poison rings containing seeds able to conservation the genetic heritage of the traditional Mexican chinampas (floating gardens).	Digital model	Conservation of genetic heritage and sustainability	Cultural heritage
Pro-Pelle scrub, Mariana Alcocer	Cleaning and skin care system for a scenario in which there will be no water available for personal hygiene.	Digital model	Scarcity or lack of resources	Hygiene, domestic rituals
Emergency kit, Carlos Shelley	Emergency system for cases of security fail of the iris reader.	Hand-illustrated model	Technology and new dilemmas	Identity, security
Books reader, Arturo Rossier	AI algorithm that converts books into tweets	Digital model	Technology and new dilemmas	Learning
Mexican nationalism manual, Camila Anaya	Cultural heritage Guidebook containing all the mandatory precepts to be and live like a "good Mexican" within an ultra-nationalist scenario.	Book design, printed and bound	Memory and identity	Cultural heritage
Interior planter for malls. Sofía Menchaca	Indoor nature, Bio domes and Indoor gardens for the built environment	Hand-illustrated model	Technology and new dilemmas	Sensory perception
Itinerant empathy pavilions, Sophia Arrazola	Ubiquitous learning experience that fosters an emotional and empathetic connection with the urban environment	Cardboard model and illustration of the learning system	Technology and new dilemmas	Emotions
Universal voting system, Mauricio Hernández	New post-political parties' election system based on goals-based anonymous electoral programs	Cardboard model of the voting booth and ballot's material	Technology and new dilemmas	Democracy and civil rights
Talent assessment system, Mariana Nuñez	Talent self-assessment system to facilitate the hiring and training of human resources	Cardboard model	Technology and new dilemmas	Human talent management
Indigenous genetics bank, Jesica Bastidas	Institute that preserves the genetic heritage of the indigenous people of the country.	Cardboard model of an ultra-safe DNA bank	Memory and identity	Cultural heritage

Powder food display, Fernanda Rocha	Speculation on the future of food in which synthetic powders will replace traditional meals.	Cardboard model of food packaging and distribution unit.	Technology and new dilemmas	Sensorial perception
Dictionary of gestural and somatic terms, María Eugenia Cué	Emotional Thesaurus to help navigating human feelings during social interactions.	Cardboard model	Memory and identity	Communicati on
Internal tourism system, Carlos Buenfil	Experiential tourism kit for a scenario in which psychotropic consumption in Mexico is legal.	Cardboard model	Technology and new dilemmas	Sensorial perception
Transcultural tour, Diana Espinosa	Digital simulator for tourism in traditional Mexican villages	Cardboard model	Technology and new dilemmas	Cultural heritage
Pocional, Elena Cruz	Emotional experience enhancers. Psychoactive remedies to restore our ability to “feel”.	Blown glass prototypes	Technology and new dilemmas	Emotions, Alternative medicine

Through the analysis of the available data, we can cast a few observations. The discourse around innovation and technology, and its long-term consequences, represents a recurring concerning theme in the students’ work. The preservation of identity, heritage and memory are also critical and recurring topics, mostly fostered by the fast and vertiginous changes of the Mexican society, especially in consideration of the richness of the local cultural heritage.

Interestingly, some of the projects express political concerns, specifically the work produced during the workshop held in 2019. This data is pertinent if related to the social climate at the time of the activities. The workshop happened just after the latest presidential elections, a political tide that clearly permeated students’ future thinking and their models: challenges about how to achieve transparent and democratic elections or concerns regarding a totalitarian state, were central topics.

Although present in a smaller quantity, magic, religion, and scarcity of resources are other significant speculative subjects. Both are well tight with the Mexican context and they represent strong cultural reflections. Magical and spiritual thinking still holds a particular place in the present society and they represent a tangible connection with pre-Colombian beliefs. The latter, together with the present environmental crisis, has been also the input for a reflection on the detriment of nature and its consequences.

Below we refer to three particular projects that we consider deserving special attention.

The Arc of Life (Cohort 2017)

The artifact in Figure 1, entirely hand-made with silk by fabric designer Matilde Breña, corresponds to a future scenario in which suicide is no more a taboo. In Breña's future, when citizens turn twenty, parents give their children this personalized jewelry box-like little cabinet. The box has small drawers for the storage of personal memories such as the first tooth or the first strand of hair. Through a fingerprint reader, the young adult has also access to a suicidal pill, a single lethal dose to be used at personal discretion. The speculative context of the Arc refers to the normalization and legalization of euthanasia.

Figure 1. The Arc of Life

The event, during which the box is given to the children, is also part of the author's speculation and it is inspired by the Mexican folklore's rituals. The presence of the family as the core emotional element of the narrative, together with the aesthetic of the objects, far from any techno-dystopian image, provide the project strong cultural references and matches perfectly with the local context.

The Mexican Nationalism Manual (Cohort 2018)

This heavy and thick book, leather-bound, with sewn folios, presents a design inspired by authoritarian and ultranationalist regimes (Figure 2). In all its elements, from typography, iconography, to the colour palette, the manual suggests the presence of a dictatorial power with the agenda of preserving and protecting the Mexican heritage. Created by Camila Anaya, and assembled by a local bookbinding master, the book is illustrating all the rules that the future citizens of a totalitarian future must observe for living, thinking and behaving as “proper” Mexicans.

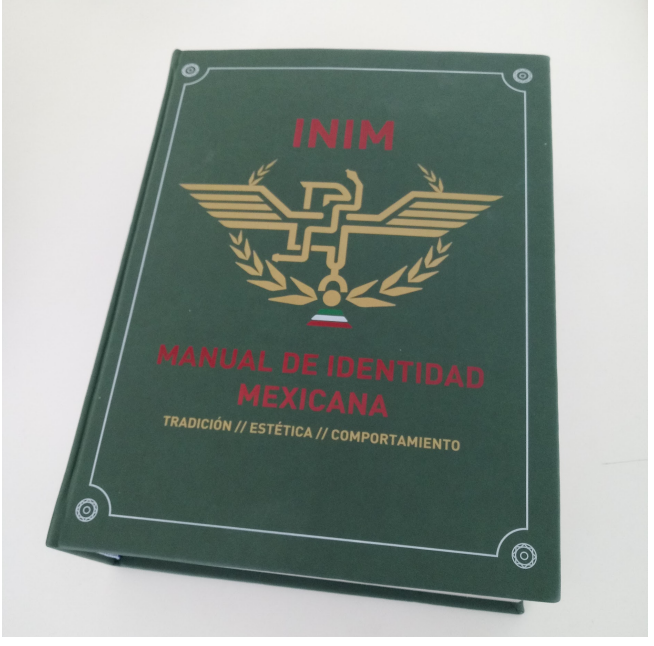

Figure 2. Mexican Identity Manual

The dystopian tone is evident in this speculation but there is also a laud invite to reflect and discuss the relation between tradition, identity and cultural evolution. At a time when there is a lack of identities in the global context, the author explores the opposite side of the spectrum where the noble intention of cultural valorization turns into a repressive system of cultural homogenization.

Pocional (Cohort 2019)

The term "pocional" results from the fusion between the words "potion" and "emotional". This scenario, developed by Elena Cruz, merges traditional esoteric practices, psychotropic

drugs, and mainstream medicine. This project forces the attention to the increasingly complicated relationship between humans and their feelings. In Elena's vision, the predominance of digital interaction, the loneliness and individualism characteristic of the present society, will result in humans' limited capacity to experience and feel. When the time will come for artificially induced emotions, everyone will receive a bottle for each major emotion: joy, anger, surprise, disgust, and fear (Figure 3). Those bottles will represent our life-long emotional capital which everyone will have to manage and use wisely.

Figure 3. Pocion *al Bottles*

4. Conclusions

To conclude, the archive of future visions created within the Global Futures Lab Observatory in Mexico City offers a rich framework for some reflections.

From a methodological and pedagogical perspective, the overlapping of critical design practices with traditional forecasting technics and speculative anthropology allowed students to move with a certain agility and unleash their creativity. Critical design and speculative anthropology, through the use of highly subjective micro-narratives, made possible to keep the focus on the specific cultural context. From a more pragmatic perspective, according to Wendell Bell's tasks for Futures Studies, we observe that the workshops contribute to some of them, including the study of possible futures, probable futures and the study of images of the future. We also observe that while some of the projects are deeply rooted in the fictional/speculative realm, they could be developed further towards more plausible solutions.

From a content standpoint, while the different themes selected by the students precisely capture the zeitgeist of the current century, they are also extremely contextualized representations of global concerns. Is worth to be noted that the conversation around progress and innovation that happens in the students' proposals is not following the traditional path of blind technological determinism; it is rather leaning towards a more interesting cultural determinism in which the contextual framework informs the use of certain technological opportunities.

Finally, reflecting on the challenges fronted during the GFL/MX program, we can identify sometimes a discrepancy between the quality of the students thinking and the quality of the produced outcomes. Physical artifact offers a valid opportunity for communicating and debate around future scenarios otherwise difficult to communicate. However, the limited design skills of most of the participants can make difficult the passage from the concepts to their representation. This problem has been partially mitigated by the help of Centro's support faculty and external design experts who assist the students in the creation of their artifacts.

The Global Futures Lab Mexico City Observatory will continue to collect students' hyper-contextual visions and report on the cultural significance of those contributions.

Learning and Differences reciprocally shared and validated: A decade long Participatory Design collaboration between KG Elementary School and AD University

Raymond Patrick Zachary Camozzi, Helene Day Fraser, Caylee Raber[a]

[a]Emily Carr University of Art and Design

Abstract | Imagine the feeling of successfully transmitting/sharing your wildest ideas with others, when communication is one of your largest hurdles. Over the past decade, the King George Elementary School (KGES), a private K-12 school that serves children with learning differences, including autism, dyslexia, anxiety, and ADHD, has worked in collaboration with second year industrial design students from ADU (ADU). This participatory design project that includes mailed creation kits, generative activities at KGES, user testing, and presentations within the KGES community, investigates how co-design could help K-7 students with learning differences. This paper focuses on the evolution of the annual design collaboration process and its residual impact on both students and faculty. In both institutions, individuals are given means to express, communicate and envision in ways they never expected. Design is shown to support embodied learning, using making, movement, and sensory cues to foster students' expression and agency.

KEYWORDS | LEARNING DISABILITIES, PARTICIPATORY DESIGN RESEARCH, AGENCY, EMBODIED LEARNING, CHILDREN

1. Project Overview

Over the past decade, the King George Elementary School (KGES), a private K-12 school that serves children with learning differences, has worked in collaboration with undergraduate and graduate design students from (ADU). The partnership, seeded in 2010 through an initial project that investigated how textile-based objects might help grade 7 students with learning differences, now supports a range of projects on an annual basis. For members of this K-Masters studies level community, it provides valuable sites for change and agency. Students and faculty from both institutions are given means to express, to communicate and to envision new unanticipated outcomes. Within the collaboration, there are three annual projects, and over its ten-year lifespan the project partnership has included approximately 150 KGES students; 170 ADU undergraduate students; 9 ADU graduate students; 15 KGES faculty and staff; 5 ADU faculty and staff.

For the purposes of this paper, the project discussed is the KGES and ADU *classroom collaboration*. Annually an elementary class of KGES students engage in a participatory design process with a second-year Industrial design studio from ADU. ADU students are tasked with developing a prototype that supports the learning of their KGES participants. Through this collaboration KGES students, also referred to as co-creators, explore self-expression through the design of tools for their own learning (Figures 1, 2, 8, 9).

2. Research Methodology

This document is a retrospective review of the classroom collaboration over the past ten years. It pulls insights from two main sources, including:

1. Six Interviews with project stakeholders, on both the KGES and ADU faculty.
2. Review of reflections on ADU student process, which was completed for all years of the study. Each year is its own cross section.

These lived experiences are relational and strong interconnected themes emerge from the data collected. Insights in this paper are based on human experiences and feelings, carrying valuable reflections for the design community. It shows that design research itself can be a vessel for community building and collaboration. That health through design takes a committed effort over time, and that design can envision itself in longitudinal studies. Following KGES or ADU students, after they have engaged in collaboration, would be helpful in furthering this research.

3. Contribution from Participatory Design

The classroom collaboration applies Participatory design, a strategy within design practice that prioritizes contributions from stakeholders across all stages of creative practice (Mattelmäki, 2006; Sanders & Stappers, 2008). Within this collaboration students, faculty and staff, from both KGES and ADU, all act as key contributors to the project. The KGES students' lived experiences, stories, thoughts, and tangible actions are not only collected and observed by the design students and faculty but also discussed and built together through acts of collective making and reflecting. Though, the KGES students are the primary contributors as they bring "fresh ideas and idealistic views to the design process" (Rigolon, 2011). They criticize the perspectives and assumptions of the ADU students, through how they engage, often exposing views that adults move beyond with little thought (Rigolon, 2011; Sutton & Kemp, 2006). These can be crucial moments for ADU students.

Participatory design in education can be labelled as efficient for design practice, rapidly producing novel and innovative concepts (Yalman & Yavuzcam, 2015). This approach is aligned with industry and prioritizes developing skills in design (Schepers et al., 2017; Read et al, 2014). Alternatively, it can also be linked to place making (Rigolon, 2011), identity and self-confidence of participants (Schepers et al., 2017; Mazzone et al, 2010). In this second scenario participatory design processes a range of design research and development activities, supports not only problem framing and action towards new ways of being, but through verbal and non-verbal dialogue exposes layers of complexity or latent issues (Moline, 2014). It often ends when a goal, re-defined through the process, is reached. This can be artefacts, but "genuine participation should generate knowledge in the children, enable their voices to be heard, impact decision-making and empower them" (Schepers, et al., 2017, p. 2).

Smith and Iversen discuss scaling participatory design to support "engaging people in the complex acts and networks involved in contemporary social […] transformations" (2018, p.10). This decade-long research project has scaled to include Master's students, professional development for teachers at KGES and within the Vancouver school board, and continues to be a research catalyst for several faculty at ADU. Additionally, the structure and intention of the collaboration has been applied to other projects within ADU's Health Design Lab.

Scaling participatory design work requires scaffolding design and research goals while keeping in mind that often the heart of major insights comes from the trusting relationship between the designers and participants (Smith & Iversen, 2018). These research projects are aligned to scale further, beyond continuing to support social and ethical interventions in the schools and within the practices of ADU students when they graduate.

Figure 1. Creative Cloth by Student1 (2018) supports drama curriculum. Each CreativeCloth contained ornaments (moon, bolt) and notions that could be interpreted as both a character or connected as a background.

3. Classroom Collaboration Overview

Started in early 2010 as a studio-classroom partnership, the project paired Faculty 1's second year industrial design students with KGES grade 7 students in order to develop learning tools through the power of participatory research in design (Author 1, 2019). KGES balances social and open learning within the classroom with individual instruction for students to achieve specific literacy and math goals. Faculty 1 recognized that many KGES students need to move, they use kinaesthetic and auditory cues to support their learning. This mirrors curriculum in industrial design, where students are required to experiment with materials to understand ways of knowing. Touch, sound, temperature, texture and many more factors affect the emotive properties and our connection to objects. Designers prototype as a way to think through problems and situations, this means that literacy and math may be equivalent in importance to manipulation, motion and physical creation (Author 1, 2017; Root-Bernstein, 2013). Faculty 1 recognized that KGES and ADU students had much to share through these types of interactions that make up embodied learning. Arguably, this affinity to embodied modalities of learning is the reason why the collaboration has continued successfully for a decade. The project outcomes, during this time, have shifted based on the annual research questions posed and the diverse range of KGES students engaged. They include: musical instruments that enable KGES students to express and communicate in unique ways; chairs that support motion and hand movements required for embodied learning and concentration; play devices that support social connection. Each project speaks to the context discussed by the KGES co-creators, situating them as agents in the process.

Figure 2. RingSeat by Student2 (2017). The flexible fabric seat on a steel role cage recognizes that the ability to move supports learning for many students at KGES.

Faculty 1's initial structure has continued successfully with minor variations over the project's lifetime. Each Spring semester ADU students are introduced to learning differences and given an opportunity to learn about the children they will be working with by a KGES teacher. Often this brief is done by the teacher of the previous years, giving them the opportunity to reflect on the project and disseminate some of their own learning. With this base in place, the ADU students begin working in groups of two to develop design probes for their two co-creators at KGES; within the partnership, we call these probes co-creator kits (Figure 3). This is a medium for initial introductions from afar and also sensitizes the KGES students to the types of activities that design researchers might engage in. The word research is not well understood at the K-6 level and often the assumption by KGES students is that they will be observed or asked direct questions. But design probes (Mattelmäki, 2006) generally consist of three to five making activities, and an opportunity to share some personal interests through mapping, photography or mark making. In late January of each year, the ADU faculty member (Faculty 1, Faculty 2) delivers the ADU Probes to the KGES students, along with an introduction talk on what designers do, and an invitation to participate. Over the following two weeks the KGES students work through the design probes before their interpretations are returned to the ADU students.

Figure 3. Co-creator probe Student3. Probes sensitizes KGES students to creative activities and often include text, art supplies and other forms of making (2019).

After the probe exchange, the ADU students use the KGES responses to support their initial in-person visit to KGES. In mid-February, the ADU students spend half a day at KGES being introduced to their co-creators and the school. They engage the KGES students in more participatory design related activities, often including some sort of world building as a way to share content about each other's daily life and personalities. Figure 4 shows how is spontaneous a part of this work. It clearly suggests that conversation continues and relationships between the KGES and ADU students are developing.

Figure 4. In early interactions at KGES some students start by creating forts. This known and relatively risk-free activity allows students to discuss needs or comfort, building the initial conversations that shape much of the final work (Student 1, 2018).

With this experience under their belt the ADU Students return to the studio to work on research synthesis, design ideation and concept generation. The following third and fourth interactions between the co-creators become a messy balance between imaging possibilities and creating prototypes to discuss and test. One of these interactions occurs at ADU University where the KGES students get the opportunity to learn how the prototypes have been made. Through the course the children's responses and contributions are taken into account and used for the final refinement and revisions of the ADU students designs. And after three months working on the project, ADU and KGES students present their final design outcomes to the KGES community (Figures, 1, 2, 8, 9).

Since 2018, ADU Faculty, Faculty 2 has led the project. By exposing their expertise and experience, Faculty 2 has shifted the emphasis into the school yard. In asking ADU students to consider and find means for activating outdoor spaces for self-regulation and learning. Faculty 2 links the exploratory nature of design with physical exploration of a specific context: the school grounds. Here, the risks that design can take become obvious to more than just the KGES classroom participants; fear of failure, judgment, being physically uncomfortable in a new context, pushing boundaries and testing how materials can be used (Faculty 2, 2018). The entire K-12 school community gets glimpses of the often-chaotic process (Figure 5) and are able to provide feedback as the objects and environments are re-created by the KGES-ADU student teams.

> “kids often don’t understand how the things they use everyday went through an entire sequence of steps, [through this project] they see the original thing reshaped and reformed” (KGES Faculty3, 2019).

Figure 5. Messy Suits by Student 4. Seeing this chaos from a distance looked unproductive, bordered on vandalism, and was disruptive. ADU students confirmed that "fatigue from the physical activity helps down-regulation" (2019).

4. Impact on KGES students

A key driving benefit to the collaboration is showing the younger participants a future path in post-secondary education. Over the course of the twelve-week project, KGES and ADU students build strong relationships, their input is listened to and valued by ADU students. These mutual relationships involve mentorship that sits outside of the usual student-teacher format found in the K-12 environments. Alexandra Lange, the author of "Design and childhood", writes about how materials, products and the built environment influence child development at home and in the classroom. She notes that teachers are often expected to be guides or sources of information and that this creates a hierarchy that would directly bias the participatory design process (2018, 9). Co-creators, in this case KGES students, need to know that their input is what the designer is looking for and that anything may be relevant even if it potentially tangent to the task in progress. This approach is often new for children and their teachers, who are more accustomed to prescriptive outcome-based art-piece projects. Rather than aligning this work with teaching specific competencies, which may not allow for open-ended or self-initiated work, the project invites KGES students and teachers to embrace the unpredictable.

ADU students become seen as peers by the KGES students and this difference produces a unique type of engagement with the projects. The KGES students quickly perceive this difference and space of exploration that is non-assessed or errorless (KGESFaculty4, 2019). This freedom from assessment, in turn, opens the door to unbridled creativity. Combining this with the facilitation inherent in participatory design supports directing that creative output toward the projects. Just imagine the feeling of communicating your wildest ideas, when communication is one of your difficulties. ADU students are forced to re-evaluate how

they reach their co-creators, often moving away from text-based content towards manipulatives and creating meaning through form building and prototyping (Figure 6).

> "[KGES students] struggle to find ways to communicate their ideas. This is a tremendous vehicle for a lot of them. It is a way to show people what they understand" (KGESFaculty1, 2019).

Figure 6. Ambi by Student3. Ambiguous objects supported the co-creators in expressing themselves through how they stacked, placed, and manipulated. (2019)

By the third interaction KGES students take ownership of the projects but also find the mentorship and attention that comes from the older ADU students extremely exciting. KGES students literally drag ADU students around, showing them the extent of their understanding of the world on the KGES grounds. These interactions open up new and exciting conversations that would not happen from a distance or by reading about learning differences in a textbook. As we see it, the younger KGES students unwittingly give the ADU students the exact types of insight that most designers are looking for. Not the scripted answer to a survey question, or the one that makes them fit in, but feelings and responses that come from a deep understanding of their own situation. There is an ongoing desire to share thoughts, that builds as the term progresses.

They are advocating for their ideas and helping to shape the outcome. Through the collaboration KGES students become seen as the experts in their own learning. They may not always be able to articulate this expertise with words but certainly do it through actions.

How they think with the objects the ADU students bring to KGES. The definitions of their learning difference, become an aspect of the behaviours or feedback that influences the project but not the reason for it.

Figure 7. Group collaboration at its peak. Students from both ADU and KGES form strong bonds that support listening and collaboration.

Many KGES students are anxious (KGESFaculty1, KGESFaculty4, KGESFaculty3, 2019). They left the regularized school system because they needed a fresh start to rebuild their confidence and get direct instruction on strategies that support them in at least one area of formalized learning. KGES "students don't want to fail because they have failed so many times in their last school" (KGESFaculty3, 2019). For this reason, acceptance of mistakes is not typically a trait observed in KGES students. Difficult tasks might require movement around the room or school, sometimes even resulting in frustration or outbursts. ADU students model process which is active, requires failure, reframes problems and builds empathy for others. It is unclear if KGES students can explicitly share that these skills are transferred to them, but ADU students do reflect on their own learning in this way through the reflections they submit at the end of the term. This suggests that through the process of the project KGES students may also move toward being emotionally ready to initiate work independently (KGESFaculty4, 2019). This is present in small self-initiated projects that the KGES students create for the ADU students between visits, whether drawings, sculptures or simply ideas they share immediately upon ADU students return.

> "It's brought out their creativity that they've always had but have felt they can't explore in a typical classroom because they are not willing to make a mistake. And here that ability to make a mistake is really just completely mitigated by the fact that you're supposed to; it's part of the entire process" (Author3, 2015, p.52).

Figure 8. Tempo Totter by Student4. Tempo totter is a stool that channels energy though both hip and hand motion, producing a range of tones for musical output. (2019)

When the project reaches its final weeks, many ideas have been realized into physical prototypes (Figure 1, 2, 8, 9). KGES students often interpret the ADU students' prototypes in an unexpected way. They play, connect, shape and change them, shattering ADU students' assumptions of how they would be used. This is an important part of design and design learning for all students. As these mash-ups, linked to values, often lead to innovation. Sometimes at this phase of the project ADU students feel disappointment, but it is not the same type of disappointment that a KGES student feels doing rote or outcome focused work. It also is not that the ADU students failed to listen. It is just that, to make some of these ideas' tangible, students have to work within their skills and the material production limits of ADU University. The key here is that both KGES and ADU students have to grapple with compromise, not all ideas are immediately possible. They begin to recognize that the outcomes are just one of many possibilities to define the project. It is extremely freeing to know that there is a different kind of right answer in the world, answers that can revolve around our own criteria, current limitations and context.

Figure 9. Wing-it by Student5. Wing-it are field game pinnies and soft projectiles that re-envisioned how we get tagged and where in dodgeball style field games. Students at KGES developed their own rules and ways of playing. (2019)

The final presentations occur at KGES and allow the students to show pride in their work, they have the opportunity to engage peers from other classrooms. This serves as an important means of giving credence to the KGES students' own creativity and input. This sense of accomplishment that comes from actively and deeply engaging with the projects is modelled by the ADU student's own engagement in the project (National Research Council and Institute of Medicine, 2004, p.32). Additionally, through this initiation into design process, the KGES students' tendencies to make, explore and be active are validated. The project shows them a possible path through post-secondary education in design or art. A career path or practice that may have previously been unknown or seemed out of reach. Currently, in the 2020 cohort of this project, there is at least one ADU student who graduated from KGES. Unique learning styles can easily and positively be applied to creative thinking.

> "The acts of making, that designers find so satisfying, is built into early education, but as they grow, many children lose the opportunities to create their own environments, bounded by a text-centric view of education and concerns for safety" (Lange, 2018, p.9).

5. Impact on KGES Faculty & Staff

Design as a curriculum topic was introduced in British Columbia in 2015, situating KGES faculty in a unique position through this collaboration. KGES fosters an environment that allows students to advocate for their needs in learning, and placing design into their pedagogy was a means to this end. Design was not integrated at KGES because it was prescribed, it was integrated to suggest that there are alternative ways of teaching curriculum that might be more appropriate to the types of learners they cater to. Design

supplies a way to instruct that supports students in “determining what they need to learn” (Gini-Newman, & Case, 2018, p.8). The head of School, KGESFaculty1, has come to understand what this collaboration brings.

> “There is a great deal of learning on our end. I know for our teachers it is about the design process and thinking outside the box. It gives them ideas, and an offbeat way of looking at the things they take for granted. It is an enriching learning experience as much for the staff, as it is for the kids” (KGESFaculty1, 2019).

This comes with some difficulties or costs to others in the school. Design is a way of working toward change and, in its open-ended exploratory mode, can often be quite disruptive in the school environment. The projects have been interrupted in more than one classroom, they are often loud, can damage the grounds, can be perceived as unsafe or simply take up space. Even more frustrating for some faculty and staff participants is that at times design exposes issues but does not necessarily resolve them. In many contexts these hurdles would be enough to end a project. These obstacles, which in the early years of the partnership may have been perceived as a reason to stop, are no longer perceived as such. The culture of the school supports the collaboration and its messy, unpredictable and sometimes misguided approaches. Designers are not all teachers. “The experience is so rich for us that it does not matter if we have an off year or a misalignment” (KGESFaculty1, 2019); the collaboration is resilient.

The collaboration has introduced students, faculty and staff of KGES to design, and methods of inquiry integral to the design process; Design brainstorming, ideation, making as thinking and participatory design theory have been made accessible to KGES. Participating faculty are integrating aspects of design into their own pedagogy and this helps them experiment with augmenting learning through objects and physical environments.

> “I’ve come to understand the design process a little more. It is constantly sprawling back, looking at new designs, improving, and getting ideas from the most interesting places” (KGESFaculty2, 2019).

6. Conclusion

ADU students' education is enriched with aspects of sustainability as it relates to social equity, place-based learning, context driven design and even the use of materials that are likely to result in their graduation. Often ADU students engage in Participatory methods for social transformation for their final year capstone project. Further research on this possible imprint is being conducted in 2020-21.

ADU’s Health Design lab has seen how these benefits to students and partners can be ported into two other partnerships. The first project, of three years, continues to support cross-generational knowledge by asking ADU Communication Design students to co-design publications on the life stories of the elderly residents in long term care. The publications are

available for future residents, family members and the care team (Author 3, 2019). And the second project, of two years, pairs communication design students with individuals with visible and invisible disabilities (Author 3, 2020). The KGES partnership structure and model has built awareness that long-term partnerships build community and support health across its spectrum. Over time, the first and second projects will be about health through design as much as the KGES-ADU collaboration is.

For the last ten years this research has evolved to include ADU Industrial Design classrooms, research assistants from both the undergraduate and graduate level and within KGES faculty, students, librarians and specialized tutors. KGES students show confidence in their way of being in the world, ADU students grow their understanding of design process beyond simply making artefacts. Faculty at both ADU and KGES supply avenues to support student growth through this open-ended co-design project, and as a result this community is changing, toward a culture and built environment that fosters student expression. A lot of learning occurs on both sides of this collaboration that comes from a unique relationship, developed through process. It is a model of design pedagogy that could be beneficial for any design classroom.

On (un)becoming in Design Academia: A Coloured female's autoethnography

Cheri Hugo

Cape Peninsula University of Technology
hugoc@cput.ac.za

Abstract | This paper draws on an auto-ethnographic exploration as part of my PhD study. In this paper, I respond to the question: "how did my earlier lived experience of exclusion informed my (un)becoming a Design academic in higher education in South Africa?" I explain how I became aware of my exclusion due to my race, gender and my social economic situation at a young age, by a system designed to exclude none white people, like me. Further, I unpack how this system has impacted on myself worth, on my readiness and struggle for post-graduate education opportunities. I demonstrate how this lived experience of exclusion has informed my higher education teaching. My academic undertakings hold strong values of inclusion, equality and social justice. I retell my journey, highlighting the effects of this legislated racial exclusion through the struggle for inclusion.

KEYWORDS | AUTHOETHNOGRAPHY, RACE GENDER, DIVERSITY, INTERSECTIONALITY

1. Introduction

At a workshop of Design educators in Cape Town, Western Cape, South Africa, a colleague makes a comment to me about the lack of "historical specificity and political analysis" in the work of educationist in study, work and everyday life (Lave, 2012). It is my opinion that this same silence continues in the fields of Design Education where I work professionally in High Education, as a teacher; as an emerging researcher involved in higher education in South Africa (a country where higher education and access to higher education is deeply political). South African education has a long history of political interference and struggle. I am particularly aware of how history and the past inform and experience the present along with its aspirations. In this paper, I am commenting on individual's past and how these paths can inform present professional identities, practices and values. Writing about this, I discover some silences about the link between politics, the past and my professional life. I also provide a setting, of my experience growing up in South Africa, as an auto-ethnography. In doing so, I offer my understanding of the remaking of social order, however ever small its impact my be.

I write about my younger lived experiences as part of my PhD series. In this paper, I focus on when I became aware of how I was excluded by race and gender from educational opportunities. An introduction to my younger self is depicted in this work to provide background to my PhD work. This sets the stage for the struggles I now face during my post-graduate studies in (un)becoming a Design Academic and its complexities as a woman of colour in higher education. Further, it illuminates how politics, the past and histories are involved and the struggle I face in my professional identity.

1.1 Context for the narratives

Apartheid and I were both in trouble in 1980's. The Republic of South Africa was experiencing birthing pains that would set off a decade of events and that eventually would shape its history. As I was gasping for my first breaths from an unwanted womb, on the hill in Bishop Lavis (figure 1), popular protest by the masses of ordinary South Africans against apartheid education and other related issues reached new heights in '80s (figure 2). The government at the time responded with extreme brutality, equal to the life in the popular Cape Flats, in the Western Cape, South Africa. The apartheid legislation at the time was efficient both in excluding the majority of South Africans from a range of human rights, and in preventing all South Africans from having social relationships with each other (Hoosain, 2013). The topic in which they were most successful and which had the greatest impact, was excluding the majority of South Africans from quality education (Salo, 2007).

Who I am is defined by my childhood, growing up during the final years of apartheid. My family was forcibly removed from District 6. Thereafter, they were unwillingly placed into a gang infested, poverty stricken, coloured township in the Cape Flats. But is defined also by finally attending and teaching at a University of Technology in the Western Cape. A journey

of becoming and (un)becoming a scholar and a teacher of Art and Design, in a highly political, racialised and gendered environment through a PhD program. This paper hopes to be part of that journey.

The objectives of this paper are to help understand the journey of women of colour in academia. Further, it may offer valuable insights into culturally situated, complex (race and gender), multi-layered, relational identities of women of colour (Reinharz & Monroe, 2017). In this diverse and complex space in Design Education, the research takes place and is ongoing.

The significance is to understand how a childhood event may impact the life journey. How is experienced the process women of colour go through to negotiate their identities in Design Education and the lack of diversity in Design Education (Akama & Barnes, 2009). Additionally, the study considers the individual (myself) as the subject of the study, which normally, in Design would be focused on the artefact. A focus of my lived experience of exclusion becomes the focal point, and the journey becomes the design process.

Figure 1. Bishop Lavis," Die Bult" (the hill) 1980. On the other side of this street there was my birth place, four houses away from my church to the left, my house and local super market to the right. This was also neutral gang turf. Also, the first wall I drew on.

Figure 2. Grassroots newspaper report on the 1985 protest increasing.

2. Methodology

Through a reflective auto-ethnography, I make sense of my personal lived experience as post-graduate student, Design teacher and woman of colour, in a post-protest environment. I explore methods that enabled me to know myself. I use auto-ethnography as a detailed depiction of my internal conversations and the conversations with others in the process of excavating my journey of becoming and unbecoming a Design educator in a post-protest context (Tuhiwai-Smith, 1999; Ellis, 2003).

I value my own beginning, and therefore I am in the position to have authority in my work and to identify who I am in relation to others. In order to know myself and to understand who I am as a post-graduate student, I must start from the beginning, when I first became aware that I was different and not white not enough. As an emerging academic professional, I dedicate my work to auto-ethnography as a research method that embraces reflection, responsiveness, transparency of the researcher (myself), relational awareness and conversations between my practice and my research (Pillay, et al., 2016).

In this paper, I reflect critically on memories, photographs, documents and inner dialogues by freewriting (Chang, 2008) to provide an account of my lived experience (Korabik, et al., 2008). I obtained ethical clearance through institutional channels but also from my family to use some of our family photographs included in my study. My family were able to assist and be part of my PhD study by searching for photographs and telling the stories and events that impacted my life. They were proud that our family photos, history and generational stories would have value. This motivated them to tell their own stories and maybe to continue to

write about some of them. I act with care and awareness by removing or renaming characters in this paper as I am aware of the impact any identification may have on other people mentioned in our stories and those who may read it. I am also aware of my focus in this study as a woman of colour and the implications that may arise from the complexity of this narrative.

3. Framing my narrative in identity, intersectionality and auto-ethnography

3.1 Coloured Identity

The fact that South Africa is such a culturally diverse country, meant that individuals of multiple ethnicities were given an intermediate status. Therefore, the term "coloured" refers to a person of "mixed-blood" (Korabik, et al., 2008). Before apartheid laws were implemented, people of colour usually mingled with Europeans and adopted some of their culture and identity (Montero & Sonn, 2009). According to Ratele and Duncan (Ratele & Duncan, 2003), coloured identity is viewed as a social construction of the apartheid regime. It was crucial for the apartheid regime to de-emphasize the African roots of the coloured person, and to promote the idea of an independent separate coloured identity. Boddy writes that coloured people are a community that cannot be considered white nor black (Boddy, 2009). Thus, this conflicting situation placed the coloured community of South Africa in a rather dangerous position between the oppressor and the majority of people that were oppressed. However, including coloured South Africans in the group classified as white was just as complicated, because it tainted racial purity. Thus, coloured people were regarded as second-class citizens before and during Apartheid. In conclusion, clinging to colouring as a racial identity is full of complexities. Davis summed up the situation regarding the complexity of colour identity as "South Africa's coloured community has remained marginalized by history and even historians" (Davis & Johnson, 2015). One can argue that the way colouring is currently perceived leaves little hope for future generations to see themselves represented in a positive way in the new South Africa. However, according to Erasmus (Erasmus, 2001), colouring has infinite possibilities for transformation. She warns against limiting colour identity as it is trapped between black and white identities.

3.2 Intersectionality

Kimberlé Crenshaw, law professor and social theorist, first coined the term intersectionality in 1989 (Crenshaw, 2017). The theory emerged two decades earlier, however, when black feminists began to speak out about the white, middle-class nature of the mainstream feminist movement. Many black women found it difficult to identify with the issues of the mainstream (white) feminist movement, issues such as the pressure to be a homemaker. Black women, who often had to work in order to keep their family afloat and therefore

without the luxury of being homemakers, did not feel as these issues pertained to their experiences. At the same time, many black women experienced sexism while participating in the Civil Rights movement and were often shut out from leadership positions. This intersectional experience of facing racism in the feminist movement and sexism in civil rights encouraged black women to call for a feminist practice that centralized their lived experiences (Mirza, 2014; Mackinlay, 2019).

3.3 Auto-ethnography

This paper uses auto-ethnography, a critical reflection on stories from my life, in particular about my younger years. This method advances our understanding of possible alternative narratives and uses of visuals (photography, imagery and freewriting) in qualitative research (Pensoneau-Conway, et al., 2017; Ellis, 2003; Holman Jones & Pruyn, 2018; Gachago, 2015). These methods have been used to study changes in life situations, ideas, self-perception and in shaping displaced identities (Hoosain, 2013). I use these methods as previous research states that, into the literature, there is a lack of insight about doctoral research that recognises the different experiences that come from the researcher's life (Richards, 2015).

3.4 Generating my narrative

This struggle for quality reignited during the student protests of 2015, 2016, 2017, and the gender-based violence protest of 2019 in Cape Town, South Africa (Gouws, 2017). During these times of protest, opportunities arose for research about continued inequalities in society, in particular in the field of Design Education (Armstrong, 2009). One such opportunity arose for me, undertaking post-graduate design studies and understanding that power in education plays a role in learning, even for academics (Boler, 1999). As an emerging researcher, I investigate my own academic journey as a woman of colour, designer, and teacher in higher education, in post-protest times defined by a shift in how young people of colour, and in particular the so-called 'Coloureds', see themselves and engage with each other and the world. This questioning about myself, was sparked by the Stellenbosch paper about coloured women and their low cognitive function.

I decided for a reflective narrative approach in which I write up the story of my life, focusing on my early life and the impact of where I grew up. I wrote mostly at 3 am after this method was suggested to me by my supervisor, when I complained that I had nowhere to write that was quite enough given the ensuing commitments of being a mother of three young boys, a and all the other responsibilities we have as women. Holding all the struggles we have as women of colour, to be able to do it all (mother, career, research, designer). I wrote about how angry for the depiction of coloured women in the Stellenbosch paper; the rage for how and why I ended up in a poor area of Cape Town. I wrote about the political system that kept us there and how it was designed. I presented these at SAVAH 2019 conference, Defsa 2019 and used it for the application to my PhD.

3.5 Analysis of the Autoethnography

The primary goal of this paper is to understand how identity and self-perception changed along my journey in academia. Drawing on auto-ethnography, I investigate my awareness and adaptation to academic culture and social system and my growth in academia (Ellis, 2003). The ongoing struggle of people of colour, in particular women, for a place to breath, for recognition in academia, continues to be a story that pushes against dominant narratives in a context defined by masculinity and race (Salo, 2007). Research like this offers alternatives that disrupt the current status by offering a women-focused narrative. Additionally, cultural production and approaches to diversity in Design Education for academics has not been fully explored (Akama & Barnes, 2009).

From the critical analysis of my stories various themes emerged, which I will fully unpack in my thesis. For this paper the themes that started to emerge, even as I was writing, is the one I explain here, only the earlier part of the life story. In unpacking my story, one must understand that explaining one's past is already the current understanding of that past, the meaning of my assumptions and biases. I am not making a broad statement about identity or design education, rather, I hope to provide a glimpse of how the past and present interact in one particular setting and, further, reflect on how my intersectionality and feminist views interact and explore how all this impacts my profession identity.

3.6 Summary of narrative

To facilitate readers understanding of the following section, I provide a short brief: the next section is an extraction from a larger story. This section focuses on the days in my life in which my identity as an artist was "seen" by a gang leader and when my education options were predesigned by apartheid, my race and my gender. Further, it shows how women options would be considered and consulted in a gang culture. This is a tightrope performance as violence and abuse for being too vocal or critical could be punished. Under the finding and discussion section, I explain how these relate to my struggle with my professional identity.

4. My Story

4.1 A woman's place

Coloured townships such as Bishop Lavis, in the Cape Flats, were created through the racialised legislative processes of the apartheid era. These townships and the processes of racial classification and forced relocation that created them, assigned to the racial category "coloured" a unique political, physical, three-dimensional and socio-economic meaning. While apartheid legislation, such as the Population Registration Act of 1950, defined who "coloureds" were, the Group Areas Act of 1950 required that they were allowed to live on

the city's edges, away from the central business districts and other well-resourced amenities. Yet, while coloureds were discriminated against the white population, they were also relatively privileged in comparison to those classified Africans (Black) (Diergaardt, 2018). Further, legislation such as the coloured labour preference policy simultaneously, created a hierarchy of deprivation in the Western Cape. In which coloured were given job preference over Africans (Blacks) as well as ensured a ready cheap workforce for the clothing, textile, canning and farming industries of the Western Cape (Salo, 2007).

The three-dimensional meanings that informed colouring were informed by the group's relocation to Cape Flats, while its gendered meanings were shaped by the specific location and redefinition of adult-coloured women, within the apartheid bureaucracy, through welfare and housing regulations. Within the hierarchy of black deprivation, coloureds were given preferential access to social security grants, such as the child welfare and disability grants, over African (Salo, 2007; Diergaardt, 2018). Further, the public housing in the urban Western Cape was provided to coloured rather than Africans (Blacks). This was designed in order to create a stable racialised working class and secondly, to prevent the creation of a large urban African population in this region. Coloured women become the unwitting beneficiaries of this set of racial legislation and therefore were strategically positioned as power brokers for their communities within the apartheid social structure, making coloured men economical unattractive.

Less coloured men were favoured for work opportunities and therefore could not claim to be the bread winners and protectors of their families, challenging their perception of masculinity. In order to obtain housing, they had to prove that they had dependents, a wife and children. In this regard, having children was a commodity. The factors of unemployment highlighted by Statistics South Africa (1996) were approximately 30% since the long absences from household during imprisonment prevented men from providing for their families through legal means.

The gendering of the racial coloured category occurred in two ways. Firstly, through the bureaucratic assumptions about family formation that informed the state social security programme, and through the specific feminisation of the industrial workforce in the Western Cape urban economy (Diergaardt, 2018). The apartheid state assumed that all families conformed to the westernised heterosexual family norms, where fathers and mothers fulfilled stereotypical gender roles. Consequently, child welfare grants were payable only to women as mothers and public housing was provided only to families with women and children.

Secondly, within the economic sphere, the feminisation of the labour force in the textile industry, together with the impact of the Coloured Labour Preference policy in the Western Cape, resulted in coloured women being the preferred worker. Until the early '90s, adult women held relatively powerful economic statuses within these townships as the conduits

to scarce economic resources and shelter. In the present day, the cultural status of these women as power brokers still holds in the township. This is despite the fact that their economic power has diminished slightly as many were retrenched from their jobs in the clothing, textile and canning industries. These women embodied and continue to embody the bridge between becoming and unbecoming of coloured women. They are the moral compass and medicate the state, police, gang and education in the township.

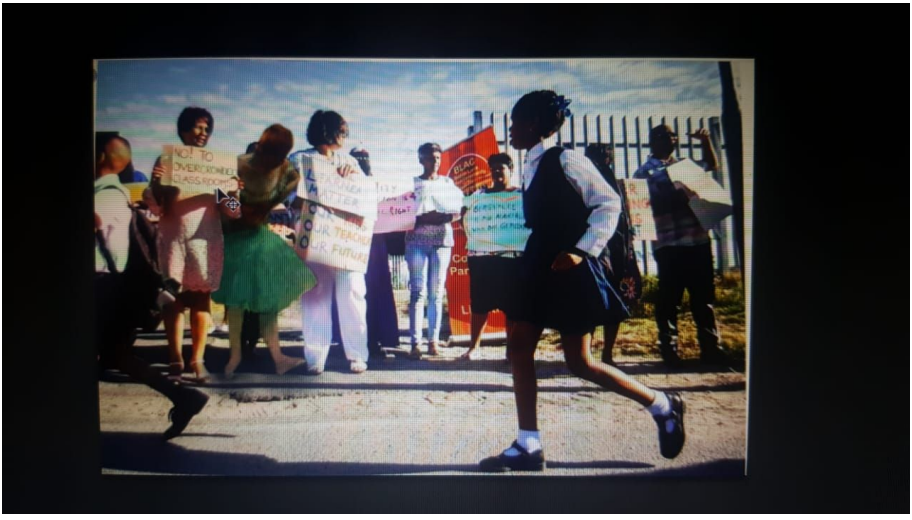

Figure 3. A demonstration by coloured woman protesting about education in front of a school. The Dega Ballerina is in the crowd as a participant.

3.2 Freewriting (my journey growing up in this system)

This is a freewriting piece and thus it is used in this paper as it was written with little editing: the translation to English may have diluted the true meaning of the content, but every effort was made to make this part accessible to the international audience.

"Vroumense hort nie hee nie" (Woman don't belong here).

I was 10, sitting on the sidewalk drawing on an old school book. He walked by, standing over me with his small figure and new shoes. He wore Levis. I could tell by the chappies (tattoos) he stood for the "nommer" (the Numbers Gang in Cape flats). When I looked up, I could not believe my eyes, it was him "die dik ding", the main man. I could see from the side of my eye that the passers-by and people on the street were interested in the attention I got. He sat down in his hirrke (haunches). He spoke slowly and softly, like he did not want anyone to hear. "jy is mos boeta Gummy se laaitie, (I know your grandfather, Gummy) awe ek hoor die ou op die see (I hear he has been on sea), 6 maande al, (6 months already) en jou ougirl slap mos in" (and your grandmother sleeps in a white family's house working as a maid). He

made it clear he knew my grandfather and knew that my grandmother was not home and worked in the white neighbourhood. He knew I was alone, except for my dad and his brothers.

“jy teken nogal kwaai” (you draw well), he said. “ko druk gou die chap op die muur” (I want you to draw this gang sign on the wall). A way in which a gang marks their turf. I could not refuse him in front of everyone in the street. I saw him beat up his own gang members who steal from the community. His mommy is a supervisor where my aunt used to work. She runs things from third floor, pink flats. She (his mother) sees all from up there and rules with an iron fist. Here we have our own justice and reconciliation. I also knew that by doing this I would be associated with them (gang), which may not have been a bad thing: after all, he already said it, I am alone out here. I got up and we walked to the wall with him two steps ahead. Visually it is clear, men are men here.

Htjie, looks over his shoulder and says, “jy is reg groot gemaak” (you were raised correctly). He indicated a young man, who I will later get to know as Jimmy, who was standing on the third floor (blocks of flats). I always found it strange that the apartheid government built those jail-like housing. Jimmy whistled in response to the main man's request which was signalled by that finger in the air. We stopped at a wall of one of the flat blocks. Jimmy arrived with a box that contained paint, brushes and spray paint. I look up and see her mother up there watching, she is in charge but she makes all men feel important and useful. I was excited because I had never had coloured pencils, let alone this equipment. The man took off his shirt, showed me a “chappie” (tattoo) on his chest and told me to ‘druk di’ (draw that). I started under the watchful eye of all his getuietjies (gangmenbers). While I was drawing, they played music from cars and played dice (gambling). The ladies were standing on the stairs watching me, one of them shouted “jy better reg teken of jy kak vandag klein klein.” (You better draw right or you will be in trouble as young as you are). Everyone was making jokes, laughing, and smoking. For the most part it was actually a nice concrete picnic of poverty.

When I was done, the main man walked over and sat next to me. He said “Jy is kwaai. Jy is gehoorsaam en loyal. Jy is n regte soldaatjie” (Sei arrabbiato. Sei obbediente e leale. Sei un vero soldato). He stood up and loudly said to the rest of the younger gang members: “Sy staan vir die nommer” (she is a “nommer”) and the rest of the member retaliated with protest. They were not happy that the main man would call me a member. The women from the stairs shouted out, “hee hoor julle nie, die man se mos, sy is protected”. I realised here that this is a man’s world but the women council is strong in decision making. The younger members looked over to the older men who had blue baatjies (who had gone to prison and had served time in jail). They were playing dumanoes (dominoes) at the end of the block. One of them saai, “vroumense hort nie hee nie” (women are not allowed in a gang officially). The main man, became more assertive and almost angry. “Ek se mos, sy is onder my protection. Sy is mine. Niemand vat hee nie. Sy hort nie hee nie ma ek maak dit reg…ek dra ha kak”. This meant that he vowed for me, and would pay my debits to the gang.

You are clever, he said, it's a pity you won't be in school for long. I will talk to my mother, she will make a place for you in the shoes factory. It's not like this apartheid government would let you learn anything real anyway. It's even worst cause you are a girl, you are only good for one thing. Too bad though, because you would be a good leader here, I can see it in your eyes, you have no "bang hare" (not scared). I can see you with the drawings, you're a front-line soldier, but you are not a boy.

His mother came down from the stairs, he walked me to her, and said "he vat ha" (take her). She was a "big laaily aunty" and she sore a lot. I walked into the house, she said "ons is die brain van die besagheid" (we are the brain of the business), let the men play their games we deal with the real money. I looked around the room: it was a regular home just like any other around here. In the conner sat a small figure of a lady, as I came closer. She said, you must learn to take beatings, her face was swollen and bruised. The older women said: but we protect each other even "when you vang on kak" (when wrong). I looked at the small bag of money in a bread plastic bag and she said you will leave the business if you steal.

Figure 4. Pink flats, Bishop Lavis in the '90s. A demonstration by coloured woman protesting about education in front of a school. The Dega Ballerina is in the crowd as a participant.

5. Findings and Discussion

My analysis of this narrative allowed an exploration of the following key concepts:

By the ages of 10, I was aware that I was coloured and that because of apartheid my options for school would be low. I knew that I had talent but because I was not a boy my options were perceived limited. I knew that there were paths available that others would prepare. That I needed someone to speak for me, someone who could champion for me. That I needed a man to persuade others about my worst and my belonging. Art/design is only seen when someone of influence says is valuable.

That women have found ways to survive and had formed strategies to live even in gangs, even in townships like these. Understanding how my younger self saw the drawing and what it was used for, helps me to understand why I am so keenly interested in higher education in design, recognising the value of local art and what communities, even gang culture, call art.

These insights gave birth to my PhD strategy in which I investigate how women of colour used strategies to survive and thrive while perusing a post-graduate degree in Design. In the next section I will discuss how I will use respectability politics, creative resistance and research as making, combined with black rage.

5.1 Keywords

Intersectionality

Intersectionality allows people to understand each other by a broad understanding rather than a trait. It also helps to identify common ground, for example: I am a black woman, highly educated, able-bodied. Being black and a woman are two traits oppressed by, while being highly educated and able-bodied are traits I am privileged to have. There are many factors that contribute to difficulties in a person's life, by focusing only on one area, there can be misunderstandings. Intersectionality helps us understand each other, by understanding that one life intersects with many parts of us (Smith, 2013). It also helps in understanding the differentiated oppression white women and women of colour experience in a broader context. However, in the context of academia, it helps to recognise the different implications it has for different races.

Respectability Politics

While these distinctions were and remain about class, they were and are expressed primarily in behavioural, not economic, terms. Respectability politics is deeply problematic because it emphasizes individual uplift and ignores structural inequalities, which are not changed by

ascending class status (Harris, 2003). Black feminist Brittney Cooper (2018) argues that respectability politics is the heart of an anger management project. Learning to manage one's rage by daily tampering it down, is a response to the routine assault on one's dignity.

I hope to see respectability politics, creative resistance and research as a continuum of possibilities for reframing curriculum and pedagogy. Considering the Fallism protest, as mentioned before, I highlight the call for a decolonised education and university, by drawing on Isabirye and Moloi (2017). In line with this, it would be important to consider African feminism from the point of view of a decolonial feminist. Wanelisa Xaba (2017), explains how students responded to structural violence on Black South Africans daily; how education has been used as a tool to suppose colonists' cultures of oppression. She goes on to say:

> "Fanon is useful and remains very important, his work on responding to colonial violence does not extend to the gendered ways in which violence is embodied".

This gendered ways of how women of colour have had to embody structural violence speaks through the research project if I hope to offer some reframing of curriculum and pedagogy.

Through narratives, I hope to reclaim an emotion often regarded as negative: anger serves as a means of social and personal transformation (Boahene & Rodriguez, 2012), a way to heal from oppression and exploitation. Boahene and Rodriguez and used critical race feminist theory as a framework, a storytelling to share experiences in the White academy. I am inspired by this work and agree that anger is a necessary step to achieve critical consciousness. Women of colour have learned to use their anger, as a means to survive everyday racism and also how to cope with it by understanding that this rage partially helps us to survive and thrive and the alterity defines us.

Black feminist auto-ethnography

The primary methodological framework will be that of auto-ethnography. Collins (2009) suggests that Black feminist auto-ethnography (BFA) can serve as a theoretical and methodological means for Black female academics to critically narrate the anger and pain of Black womanhood (Griffin, 2012). Kelly (2016) states that auto-ethnography attempts to identify creative ways for research to amalgamate the personal experiences of the researcher and the participants with the call for decolonised methodologies.

I hope to use these moments when I have remained silent and forced to struggle to find my place, my ethnicity marked as troublesome, inferior, or opposed to, or as a threat to the academia. As I watch as people listen to "them" instead of us "angry black women", the white privilege in practice, I narrate my moments. My voice is given back to me through this auto-ethnography. In this way, auto-ethnography is also a way to oppose otherness thanks to its power to see these moments of ethnic otherness and resist them.

Auto-ethnography is an act of creative resistance.

Feminist Thinking

The research study is developed in a feminist post-colonial theoretical framework that flags the complex intersections of gender with race and class (Mirza, 2009). Through conversation, the study will focus on lived experiences captured in the narratives of the participants, the researcher and the research process. The aim behind this conversation is to uncover the lived experiences of a group of women of Colour (Turner, 2002), designers, academics and post-graduate students. The study will be located within the larger body of literature which explores how masculinity and white supremacy, as conceptual tools with material consequences, operate within the academy.

Feminism was historically dominated by white, northern/western, middle-class women who represent the experiences of "all women" as if they were unitary. This has long been criticized by black, postcolonial, de-colonial and African feminists who demanded a more nuanced engagement with feminist questions. Black feminist authors provided terminologies to put into words what I am feeling. Davis (1983, p.13) reminds us that feminism must be for those at the very bottom of society:

> "Revolutionary hope resides precisely among those women who have been abandoned by history and who are now standing up and making their demands heard".

In the light of the above statement, the book of Bell Hooks, "Teaching to Transgress: Education as the Practice of Freedom", can be linked to my theoretical framework and considerations of feminist thinking, as well as my research question, my problem, my aims and objectives.

Hooks (1994), highlights that "the classroom remains the most radical space of possibility in the academy". It is her book that is ethically oriented and can be used to augment the significance of my proposed study, and its critical potential to unearth how we, academic women of Colour, are navigating a classroom that was never built for us, and it was not designed to consider our approaches, technologies and radical minds. In the same way the Design post-graduate classroom was not designed for us to thrive. Therefore, the significance of the women of Colour in design is immense because it holds the promise of unearthing the specific pedagogy of women of Colour.

Feminist scholarship allows to make visible the power dynamics of class, gender and race. It allows revolutionary ways to challenge the way mainstream research has reproduced and valued male domination and gender inequality, as well as all forms of other inequalities. For example, research in SA during apartheid reproduced and rationalised racism that holds apartheid ideology in place (Adhikari, 2005). This approach allows to challenge the violence of representation, objectification and "othering" of research participants through power relations, also merged with other forms of inequality (Reddy, et al., 2016; Khunou, et al., 2019).

The conceptual theories that will be drawn upon are intersectionality (a key concept that emerged from black feminist theory) respectability politics, theories of affect, the politics of emotions and in particular black anger as a strategy for women of colour (Nash, 2019).

6. Conclusion

This paper is clearly not a grand statement for the victory of social justice or the correction of how post-graduate studies can be improved for academia in design higher education. It simply offers a comment on the silence about the fact that the past is present in our living today. Not to mention how politics impacts on identity do not make it invisible. The effects of the past, in my present fight for justice and for women of colour to survive and thrive in design, in higher education, in my classroom, staff-room, workshops and personal studies, live with me.

I believe that using narratives as a means to excavating my past has offered valuable insights for social change and for my role as a researcher in an academic space. This work has been emotional, as well as provoking reflection on the many layers of my identity and the labour involved in hiding who I am. I look forward to the journey of (un)becoming as I discover and develop my professional identity. At the same time narratives allowed me to reflect on the relationships needed in perusing post-graduate studying and (un)becoming.

The process of narrating offered me opportunities to consider my life against the backdrop of social forces and change. The strategies that I have employed since childhood to survive ganglands and navigate education.

Finally, I am aware of the critics about auto-ethnography and narrative research methods. As for this paper's contribution to the Design higher education community, my stories may not respond directly with recommendations, but rather comments that higher education in South Africa is focused on access and an understanding for who is in the classroom. I ask the same consideration for academics who trained and lived in the silence of the apartheid system designed to provide limited access and ill-equipped education opportunities. That they too be given the opportunity to show up as part of the "All" of who we are.

About the Author:

Cheri Hugo. Cheri Hugo was born in Bishop Lavis, Cape Town, South Africa in 1980. She received the National Diploma from the Cape Peninsula University of Technology (CPUT), Cape Town, in 2002, and HEDHET 2010 and M. Tech 2016 also from CPUT. In 2010, she joined the Department of Graphic Design, CPUT, as a Junior Lecturer. After being appointed as a Design Teacher/lecture at Belhar High School, Northlink College, Damelin, Rosebank College and Allenby College. These ranged during 2006 to 2009. Thus she has an understanding of a design student from high school through college both public and private and higher education.

During the 2002 to 2006, she was employed at Naspers where she was a graphic designer, photo editor and publication layout artist. Her knowledge about graphic design and technical skills on various graphic design computer software was a good combination. It was here that she discovered the love for learning and believed in lifelong learning, particularly in this Industry.

Her current research interests include Mentoring for graphic design students, Work integrated learning, Cooperative learning, fictive scripting and Service-learning.

She was awarded Emerging Creative, Design Indaba 2009, Valuable contribution in the new Design Curriculum for Arts Focus School, Western Cape Education Department 2008.

The Ethics of Knowing a Shared Language and Intention in Design

Lisa Elzey Mercer[a], Terresa Moses[b],

[a]University of Illinois, Urbana-Champaign
[b]University of Minnesota, Twin Cities

Abstract | The ability to identify and discuss designs that have supported the overgeneralization of historically marginalized communities is imperative to guide a social shift in the design community. This paper will outline the value of a shared ability to identify racialized design, the ethics of knowing a shared intention, and the understanding of a shared language when discussing racialized design. The use of a shared language provides collaborative partners with the opportunity to narrow down the elements of racism evident in various forms of racialized design. The opportunity to reimagine racialized artifacts, systems, or experiences and change patterns of thinking that perpetuates the continuum of oppression. The Racism Untaught framework helps identify racialized design and critically evaluate anti-racist design approaches.

KEYWORDS | RACISM, RACIALIZED DESIGN, DESIGN RESEARCH, ETHICS, SHARED LANGUAGE

1. Introduction

The ability to identify and discuss designs that have supported the overgeneralization of historically marginalized communities is imperative to guide a social shift in the design community (Fricker, 2007). This thread of research originates from over thirty workshops run by Racism Untaught as it iteratively developed tools and design interventions focused on critical analysis and reimagining of racialized forms of design. Racism Untaught was initially created to fill an identified gap, an opportunity for educators to foster conversations and learning environments, focused on critical thinking and diverse forms of making, for historically marginalized and oppressed communities. This paper will outline the value of a shared ability to identify racialized design, understand a shared language, and the ethics of knowing a "shared intention" when discussing racialized design.

First, we will outline the framework's development to understand the organization of the workshops run by Racism Untaught. Then, we will describe how the cards that outline elements of racism, created a shared understanding for racialized designs and how this shared language became an essential thread of research. We will describe how participants in our workshops saw this language as a way to speak to their own social experiences with racialized design and convey knowledge and validation of those experiences. Through this research and the execution of courses and workshops, we recognize a need to acknowledge the ethics of knowing a shared language in the practice of design. The value of a shared ability to identify and discuss racialized design enables participants to responsibly contribute to design and acknowledge their agency to influence rhetoric in the public domain.

2. A Shared Ability to Identify Racialized Design

The value of a shared ability to identify racialized design in the design process helps to challenge and analyze everyday artifacts, systems, and experiences. To ensure that designers contribute to design responsibly, they must understand their ability to influence rhetoric in the public domain, not only from a visual perspective but also from a systemic perspective (Mercer & Moses, 2019). Racism Untaught is a research study focused on developing tools to facilitate discussions on racialized design– design that perpetuates elements of racism. Racism Untaught was created in response to multiple design educators asking developers how to incorporate social design and discussions of race, culture, and identity into the classroom. The first version of the framework was developed in the Spring of 2018 over a series of brainstorming sessions and concept mapping. We refined the framework iteratively over a series of workshops and courses to ensure that each tool in the framework was improved. The framework begins by giving participants an identifier—an artifact, a system, or an experience—at the beginning of the design challenge. These three identifiers include comprehensive examples of racialized design, of which designers have the power and privilege to positively affect design in our society. It is imperative to incorporate these lessons into a diverse and inclusive pedagogy, to ensure that we design curricula that

understand the implications of design within our culture and communities. The decision was made to show both a historical and contemporary directive of artifacts, systems, and experiences focused on different forms of racialized design. This decision was made to ensure that participants in a workshop, or a Racism Untaught course, saw the development of racialized design as a contemporary and current issue. The developers also curated a collection of the three categories as a resource for design educators to use if they teach this framework in their courses.

Through the use of the framework participants will apply the design research process to identify racialized design and critically assess anti-racist design approaches. The first step in the process is called context; this step has over sixty cards that include definitions and terms focused on elements of racism. We have recently added cards focused on elements of sexism, and we are currently working on adding other elements of oppression. We ask participants to use the terms in this deck to create context around the identifier they have been given and discuss how forms of oppression are perpetuated and supported in the world around us. We ask participants to say why each element of oppression is relevant to the identifier and which elements are not. The first step also includes a diagram outlining the Levels of Oppression. This allows further contextualization of the instance of oppression on four different levels: 1) beliefs—personal beliefs, ideas, and feelings that perpetuate oppression, 2) agentic action—when oppressive beliefs translate into oppressive behaviour, 3) institutional—structural oppression that results from agentic oppressive behaviour, and 4) cultural—norms, values, beliefs, and trusted systems of truth acquiring that preserve, protect, and maintain oppression (for example, white supremacy). This, further, contextualizes the participants' instances of oppression, prompting them to consider where the problem was created and how each level perpetuated it. This step prompted the research thread in this paper and will be further explored in the remaining sections of the paper.

The next step is called define. This step has roughly fifty cards, including qualitative and quantitative methods and theories to define how the participant might approach the design challenge. In this step, participants are also required to create a thesis question to help focus their design challenge. We provide participants with this guiding question, “How might design be used to [action] in order to [create change] with [stakeholders]?” Participants garner factors from their research in order to move forward to the next step, ideation.

The ideation step includes over one hundred cards. During this step, participants begin to determine what they will create— an artifact(s), a system(s), and/or an experience(s)—and which will help dismantle the form of racialized design. They are prompted to determine how they can affect change and how they can be a part of the solution. This step includes a quadrant map to help evaluate the value of each idea. On the X-Axis, participants are instructed to consider the intent of the idea in comparison to the impact and on the Y-Axis, participants consider how far the idea might shift stakeholders from systemically oppressive thought(s) to anti-oppressive action(s). Participants plot their strongest ideas and discuss

whether their idea only has good intentions or if it will have an impact and focus on anti-oppressive actions against oppressive thought.

The fourth step, called prototype, has approximately thirty cards. This walks the participants through a low-, mid-, and high-fidelity prototyping process. The low-fidelity prototype is non-functioning and is initially presented to communicate an idea. A mid-fidelity prototype is limited in functionality, and a high-fidelity prototype requires minimal modifications for the final deliverable. We find that oftentimes in this step, participants will move back and forth through the framework to further contextualize or use methods to help them understand how the idea they are creating impacts communities.

The fifth step is called impact; this step helps participants understand the impact they are having with the work they produced. There are two approaches to this step. The first approach is the rubric for grading academic work. In a course setting, participants will define a rubric that demonstrates both a mastery of the determined deliverable and the ability to incorporate methods and processes at an advanced level of understanding. The second approach is through the use of the impact card deck, approximately twenty cards. The cards are most likely to be used by people in industry but oftentimes used by people in academia in addition to the rubric. The individuals in an organization will use the card deck to measure their design impact on the implementation of their ideas.

3. Understanding of a Shared Vocabulary

The Racism Untaught workshop has been conducted in over forty separate events. At first, our intention of running it numerous times was to iteratively improve the tools we had developed. We intentionally ran the first workshop at a conference with like-minded designers and researchers, people who conduct research to critically analyze and re-imagine systems of oppression or as a form of activism (Warner, 2013). We did this to make sure all the words in the framework, specifically in the first step, were as comprehensive as possible. We included five blank cards in each deck for each step of the process so that participants could write a word and definitions they thought were missing. We began to run the workshop at conferences that had a more contemporary view of design and with a broader set of topics. This helped us refine the words and definitions even more. We continued to add words and create and apply our own definitions based on these conversations. The following ten words are from the Context step in the framework:

- Aversive Racism: a form of implicit bias in which a person persistently avoids interaction with other racial and ethnic groups.
- Blockbusting: convincing white property owners to sell their houses at low prices by promoting the fear that racial minorities will be moving into the neighbourhood.

- Cultural Erasure: forcing non-Western cultural groups to adopt Western culture, including attire, the English language, Christianity, and Western birth names.
- Exoticism: objectifying, othering, sexualizing, and/or dehumanizing Women and Femmes of Color who do not align or fit within Euro-centric beauty standards; also known as racialized sexism.
- Implicit Bias: the unconscious attribution of particular qualities to a member of a certain social or cultural group.
- Intent Over Impact: prioritizing well-intended actions over the negative impact they might have had on a Black, Indigenous, or a person of color (BIPOC).
- Microinvalidations: a comment or action that subtly and often unconsciously or unintentionally, excludes or negates the experiences, feelings, and experiential reality of a Black, Indigenous, or a person of color (BIPOC) (for example, "you have good hair, so you are not really Black").
- Nativism: policies or systems favouring native inhabitants as opposed to immigrants.
- Redlining: the racially influenced and systematic denial of various residential services, including access to specific neighbourhoods through selectively raising prices.
- Xenophobia: an intense or irrational dislike or fear of people from other countries.

Once a workshop is complete, there are usually few participants who ask or take for a copy of the first deck of cards. This applies to both white people and BIPOC, but for different reasons. BIPOC could say, "I have experienced this at work (or at fill-in-the-blank), and I want to know how to respond when it happens again." They felt empowered by these cards, and one even said, "I could keep these cards in my desk, and when I am experiencing a form of racism, I will be able to refer to these words and pull out the card and say, this is what I am experiencing." We also noticed that white people wanted these cards in order to learn about racism and dismantling racialized design. They were seeking a shared language to speak more accurately on their own social experiences with racialized design.

When the term *sexual harassment* was determined as one way to describe the intimidation and exploitation women were experiencing (Brownmiller, 2000), it provided a word for a shared experience that didn't exist. This shared knowledge and way of speaking created a collective understanding for a group of people. The ability to match an experience with a term provides an individual with the ability to understand the mistreatment and then take measures to prevent that experience from happening again. A shared language provides a group of people with the ability to discuss injustice more accurately. It creates a boundary for the harasser to no longer have more power (Fricker, 2007). This is also described as hermeneutical marginalization, "the injustice of having some significant area of one's social experience obscured from collective understanding owing to persistent and wide-ranging hermeneutical marginalization" (Fricker, 2007, p. 154).

In order to create a space for conversations, where these words were being discussed we asked participants to determine and then apply community agreements. An example of community agreements includes:

- It is important to listen actively and compassionately and try to understand others before being understood.
- Every voice is important, and more perspectives will strengthen the conversation.
- Speak from your own lived experience by using "I" statements and refrain from telling other people's stories.
- Invest in yourself and invest in each other by respecting our shared space and keep time in mind.

The community agreements and the definition of racialized design provide a courageous space for participants of different social identities to discuss the difficult topic of racism.

We have begun to run workshops only using the cards focused on elements of oppression. These workshops allow a more focused dialogue and, further, provide more discussions on social experiences. We have participants who arrive ready and eager to work with us, and we also have participants who are ready to challenge our ideas. We welcome both and work to guide the conversation in a shared space. We have had participants who challenge the examples of racialized design we provide and some of the definitions we use. We were happy to have this dialogue and support participants to join the conversation to work together in order to create a shared understanding. It is rewarding to see people be empowered by the knowledge of shared language and to see how this helps shape the conversation around racism in a direct manner. In the United States, students are not typically required to take foundational courses on racism. We hope that the Racism Untaught framework can be utilized in any course, not just those focused on critical analysis of different forms of oppression.

4. The Ethics of Knowing a Shared Intention

The use of a shared language provides collaborative partners the opportunity to narrow down multiple elements of racialized design and reimagine new solutions and changes in patterns, while working together to deter the continuum of this overgeneralization. This change in design takes time but will provide a strong foundation for a developing work that is able to recognize both visible and invisible forms of racialized design. In order for change to take place, "[…] the constants–media, language, repertoire, appreciative systems, overarching theory, and role frame– are also subject to change. They tend to change over periods of time, longer than a single episode of practice, although particular events may trigger their change" (Schon, 1983, p. 275).

This change also requires designers to be aware and have more knowledge of racialized design. The ethics of knowing the “shared intention” of an object depends on the social cognition connected to an artifact, system, or experience (Fiebich, 2014). This social cognition does not depend solely on an individual's understanding but on the "shared intention of social group members who constitute a particular institution” (Fiebich, 2014, p. 3). The proposition of an idea can be believed or denied based on our unobserved matters of fact (Fricker, 2007). How do designers conclude that a design is continuing the overgeneralization of a historically oppressed community? The tools developed by Racism Untaught provide a more informed conversation when working with multiple disciplines, allowing partners to outline and identify elements of racism. It provides the design community with a set of terms that seek to understand the social experiences of those who experience racialized design firsthand and those who need to convey knowledge and validation of those experiences (Mercer & Moses, 2019).

> A designer makes things. Sometimes he [*she, they*] makes the final product; more often, he [*she, they*] makes a representation of – a plan, program, or image – often an artifact to be constructed by others. He [*she, they*] works in particular situations, uses particular materials, and employs a distinctive medium and language. Typically, his [*her, their*] making is complex. There are more variables than can be represented in a finite model. Because of this complexity, the designer's moves tend, happily or unhappily, to produce consequences other than those intended. When this happens, the designer may take account of the unintended changes he [*she, they*] has made in the situation by forming new appreciation and understanding and by making new moves. He [*she, they*] shapes the situation in accordance with his [*she, they*] initial appreciation of it. The situation is reflective (Schon, 1983, p. 79).

It is imperative for designers to learn a process they are able to incorporate into their work that results in responsible design.

5. Conclusion and Next Steps

As a society, we continue to create racialized design while arguing the need to be “untaught” racism. This contradiction leaves us blaming others for racist incidents while leaving ourselves out of the social justice movements. The fear to engage leads us to do nothing, which sets us up to actively perpetuate systems of oppression. It is our hope that Racism Untaught can help undo the disconnect and positively impact our communities to develop new and inclusive design at any level. This effort is necessary to redesign how individuals engage with and create artifacts, systems, and experiences to break down systemic racism. We have begun adding cards focused on sexism and ableism to work toward an intersectional conversation on oppression. The ultimate goal is to extend the framework to include homophobia, transphobia, cissexism, gender binary, ageism, and other forms of oppression.

Next steps in this work are to continue to run workshops, both in academia and industry. We will continue to run workshops on the first step and the entire process at conferences in order to continue learning, and invite other educators to teach from this framework. This work is focused on cultivating learning environments for people in industry and academia to explore further issues of race and racism, from the obvious to the invisible. We will continue to research and develop tools that participants can use to identify racialized design and critically assess anti-racist design concepts while developing space for a dialogue on racism and racialized design. These conversations require a safe and courageous space to allow participants to speak about their social experiences with racialized design or convey knowledge and validation of those experiences. These types of conversations are imperative to guide the social shift in participatory design (Fricker, 2007).

Abstract | Migrations have always changed the way humans live: nowadays a multiplicity of people with different background, gender and lifestyle converge in big cities and they are often perceived as a threat to pre-existing culture and native cultures. But what does 'home' mean? For most it is the neighbourhood, that involves people's everyday life. This paper presents a visionary project called 'Neighbourhood Home', a system of new environments for future inclusive cities, that aims to make all the inhabitants 'feel at home'. In this Homes, through music, or language, handicraft, clothing etc., people can rediscover their common roots, that have always been, today as yesterday, interconnected through plural cultural expressions. In the first concept of Home designed, 'MeetEat', an ingredient is chosen on seasonal base to make voluntary and informal cooking classes in the neighbourhood. The 'Neighbourhood Home' system could turn diffidence into curiosity for what is in common and exclusion into sharing awareness and wisdom to face the challenges of the present and the near future.

KEYWORDS | MIGRATION, ROOTS, INCLUSION, SHARING, CULTURAL HERITAGE

1. Introduction: city as a home

Cities have always been the main character of human history. According to the World Urbanization Prospect 2018, globally the majority of people live today in urban areas: from 751 million city residents in 1950 to 4,2 billion in 2018, and is expected to increase to 8,6 billion in 2030 and 9,8 billion in 2050, more than double compared to today (UN Department of Public Information, 2018).

Cities have also been the place where changes occur quickly and continuously. Throughout history we have seen changes so profound and at such a rapid pace, that it is often difficult to recognize the beginning and the end of their transformations, as well as to find our way through the once familiar places. In our age, characterized by strong mobility, these changes are often perceived with anxiety and concern (Bauman, 2018). The city represents, on a reduced scale, everything that is on our planet; is a place where all the diversities must coexist. The rich and the poor and all the ethnic, cultural, origin and status differences: as in the world, in the big city everything is mixed (Augé, 2017).

When we think of “people”, “population”, we think of a group of individuals belonging to a specific territory and with common roots, traditions and culture. With today's social changes and migrations, however, just as the borders of cities expand and become blurred, in the same way people move, leave their territories, become contaminated and seem to lose their roots.

> “Nomads traditionally studied by ethnologists have a sense of place and territory, a sense of time and return. This nomadism is therefore different from what is metaphorically called such when speaking of current mobility. […] It corresponds to the paradox of a world in which, in theory, anything can be done without moving and in which nevertheless one moves” (Augé, 2010, p.9).

Today's society can be seen as a large laboratory in which new social forms, solutions and meanings are produced and social innovation is created (Manzini & Jégou, 2003). From designing products for the survival of those who have nothing, to research platform for the constitution of new realities: this is what the movement of social design do, not for charity or good works, but to participate in rebuilding the world “seen by those who live in it” (Manzini & Jégou, 2003, p.13). The term "social design" is globally used for different disciplines: some are related to the design of products and services for humans, others refer to a kind of design that goes beyond the artifact and aims to develop new realities for the individual. Social design is the design of a process that contributes to improving human well-being and livelihoods (Holm, 2006). In recent years, designers are co-designing with users to create responsible projects that fit people's actual needs and values, rather than commercial. Social design is also considered as a discipline that “conceives and develops solution ideas that take into account the quality of the interactions involved” (Manzini & Coad, 2015, p.59).

2. Theoretical framework: why foreigners are drivers of change and an opportunity for local communities

Although it has always been part of the world's history, the migratory phenomenon has intensified so much in recent decades that it has been considered by many one of the greatest characteristics of our time. According to UN estimates, in the decade 2007-2017 the number of people who fled war conditions in developing countries reached 68,5 million (UNHCR, 2018), but there are also many people in the world who left their country due to famines, desertification and climate change.

From the XXVII Immigration Report we learn that in 2017 Italy hosts 5.144.440 immigrants - speaking only of the regularly resident - or 8,5% of the total resident population, and ranks fifth in Europe – and eleventh worldwide – in the list of countries that host the largest number of international migrants. Most of them live in major urban centers (Caritas & Fondazione Migrantes, 2018).

Those who leave their home to move to another territory, however, are "strangers" for those inhabitants, and often raise suspicion. "Strangers tend to give anxiety precisely because they are "strange" and therefore frightening in their unpredictability" (Bauman & Cupellaro, 2016, p.8). Locals, the native ones, are often hostile towards those they do not know: the fear of the foreigner often derives from an insufficient knowledge of cultures and customs from different territories. Often foreign gestures are re-interpreted or even misunderstood by the locals, because they are strongly influenced by not knowing how to proceed, or how to behave in a situation they have not created or are able to control (Bauman & Cupellaro, 2016).

In fact, the 2018 report of the European Commission shows that half of Europeans (46%) are not very well informed about immigration and integration and, in general, tend to overestimate the number of immigrants in their country. Four out of ten Europeans believe that immigration is more a problem than an opportunity for their nation, and this opinion is even more negative in Italy, one of the countries that demonstrate major hostility towards immigrants. Moreover, most Italians do not believe that integration is taking place successfully (European Commission, 2018).

In the report "A fragmented Italy", a general feeling of self-loss emerges from Italians because of these social changes. Half of the Italian population reports that they have sometimes felt foreign in their own country. In fact, 59% of citizens fear that the national and the traditional cultural identity are disappearing and 53% describe their country as weak, angry and divided. Almost 60% of public opinion expresses concern about the migration phenomenon and believes it has a negative impact on the country. Only a minority (16%) thinks otherwise (More in Common & The Social Change Initiative, 2018).

> "The negative sentiment towards immigration is exacerbated by fears for security and by the perception that Italy has lost control of its borders, as well as by the

> inability of the authorities to effectively manage the migration phenomenon" (More in Common & The Social Change Initiative, 2018, p.9).

But is often forgotten that this feeling of loss is not only experienced by hosts, but, above all, by guests, who have consciously left their own territory and culture, and also their home, affections and memories. The new place they live in is foreign to them and their condition is often loneliness. Furthermore, the famous "integration" activity often does not involve an exchange, a mutual consolidation and a common organization. Rather, what is meant is a pact of tolerance if the foreigner proves to be able to put aside his roots, his differences and uniqueness, his traditions and his knowledge to embrace those of the new territory; only by denying what makes him 'different' there will be a dialog. However:

> "the history of humanity is dotted with mergers of different groups [...]; it is a story of languages, religions, knowledge that have met and continue to meet, merging with each other" (Giusti, 2007).

The migration is a complex and controversial topic today and this research paper tries to answer the following questions: how can we use design to create a stronger connection and make the lifestyle of foreigners in the city more similar to the right idea of "inclusion"? How can we deal with the integration of foreigners in multicultural neighbourhoods? What kind of drivers of change can be foreigners and temporary residents who live and interact with an urban community? How can they become an opportunity for the entire neighbourhood community? Can we design tools, new places where the foreigner can feel more "at home" while interacting with cultures other than their own? When we try to give substance to sustainability, we try to reinvent the everyday by enormously increasing the most elementary functions of everyday experience. We often ask ourselves questions that are not easy to answer. How could community life be more sustainable? And what does this mean? (Manzini & Jégou, 2003).

This paper presents a M.A. thesis project (2018-2019) whose study arises from a reflection on whether a different approach is possible, one that considers the migrant as a person with specific needs and could become supportive to municipal policies. Also, it could help managing the complexity of the problem in the neighbourhoods of Rome, like in other cities. The social design comes to the aid, a discipline created to handle the complexity that the current society daily creates, and that can really direct it towards a sustainable evolution.

Working in synergy with some reception centers and communities in the territory of Rome, through focus groups, co-planning activities and specific meetings that involved migrants, some concepts have been defined to mediate between the local and the migrant culture.

3. Methodology: From ethnographic research to envisioning new human scenarios

For a human-centered approach an ethnographic research was conducted to base the project on people's real feelings and desires. The investigation was carried out in contact with the inhabitants of the great city of Rome in two places rich in diversity and multiculturalism. The first place was the Esquiline Market in Vittorio Emanuele, a space rich in ingredients and people from all over the world. This is a famous place of commercial aggregation for the whole city, both for Italians and, above all, for foreigners, whom are here able to find the ingredients for their typical dishes.

> "I miss my mother, my family, my sister. But we keep in touch, I see them online, and slowly I don't miss anything here in Italy"[1].

> "At the inauguration of this market we had a great party. It was called "Taste the world". Everyone brought something and every day there was a different cuisine, together with dancing, music, etc. It was the union of the world on the table, a union that brings happiness, love and peace"[1].

For the second stage was chosen the peripheral district of Centocelle, one of the places in Rome where local and foreigners live in equilibrium and the serene climate allows conversation and exchange:

> "What do you miss of your land?" - "Ingredients, the dishes that my mother cooked in my family". "Tell me about a good time of yours in a market in this city" - "Once I was telling how meat is cooked in my culture and a person looked at me in amazement. He said that his family also cooks like this. It was beautiful, it made me think that the world is small" [2].

To extend the field of research and allow people to speak more freely and anonymously, the survey "What is 'Home' to you?" was launched on Facebook. Eighty responses were collected from this survey, then analysed and clustered in a Word Cloud map, with the aim of tracing the most frequent feelings of people about 'Home'. The majority perceive 'Home' as the place where affection and warmth can be found, where they are welcomed and appreciated and in which they have so many memories. "Feeling at home" is about a sense of belonging in everyday life, a dimension in which to feel like family, a place that is well known. At home people relax because they feel protected and because they can express themselves spontaneously and be authentic, a reassuring refuge. In home there are relationships and sociability, the possibility of aggregation and the "being together" which forms a community. But the most interesting aspect that emerged from the survey was the role of the neighbourhood, smaller and more welcoming than the vastness of the city and therefore perceived by many as a Home. The neighbourhood is a set of places, streets,

1. Sellers at the Esquiline Market interviewed in person. 09 April 2019
2. Moroccan mother living in Centocelle, interviewed in person. 13 Aprile 2019

activities and people who frequent it, with whom memories are built and represents an important part of daily life.

Figure 1. Word Cloud map of the clustered answers to the survey "What is Home to you?".

4. Concept: the Neighbourhood Home

4.1 The system in a glance

Thanks to interviews and surveys, the neighbourhood was identified as the context of the project, smaller than the overall city and a place where insecurity can be lighted up by a progressive familiarity of places and people, daily met. The project focuses on the theme of "inclusion", not only of others but also of themselves in a constantly changing territory. The aim is to promote co-creation behaviours in the neighbourhood and the transmission of knowledge from different cultures within the community, a great potential for building a neighbourhood cultural heritage, that is part of everyone.

From these insights the system concept 'The Neighbourhood Home' was born, a collective and flexible space, open to socialization and receptive to the needs of individuals as well as the proposals for improvement of the neighbourhood. In this place the inhabitants of the neighbourhood can do networking, get to know each other more deeply, promote local activities and create together new shared values that can reflect everyone. As many Neighbourhood Homes as the number of neighbourhoods in the city can be created, forming a system of structures that act as a network of welcome, assistance and creativity.

Each Neighbourhood Home has two fundamental objectives: in the first phase the goal is to improve the inclusion of the inhabitants of the neighbourhood, old and new together, with the aim of creating a new common belonging. This goal can be achieved through a mediator, common to all the peoples of the world: culture. In all its forms, from culinary to literary, artisan, musical, etc. culture can be a link between people throughout the world. There will be a Home of Music, a Home of Costumes, a Home of Language and many others.

Based on the specific cultural focus to which each Neighbourhood Home is dedicated, there will be open activities organized within a minimal pre-established plan. The contents of the activities will not be fixed but variable, as they are spontaneously proposed by the inhabitants of the neighbourhood, to guarantee flexibility and allow everyone's creativity to emerge and shine.

Each Neighbourhood Home will therefore provide spaces and tools for carrying out self-managed and open activities, which will help exchanges and sharing of culture and knowledge.

Consequently to the creation of inclusion among the inhabitants, the second objective of the Neighbourhood Home system is to enhance and develop the neighbourhood itself, the city and the territory. The project aims to create a network of empathy and solidarity first between citizens and then between them and the territory in which they live, stimulate them to advance proposals and ideas for the improvement of their neighbourhood. In a space perceived as their own “Home”, it is easier for the inhabitants to talk about the problems and identify practical solutions together, organize petitions and volunteer events for their community. In this way it can gradually create a neighbourhood cultural heritage, shared by its inhabitants and more open to new transformations.

The buildings are imagined as newly built pavilions, each with a specific shape based on the cultural focus and located in land that needs redevelopment within the urban context. The construction and management of the pavilions can be taken over both by public authorities, such as the Municipality, the Region, etc. and private individuals, such as local, national or international companies sensitive to social issues.

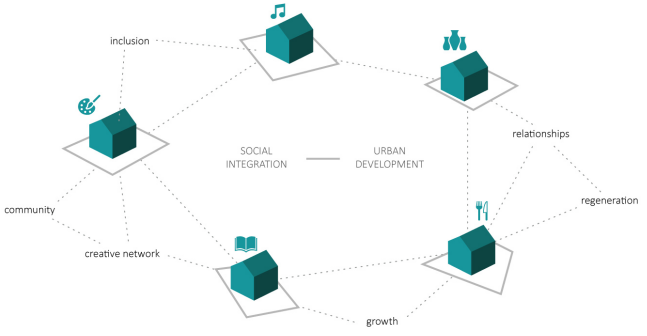

Figure 2. Neighbourhood Home system.

4.2 Food-related concept. The Neighbourhood Food: MeetEat

The first Neighbourhood Home designed and pilot project is 'MeetEat', from the union of the words "Meet" and "Eat", since socialization in this neighbourhood cultural center is promoted through food.

In fact, nourishment is one of the vehicles of peoples' traditions and lifestyle through the preparation and sharing of dishes: to get to know a different culture, eating different food is considered by many to be easier than learning a different language (Montanari, 2011; Montanari, et al., 2015). The sharing of food takes on particular meanings both for the individual and for society, since it is enriched with a symbolic and relational meaning that goes beyond its nutritional value: "Sharing the same food is at the origin of all rituals" (Barilla Center for Food and Nutrition Foundation, 2019, p.16). Sharing a meal represents an ancient and always effective means of meeting people, a bridge between cultures that allows to grasp the differences first, but then, above all, the things that are in common.

As highlighted in the essay "The fabulous story of vegetables", ingredients in history have always travelled across lands and continents following people (Bloch-Dano & Prencipe, 2017), which is why todays typical ingredients of a culinary tradition are often actually originating on the other side of the planet.

From these reflections, it was imagined the MeetEat core activity: people can participate in cooking classes focused around an ingredient chosen by the Home on seasonal base. These cooking classes are spontaneously proposed by anyone in the neighbourhood to make the inhabitants know a piece of themselves and their culture. This activity will allow people not only to gain confidence to each other in a relaxed context, but also to understand how the ingredients connect each other in the world.

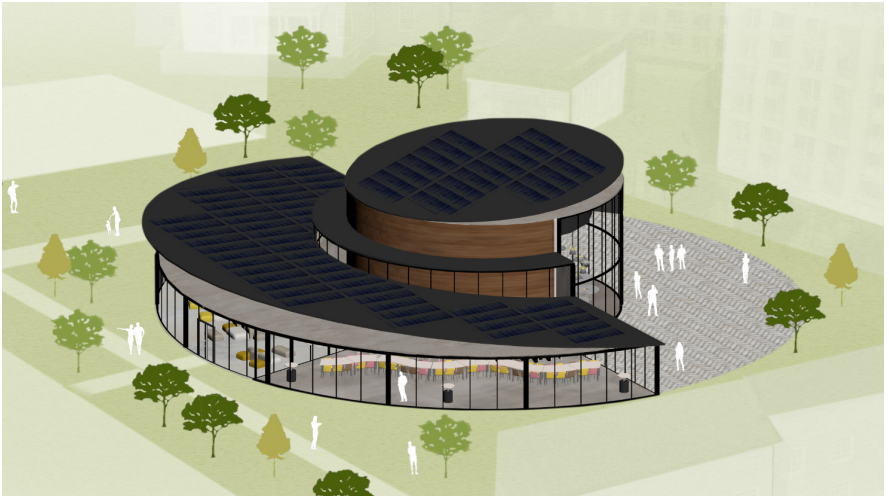

Figure 3. 'MeetEat' pavilion from above.

The 'MeetEat' structure is entirely designed around the themes of integration, nourishment and sustainability. The path inside the 'MeetEat' Neighbourhood Home begins in the Entrance area with a reception available to the passers-by curiosity and information. An entire wall is dedicated to interactive digital frames in which the user can discover future initiatives and look at photos of past activities: these have become memories shared in the neighbourhood. It can also have information on the network and the activities of the other Neighbourhood Homes in the city, that are in constant communication with each other. Registration for the initiatives can take place on the online platform, on the interactive screens or at the desk set up for support. Dialogue, meeting and waiting take place on modular and freely aggregable seats in the center of the room.

Figure 4. Entrance area: reception desk and view of the Dining Hall

Figure 5. Kitchen area: the 'Earth' section during a cooking class.

The Kitchen area is the thematic focus of the structure, because the main activity of this Neighbourhood Home takes place in this space: the informal cooking class. The inhabitants of the neighbourhood can turn in volunteer as teachers of a dish of their own culinary tradition. During the cooking class they will be able to tell stories, the origin, tricks and gestures necessary for the skilful preparation. Monthly, the Home will publish an ingredient themed calendar and people can set the corresponding cooking classes. Ingredients will highlight how many cultures have common roots, and people can discover new culinary knowledge, techniques and gestures. All those who want to participate and learn new recipes will be able to register freely, bring the ingredients with them and use the spaces and tools provided by the structure.

Tools and furnishings organization within the Kitchen area is innovative and does not reflect any specific tradition: the Neighbourhood Home needs to abstract itself from specific culinary cultures and identify a common core for all food preparation, in order to embrace the largest number of techniques and ensure flexibility. This original and “neutral” interior concept aims to bring out new behaviours and values that favour community and participation, rather than choosing a typical layout of one culture at the expense of others. For this scope, the general process of preparing a dish was analysed: it starts from the pantry to find the ingredients, goes through the preparation (cutting, cleaning, kneading, washing, etc ...); cooking - if present - (boiling, frying, smoking, grilling, steaming, cooking in the oven, etc.); ending with the dishing and the washing activities. For each of these steps, the necessary tools and functional components were designed.

In order to satisfy a multiculturality, a new aggregative rationale was identified: taking inspiration from the Lévi-Strauss culinary triangle, it was chosen to cluster activities and functions according to the four natural elements, because each one is essential in all the culinary traditions and is able to evoke the ancestral rites of the culinary space.

There is a “Water” section in which there are the activities of “filling” (containers, pantries, shelves, refrigerators) and washing. The “Earth” area is dedicated to handwork such as “kneading”, “cutting”, “forming” etc. and corresponds to worktops equipped with sinks, drawers for instruments and waste bins. At the center of the room, six functional blocks are designed for fire-related activities, each of them provided with a different type of cooking: stove, oven, wood-burning oven, grill, plate and deep fryer. These six pillars represent -at mythical level- the fireplace of the tribe, around which stories, culture, myths and rites are transmitted. The “Air” section is merged with the previously “Fire” area for what concerns smoking and steam cooking, and the absorption of vapours is guaranteed by ventilation hoods placed on the kitchen blocks.

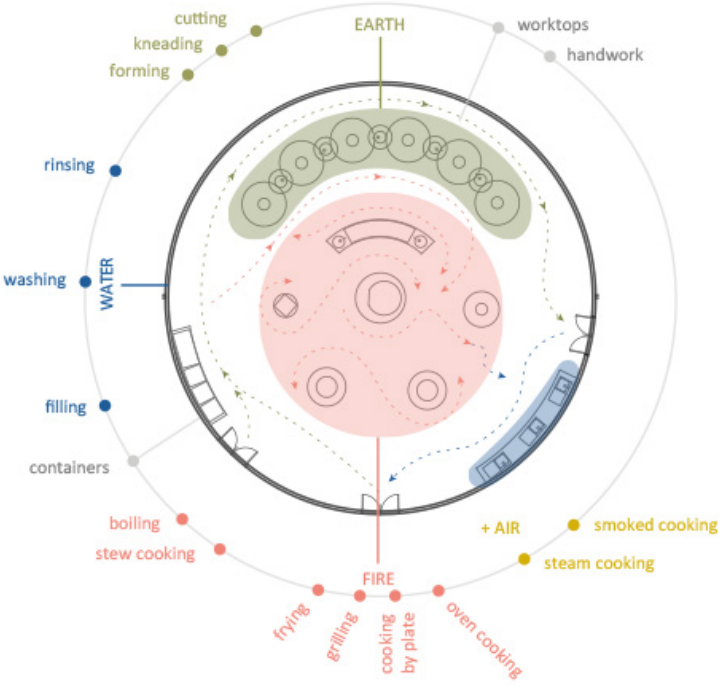

Figure 6. Semantic and functional organization of the Kitchen area

Finally, the consolidation of the experience within the MeetEat structure takes place in the glazed and openable Dining Hall, that allows to extend activities outside. Thanks to the presence of tables that can be combined in multiple ways and allow compositional flexibility, it is possible to achieve two objectives: the consumption of the dishes in a social eating, which generates sociability and strengthens the confidence among the guests; and the possibility of holding neighbourhood meetings to discuss problems, find solutions and organize events of collective social commitment. In this way can be created a community as a network, responsible for its own Home and neighbourhood, eager to take care of it and respect it with a new trust and a renewed sense of belonging.

Figure 7. A social eating in the Dining Hall (street view).

5. Conclusions

Today we still live on a Planet where there are several paradoxes. But those that characterize food sustainability (malnutrition, unsustainable production systems and the fight against food waste, just to name a few) have required in recent years to concretely rethink our objectives, to find immediate and long-term impact solutions. Studying new scenarios in the field of cultural and food sustainability is fundamental. Design as a participatory and co-creation method in food experience design can help to glimpse opportunities where today we only see criticalities and problems (Massari, 2017).

There are many existing design projects to increase the interaction of migrants and foreigners in the social supply chain of food and solidarity, such as the tools for integrating the activities of associations operating in the management of foodstuffs. Instead, there are fewer projects for the dissemination of sharing culture, tools and systems for inclusive integration within cities. The roots of all people have always been interconnected with each other by exchanges and migrations in trade and history. Culture is the human dimension par excellence and takes on the appearance of innumerable forms of transmissible and shareable rituals, which enclose the soul, the very essence of peoples and their values. Understanding rituals through different cultural expressions allows understanding the cultural traditions, values and “myths” of people around the world and helps generate inclusion with each other. Transmitting and sharing culture generates not only a more inclusive society in each neighbourhood, but also a possible neighbourhood cultural

heritage, composed of shared rites and myths, that can be transmitted and can become part of people in their daily lives. No longer an “I” and “them”, but an "us".

The Neighbourhood Home system aims to trace the similarities between people, the roots in common; at the same time, it helps to develop curiosity and interest in distinctive cultural traits, to teach how precious diversity is and how much growth and wisdom it can offer. The project can lead to the creation of more inclusive cities and nations: today this goal would be not only desirable but also fundamental, because plurality and diversity are beneficial for all when they become connections and exchanges.

Abstract | Communication Design today plays a role of social and cultural responsibility. It represents, and at the same time shapes, the society, acting on both individual and collective biographies. An *inclusive* and *sustainable* Communication Design needs therefore to be able to take into account the multiplicity and diversity that characterize society, making itself an expression of pluralism and respect. The context in which we live and act is characterized by an enormous amount of media messages which still spread and feed, limiting and degrading gender stereotypes - both consciously or unconsciously.
The urgency to act towards a fair representation - free of negative gender stereotypes - is reiterated by the resolution of the European Parliament of 17th April 2018, which highlights the duty of the media "*to ensure [...] diversity of opinion and media pluralism, to promote respect for human dignity and to combat all forms of discriminations and inequality by, among other things, portraying diversified social role models [...]"* furthermore it "*stresses the role of the media as an agent of social change and its influence in the shaping of public opinion and calls on the Member States to promote content on gender equality in public media*".
Starting from this context we intend to adopt the interdisciplinary point of view of Gender Studies, focusing on the consideration about the representation of the genders and the centrality of the white man, elevated to a "unique prototype of the human species" (Melandri, 2011). The contribution therefore means to focus on the gender asymmetries conveyed by schematic visual representations, specifically the pictographic language. The objective is to highlight how artifacts and communication systems, which are *universal* by definition and addressed to the whole community - therefore ideally representative of the multiplicity - are strongly asymmetrical and oriented to the male.

The subject of study are therefore the visual forms that are part of the pictographic language with an informative and prescriptive function, an area that has well-established origins in the history of communication design, starting from the studies of Neurath and Frutiger.

This kind of visual forms are characterized by a high degree of objectivity but at the same time they unconsciously translate models that include behaviours, duties, responsibilities and expectations linked to female and male identity, the subject of social expectations, which allows us to focus our attention around those gender roles to which women and men are encouraged to conform. The observation therefore concerns the forms of schematic representation which permeate everyday life. A both quantitative and qualitative analysis of the gender asymmetries (hierarchies, roles, contexts...) will allow to highlight through which modalities pictographic languages contribute to convey negative stereotypes towards women.

The proposed contribution is located in an area of communication design which is historically central but not widely investigated from the point of view of gender studies and which still results strongly unbalanced towards the male sphere. We therefore assume a gender-sensitive perspective to exercise an innovative point of view for the discipline of design (Decataldo & Ruspini, 2014), in accordance with a vision that enhances the multiplicity towards a fair and equal representation of genders in the media context.

KEYWORDS | PICTOGRAPHIC LANGUAGES, GENDER INEQUALITIES, IMPLIED STEREOTYPES, FAIR REPRESENTATION

1. Introduction

1.1 A polluted environment, the need of an *ecological* communication

Communication Design nowadays plays a role of undeniable socio-cultural responsibility. It has the task to "translate" (Baule & Caratti, 2017) the content into a visual form by making it accessible and it is therefore responsible for the resulting message and the effect it has on the community to which it is addressed. As Ezio Manzini states in *Designing as everyday life politics:*

> "Design has always played a social and political role. Directly or indirectly and whether consciously or not, it has assumed all kinds of stances towards dominant social, cultural and economic systems: ranging from enthusiastic support to radical criticism and alternative propositions" (Manzini, 2016).

Design therefore acts on social reality, influencing opinions, expectations, attitudes and habits and it changes the perception that individuals have towards reality.

These premises highlight the urgency to outline a Communication Design which is *sustainable* from a socio-cultural and ethical point of view. The metaphor of the *environmental sustainability* can be traced back to a passage written by Bucchetti in 2019, in which he refers to the concept of "media landscape" and the pollution of the media landscape. We live in an environment overflowing with images and media messages. The quality of these messages — especially when reiterated — has important consequences on the construction of individual and collective biographies. It is also through Visual Cultures that harmful, *polluting* stereotypes are conveyed and amplified such as discriminations on the grounds of gender, ethnicity, age, etc.

That is why it is essential to rethink how communication could be defined *sustainable*. We need therefore a Communication Design: (I) able to take into account the complexity of reality and to face the multiplicity that characterizes the environment in which we live, act and relate, and therefore able to make responsible choices; (II) aware of its social responsibility and of the consequences that a stereotyped message can have on the group of individuals to whom it is addressed; (III) vehicle of values such as inclusiveness and equity rather than spreading disvalues that undermine, in more or less implicit ways, opinions and expectations towards certain social groups.

Our contribution is situated at the intersection between Visual Cultures and Gender Studies. The paper intends to provide a contribution from the Communication Design point of view, by assuming the perspective of Gender Cultures as analytical category. The use of gender as a descriptive axis allows us to carry on a wider reflection about the *implicit* stereotypes conveyed by the visual languages that every day characterize the environments in which we live and grow. We decided to focus the observation on the pictographic languages of everyday life, from wayfinding systems to instruction manuals. The pictographic languages represent an area of Communication Design — historically central — which is characterized

by a high degree of universality and perceived objectivity (Bucchetti & Casnati, 2020) but not immune to stereotypes. This represents an environment affected by forms of pollution that are less obvious than others — for example the advertising sector — but equally harmful. These forms of pollution act slowly and at an underlying level, which end up to be perceived as normal. Our aim is therefore to investigate whether and through which modalities and forms pictographic languages are actually representative of multiplicity or whether they — universal by definition — are influenced by a society still male-oriented and therefore subject to gender stereotypes.

1.2 Why Gender Studies – the urgency to reach gender equality

There are several reasons which led us to adopt the point of view of Gender Studies. The urgency to act towards the eradication of gender inequalities is, first of all, underlined by the institutions at international level. Starting by the Cedaw adopted by the United Nations in 1979, which represents "the most important international legally binding instrument on women's rights"; the World Congress Women's World; the Instanbul Convention of 2011, to protect women and fight against all forms of gender violence; up until the *ONU Agenda 2030*, which places gender equality at the top of the objectives to reach sustainable development: to “achieve gender equality and empower all women and girls [....], and all forms of discrimination against women and girls everywhere".

In this context the *Global Gender Gap Report* for 2020 highlights Italy's backwardness in achieving gender equality. The country occupies the 76th place out of 153 countries (six positions below compared to 2018). Measures were also taken within the field of media focusing on the forms of representation of women. One of the main examples is represented by the work of the Gender Equality Commission in relation to the issue *Media and the Image of Women* (Amsterdam 2013) and the resolution of the European Parliament of April 2018 (2017/2210 (INI)) on the impact of marketing and advertising on equality between women and men, which reaffirms the role of responsibility of marketing, advertising and media images and

> “highlights the importance of promoting media literacy [....] so as to encourage young people to develop critical thinking skills and to help them identify and denounce sexist representations and discrimination [...]. Stresses the need for preventive measures [...]; points out that advertising can be an effective tool for questioning stereotypes”.

This contribution is part of a wider work carried out by the research group xxx. The group works on issues related to the representation of women in the media by experimenting new models and communication tools, focusing on the socio-cultural responsibility of the designer himself.

2. Communication Design, stereotype and social identity

Media images, by their own nature, communicate by models in order to be immediately recognizable and comprehensible to the social groups they are addressed and these *models* contribute to activate gender stereotypes which in turn are responsible for the definition of self-schemas. They affect both "cognitive resources" and "emotional reactions to sexist statements" (Camussi & Monacelli, 2010). Media communication draws from a collective cultural basin, using already established and consolidated models and returning them amplified. The designer himself is inevitably conditioned by his own socio-cultural background and, if he does not have the tools for a critical re-reading of his work, the project will result permeated by the dominant culture.

From this point of view social reality and media representation are part of a vicious circle in which the media take on the role of a "faithful and deforming" mirror of reality (Baule & Bucchetti, 2012). It could be defined as a feedback process that continuously pollute the *media landscape*. The designed images are in line with the sensitivity of the moment but, at the same time, have the power to shape it. The repetition of a stereotype leads to its rooting and its transformation into prejudice, ending up by determining expectations towards specific groups of individuals and consequently shaping social identity. This mechanism is most evident in contexts such as advertising and marketing, as highlighted by Clarke and Griffin (2007):

> “[...] the cultural message about how women should look and act is endlessly disseminated on covers of women’s magazines sold at supermarket check-out counters, in the news media, on TV, in films and in advertising, all of which endorse a value system that preaches bodily perfection”.

The issue we wish to address concerns the role played by designed communication products — which are employed in society to circulate information, data, goods, services, etc. — in contributing to the development or maintenance of gender inequalities. We therefore wish to focus on iconic and pictographic representation which respond to prescriptive, orientation, guidance functions and which are by nature designed on the basis of normative principles. All those cases where the message of communication is perceived as universal and objective.

3. Universal visual languages

Starting from a consideration expressed by Bucchetti,

> “Each “visual configuration” is a text: the place where its signification materialises and manifests itself; that place, in other words, where two levels may be recognised and distinguished, belonging to each language, to each sign system: the level of the signifier and the level of the signified; the level of expression and the level of content”.

Cecilia Robustelli refers to verbal language as it enables us to codify thoughts and express opinions and expectations. The same principle can be applied to visual languages. The content and the coding of the message itself provide information about the idea of gender owned by the speaker – or in our case by the designer - and may cause discrimination.

> "A language which is respectful of gender differences constructs the message to avoid its reading in terms of subordination or discrimination, through the adoption of precise semantic or grammatical strategies, the former relating to the content and the latter to the use of the methods provided by the language system for recognising and specifying the existence of different genders" (Robustelli, 2015, author's translation).

How do visual languages, which are defined *universal,* behave? Is it possible to apply the notion of *universal masculine* even to pictographic languages? If we consider language as the expression of a culture and interpretation of one's own thoughts and opinions, how does the designer act in relation to multiplicity?

The reasons which led us to identify the pictographic languages as research field are briefly listed below (Bucchetti & Casnati, 2020).

1. They are simplified representations of reality. They make it possible to relate to the surrounding world through the adoption of *meaningful* practices and behaviours;
2. they are signs that should — by their own nature — be accessible and immediately clear to the entire population. The effectiveness of the sign is greater if it does not require the acquisition of new decoding rules. Interpretative rules should ideally be embedded in the socio-cultural basin of the target population;
3. they have a normative dimension, they have the task of transferring rules, indications and prescriptions;
4. they are addressed to a wide range of recipients, to the community as a whole, so they have a recognized universal value;
5. they are perceived and recognized as objective messages.

Starting from these assumptions, a first phenomenological research with a preliminary value was carried out, aimed at defining the study area. This represented a first on-field research which allowed us to identify and collect those pictographic signs which are peculiar to public and private environments that we are used to frequent and that characterize our routines. From public signposting to other wayfinding systems, pictograms on product packaging or instruction leaflets, focusing on icons depicting people. This first exploration allowed to isolate and identify issues that may give rise to specific in-depth analysis, aimed at extending the iconographic material basin and verify whether certain aspects, found in individual cases, are recurrent or not.

4. Gender discrimination conveyed by pictographic languages, three main areas

The observation highlighted how the pictographic representations of the male and female figure "give rise to denotative signs that refer, depending on the circumstances, to distinct classes which are not necessarily coherent with their own denoted, according to a vision closely related to male domination".

> "The strength of the male order is measured by the fact that it does not have to justify itself: the anthropocentric vision imposes itself as neutral and does not need to be enunciated together in speeches aimed at justifying it. The social order functions as an endless symbolic machine tending to confirm the masculine domination on which it is based" (Bourdieu, 1998).

Abdullah and Hubner (2006) underline the role of pictograms and the consequent need to be as independent as possible from culture:

> "Pictograms are used to warn, guide or protect and need to be immediately decipherable. They must get right to the heart of the matter by visually conveying a vital piece of information in such a way that it cannot be misunderstood, and they should therefore be internationally recognizable and independent of culture".

What emerged, on the opposite hand, highlights the tendency of communicative projects to inevitably reflect the culture and thought of the designer — who grows and forms within a certain social group and with a certain culture. As the verbal language, the visual configurations examined in the study reflect a historically located social situation, inevitably leading to judgements that "diminish, reduce and, ultimately, penalize the positions that the woman has come to occupy today" (Sabatini, 1993).

Therefore, three main areas that represent different ways in which gender stereotypes occur have been identified. Areas that, once delimited, can become the object of future in-depth studies or a starting point for the designer to reflect on.

4.1 *Man-as-default*

The public sphere was the starting point from which the observation originated. Signposting characterizes all public spaces and generally represents codes that are supposed to be assimilated by the community.

They are *neutral* and *universal* systems by definition, from which, however, inconsistencies that lead to a strong orientation towards masculinity emerge. Specifically, implicit elements have been identified which reflect and justify a clear condition of gender inequality, which has not been resolved yet. The predominance of the masculine is clear and seems to coincide with the representation of the neutral, i.e. used when the message is addressed to the whole community. The issue is emphasized by a low presence of female figures which, as

we are going to see later on, seem to be mainly related to the mother/family dimension or, more generally, to care roles.

Figure 1. Examples from the Italian public signage system

The definition of *neutral masculine*, drawing, once again, from the field of linguistics, indicates “uses of language that do not correspond to those of grammar but which attempt to justify themselves based on a misunderstood interpretation of sexual plurality. Everyday language and the press reinforce the use of the masculine plural grammatical gender in its extensive and inclusive interpretation, in other words, to indicate male and female referents” (Robustelli, 2015, author’s translation). The same happens when addressing the plurality of citizens through the use of icons. Figures with masculine traits are used when the message is addressed to both men and women, while for specific cases, i.e. when addressing circumscribed groups, the figures may assume feminine traits, for example if in relation to a child, therefore in the role of mother. The "non-marked male" is therefore identified with the bivalent function of the male gender, which refers both to the male sex and to both genders. We can also talk about *fake neutrality* of the masculine when one "claims that what is only of man is universal"(Sabatini, 1993). The *Man-as-Default* (Kotthoff & Wodak, 1997) seems so obvious to us that it ends to be considered *natural*, both the motivations and the processes are taken for granted (Ghisleni, 2004).

4.2 Hierarchies

In the previous section the notion of the *neutral masculine* was introduced. If, however, we consider the numerically inferior cases in which female and male figures are co-represented, our attention is immediately drawn to hierarchical relationships and to those parameters that lead the beneficiary of the message to perceive a subordinate relationship of women to men.

Dimensional relationship - In case of co-representation, the female figure appears smaller in size than the male figure. Among the examples collected, is particularly interesting the danger sign "crossing children" (Fig. 2), in which the female child is clearly smaller than the

male child. The difference is emphasized by details that characterize different age groups (the bag for the male and the lunchbox). Size, posture and connotative elements also subtend the role of the man as *guide* or *protector* of the woman, referring to the universe of gender roles.

Figure 2. Children crossing sign, Italian public signage system

Figure 3. Elderly people crossing sign, United Kingdom

Topological space - The spatial correlation between the female and male figures. In the representation of two or more subjects of different sexes, the female figure is perceived "behind" the male one. The perception of the position can be suggested, as in the case mentioned above, by the orientation of the two figures. The two kids (Fig. 2) are represented while running and their orientation defines who is in front, leading and assuming a role of responsibility and power and who needs to be led (the female kid). The same happens in the case of the "lift" pictogram which is part of the Italian public signage system. In this case the woman icon is placed in the middle (Fig. 4), between two male figures, to reiterate the need for protection.

Another modality of representation is well exemplified by the pictograms indicating "groups" and "groups with baggage" (designed for Zurich airport's wayfinding system) (Fig. 5), which place the woman icon in the background over the male figure thanks to an overlapping composition in which the male pictogram is read perceptively over the female pictogram.

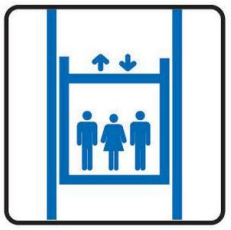

Figure 4. Lift sign, Italian public signage system

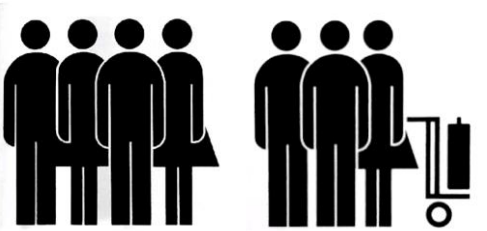

Figure 5. Groups and Groups with luggage signs, Zurich airport, Swiss

Quantitative Relationship (in representation of groups) - It concerns the numerical relationship between female and male figures. When multiple subjects are represented, as in the examples mentioned above, an unjustified numerical prevalence of the male figure emerges.

Type of Action Performed - The action that is represented and attributed to a male rather than a female figure implies another fundamental issue concerning gender roles, which is specifically dealt with in the next paragraph.

4.3 Gender roles

The third defined area concerns the roles attributed to the woman when the communication is specifically addressed to her. This area is more generally part of the issues concerning the fixed roles attributed to women in the media.

Female roles

> "Women have long been the symbol of men's desire and fantasies, essentially bodies with no other history than the one defined by male interest, by the criteria of value/disvalue in practice in the patriarchal symbolic order that absorbed the feminine into the masculine and gave as the only possibility of existence subalternity or parity" (Pallotta, 2012).

The issue brings with it wide-ranging problem areas such as work-life balance, the issue of glass-ceiling, inequalities in work, etc. The observation highlighted the fact that, even in the case of pictographic languages, there is a fixity of roles. The woman is mainly attributed the roles of mother, caregiver, housewife. By way of example, it is useful to mention the pictogram placed on the shopping cart of an important distribution chain, which represents a female figure (Fig. 6) in the act of pushing a shopping cart inside which a child sits. The supermarket in this case is Esselunga, whose wayfinding system uses a visual language very similar to that of public signage, in which the *male-as-default* prevails. The designer's "need"

to decline the icon to the feminine emerges from the relationship between a child and the act of shopping.

Figure 6. Accompanying children on escalators, Esselunga supermarket, Italy

Figure 7. Pedestrian area sign, Sweden public signage system

Figure 8. Safety signs on escalators, Italian public signage system

The icon of the mother occurs in other cases of co-presence with pictograms representing children, an example is given by the signage in stations, airports or shopping malls near escalators. The sign usually carries a series of warning or danger messages. in all messages the subjects are declined to men, even if in groups or couples, except for the signal indicating that children must be accompanied by an adult person, relegating once again the woman to the maternal and care dimension (Fig. 8). The same happens in some road signs placed near pedestrian areas (Fig. 7). On the sign, part of the public system, we can see the pictograms of a walking man, the icon "crossing children", with all the considerations previously stated, and a third icon representing a female figure in the act of pushing a baby carriage.

Furthermore, the representation on the packaging of household products — detergents, cleaners, etc. — denotes deep-rooted gender stereotypes. Only female figures alone or accompanied by children are represented on this type of products. Even when warnings for use or dangers are given, the figures are marked feminine. An emblematic example is the icon that most laundry detergent packages display to encourage correct behaviours. The message is "keep out of the reach of children". To transmit this information, a little girl is depicted stretching to pick up the product placed on a shelf above her. The action performed by the child confirms that the product is aimed at a female audience (the symbol

is similar if not identical on other products of different brands) and implies the role that she will play as she grows up. The girl is represented with a dress, ponytails and a doll in her hand, a key reference that symbolizes the learning of the roles of care we have seen to be of female domination.

Male roles

If the woman is attributed roles that relegate her to the domestic sphere, the male figure is attributed active roles, which refer to positive values. From a first observation on the same product category mentioned above — household detergents — only one case was found depicting the male figure. It is a stain remover that shows some male silhouettes on the packaging. While the woman is represented doing the laundry or, in some cases, as a simple silhouette, to highlight the target audience, the man is represented as a sportsman. The product is called *sportswear, penetrating anti-odour, specific sanitiser for technical garments* and the three silhouettes represent a skier, a cyclist and a runner during their respective sporting activity (Fig. 9).

Still in the field of technical/sporting products, if we observe the forms of pictographic representation that have a prescriptive function and guide to the "correct doing", which are developed in sectors such as clothing and technical/sporting equipment, we can see that they are addressed to a male audience even when the product is not differentiated according to sex. An example is given by the sport climbing equipment (harnesses, safety devices, etc.), unisex products whose images of instructions (on tags, pendants, websites, etc...) present mainly male figures. The female figure is represented when, talking about safety devices, the practice of *couple control* is described and her role is passive (Fig. 10).

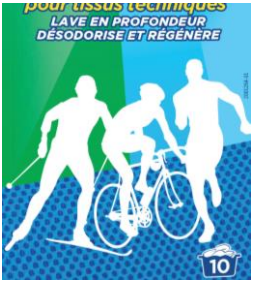

Figure 9. Sportswear package detail

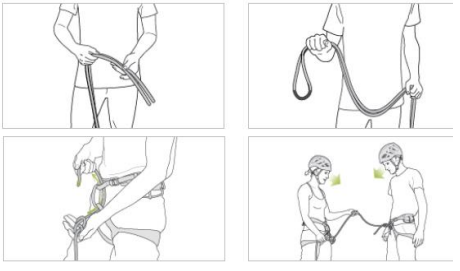

Figure 10. From Petzl instructions, climbing devices

The assignment of active or passive roles on the basis of gender is recurrent in other areas such as the emergency instructions. In three of the collected cases — referring to material distributed by airlines — the actions to be carried out in emergency conditions, in which some passengers have to take an active and collaborative role, are explained through a sequence of images. In the first one the company is Ryanair, the man has an active role (he wears a mask and life jacket, he takes care of the emergency exit) while the female figure is represented in the passive act of descending the emergency slide. Another case that deserves our attention is the one from Lufthansa, in which the subject is a female stewardess — represented in the action of taking care of a young boy by making him wear a mask and life jacket — but still, the “strength” operation — to turn the lever to open the hatch — is done by a man. The female image returns in the storytelling to show that kids and children should be picked up on the emergency slide, so once again in relation to the caring activity. In the last case (SAS) the man once again takes care of the opening of the door, assuming the role of hero and guarantor, while the woman is represented exclusively to focus the attention on the obligation to remove heels before using the inflatable slide, referring to a dimension of frivolousness.

5. Towards a sustainable Communication Design

The three identified areas highlight the persistence of gender stereotypes in areas of communication that have a recognized value of universality and neutrality. These are stereotypical forms less evident than others but which characterize everyday life by polluting it. Any kind of recurring image, despite not paying particular attention to it, ends up appearing so obvious to us that it is considered "natural", even by the designer himself. Referring back to a Ghisleni's passage in *Sociologia della quotidianità* (2004), everyday reality and the images that are part of it are expressions of "practices of reciprocity which, being mostly unconsciously assumed, tend to make everyday life a world taken for granted"

We deem that the work carried out so far may constitute a further piece within the perimeter of Communication Design for gender cultures, but we also believe that it may represent a model for a wider reflection in the direction of a communication design suitable to deal with contemporary issues (*Agenda ONU 2030 for Sustainable Development*). This kind of design should be: (I) inclusive; (II) fair to the social groups it addresses and to all individuals; (III) representative of multiplicity; (IV) promoter of values rather than a vehicle of disvalues. “Social design is the practice of design where the primary motivation is to promote positive social change within society” (Resnick, 2019).

Abstract | Covid-19 has been disturbing the formal societal life, education not be excluded. With computer science progress, the ecology of distance working has been flourishing. To prepare for the regular situation of the epidemic, this study has started to explore an iterated online education model toward the unpredictable environment. The researcher took Politecnico di Milano, Tsinghua University, and Tongji University as research objects, and engaged a mixed methodology to conduct the investigation, which constitutes literature study, case study, interview, and comparative study. Meanwhile, a Randall Collins' s Interaction Ritual Chain theory was integrated to analyze the concrete conditions, the data were classified into three aspects of online education, the group symbols, the high-intensity emotional energy, and the group unity. Within this study, the three aspects correspond to the touchpoints, the form, and the performance of online design education respectively. Based on the outcomes, the researcher gave suggestions to the current condition.

KEYWORDS | ONLINE EDUCATION, SINO-ITALIAN SCHOOL OF DESIGN, COMPARATIVE STUDY, INTERACTION RITUAL CHAIN

1. Introduction

Covid-19 has been making the traditional education model transited rapidly ever since last winter. According to UNESCO statistics, as of March 30, 2020, the coronavirus epidemic has caused 1.53 billion students to suspend classes globally, accounting for 87.6% of the global school students (Unesco, 2020). Although pandemic condition disturbs the normal societal life, people have been overcoming this issue by taking advantage of synergy during quarantine time. This study takes online teaching of design as research objects based on the three universities that had international collaboration, and utilizes a comparative method to investigate the diversified experience rooted in their pedagogy. The goal of this study is to share useful teaching approaches with the design education field and relevant stakeholders between China and foreign countries and regions.

2. Literature review

The authors had reviewed the historic processes of how distance education developed worldwide, which referred to the China's development process and the experience from the U.S.

China has been undergoing four periods of distance education model and during which who also been influenced by other countries: the first three are correspondence education, radio and television education, and third-generation distance education (Chen, 2020). The main method of correspondence teaching is self-motivation study, and the form of face-to-face pedagogy is supplemented. Correspondence education in China first appeared in secondary normal colleges. Ever since the Reform and Opening, radio and television education model was successively recognized as the most significant type of distance education, the approach of this model is by positively or actively watching. Radio and television education is broadcasted uniformly throughout the country, mainly offering theoretical foundation and professional basic general education courses to meet social needs based on the actual conditions. Thirdly, since the 1970s, the University of Phoenix began to explore the establishment of an adult education learning system, and provided educational services to students through the Internet in the late 1980s. In 1989, it became the first worldwide recognized online education degree in the United States' institutions. After that, online education platforms had been flourishing with the development of computer science, such as Udacity, edX, and Coursera. Among them, 2012 has been seen as the first year of Massive Open Online Courses (MOOC) by The New York Times (Pappano, 2012). Additionally, XuetangX MOOC platform was established by Tsinghua University in 2013, which marked China has stepped into the third-generation distance education stage (Wang et al., 2020).

From correspondence education to MOOC, the efficiency of education has increased largely. However, the passive learning model makes the distance education lacks interaction between the educators and the learners. This reduces the emotional energy that has been

regarded as the essential factor of educational engagement. Based on the issues mentioned above, real-time communication platform (RCP) had been designed to meet this gap, which can break the geographic boundary and provide audio and video service to the users. RCP was initially created to serve telecommuting work and distance business, its accessibility has also been extended to the education field under quarantine conditions. At a first glance, RCP gave the solution to respond to the call 'keep learning during class suspension' (Ministry of Education of the People's Republic of China, 2020).

New-born technology had always been evaluated by stakeholders. In the March of 2020, American Shorelight institution released the American Collegiate Live program (ACL), which allowed international students to learn online university courses in their domestic homes, then go abroad after gaining the general accredits (Shorelight). Also, some China's universities gradually set educational cooperation with foreign institutions. The domestic students started university life at home and would go to partner institutions after finishing the fundamental requirements, such as Westlake University with Cornell University, they set an example of this coordination model in China (Xv, 2020). The RCP used in Zoom, Microsoft Teams, Tencent Meeting, etc. Collective online education appears many merits, such as the flexible forms of teaching materials, the freedom of space-time limitation, the efficient learning outcome evaluation, and the effective check of work attendance.

Nevertheless, the disadvantages of RCP become visible after collective utilization. Some design researchers had begun to investigate the shortcomings of RCP by classified inquiry, which involved the course design, interaction effects, learning process, outcomes and the attitude of students toward blended learning. In general, there are several issues reflect the weaknesses. First, the divergence of learning circumstances had caused various influences on students, which made it difficult to guarantee learning efficiency. Second, students tended to hide behind the screen by closing the camera, which was common in China and misled the class effectiveness. Last, over-loading usage of digital equipment not only affected the physical health, but increase the mental burden on both sides. Yet, a number of authors commented the outcomes by their experience, but empirical research, and they seldom pointed out a solution or orientation (Figure 1.).

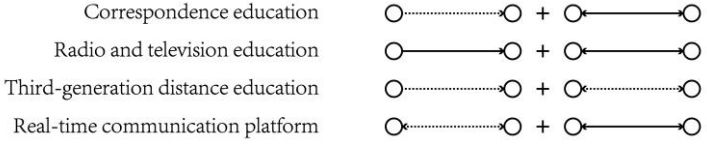

Figure 1. China's four periods of distance education model. The circle in the diagram indicates the stakeholders of design education. The full line means the process of offline education. The dotted line means the process of online education. The direction of the arrow is also the direction of information flow. The left side of plus sign presents the main education model, the right is the assistant one. Author self-painted.

Given the current situation mentioned before, this study proposed the research problem: facing the possibility of regular epidemic prevention and control, how can online design education be iterated to a more humanistic circumstance? To respond to this problem, this study attempts to integrate a sociological framework on the current design education system by probing into the selected cases.

3. Methodology

Research methods used in this study are literature investigation, case study, interview, and comparative study, which consisted of the research methodology of this study.

In the first phase, the author explored two areas of the literature, which are the common situation and pedagogical cases of online design education between foreign and China's institutions. During this process, the general development of this field had been figured out.

Additionally, the author selected three universities' design education systems as case study objectives, Politecnico di Milano (Polimi), Tsinghua University (THU), and Tongji University (TJU); then respectively interviewed their students about the condition of online design education during quarantine time. The data collected from the above procedures constitutes the original research materials.

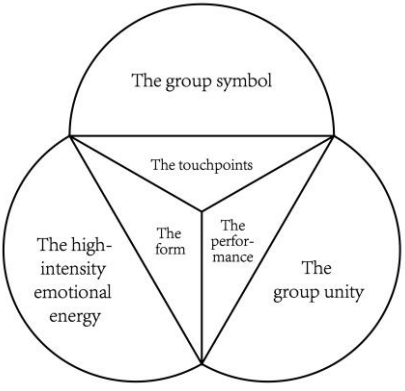

Figure 2. The usage of the IRC framework in this study. Author self-painted.

The last phase was to comparatively analyze the cases' similarities and differences from the following three perspectives, the group symbol, the high-intensity emotional energy, and the group unity. They were originally integrated into the Interaction Ritual Chains (IRC) theory of Randall Collins, who suggested combining micro and macro views in the context of sociological background, providing a theory of change from one situation to another, as well as a model for in-depth analysis of social phenomena and behavior (Collins, 2005). In the

view of education field, IRC had a bearing on the ideal status of online pedagogy. In detail, the three perspectives were designed to correspond to the touchpoints, the forms, and the performance of online design education in the three universities (Figure 2.).

4. Discussion

Ceremony is a special behavior system developed by human society. This system first appeared in the religious field. Later, Goffman expanded the scope of the application of rituals. He believed that rituals are ubiquitous in life (Goffman, 1982). In the secular field, it is the same as in the formal religious occasions. It plays an important role in shaping individual characteristics and dividing group boundaries. When online design education approaching perfection, of which spiritual satisfaction is becoming absolute. This study collected the teaching process and the individual feedbacks from the interviewees of the three universities, they also acted as teaching assistants, on which the following analysis was based (Table 1.).

Table 1. The matrix diagram of the three online design education.

	The group symbol ↓ The touchpoints	The high-intensity emotional energy ↓ The form	The group unity ↓ The performance
Polimi	Microsoft Teams, Zoom and Cisco	Blended learning model, ritual space construction	Sustainability, inclusiveness
THU	Rain Class, Tencent Meeting, Zoom, Tencent QQ and WeChat	Blended learning model, digitalization of the practical school education	The immersive experience of digital education
TJU	Tencent Meeting, Zoom, Tencent QQ and WeChat	Blended learning model, distributed education model, abroad semester program model	Sustainability, the experiment of the emerging education model

4.1 The group symbol

The IRC can produce distinctive group symbols, which are realistic carriers that carry the emotional energy, the group morals and the group unity, and trigger a strong sense of collective belonging among the members. In this study, the touchpoints of the group symbol are the RCPs and the teaching contents.

The School of Design in Polimi has been utilizing Microsoft Teams, Zoom and Cisco as the RCP for their online classes throughout the quarantine time. Compared to the others, Cisco settles a few cameras in the practical classrooms to catch the teachers' statements,

behaviors and expressions. It provides a real-time classroom system to engage students in an immersive environment, which produces a sense of ritual. In addition, Cisco allows students to review the previous videos of the classes, then the customer stickiness gradually emerges. Moreover, the login authority of Cisco carefully recorded the identity information of each participant, which protects the intellectual property of the teachers and the students.

In 2016, XuetangX and Tsinghua University Online Education Office jointly developed and launched a smart teaching tool Rain Class. It integrates information technology into PowerPoint presentation software and WeChat social platform. The teachers push the pre-class learning materials with MOOC videos, exercises, and voice to the students' smartphones to facilitate teacher-student communication, timely feedback, and real-time answering and bullet comment interaction. Rain Class covers every teaching section and provides teachers and students with complete data support, attendance monitoring, personalized reports, automatic task reminders, personnel grouping and other teaching services.

Different from the previous two institutions, The College of Design and Innovation in Tongji University tends to frequently use Zoom or Tencent Meeting to conduct online teaching and administrative management, and it has no specific RCP.

Except for the advantages of RCP, there are also several issues unveiled during this process. Above all, the technical problem is one of the most influential factors toward online education, which directly delays the teaching activities, such as the limited bandwidth and the instability of the system. In addition, the time difference is another troubling point while conducting international courses.

4.2 The high-intensity emotional energy

Emotional energy is not a specific emotion in the usual sense, it is a long-term stable social emotion. Emotional energy is the most critical factor and the core in the IRC. The strength of the emotional energy will be an important factor that affects students' online engagement. In this study, the organization forms of online design education are regarded as the embodiment of accumulating the emotional energy.

Polimi employs a blended learning model to conduct education under the pandemic context, which allows the domestic students to come to the university in person, and engages the international students online at the same time.

THU has broken down the original long-term lectures into a 40 minutes' unit and added the text contents of the learning materials. The students watch in front of the screen more clearly than on the offline projection. To make the students have a better immersive experience, they adjust and enrich the pictures, videos and blackboard writings that need to be used for different media, so as to reduce the time caused by the screen staying. Besides the formal professional classes, video conferences and online exhibitions are also inevitable

activities. In order to give students better tutorials and motivate them, teachers will often share what they have done during the epidemic in class, so as to enhance students' enthusiasm for professionalism and expand their thinking.

TJU has been iterating design education model from The College of Design and Innovation. Even in the middle period of the quarantine time, they have been attempting to extend the blended learning to the community. This benefits from the previous experimental outcomes of serial community regeneration activities. TJU never limits its education inside the university campus, every corner of the neighborhood can be the learning center, which has maximized the spatial and educational resources. NICE 2035 prototype street and NICE Commune are the typical representatives of this idea. The distributed educational system shares the burden of the traditional university model, the emerging co-creation centers act as the resilient learning center, which supplements the school learning. On the other hand, the community-based learning center can protect its users from external infection by real-name registration system. Also, The College of Design and Innovation started abroad semester program at the beginning of 2020, which has received dozens of domestic students who originally plan to go to Art Center College of Design and Parsons School of Design.

The accumulation of positive emotional energy can stimulate high-intensity emotional energy, so that members are full of enthusiasm and confidence in the interactive ceremony. The relationships between teachers and students directly affect learning efficiency, the educational institutions should customize their interactive models based on the condition. For example, the project-based learning and case study-based learning models are seen as essential training models among empirical disciplines, yet the practical conduct methods have to be adjusted according to the situation.

4.3 The group unity

Group unity is the essence of the ceremony. Its occurrence requires the condition of the common presence of the situation and the gathering of the people. Within the online environments, the common presence has been seen as the basic requirements of design education, which involves the teachers and the students. The touchpoints and the forms are the foundation of the group unity, of which they decide the performance. Although the physical presence is an important condition for the formation of group unity, its theory is still applicable to cyberspace. It is not based on the experience of gathering and interacting with people in the physical presence, but it can provide close interaction situations. Cyberspace can evoke the virtual presence of collective psychological structures. In this virtual presence situation, the visual focus is weakened, but it can be compensated by imagination and experience, and a higher level of visual focus and emotional connection can be established.

However, the spatial discreteness results in potential risks, such as the delay, instability and disconnection caused by the technical issues. Also, the diversified domestic circumstances interrupt the students at varying degrees. Sometimes, the students even make use of the technical problems to cut class, which causes the resource waste of online education.

Furthermore, as a comprehensive discipline that combines theory and practice, design has always been facing challenges about tutoring sketch or prototype making online. For example, limited with the size of the camera, both students and teachers usually draw sketches out of the screen without perception. And the three-dimension modeling tutorial is tougher for the teachers. Therefore, online design education should call for the improved technology of remote control.

Mead believes that human beings not only can express other actors as objects, but also have the ability to express themselves as objects (Mead, 1934). This is the so-called objective self. The opposite concept is the subjective self. When teachers and students are doing teaching reflection, of which the memory becomes the objective self's component of self-concept, and it is necessary to reflect the meaning of this action for his identity from the standpoint of others. There are numerous factors that influence the performance of the group unity, the author recognizes the attitude of empathy as the most essential factor that affects it.

5. Conclusion

Facing the possibility of the regular context of epidemic and quarantine, it is necessary to consider a more pleasant and customized circumstance to support online design education. Several recommendations can be proposed toward the current situation based on IRC analysis.

The process of teaching is actually a social interaction process between teachers and students using symbols as a medium (Lu, 1990), which indicates the touchpoints in the background of this study. It can be seen that symbol construction plays a critical role during the online teaching. Nowadays, in the online teaching of colleges and universities, both teachers and students should stand on the point of object self to co-create the synergy on this virtual space. Otherwise, it may cause the meaning of the symbols incomprehensible, which leads to the failure of symbol construction. In other words, the pedagogical contents and the RCP should be prepared carefully and make them suit for the concrete situation, also the technical support ought to be always ready for the emergency.

Communication plays an important role in the development of a good teacher-student relationship. It is a key foundation for stimulating the emotional energy between them. The variety and smoothness of communication methods is the guarantee for a desirable teacher-student communication, of which the lack will weaken the relationship and hinder the emergence of emotional energy. An inspiring teaching environment is good for the interaction and the production of emotional energy. The model of the flipped classroom and the micro lecture provides constructive suggestions, which encourages the students to participate in the teaching process and break the time limitation of online tutorial (Zhou et al., 2020). Last but not least, educational institutions ought to develop a more inclusive blended learning system. Under the perspective of IRC theory, the distributed thinking of design education may help to share the burden of distance learning, which integrates the

fragmented space and time to build a resilient learning environment during the regular epidemic condition.

In cyberspace, the efficiency of knowledge communication will decrease, so do emotion. This reminds us that the participates of online education should conduct empathy except for the perfect technical supports, such as the establishment of the common focus. At the same time, the bespoke evaluation system largely affects the performance of online design education. For teachers, a clear power list can be useful for them to modify the teaching behaviors, which also stimulates enthusiasm. And for students, the diversified domestic surroundings influence the learning performance directly, which needs the collaboration between the schools, the society, and the homes to guarantee their learning.

In the next phase, this study will continue to pay close attention to the situation of online design education in a wider context, which extends the research scope to the regions of American and Africa. The outcomes will not only benefit the current condition, but help to iterate the design education model and fit it to a more inclusive and sustainable future.

A COVID-19 Horizon Scan Looking for Post-Pandemic Implications for Design

Marcus Foth*[a], Glenda Amayo Caldwell[a], Joel Fredericks[b]

[a] QUT Design Lab, Queensland University of Technology, Brisbane, Australia
[b] Design Lab, The University of Sydney, Australia
*corresponding author: m.foth@qut.edu.au

Abstract | So far 137 million people have been infected by the COVID-19 virus worldwide, and over 2.96 million lives have been lost. The urgent and sustained response to COVID-19 has impacted on everyone's life in one way or another. This paper contributes to the collective and reflective appraisal of COVID-19's impact by conducting a horizon scan in search for some of the post-pandemic implications for design research. After reviewing some general implications, we investigate two focus areas: (1) supply chain disruptions, and; (2) post-pandemic cities. While some measures may remain temporary and ad hoc, our analysis suggests it is imperative to derive a learning dividend and legacy from this traumatic and profound experience. We conclude with some remarks on community activism and ways for design to evolve in order to create more socially and ecologically just practices and outcomes in the aftermath of this global crisis.

KEYWORDS | PANDEMIC, COVID-19, CORONAVIRUS, CRISIS, VIRUS, RECOVERY, POST-PANDEMIC

1. Introduction

The coronavirus pandemic is a global crisis that, at the time of writing, has claimed the lives of over 2.96 million people worldwide, and over 137 million people have been infected by the COVID-19 virus.[1] This crisis comes with an opportunity for us to rise to the occasion in new ways we might not have been able to previously. The special circumstances of the crisis thus afford us a window to see possibilities that we did not see before and to do things that we could not before. We owe it to those affected directly and indirectly by this pandemic that we do not waste this opportunity to seriously and critically reflect on COVID-19's impact and the post-pandemic implications for design research and practice.

This paper does not entail a systematic literature review, which uses a replicable and rigid search algorithm to perform a meticulous appraisal of all primary sources on a given research question. The specific literature on COVID-19 we wanted to capture for this review is far too recent, fast paced, and interdisciplinary to be adequately captured by a systematic literature review. Instead, this paper combines a specific type of literature review called a horizon scan (Hines et al., 2019) to identify research work and studies that have been published on the topic of COVID-19, with the aim of contributing to the emerging debate in the field of HCI about trends, gaps, opportunities, and implications. Horizon scanning is a useful method for our purpose, because it allows us to capture a diversity of research publications at an early stage of their development, and the resultant list of references offers a rich collection of publications for the reader to draw upon for follow-up research and cross-disciplinary connections.

Our search method employs a broad horizon scan of COVID-19 related papers published in 2020. We used databases such as the ACM Digital Library, IEEE Xplore, Scopus, and Google Scholar. In addition to the HCI literature, we also purposefully included papers from other disciplines such as STS, sociology, cultural studies, human geography, health, and policy. This enables us to establish a transdisciplinary perspective. We are particularly grateful for two meta-reviews of the evolving COVID-19 literature (Dalsgaard, 2020; Lupton, 2020). We also employed a bidirectional snowball technique by following relevant references cited by the papers we found as well as checking on Google Scholar whether any new papers have been published that cite these papers. We use this meta-analysis to offer a critical appraisal of this evolving domain that argues for the significance and urgency for the design community to collectively consider post-pandemic implications. The paper can thus be classified as a hybrid "survey" and "opinion" contribution using the taxonomy by Wobbrock and Kientz (2016). It contributes to ongoing and emerging discourse on design and COVID-19, such as papers in the July 2020 special issue "Design in the pandemic" published in the ACM *interactions* journal (Taylor et al., 2020).

[1] https://news.google.com/covid19/map

The paper is structured as follows: First, we review some of the general literature on the topic of coronavirus and COVID-19 to establish a baseline overview. We then review and investigate two thematic foci. These have been chosen (a) to avoid overlap with previous coverage (Taylor et al., 2020), and; (b) based on the interest, expertise and previous and current work of the authors. We acknowledge that a range of additional themes could and should be explored, too. However, to keep this review within the available scope, we had to limit our selection to (1) supply chain disruptions, and; (2) post-pandemic cities. For each, we cover measures taken, societal consequences, design's role, and some possible long-term repercussions for research and practice. While some measures may remain temporary and ad hoc, we argue that it is imperative to derive a learning dividend and legacy from this traumatic experience. We reflect on this and the role of design in supporting community activism in our conclusions. Our analysis and critical review suggest that this can help the design field to evolve in order to create more socially and ecologically just practices and outcomes in the aftermath of this global crisis.

2. COVID-19

The first coronavirus cases in Wuhan, China, already started spreading at the end of 2019. AlJazeera's timeline reports: "On December 31 last year, China alerted the WHO to several cases of unusual pneumonia in Wuhan, a city of 11 million people. The virus was unknown."[2] An overview of the outbreak in China was published in the *Journal of the Chinese Medical Association* (Wu et al., 2020). As the virus spread from China to Thailand, USA, Nepal, France, Australia, Malaysia, Singapore, South Korea, Vietnam, Taiwan, and other countries, the World Health Organization (WHO) declared the coronavirus crisis first a global emergency (30 January) and eventually a pandemic (11 March). For the first time in Australia's history did the Prime Minister Scott Morrison declare a national "human biosecurity emergency" (18 March). Urgent strategies and measures were needed and deployed in an attempt to control the pandemic. Anthony Fauci, a member of the White House Coronavirus Task Force established in late January 2020 under US President Trump to deal with the coronavirus pandemic, and colleagues published an editorial in the *New England Journal of Medicine* outlining their strategies for navigating uncharted territory, saying:

> The Covid-19 outbreak is a stark reminder of the ongoing challenge of emerging and reemerging infectious pathogens and the need for constant surveillance, prompt diagnosis, and robust research to understand the basic biology of new organisms and our susceptibilities to them, as well as to develop effective countermeasures. (Fauci et al., 2020, p. 1269)

[2] https://www.aljazeera.com/news/2020/01/timeline-china-coronavirus-spread-200126061554884.html

While the COVID-19 crisis certainly opens uncharted territory, the virus and its spread behaves similarly to previous pandemics, and as such well-established control measures and tactics such as social distancing and contact tracing have been recommended and deployed successfully in a systematic approach (Zhao et al., 2020). However, global directives and recommendations by the WHO based on the dire worldwide statistics of infection numbers, recoveries and sadly, deaths, fail to adequately capture and empathise with the human dimension and the lived experience of patients, family members, carers, and health workers. Everts calls this the "dashboard pandemic."

> Notwithstanding the global dashboards of the World Health Organization (WHO) and Johns Hopkins University, most dashboards have a built-in spatial imaginary of territorially confined spaces and societies whose integrity must be defended or regained. What is missing (or sometimes hidden in plain sight) from dashboards is more nuanced spatial, temporal, social, and epidemiological information. (Everts, 2020, p. 260)

The positivist, global, and clinical approach must be tempered with realism and the experiential. This requires local contextualisations and adaptations in order for health directives and strategies to work and be applied in different socio-cultural contexts (Mahmud & Al-Mohaimeed, 2020). The preparedness and vulnerability of African countries facing coronavirus (Gilbert et al., 2020) is different from the situation in Australia (O'Sullivan et al., 2020) and other countries (Georgeou & Hawksley, 2020). Without a solid understanding of how to tailor and adapt to local nuances and specificities, health directives and control measures are at risk of failure. It is the skills and expertise of the humanities, social sciences and design fields that are most apt and suitable for these tasks and thus ideally positioned to complement the advice and scholarship by public health experts and epidemiologists. Science and humanities disciplines together can make a difference and beat this pandemic. Designers are particularly well positioned to connect scientists and humanities scholars. They can use their polymath mindset and lateral thinking skills to create the epistemological, methodological and empirical links that create the transdisciplinary understanding required for humanity not just to bounce back but to bounce forward.

Designers and other scholars were quick to spring into action to address immediate needs and urgent pressures. Some of the COVID-19 related work being reported so far focuses on social distancing (Wiberg, 2020); quarantine (Brooks et al., 2020; Salamanca & Vargas, 2020; Shields et al., 2020); remote work and working from home (Kramer & Kramer, 2020; Manzini Ceinar & Mariotti, 2021; Rogers, 2020) and their associated remote collaboration tools for work and education such as Skype, Slack, MS Teams, Zoom, Facebook, Discord, Miro, Jitsi, etc. (Brown, 2020; Lottridge, 2020; Teräs et al., 2020; Williamson et al., 2020). In the domain of health and hygiene itself, design's focus on touch interfaces may now see an increasing need for touchless interaction such as gesture and voice (Iqbal & Campbell, 2020) or new ways for personal devices such as smartphones to be used to interact with shared public interfaces such as ATMs and traffic lights. There are also urgent challenges for HCI to help rethink general medical practice (Thornton, 2020), hand hygiene compliance (Banerjee et al.,

2020), as well as new ideas for conserving the supply of personal protective equipment (Bauchner et al., 2020). Working with colleagues in political science and media studies, design research should also confront the way social media platforms are used and misused for the coordinated and viral spread of coronavirus misinformation and disinformation (Bursztyn et al., 2020; De Coninck et al., 2020; Graham et al., 2020).

In addition to the immediate and urgent pressures, there is a desire to learn from this experience for the long term. Salisbury (2020) asks, "what might we learn from the COVID-19 pandemic?" and "What next?" (Remuzzi & Remuzzi, 2020). Will the pandemic bring us together and will we see – despite social distancing – a new form of "human togetherness" (Gardiner & Fulfer, 2020)? Will the pandemic make us reprioritise what matters most to us? As a result, will we expedite action on climate change or focus only on the immediate threat at hand? If politicians and corporations let this "good crisis" not go to waste, will they have ours and the planet's health and well-being in mind, or just their own profit or re-election (Klein, 2020)? Will the pandemic see a proliferation of the digital, or will we enter a postdigital era (Coeckelbergh, 2020)? And what is design's complicity and responsibility in how we got into this mess (Monbiot, 2016; Monteiro, 2017, 2019), and what role do we see for ourselves moving forward (Dalsgaard, 2020; Taylor et al., 2020; Welankar, 2020)? What will be the post-pandemic implications for design? We will now turn our attention to two specific themes.

3. Supply Chain Disruptions

The outbreak of COVID-19 has demonstrated the fragile state of many organisations, primarily those highly reliant on China to either supply products or raw materials. Nonetheless, consumers in China have shown strong grassroots resilience due to locally specific consumer dynamics and frameworks such as "community group buying" systems (Georgeou & Hawksley, 2020). Unlike natural disasters, the global pandemic is not restrained in terms of impact to one geographical location or a time period (Ivanov & Das, 2020). During a pandemic different aspects of the supply chain are impacted either concurrently or sequentially, where manufacturers, distribution centres, logistics, and consumers are affected, stopped or paused at different or even overlapping times due to lock-downs and quarantines (Bonaccorsi et al., 2020; Ivanov & Das, 2020; Thomsen et al., 2020). Therefore, relocating stock to other areas or seeking alternative sub contractors or suppliers does not necessarily resolve the supply chain disruption. For decades supply chain optimisation has focused on minimising costs causing many companies to become vulnerable to global shocks as revealed by the pandemic. There are new supply chain technologies becoming available transforming into digital supply networks (DSNs) allowing companies to connect with their complete supply network, enabling collaboration across their supply chains and end-to-end visibility (Deloitte, 2020). Advanced Industry 4.0 technologies such as Internet of Things, robotics, artificial intelligence, blockchain, DSNs, and 5G telecommunication networks are designed to meet future global challenges (Deloitte, 2020). Boosting domestic and local

supply chains and manufacturing is also seen as a step to mitigate global vulnerability. Ivanov and Das (Ivanov & Das, 2020) indicate that capacity flexibility and product diversification need to be considered to allow for agile and responsive manufacturing technologies where companies can produce the goods that are in demand by remaining markets. A prime example has been the global use of additive manufacturing, fabrication, 3D printing, to manufacture medical supplies and the crowdsourcing and even the making of DIY healthcare equipment across a distributed set of community members and companies (Bragazzi, 2020; Manero et al., 2020; Richterich, 2020; Salmi et al., 2020). This approach has been used across the world to overcome supply chain breakdowns. However, it has raised questions concerning standards and medical certification, too (Manero et al., 2020; Salmi et al., 2020).

In Australia, COVID-19 is driving demand for Australian made products while supply chains are weak and manufacturers have experienced a hollowing out of their capabilities, down to approximately 6% of gross domestic product (GDP) (Green, 2020). Australia is seen to be over reliant on the export of raw materials and the import of cheaply made goods. In response to COVID-19 the manufacturing sector is receiving an increase in support for research and development while the Australian government has created a national task force to reinvent Australia's manufacturing sector (Green, 2020). The Innovative Manufacturing Cooperative Research Centre (imcrc.org) aims to accelerate Australia's manufacturing sector into the fourth industrial revolution, Industry 4.0, by supporting the uptake of advanced manufacturing technologies such as robotics, 3D printing, augmented and virtual reality, machine learning, AI, and data analytics. Industry 4.0 promises growth in design and manufacturing, where advanced digital technologies support existing infrastructure to develop new, efficient and automated processes. Robotics and AI have faced concerns and controversy in relation to job losses and data privacy. These are valid concerns which need to be mitigated and responded to by providing upskilling and training support for workers, policy development and government supported infrastructure for procurement, investment, and research partnerships (Green, 2020).

In the health sector, Industry 4.0 is referred to as a "smart system, used as a flexible production line for almost entire production processes" (Javaid et al., 2020, p. 420). In a recent detailed literature review of the application of Industry 4.0 technologies to fighting the COVID-19 pandemic Javaid et al. (Javaid et al., 2020) identified the following benefits, including better planning of activities regarding COVID-19, minimising health risks to health workers, manufacturing of protection and precautionary items in relation to the virus, provision of medical parts in time due to smart supply chain, robotic applications for treatments of infected patients, virtual reality for training, promoting flexible working environments for treatment infected patients, uptake of digital technologies in everyday life during lockdown, increased innovations as a result of advanced manufacturing technologies, use of advanced technologies for social and media platforms to identify information, used to improve risk assessment and global health emergency of the pandemic. Additionally, telemedicine and remote health monitoring systems are supported by advanced digital

technologies creating improved support systems, applications, and education for remote and regional areas. For more specific information regarding particular technologies and their helpful use in fighting COVID-19 see Table 1 by Javaid et al. (Javaid et al., 2020).

Beyond manufacturing and health, Industry 4.0 and its advanced technologies are applicable to tourism and travel, hospitality, transportation systems, construction and engineering, education, and communities in general. COVID-19 has demonstrated that these technologies can minimise human contact and the potential spread of the virus in the delivery of goods and materials, disinfecting spaces, detecting temperatures, supporting safety and security, and treating patients (Zeng et al., 2020). Considering the numerous areas of application and benefits associated with them, advanced technologies such as robotics and AI will continue to be adopted and applied in more aspects of our living and working lives. Therefore, it is essential for HCI to inform the ethical development and deployment of such technologies that will increase productivity, create more jobs for the future, protect natural and cultural environments (Zeng et al., 2020), increase citizen participation and engagement, and protect human and planetary health.

Reflecting on the contribution of and opportunities for HCI researchers to inform, explore, and direct Industry 4.0 initiatives, the benefits and potential opportunities for uptaking and adopting advanced technologies are clear. Yet, a main challenge we have encountered when working with industry partners is their focus on technology. With hopes of solving all the problems through the technology itself, the needs of their workers, clients, and collaborators are often overlooked. These technologies are novel and rapidly developing, largely they are not plug and play. Time is required to better understand and apply a human-centred design approach to the development, implementation and evaluation of advanced technologies. 'Open innovation' describes how an organisation can purposely manage inward flows of external knowledge, and outward flows of internal knowledge to increase its ability to innovate in line with its business model (Chesbrough, 2003; West & Bogers, 2014). Open innovation as a theoretical position informing industry partners fosters open mindsets, collaboration, creativity, and knowledge sharing as key aspects to the adoption and implementation of advanced technologies (Brophy et al., 2020; Caldwell et al., 2019). HCI researchers collaborating with disciplines such as industrial design, robotic engineering, architecture, and the wider humanities are well placed to design, develop, and make user interfaces, systems and processes, artefacts, prototypes, and products within the realm of advanced manufacturing and Industry 4.0.

Our research experience aligns with Dalsgaard (2020) advocating for HCI methodologies, tools and methods such as participatory design, scenarios, and design fictions, which can help to address global challenges. More specifically, the area of Human-Robot Interaction (HRI) will need to expand to include more critical and ethical questions, particularly as collaborative robots become more accessible and safer to use across industries and eventually in everyday life. We may also have to re-think the role of robotics in managing

public health and infectious diseases (Yang et al., 2020). We agree with Feil-Seifer et al. who argue that:

> Researchers in the broader robotics community have hypothesized that one consequence of the pandemic will be to alter the conversation around robots by highlighting that while robotics and automation may be eliminating jobs and exacerbating income inequality, they are also critical for enabling a global economy that is robust to pandemics, by enabling work to continue while limiting human-to-human contact and potential spread of the disease (Yang et al., 2020). (Feil-Seifer et al., 2020, p. 4)

4. Post-Pandemic Cities

Design and cities have a long history of interaction (Foth, 2009; Mitchell, 1995), and the aforementioned dynamics and challenges come especially to the fore in urban environments. The different sub-fields of design that focus on urbanism – architecture, urban design, urban informatics, media architecture – have already produced a number of notable proposals for alternative, contestable, and desirable city futures. We want our cities and urban habitat to be more inclusive and participatory (Foth, 2018; Hearn et al., 2011); resilient and antifragile (Hespanhol, 2017); equitable and ethical (Daly et al., 2019; Mann et al., 2020), and; sustainable (Heitlinger et al., 2019; Paulos et al., 2008; Foth et al., 2009). Aspirations are for cities to be transurban (Thibault et al., 2020); post-algorithmic (Komninos & Kakderi, 2019); posthuman (Forlano, 2016, 2017; Smith et al., 2017), and; post-anthropocentric (DiSalvo & Lukens, 2011; Luusua et al., 2017; Yigitcanlar et al., 2019) and thus catering for more-than-human futures (Clarke et al., 2019; Foth & Caldwell, 2018; Loh et al., 2020).

What impact do cities and urban technology have on the coronavirus crisis, and vice versa, what impact does the pandemic have on cities? It is already clear that the pervasiveness of smart city technology plays a key role in health monitoring efforts, public communication, epidemiological assessments, and the implementation of outbreak control measures such as social distancing, quarantines and travel restrictions (Lai et al., 2020). Our previous discussion of the controversies surrounding contact tracing apps as an example of smart technology deployments has already highlighted that some of these smart city and urban intelligence measures come with a range of – intended or unintended – side effects, such as privacy and surveillance concerns, limiting a city's civic sovereignties due to obligatory corporate data governance structures, and constraints or even the temporary removal of the citizenry's civil liberties. COVID-19 management strategies employed by the Chinese and other national governments use existing IoT and smart city technology infrastructure as well as new appropriations of robotics, autonomous systems, and AI in an effort to control the pandemic (Z. Allam & Jones, 2020; Chen et al., 2020). The crisis presents an opportunity that governments and corporations do not want to waste, one that expedites and accelerates the

rollout and expansion of "urban robotics and automation in a new era of urban bio-(in)security" (Chen et al., 2020).

On the flip side, what can design learn from the way these technologies we designed are now used and appropriated? Can insights from the "viral city" give us new insights for better designing future smart cities (Sakellarides, 2020)? What will the post-pandemic city look like (Batty, 2020; Kareem, 2020) other than obviously showing heightened resilience to viral infections and pandemics (McCall, 2020)?

The inequalities and inequities inherent in not just the spread of the virus itself, but also the response and efficacy of control and treatment measures and capabilities across different geographies and populations have become stark (Dasgupta et al., 2020; Gilbert et al., 2020; Rose-Redwood et al., 2020). As a result, we need to study these implications and identify the design opportunities to promote equitable and just cities for all (Pineda & Corburn, 2020). Speculative design scenarios are a useful method for anticipatory urbanism, as it allows us to temper uncritical corporate smart city utopias with critical, realist, and value-driven scenarios that should make us not just weary but confident in our shared responsibilities as designers (Costello et al., 2020; Jackson, 2020; Nathan et al., 2007).

Finally, post-pandemic cities need to also continue the fight for climate action and urgently progress towards a genuinely sustainable future. Looking at how the twin disasters of climate change and COVID-19 could transform our cities, Bauman (2020) argues that, "the existential emergencies we face require a wholesale reimagining of how we live, work and play in urban spaces." This will require a continuing focus on food and agriculture (Blay-Palmer et al., 2020; Loker & Francis, 2020), as well as radically reframing our unhealthy relationship with nature and the planet towards a design agenda of revegetation, rewilding and more-than-human perspectives (Lewis, 2020; Mills et al., 2020; Searle & Turnbull, 2020). In "Cities Gone Wild," Lewis argues:

> Below the biopolitical management of human populations in cities there exists a biopower of occupation that subverts attempts to reestablish immunized, species-determined territorial boundaries. This biopower is immanently productive, introducing the possibility of zoomorphic rewilding as a new ethico-political foundation for a posthuman right to the city. To return to business as usual in a post-pandemic world would be to miss this opportunity to join with non-human animal city dwellers in a moment of environmental intimacy. (Lewis, 2020)

5. Conclusions

As a new decade dawns, society often reflects on the trials and tribulations of the past and looks towards the possibilities and opportunities the future holds. 2020 was meant to be the year that kickstarted the beginning of a new prosperous decade full of urgent reform towards a circular economy, social equality, and environmental regeneration. If we were to jump-back or jump-forward in time we would observe that local communities are forever

evolving and changing as a result of contemporary influences, social changes and political agendas (Fredericks, 2020). The lead up to the new decade has shifted discourse around important topics and issues that people want to see addressed and in many cases acted upon with urgency. The hopes, wants and desires around people's futures within local communities were starting to be heard through bottom-up movements, such as the global climate strike, protests against invasion of digital privacy, and opposition towards social injustices. However, 2020 has certainly thrown Australia a curveball with national crisis situations declared as a result of either natural disasters, such as the 2019-2020 'Black Summer' bushfire season, and now the COVID-19 global health pandemic.

From June 2019, Australia has experienced a heightened level of top-down government intervention and decision making across communities as a result of these declared crisis situations. Regardless of their popularity, restrictions have been placed on local communities in order to protect them for the greater good. This includes particular restrictions on travel, public gatherings, closures of schools and places of work and the introduction of specific social distancing rules. We acknowledge that these measures have been implemented to protect the safety and wellbeing of the wider community. However, we do question some of the top-down and draconian approaches imposed on communities during such crises. For example, Prime Minister Scott Morrison established the Australian National COVID-19 Coordination Commission, which is chaired by a former gas company executive and consists of high powered company directors with vested interests in gas projects, yet who have never declared a conflict of interest (Knaus, 2020). It appears Morrison also never wastes a good crisis to advance his party's ideology and policies.

Cities around the world experience bottom-up community activism in response to a variety of issues and causes. These movements encourage local communities to stand up and take action often in response to unpopular political decisions, imposed restrictions, opposition to injustice, social transformation and new opportunities. Throughout time, community activism has allowed people to voice their discontent, show power in numbers and to ultimately stand-up against top-down decision-makers, and design has already played a vital role in this regard (Foth, Brynskov, et al., 2015; Foth, Tomitsch, et al., 2015; Le Dantec, 2016a, 2016b). However, there is a significant risk of democratic values being jeopardised as a result of government opposition to community-driven activism in times of crisis, and a drive for legislative change to prohibit this. An example is the New South Wales supreme court ruling, which effectively banned an organised Black Lives Matter protest. This opened up demonstrators to significant fines or even arrest if found in breach of the ruling (L. Allam, 2020). The interpretation of this action could be viewed in two ways. Firstly, the government is taking these measures to protect communities from COVID-19 infection, which is completely valid during a pandemic. However, this could be communicated in a better way. Or, secondly, there is the option of fighting the action through judicial channels as a direct challenge to the defiance of government power and control. Valls (2020) argues that city (or countrywide) lockdowns have strengthened the need for social connection and in fact brought people and communities closer whilst fostering a new sense of activism:

> Activism is evolving, as movements and organisations are learning to adapt their tools and systems to build power, organising and mobilising people for action overcoming the physical distancing limitations. (Valls, 2020)

This brings us back to the argument of 'never waste a good crisis,' in both a positive and negative approach to community activism. There are significant positive opportunities to design and investigate tools that promote a common task by traversing across social and cultural divides (Light, Frauenberger, et al., 2017; Light, Powell, et al., 2017). The ultimate objective is to lead a process of discovering collective and personal purpose that brings top-down and bottom-up stakeholders together in a dialectical discourse – rather than in opposition (Frauenberger et al., 2018). However, this also provides opportunities for governments seeking to maintain draconian control and power, such as changes to legislation and suspension of human rights and civil liberties in the name of national security (Bagchi & Paul, 2020; Kitchin, 2020).

We are specifically interested in the opportunities design affords to community activism in facilitating more open, democratic and collaborative discourse during declared crisis situations. More specifically, there is an express need to investigate opportunities for designing technologies that encourage people to participate in declared crisis situations before, during or after the event. And most importantly, we need to improve how top-down and bottom-up stakeholders better work together for more open and collaborative discourse through middle-out engagement and design (Dow et al., 2019; Frauenberger et al., 2018; Fredericks et al., 2016, 2019). By drawing on a collective knowledge base comprising top-down decision makers informed by academic experts and local communities who bring rich domain expertise, a dialectical engagement and greater collaboration between these stakeholder groups can emerge that is required to learn from this crisis in order to avert the next.

About the Authors:

Professor Marcus Foth is Professor of Urban Informatics in the QUT Design Lab, Queensland University of Technology, Australia. He is also an Honorary Professor in the School of Communication and Culture at Aarhus University, Denmark, and was a 2019 Visiting Professor in the School of Design, Politecnico di Milano, Italy.

Associate Professor Glenda Amayo Caldwell is the co-leader of the Design Robotics and Digital Fabrication research program in the QUT Design Lab, Queensland University of Technology. Glenda's research interests are in urban informatics, media architecture, advanced manufacturing, and community engagement.

Dr Joel Fredericks is a Lecturer in Design at The University of Sydney's School of Architecture, Design and Planning. He has a PhD from The University of Sydney in collaborative city-making focusing on the use of hybrid engagement channels for community engagement.

Acknowledgements: We thank Prof. Deborah Lupton (2020) and Prof. Peter Dalsgaard (2020) for taking the initiative to create meta-review documents and everyone who has contributed to those. We also sincerely acknowledge all those we lost during Covid-19 and those still struggling, pay our respects, and convey our condolences to families and friends.

A new way of perceiving the locality: economic growth, social inclusion, environmental protection

Fabio Mongelli

RUFA-Rome University of Fine Arts, Italy

Abstract | The Covid-19 health emergency has changed our social relations and approach towards studying and working. In this unpredictable context the role of the designer and artist coincides with that of the explorer who abandons his/her individual research to pursue a new shared mission for the future. Cities, parks, squares, agora-cultural spaces will have to deal with the changes that will affect the habits of citizens. Public spaces will be reshaped through projects that take into account social relations and environmental needs. By involving young people and researchers in the enhancement of the identity of an area it is possible to imagine a process of urban regeneration that can become an open operative model, to be applied subsequently in other urban areas. Rome tries to provide a first solution by creating a participatory design project that combines history and future in one of its iconic neighborhoods: San Lorenzo.

SOCIAL INNOVATION, PARTECIPATION, HARMONIZATION, CREATIVE DISTRICT, INTERGENERATIONAL

1. Introduction

1.1 Design as a response to covid-19

Design can be an answer to the challenges of our times, an engine of innovation and competitiveness, especially in those areas in which it is necessary to imagine new horizons, to cope with contexts characterized by profound and rapid social, scientific and technological transformations. In this process, strongly influenced by the consequences of the Covid-19 pandemic, the designer must act as an explorer, applying the working methods related to analysis, research and experimentation to support an approach to a design where the sense of community is at the center of the creative processes.

To understand how strategic it is for a designer to imagine the future and how historic the change of mentality over these last months has been; one can look at the past. The 1964 new hospital project of Le Corbusier (Boesiger & Girsberger, 1987) that should have been the first important post-war architectural achievement in Venice, but which was never built, is emblematic. On the third floor of the structure, the hospitalization of patients was organized in cells of various forms, with bed units that could be isolated if a new and contagious virus occurred, or connected to the nearby beds. Another example is the inflatable and transparent mobile office proposed by Hans Hollein (Pettena, 1998) in 1969, decades before technology made what is now called “smart working” possible. It can be seen not only as a mobile workspace, but also as a way of isolating oneself from others and from any pathogens, while keeping eye contact. If up until recent times the intention of a designer could have simply been to achieve an end, without a specific intention and a decision to work to achieve it, nowadays a systemic approach is adopted to solve the dysfunctions of entire communities that affect their members and their relationships.

The “key – word” that best defines the path that will be taken from here on is “harmonization”. The 2030 Agenda of the United Nations defines “sustainability” as the main way to meet the needs of the present, without compromising the lives of future generations, and to harmonize economic growth, social inclusion, public healthcare and environmental protection. For this reason it is necessary to invest in and support local communities through active and strategic policies, and by promptly launching public and participatory measures that can make a difference.

1.2 Post-pandemic education and re-construction

The creative industries, as well as the education sector, must raise questions about the future. In this re-construction process it is necessary to focus on cultural, personal and collective growth; making the art education - creative professional practice link even more

inextricable: from here emerge the "best practices" related first of all to social innovation and then to political innovation, that allow creativity to co-determine new solutions.
To rethink education, enhancing image education and the various forms of artistic expression, is a step to take to facilitate the affirmation of a concept that is in the DNA of art and design students: to interact with society; the so-called “Third Mission”, a fundamental objective that can be achieved through art education and research.
By contributing to the social, cultural and economic development of the host society, the Schools of Design can build bridges with industries, civil society and the local environment. Thanks to these bridges knowledge, perspectives and skills are disseminated in the area through institutional communication, “public-engagement”, “Start-ups”, “spin offs”, patents and consultancy.

Figure 1. All students of Design must interact with the society around them.

1.3 Evolved cultural districts

The consequences of the historical rift that Covid 19 represented for the global community will redefine the customer/citizen/user - locality relationships, and the cities will be at the heart of this transition.

Since the beginning of the millennium the definition “Evolved cultural district” has meant redefining the urban development policies of large cities and developing, as the main objective of political and administrative actions, policies to promote culture: a driving force capable of generating sustainable and growth economies. The projects have focused on

"social innovation", on placing the citizen at the center of the development policies. The citizen is not seen exclusively in terms of needs to be satisfied, but as a resource that must be empowered. Widespread intelligence, the ability to collaborate and creative businesses are all part of a system in which infrastructures, that enable these potentials to develop in urban settings, must be developed.

In 2002 Richard Florida published *The rise of the creative class* (2002), in which he described the future of cities as being that of "creative cities", systems capable of bringing forth and welcoming highly qualified creative professionals, the so-called hipsters, who embody the "3Ts": Talent, Technology, Tolerance.

However, the debate regarding the relationship between innovation, cultural events and the locality does not end with Florida: the publication of this volume caused a reaction to the idea of a marketing oriented city. For example, the model of creative cities developed by Maurizio Carta (Carta, 2009) adds a fourth T to the three Ts, which is the "Territory": without the involvement of citizens it would be difficult to build integrated and inclusive creative communities. Important documents have been published in this sense both by UNESCO and by the European Community in recent years.

In this concept of an evolved cultural District, culture (from cultural heritage to live entertainment) is not one service that the territory offers among many others. It is placed at the center of urban development strategies as an indispensable element to generate innovative and sustainable production chains, for example, the high quality agri-food supply chains, food and wine, traditional crafts, innovative design, tourism, recycling and reuse industries, building redevelopment.

Figure 2. The creative districts are mostly located in the suburbs. A network of artists has increasingly grown, producing wealth and promoting innovation.

2. San Lorenzo: urban and social regeneration and local identity

2.1 The San Lorenzo neighborhood in Rome

The San Lorenzo district is one of the first suburbs of Rome. It was created at the turn of the nineteenth and twentieth century and was immediately characterized by a population in which all working class activities were represented, in particular those related to crafts.

Identified from its origins as a "rebellious" neighborhood, between 1921 and 1922 it was the protagonist of three episodes of opposition to the first phase of fascism. This is why in the memory of its inhabitants and in that of the whole city, it is seen as an "anti-fascist" neighborhood. On the 19th of July 1943 the first allied bombing of Rome during the Second World War hit the neighborhood, an event that left more than 1000 victims and destruction in the area and is still commemorated.

During the second half of the twentieth century the district maintained a strong collective identity and became the favorite place for political and cultural youth associations in the seventies. During those same years the closure of the Verano Cemetery affected the artisans (traditionally marble workers), while the expansion of the nearby University made the need for accommodation and spaces for students increasingly urgent.

San Lorenzo is today in a state of partial degradation due to multiple factors. These include the weakness of the political-administrative governance of the area, speculative interests, the polarization of productive activities, the spreading of illegal activities.

But it is also a neighborhood characterized by countless creative, cultural, social and cohesive activities that make it a lively and vibrant area. A contemporary design culture of new normal cannot fail to set itself the goal of contributing to the enhancement of this incredible production sector, involving all of those who, for various reasons, cross or live in this part of the city.

2.2 Purpose of the project

It is exactly in this scenario that Rome, the Eternal City and inherent capital of the world, tries to trace a path today, launching the *San Lorenzo: urban and social regeneration and local identity* project. The goal of this venture, promoted by RUFA – Rome University of Fine Arts, is that of establishing an open operative model that can be applied subsequently in other urban areas. It is a project that does not intend to "decorate" a neighborhood that is full of urban and social layers through a design that is "imposed from above", but to engage a community by sharing specific objectives.

2.3 Methodology

In this context, the designer is the one who engages with public spaces to give voice to the local environment, enabling it to express its full potential: from the collective memory to a sense of belonging, including economic empowerment and social-related benefits. It is the designers who must provide the most appropriate means of expression and communication to the players in the field, to make sure that citizens can express their desires, their values, and find a sense of belonging.

The participatory methodology adopted in the design of the visual identity of the city of Porto sets the standard. The objective of the Lusitanian administration was to position Porto at an international level, since it had been declared "World Heritage City" by UNESCO in 1996 and "European Capital of Culture" in 2001. In these processes cities are usually represented through symbols that are useful to develop international tourism or attract investors, but completely ignore those who experience the cities every day and the fact that a locality is not a product. The identity of a city is very difficult to pin down. It is made up of history, architecture, memory, values, social ties, food, climate, language, emotions: all elements which, when combined, are intangible, difficult to define and not measurable. The real job for all designers is to represent this intangible, this indefinable.

In addition to the involvement of local actors, to achieve this vision the active involvement of students is necessary. Once they assimilate the apocalyptic experience of the pandemic students will soon become the new key players in design and creativity in an operation

aimed at creating symbols for the community, focusing on the sense of belonging, tradition and collective history; and at communicating outside of the community by redesigning the devices.

In Participatory design for the area and in evolved cultural districts **c**itizens/residents become the real protagonists of the development of the locality: it is they who must experience the projects as their own. It is not a matter of redesigning the neighborhood, but of imagining its future, of experimenting, through collaborative practices and social innovation (user-centered design), with new forms of coexistence, focusing on recreational aspects, as well as businesses, the environment and the economy.

Participatory co-design assemblies for the locality, but also meetings, discussions and conflicts: these are the grounds to implement projects, where “design identity”, sustainable cultural productions, reuse of abandoned spaces, site-specific projects, street art and everything that this research (that is very much a “work in progress”) can facilitate, are discussed.

Figure 3. The spaces of culture and of art encourage and develop a new "attractive" vocation for the area.

2.4 Purposes of the interventations

When the health emergency is solved, getting used to physical contacts again may not be automatic. So students, leave the classrooms! Citizens leave your homes, professionals leave your offices, shop owners leave your shops, local administrators leave your institutions! We are talking about the common good of all and not that of the individual. The goal is to give visibility to a journey towards the “right to the city”. By using the example of the European

experiences related to evolved cultural Districts, it is possible to create connections between the players of the local environment: public administration, entrepreneurs, educational systems and universities, cultural operators, associations and civil society.

From the experiences of the "old" industrial districts which created production chains not in the factories but directly in the localities, this model is re-proposed in the research, production and absorption of culture; that is the precondition and integral part of cities and societies viewed as sustainable environments.

The publication of the first report of the World Commission on Culture and Development of UNESCO related to creativity and culture dates back to 1996. It is interesting to note that in the document creativity is considered as a tool to empower local administrations. To tackle large cultural industries (publishing, cinema, etc.) administrations must support important creative processes to map in a systematic manner the social and technological resources available in the local area (local capital), establishing alternative development models and new public policies.

It is necessary to rethink time and space of production in terms of the vocation of the locality; environmental, economic and social sustainability, with a hyperlocal approach. The valuable resources of these new cultural district models are the demographic, ethnographic and anthropological heritage which includes live entertainment, the production of contemporary art, film, television, publishing and multimedia industries, typical local products, fashion and design. An area designs its own district model around its most valuable assets and its vocation, both in terms of the services offered and of its collective intelligence which can attract investments for specific production lines.

The goal is to encourage and develop a new “attractive” vocation for the area of San Lorenzo focusing on culture and art in general, entertainment, socialization and cultural production. The backbone of the project is the use of innovative design techniques to promote the culture of the locality, its developments and the protection of its cultural heritage, as well as the aggregation and mobilization of people and energy to achieve this purpose. A project of this magnitude can be achieved in Rome, that has always been characterized by fragmentation and discontinuity that define the urban landscape of many global metropolises. In the representations of “smart cities” each element and each function seems to be placed in a continuum that is as coherent as it is taxonomic. The vision which gives order is the one that has already translated and identified reality through the categorization of data that can be “read” by artificial intelligence. Data collection, storage and querying is not for everybody. Those who have invested in these sectors require a reconfiguration of space and time that is useful for the processes they implement: they require not a community but an interconnected community, the opacity of algorithms, that the citizenship right be linked neither to soil, nor to blood, nor be universal, but that it would depend on the transfer of personal data by individuals.
But this globalized city, this smart city, suffers a crisis when the plague spreads in Thebes, when Covid-19 empties the territory of those actors who apparently animated its economy: platforms for short-term rentals, tourists, non-resident students, minimarkets, food & drink and entertainment activities related to nightlife.

The city is now like a bone stripped of flesh, there is apparently nothing left to extract value from. But the value is there, and it comprises all of the resident citizens left to live in the neighborhood, the elderly, the migrants, and above all the social groups, voluntary associations, local gyms, those who have occupied abandoned spaces to regenerate them, to transform them into places of culture, socialization, experimentation, solidarity, that are free of charge and open to everybody.

To start again, the best elements of our communities will be able to interact with each other through three guidelines: research, exchange and operativity, creating a connection between resident citizens and students, researchers and experts in the management of cultural districts, to exchange information and experience.

This possibility is facilitated by the positive benefits that the pandemic has highlighted such as the possibility of communicating from a distance, of tackling a problem from all over the world, thus favoring discussions that have multidisciplinary approaches, facilitating the mapping of stakeholders in an area and defining the KPIs that must be analyzed, studying the local environment, processing the data obtained and sharing the results through participatory design sessions where projects, ideas, theoretical and practical activities are shared.

Figure 4. Art: yesterday, today and tomorrow. Example of the Classika project in San Lorenzo.

2.5 Ongoing activities

The activities in the field feature different projects and show just how much an educational institution such as RUFA can bring to the development of an area and how the perspective of the new generations can generate new possible worlds.

Art: yesterday, today and tomorrow.

- Sculpture: *Classika*, a homage to the decadence of Rome through a series of busts of contemporary characters of the San Lorenzo district, interpreted according to the stylistic features of classical Roman portraiture;
- Site specific: lights and sounds of memory, to actively redevelop abandoned spaces, looking into and enhancing the "dark" areas, such as the *Casa della Memoria* (House of Memory) in via Tiburtina through the light of art;
- Audiovisual project: the stories and characters of the neighborhood, the voices of the artists who "rest" at Verano, from Vittorio Gassman to Alberto Sordi;
- Multimedia: video installations, sensitive maps, participatory museum of the area;
- Videomapping: shows in the squares that create a narrative and visual scene focused above all on the neighborhood today and its future liveability.

Culture: being reborn after the apocalypse.

- Multimedia exhibition: interactive installations that tell of the evolution and transformation of San Lorenzo from a working-class district to a University district, including the bombing of the 19th of July 1943;
- Documentary film: the symbolic thread that links the tragic death of the young Desirée with the myth of Iphigenia, the sacrificial victim who atones for the sins of an entire society. The humanity that populates San Lorenzo becomes the protagonist of the making of an imaginary film about a modern Iphigenia;
- Photo reportage: a research focused on spaces and people: squares, streets, gardens, rooms, but above all communities, associations, gentrification, marginal situations, social degradation, memory;
- Publishing: a print and digital magazine for San Lorenzo: the places, the characters, the history but above all the current affairs and events, told through "profound" and vernacular designs and signs.

Design: participate and connect.

- App design: applications designed to connect people and places using specific key words, such as "art", "together", "economy", "local currency", "security", "discovering the neighborhood", "sustainability", "Urban décor", "gaming": the Apps are a way to promote socialization, meetings and exchanges that are not only virtual;
- Neighborhood signs & wayfinding. Paths that connect places through the multiple interpretations of the space from the point of view of those who pass through it. Unconventional signage and interactive exhibits;

- Creative design: research groups for the production of posters, art books using risograph printing, board games featuring the characters, places, and imagery of the neighborhood;
- Place design identity: A participatory city branding project of a multifaceted district, vital and traditional at the same time. Indispensable tool to make the area grow and stand out both in terms of attractiveness and social cohesion;
- Type design: a font, a typeface dedicated to San Lorenzo which will bear his name, an identity defined starting from the typography to describe the neighborhood;
- Advertising: a “call to action” to involve businesses, associations, cultural institutions and citizens to plan together events, performances, festivals, apps useful for redeveloping the territory;
- Virtual reality: San Lorenzo in 2030. A “non-place” where large digital platforms will have taken over the city and residents will not have a soul. Virtual reality shows the main street of San Lorenzo completely immersed in this dystopian future;
- Gamification: *Zombies in San Lorenzo*, a video game for the neighborhood. From the Verano Cemetery an army of zombies moves to conquer the neighborhood, allied with Roman crime and drug dealers. But the few remaining residents that are the non-resident students and the cultural and social entities of the area fight them;

Figure 5. Design: participate and connect. Example of the "Fluxus" project, digital wayfinding at San Lorenzo.

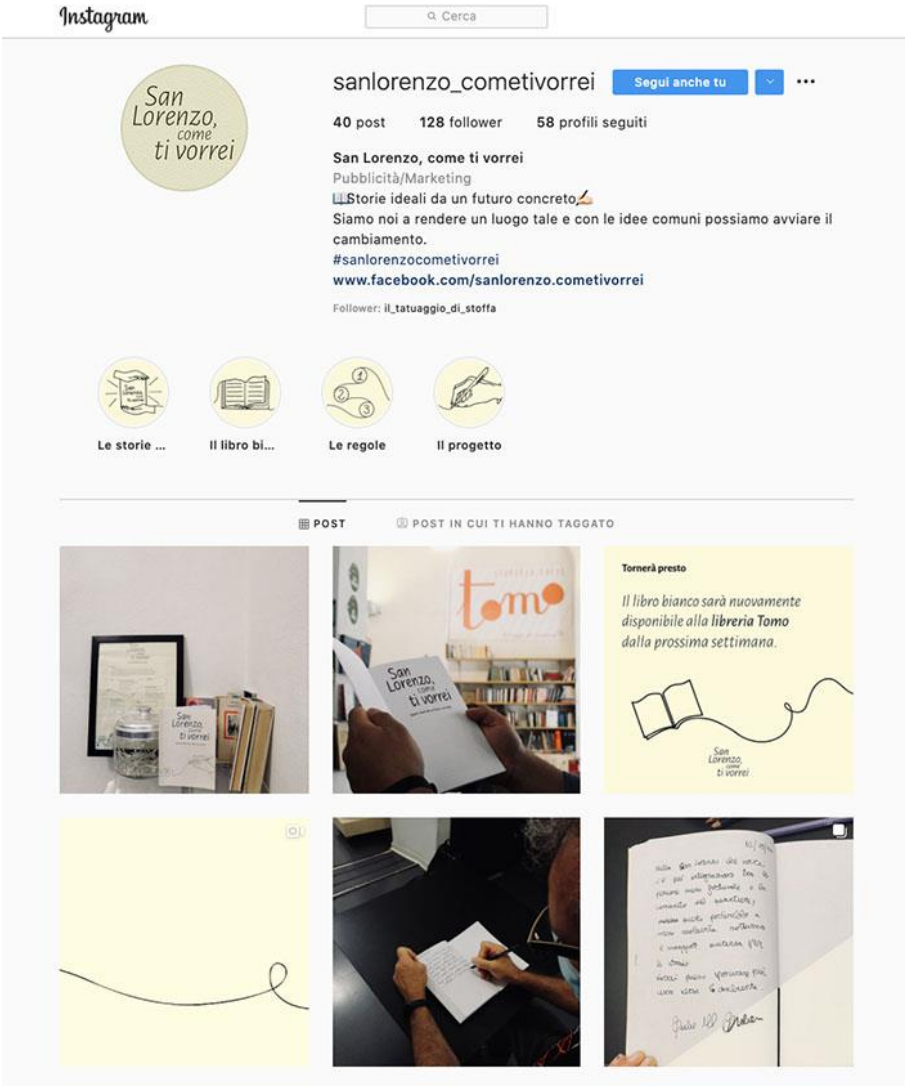

Figure 6. Design: partecipate and connect. Example of the app design project (Instagram page: sanlorenzo_cometivorrei).

2.6 Synergies

The project involves local public institutions: the Municipality of Rome II and DiSCo Lazio (regional body for the right to an education), which has its headquarters in San Lorenzo. These institutions have a direct and concrete interest in the area.
Regarding the voluntary associations and the nonprofit world, focusing strictly on the local and urban networks, a collaboration has been created with CNA Rome (Crafts National Confederation) and with Arci Rome, a long-standing association for social and cultural development.
In terms of businesses, the Intesa San Paolo banking group is involved. It has contacted a network of local businesses with the aim of creating networks and collaborations between entrepreneurs.
At an educational and University level, a successful collaboration has been created with the IT department of Sapienza University of Rome, which has its headquarters in San Lorenzo.
Another strategic player is the crowdfunding platform “Produzioni dal basso”, that helps provide support to specific projects**.**

2.7 Expected results

Various results are expected from the project, both in terms of academic education and innovation in the approach towards urban policies. First of all, a new framework for commissioning should be defined, which is not necessarily represented by a contract provided by a Public Administration. These types of activities are increasingly financed by the European Community through specific programs such as Creative Europe.
Another result is represented by the development of the students' abilities to deal with complex systems, such as those of the city. Place identity design has been strongly developed. The most forward-thinking local administrations have realized that design fails if it does not involve participatory policies and local key players.
This type of approach will be strategic especially during the post-Covid-19 reconstruction phase. The New European Bauhaus and the declaration of Ursula von der Leyen are significant in this sense:

> “I want NextGenerationEU to kickstart a wave of restructuring across Europe and make the Union the leader of the circular economy. But it's not just an environmental or economic project: it must be a new European cultural project.”

Culture as an engine for development. Sustainable and inclusive development as stated by the 2030 Agenda for Sustainable Development (SDGs), specifically in point 11: "Sustainable cities and communities".
And finally interdisciplinarity. Such an articulated project requires many professionals (graphic designers, videomakers, artists, product designers, set designers, social media managers, etc...) who interact, discuss and act in a coordinated manner on the basis of a common project and objectives: the distance between the different disciplines has increasingly decreased and this allows us to train a new creative generation that has

multiple skills.

3. Post-pandemic conclusions and discussions

Not only are artists and professionals formed in Academies and Universities, but also new citizens: they are places where very important experiences occur that influence our future, they are laboratories in which we learn and at the same time develop our critical thinking skills, they are places of culture, where the generations alternate, acquiring an identity, finding a meaning for their actions. The designers and the artists are not simply technicians who uncritically operate in mainstream communication, but people able to find new directions and explore new areas; where a new symbolic, deviant and unexpected order can always be defined.

Academies and Universities participate in the contemporary cultural debate as promoters of new approaches and new visions. Only by giving cultural and operational tools to the new generations, as well as concrete opportunities to follow specific research paths, can we fully examine the contemporary through the living eyes of our children.

In conclusion, the sudden unavailability of public spaces has shown their importance, as well as that of sociality. The loss of places and opportunities to meet and for cultural growth, even if temporary and motivated by the need to contain the spread of Covid-19, has been particularly felt and suffered by the younger generations who, as direct witnesses of the pandemic, could be the key to change. The new generations of students, now immersed in a blended existence between physical spaces and virtual meetings, will play a key role in society for the social relations of the future.

Figure 7. Planning from the area, for the area. To awaken consciences, to combine theory and practice in design, to bring together different generations.

A Sustainable Jewellery Design Practice for Psychological Health after Covid-19

Huiyi Qu[a]

[a]Tongji University
*1810645@tongji.edu.cn

Abstract The reasons why human wear jewellery are more intricate than a basic motivation to adorn themselves, one of which is to convey their sentiment. No matter pleasing pieces as tokens of affection or mourning jewels in remembrance of someone who has died. Heart-broken to hear millions of people were dead of Coronavirus last year, the author created a series of mourning jewellery for people who lost their family members and close friends in the disaster. The author hopes the work could help to ease their grief to some extent and contribute to the recovery of their psychological health. The research project is also for compassionate people who have willingness to support the victims as well as for the entire society to commemorate this event.

KEYWORDS | JEWELLERY DESIGN, MOURNING, PSYCHOLOGICAL HEALTH

1. Introduction

“Is there a possibility that people can use an artistic or poetic way to express their emotions after a disaster like Covid-19, so that their agitated mood can be recovered more quickly? Is jewellery an ideal medium? Is paper a suitable material choice for the mourning jewellery?” The research project started with these questions.

The miserable condition of Covid-19 at the beginning of last year is too hard to forget that thousands of people died in very short time and everyday news reported the updating statistics as well as people were requested to stay at home and any gathering was forbidden. The whole society remained stagnant at that moment.

While the factories, the schools open again gradually, and the economic and life order could be recovered in a short time, people who lost their family members and close friends in this disaster could never feel easy to stop the suffering and heartbreak. Money can be earned again, but the deceased never return. Bereavement is one of the most unacceptable and sad experience in one’s life. Not only the victim’s families need assistance of relief money from the government or charitable institutions, but also the bereaved need solicitude from the society. The trauma, if not being handled properly, could be lifelong. No matter how greatly we are distressed, the deceased have already gone. However, the influence on their families or close friends has just started. Human beings seem never capable of averting the natural disasters, but what we can do is to show solicitude for the bereaved, to use some proper means to help them get rid of sadness as much as possible. According to psychological points of view, the most important one is to let them express their sorrow adequately rather than suppress or try to remove these moods.

This project has explored quite a few possibilities of paper used as a main material to make contemporary mourning jewellery. While traditional materials like gold are rare and with ‘original sin’, paper is an everyday material widely found and easy to recycle which have value of ecological ethics contributing to environmental sustainability (Cappello, 2009). The rich properties of paper (both physically and optically) such as easily shaped and translucency enable it to be a proper story teller (Coan, 2009). Moreover, the ephemera of a man’s life can be appropriately represented by paper due to its fragility. The light weight of paper and its intrinsically perishable quality can be seen as a symbol of man’s intangible soul and biodegradable body after death. Besides, in Chinese culture, people burn different paper craftwork to memorize lost loved ones.

Several objectives that constitute the aim of this project are set and achieved. They are at least one satisfactory piece of final outcome in each of five paper manipulation skills which are papier mache, origami (folding), stitching, layering and encasing. All the final outcomes should be closely answered the research question which is to help people express their emotions related to Covid-19, including the sadness of loss, the desire for remembrance and the prayer for reborn.

At the beginning of this project, in order to initiate the research and get familiar with the context, literature reviews on historic mourning jewellery and modern paper jewellery have been conducted along with re-examining a visit to the jewellery gallery in V&A Museum that the author once made. Followed by the first design prototype, a quantitative and qualitative survey of people's thought and understanding of mourning jewellery has been conducted by the form of questionnaire both offline and online. These feedbacks were used to inform the project proposal. Then the author did case study of relevant precedent work as well as collated textual and visual resources related to paper jewellery design concepts and making techniques. In addition, an interview with a psychologist, whose expertise is in bereavement after disasters, has been studied to get a knowledge of how valid psychological intervention is carried out for people after suffering from a huge natural disaster, which has been taken into consideration of the design process. Then the author moved on to the practice-based approaches to develop the project, i.e. sketching and modelling. Both of them serve as essential actions throughout the making process. Design and Make Paper Jewellery (Kelly, 2011) has been carefully studied to acquire instructions of applying different techniques of making paper jewellery. Simultaneously, throughout the entire project, continuous reflecting on finished exemplars is conducted.

2. Mourning jewellery

2.1 Historical Context (gallery visit & literature review)

After re-examining the visit to William and Judith Bollinger Gallery in V&A Museum, the author started to realize how many different functions jewellery has been involved in since the very beginning of human civilization. It is regarded as an accompaniment to a man's whole life from cradle to grave. From birth and fertility to childhood and survival, to love and fidelity, to beliefs and superstitions, to wealth and status, to death and mourning. Jewellery adorns and protects the wearer on the journey through life. It could be a way to pray for something such as good luck, romance; could be an amulet to protect against illness or evil power; could be an object to express love and affection; could be a sign of faith in some beliefs like a certain religion; could be a mark of authority or social status. Also, jewellery could be a medium to express grief and remembrance.

Historically, mourning jewellery was very popular in the reign of Queen Victoria. Some special materials such as fine carved jet and woven human hair were widely used in these types of jewellery. A considerate amount of symbolism was applied in the choice of stones and motifs. For example, a ring that set gems with the order of diamond, emerald, amethyst, ruby, emerald, sapphire and topaz represented the meaning of 'dearest'. The language of flower patterns also inspired a large quantity of design. For instance, ivy represents friendship while lilies of the valley stand for the return of happiness. These mourning jewellery were not only used to express grief feelings about the dead, but also used as an

affectionate remembrance of the loved ones. However, mourning jewellery didn't regain its popularity in the 20th century except after the Titanic was submerged in 1912 and World War I (Luthi, 1998). Both saw the substantial loss of life.

2.2 Contemporary Context (survey & case study)

In the modern day, wearing mourning jewellery becomes a more personal choice and differs from culture to culture. According to the answers from the author's questionnaires, Chinese wear a piece of black textile or a white fabric flower on arm to mourn for the dead while some of British wear a chain with the loved one's ring around their neck as a remembrance. Other British may have amulets with some items related to the dead person, such as the ashes. Sometimes, they wear lockets with photographs of loved ones inside. In Ukraine, most people wear jewellery of national colours (yellow & blue) to express sorrow over dead soldiers and revolutionaries. In East Asian cultures, people burn joss sticks and paper-made objects in front of tombstone and the photo of the deceased. It is common in many countries that people wear or keep the item of jewellery from the one who had passed way.

Although there is not much prevalence of mourning jewellery today like hundreds of years ago, contemporary mourning jewellery has been effectively used to express sadness and show public concerns about loss in disasters, making the bereaved feel supported and lessening their sorrow. It becomes a rallying point to raise money for the victims afterwards, such as Poppy Appeal for World War I in the UK and Yellow Ribbon Campaign for Ferry Sewol Sinking in 2014 in South Korea. Also, special jewellery was designed to raise money to relief organizations by celebrities, designers and retailers after the Japan Earthquake in 2011, a major disaster that led to the meltdown of Fukushima Nuclear Power Plant.

Figure 1. The special jewelleries designed for World War I, Ferry Sewel Sinking 2014 and Japan Earthquake 2011.

3. Paper craft and sustainability

3.1 paper and ecological sustainability (material)

Paper, as a material of commonplace nature, seems everywhere around us. It could be newspapers, product packages, used booklets or old phone books. Contemporary paper artists recycle the widespread substance and instil it with new value, turning waste into treasure. An ecological subtext is at play here. Manheim (2009) suggests, “seeing potential in the overlooked is something artists and designers have long been accomplished in”. In today’s society, mountains of short-life, obsolete products are manufactured every day. After their brief “object-hood”, there could be the continuing lives of the original materials if they are recycled or reused. Take newspaper as an example. On the one hand, the daily newspaper is the representative of ephemera: the contents are soon outdated by the end of the day because tomorrow’s publication has already been printed and ready. On the other hand, the physical matter of newspaper takes a long period to resolve, even expose it to the weather. So, using second-hand or discarded materials rather than virgin materials to create new items is a great way to push forward ecological sustainability in our society. As “sustainable development” is defined as the development that meets the needs of the present without compromising the ability of future generations to meet their own needs, we do not tend to leave our future generations only rubbish without any useful resource and a broken ecosystem as a legacy. We should avoid waste matter to be left on the earth as much as possible now.

3.2 Paper jewellery and cultural sustainability (value)

Siliakus (2012) states that the unique characteristics of paper that sturdy yet flexible simultaneously enable it to be manipulated in a number of ways. Creased, cut, folded, bent, engraved, painted, written on, printed on, …, the list is by no means exhaustive. It can create sublime projects, such as paper jewellery. Contemporary jewellery questions the value of traditional jewellery from forms to materials: often done by adding, removing, or superimposing traditional values onto materials which are not usually considered valuable in the context of jewellery (Manheim, 2009). Paper jewellery is an epitome of that: it sweeps clean the excessive commercial needs in our society currently and calls for a return to the origins of creativity. Danieli (2009) announces that it is merely in terms of originality, construction skill and aesthetic result that make art valuable. Paper jewellery challenges the mechanical concept that it is the long-lasting intrinsic value of the precious raw materials that supports the quality of a piece of jewellery which live the daily nature of our lives. Paper jewellery meets the industry’s urgent need to go beyond the values and limits of the metal or fabric so as to claim the priority of invention and manual skill in current situation. It reminds us the original and intrinsic characteristics of jewellery are ornamental, symbolic and body furnishings rather than acts as property proof for safekeeping or passing down (Morozzi, 2009). It refocuses attention to the value of the conceptual idea rather than that

of the material. Moreover, the lightness of paper is well-matched with the physiology of the human body whereas metal jewellery very often implies the hardness and ruggedness. Thorpe (2007) states that cultural sustainability asks designers to create evolving artifacts which help people connect to the past while also being mindful of the future, not only considering the present but also the long term. These evolving artifacts meet people's emotional and expressive needs intrinsically rather than extrinsically—the latter are driven by commercial connotations. Thanks to paper's poetic nature and versatility, it's an artistic medium properly to tell stories and make evolving artifacts, especially jewellery, which stays close to people's daily self-decoration and emotion expression.

4. Design ideas and making

Thorpe (2007) highlights that 'stories' are a good way of making sense, or making meaning since they draw us in emotionally. Designers can concern from the past and collective knowledge or examines scenarios of the future. Based on this concept, the author tried to propose a concise name which represents a story or a feeling, for each piece in the series of mourning jewellery she designed while combining five different techniques of paper making. They are the pair of "Star in the night" bracelets, using papier mache; the set of "Revive by love" rings, using layering; the "Solidarity" bracelet, using stitching; the "Pray for being strong" brooch, using encasing and the set of "Flower blooming" necklace and bracelet, using folding. Aside from the author's own design ideas, she also got quite a lot inspirations from the questionnaire's results which she asked respondents to write their feedbacks on the first design piece and the key words that came to their mind. The first two pieces are for the bereaved to long keep so they are packaged in delicate boxes, while the last three are for the public so they are in portable envelopes. According to an expert in post-disaster psychological intervention, both the bereaved and the sad public need express their mood by some concrete behaviors.

4.1 "Star in the night" bracelets | Papier mache

The bracelet consists of several beads. The number of beads represents the age of the dead person. The material to make the beads is recycled newspaper. Except the eco-friendly factor, the reason why the author chose newspaper is: to most of the public, the natural disaster is just another piece of news that would be forgotten like outdated newspaper soon being tossed into a bin. However, to people who lost their loved family members, that would be an unforgettable event and it is impossible to forget the victim throughout the rest of their life. Newspaper can be a carrier to hold and preserve their memories with the deceased. The shape of the beads is designed and handmade to be roughly round. Firstly, it resembles pearl, which represents the tears, associated with sorrow. Secondly, in the countries or regions where Buddhism is the main religion, the round shape also resembles Buddha beads used for praying. Thirdly, the round shape resembles the heavenly body in the

universe which appears to be star we can observe in the dark night. Also, the color and pattern the author chose is from an idea based on a beautiful old story: one person who passed away on the Earth will fantastically transform to a star in the universe. Our loved one never left us; they just became another form of existence. When we look up at the starry night, the shining stars are they looking back to us, let us know they are fine.

Fig 2. "Star in the night" bracelets (originally designed as a necklace) and an early sketch.

The author got not a few feedback via her designed questionnaire. And some of them are quoted below:

- "Colour is nice.";
- "Colour is dark so I feel more serious than normal silver accessary. Looks like rock.";
- "Earth-like. Special. Feeling it's made of natural stones.";
- "It's similar to juzu. Also, it looks like fortune stone bracelet. But I can feel what you wanna show after I read your explanation.";
- "The form makes sense. Can't comment on materials though without looking at the real thing.";

- “I like the fact that not all the beads are the same, representing that all tears are not the same and unique. The colour used is nice and has a very earthly feel.”;
- “I think it is a lovely design with a beautiful meaning behind it.”;
- “It’s beautiful, very balanced and calm. I can definitely see the reference to the tears.”;
- “I really like the inspiration behind it and the concept of people’s souls becoming stars.”;
- “I think it is a nice concept and it is practical.”;
- “Like a Buddha beads. Colour looks like star.”;
- “It is quite nice because it reminds me of universe.”;
- “Its look already makes me think of legends (probably because of material and shape used). It looks simple and lyric, I would love to have one, especially if it conveys special meaning.”;
- “It’s beautiful. I love the idea that our loved ones become star dust.”;
- “Without the explanation, I might not have understood the meaning of the piece, but the explanation makes it clear. The colour is intriguing and it makes me wonder what dyes were used to make it. I feel maybe the beads could vary in size to represent different people/souls and could have different hues of colour for the same reason.”;
- “It does make sense, a beautiful sentiment.”;
- “Your words above help me to understand the meaning of the necklace/bracelet. It makes sense.”.

The comments suggested to change is in common:

- ” I really like the colour and your idea of this accessary but when I wish to buy, I would want to have a bit smaller, it may be easier to wear in daily lives.”;
- “a little big”, “It’s too chunky for me.”;
- “Personally, it is too big for me. Because I prefer something small which is meaningful and can relate to our loved ones.”.

After reading the above feedback, the author tried to figure out target users of this project. Since this piece is for the victim’s family to mourn, it’s different from giving the public to commemorate the event or wear as a daily jewel. However, the global respondents’ feedback expanded my thinking that I could design some pieces like yellow ribbons for Ferry Sewol Sinking which has been mentioned before or national colour jewellery for Ukrainian Revolution. Those pieces can raise the public’s awareness of the tragedy that could turn to spiritual and financial support for the bereaved families.

Respondents’ answers of “If you wear a piece of jewellery to mourn for the dead, what type of jewellery would you like? And, what kind of look would you prefer it to be? Why?” further inspired me for the following jewellery designs.

Fig 3. The following jewellery designs' outcome.

4.2 "Revive by love" rings | Layering

It was made by wasted tissue box. The pink color represents love. The layers mean people can gradually rebuild their life order and make a recovery from the emotional wound step by step.

4.3 "Solidarity" bracelet | Stitching

This bracelet was plaited with newspaper stripes and a green wool. Green represents hope for reborn. The form of it means only be together can we conquer the difficulties. Without the wool, the fragile paper stripes are so easy to broken.

4.4 "Pray for being strong" brooch | Encasing

The two-triangles shape represents mountain, which always give the feeling of strong power. The colors are from pray flags. Sewing simple and natural lines at the back of the brooch, it can be easily worn with a simple safety pin.

4.5 “Blooming” necklace and bracelet | Folding

Like flowers blossom each spring, there are always new hopes. The way to connect paper flower and the band has changed several times. Finally, in order to achieve utmost eco-sustainability and easy to massive produce for the public, I chose the simplest way of cut and insert and paper itself as band material. Additionally, the fragility of paper flowers reminds people of cherishing the evanescent life.

5. Summary

After a couple of weeks’ research, idea exploration, experimentation and refinement from the initial intent, a series of paper jewellery has been produced as a response to the research proposal.

On the one hand, the positive features of this project are:

- It creatively combined the emergent paper jewellery with a practical mourning function;
- It was enriched by the conducted questionnaire’s feedback;
- The outputs of it are meaningful, related to great love and care for human beings’ common destiny: be united and face the unavoidable huge natural disasters together.

The author has gained a great deal of new knowledge and skills through the research activities done:

- Her understanding of jewellery has been deepened, e.g. its multiple functions, its various styles and materials among different cultures in the history;
- Studying interview script of an expert in post-disaster psychological intervention broadened her horizons;
- Paper manipulating techniques have been studied and tried along with other materials such as brass and foam;
- The author has experienced how to design an online survey and how to appoint an archive visit in University, which could also be used to assist her future research projects.

In addition, the author feels her critical thinking skill and self-direct study ability have been strengthened through the process of doing this project. The author feels more comfortable and confident to present her work and ideas. These research skills are used more flexible than before.

However, on the other hand, due to the time limitation, this project certainly has further aspects to enhance:

Firstly, the author has not managed to contact the bereaved family directly to get their feedback about her design yet, who are the first group of her target audience. Unfortunately, the time was run out as the follow-up project development work occupied the author's subsequent effort and time. That means the final testing stage is missed. The experience teaches the author again the importance of time management. Do pay attention to time-limitation and self-evaluate the project plan constantly.

Secondly, the author's initial intent of incorporating psychological knowledge could be more in-depth. That is to say, conduct qualitative interviews with psychologists and people who suffered from losing family members about her ideas and design work. Then improving with clear aims.

Thirdly, the target audience can be defined more clearly and practically at the beginning of the project when producing the statement of intent. If so, the direction that the project should work toward could be clarified more, the relevant analysis and evaluation about how the outcomes accurately answer the research question could be easier. Further understanding and well-use of methodology are needed.

When referring to the making part, if time is allowed, each technique can be explored more adequately. To achieve a more environmentally-friendly result, even paper and pigment could be handmade, using some natural components. Ways of dyeing, finishing and packaging could also be taken into consideration to accomplish a more complete project and its visual proposal and portfolio.

Last but not least, to add sustainable factors to the project, the author can take into account the possibilities of the jewellery that is revealed by wear and tear, and use it in a constructive way. For example, use layered finishes. Similar to the way blue jeans fade, new colors might be thrown up when top layers wear off. An exemplar of this is the mourning rings designed by Miriam Verbeek (1993), which are made from silver covered with fine black silk crochet. As the rings are worn, the crochet begins to unravel, revealing the silver rings beneath. It symbolizes the grieving process from the blackness to the lightness and the lasting part represents the memory of the dead person. Verbeek also made another piece in this vein: *Tears Collar* holds tiny glass balls in a fragile nylon membrane. When the nylon is worn, the frill of nylon disintegrates so that the necklace will cry tears. The author identifies strongly with Verbeek's concept behind the series of her mourning jewellery: "Dying is a part of life and it is as natural as being born. Yet, in our culture we are not familiar with it. For my jewellery I worked with fragile materials, to depict the transience of life. The moment of saying goodbye and the process to give your sorrow a place, are things I used in my work." (Verbeek, 1993). Another idea, suggested by the author's tutor, is to contain flower seeds inside the paper jewellery. When it was used and thrown into soil, the paper part can be bio-degraded gradually thus providing nutrients for the growth of the plant.

Autopoietic design; seven components for a sustainable future design model

Gonzalo Raineri Bernain

Design Researcher at BigBangThinking.com
PhD candidate at Universidad de Palermo Buenos Aires, Argentina
info@bigbangthinking.com

Abstract | Maturana and Varela in 1973 declared that an autopoietic unit is the one that creates, reproduces, and repairs its own components and organization. The last two hundred years, humankind has generated an unprecedented technological development. Unfortunately, it has broken the balance of the biosphere, leading to a new geological change, the Anthropoccene. Design must assume its share of responsibility. It is clear that the practical theoretical model assumed so far is not working, it is necessary to make a paradigm shift. By appropriating a methodology born in biology and created to determine whether we are facing an autopoietic entity, design seeks new ways of understanding oneseed and thus being able to have a more sustainable action. This research suggests that contemporary sustainable design, understood as a systemic model anchored in the theory of autopoiesis, will constitute a methodological theoretical tool that will allow a more harmonious link with the environment.

KEYWORDS | SUSTAINABLE DESIGN, AUTOPOIESIS, DESIGN COMPONENTS, DESIGN, FRONTIER, DESIGN ORGANIZATION

Presentation

The 2019 Global Outlook Report stated that in the next 10 years, one million species could disappear due to human actions (UNDP and UNDFCCC). In 2018 the World Wild Fund for Nature had released its biennial Living Planet Report and it documented that since 1970 the average vertebrate population has declined 60 percent (WWF, 2018). Like these, there are hundred, thousands of papers and research. No wonder the Anthropocene, is here to stay (Cumulus Think Tank, 2016), and it's no news designers have been in part responsible for what's going on with our environment. We must find new ways for Design´s development, the model must change. What was normal has become the unnormal, the unnatural, the unpresentable. The old model must go.

Giorgio Agamben (2009), French philosopher, declares that being contemporary with someone, does not rely on spatial or temporal factors. Rather, it's given by the possibility of a true dialog with your counterpart based on the possibility to interexchange ideas. If the possibility of a dialog does not exist, you cannot speak of contemporaneity. Contemporaneity will be related to the capacity of relating to the moment of history on which you live, but above all, in the capacity of taking distance from it. You can't question something if you're not fully immersed in it and at the same time have a distant, objective view of it. You can only dialogue if there are dissimilar positions with whom to confront your ideas, where you can be listen, listen to others to and try to understand them. Otherwise, doctrines and dogmas arise giving absolute truths the possibilities to conquer the sea of knowledge. (Agamben, 2009) "An intelligent man may hate his time, but he knows he belongs to him irrevocably anyway, he knows that he cannot flee in his time" (Agamben, 2009, p. 1).

Today's design must assume its share of responsibility for environmental deterioration. It therefore requires questioning the disciplinary legacies it has accumulated, especially in structural and organizational terms. It is, from the maturation of the discipline that a structure has been defined in design. And many of its characteristics have its origins in the foundation of the Weimar State Bauhaus, 100 years ago, under a totally different reality (Raineri, 2017). It is this fact that has led to a continuous limitation of a disciplinary evolution and preventing the ultimate purpose of design from being fulfilled in a sustainable way. Design's tradition, like that of other disciplines, has maintained a mechanistic view of its constituent components, defining a partial view of its operations and links. However, a systemic gaze could manage to clear and illuminate areas that up to this day have been partially visualized, isolated, or strictly ignored.

As a way of thinking design in a more harmonious relation with its environment, this paper proposes an approach from the world of biology. Not as a practice of biomimetics, but as a first and second order epistemological observational tool. Specifically, using the work of Humberto Maturana and Francisco Varela as a framework. They developed the concept of Autopoiesis, which initiated a new paradigm in the definition of what characterizes living beings. For them, autopoietic systems are those that create, reproduce, and repair their own

frontiers, components and organization (Maturana, 1980). They have stated that molecular autopoiesis is a characteristic which is unique to living systems. Nicolas Luhmann (1991), for the formulation of his theory of a functionally differentiated society, makes use of the concept of autopoiesis and applies it to social sciences. Luhmann's usage of the concept, relates it to how social groups internally produce the elements and relationships that constitute them. Likewise, he argues that there is a differentiation between the world of practice and that of science, that is, presents the coexistence of two parallel systems as a result of differentiated functionality (Riis, 2013). This same discussion has been in vogue since the early stages of modern knowledge, even way back with Jonathan's Swift 1704 satire "The battle of books". Where Neoteric and Paleoteric knowledge confront, just the same discussion we found in design today: theory and/or practice.

We know that design is a discipline that has been specializing and concentrating its field of action into ever narrower aspects of the challenges it encounters. Self-imposing partial views of its actions and surroundings, has made design lose the holistic capacity it once had. Design has become totally alienated from his environment and its time; design is no longer contemporary and is no longer sustainable. So, it's time to put in action one of Buckminster Fuller's famous mantras: "You never change things by fighting the existing reality. To change something, build a new model that makes the existing model obsolete" (Buckminster Fuller Institute, 2016).

A new model has to be built, and we need some giant's shoulders. Biology, with Maturana and Varela's theory of autopoiesis, is the logic way to go. If autopoiesis has worked for living beings for the last thirty-five hundred million years, it should help design become more sustainable. This paradigm turnover would lead design to be understood as an autopoietic entity. If we could understand and start reconfiguring design as an autopoietic systemic discipline, maybe we could have a chance for a more sustainable future.

Procedure

The absence of a prior link between design and autopoiesis required recognizing the absence of categories that had known correspondence between the two. During the evolution of this research, the absence of existing references between autopoiesis and design was a constant. That is, in this study theory and data were developed simultaneously, as they present mutual dependence. Juan Samaja defined this methodological approach as ternary: "According to which both theory - expressed as a hypothesis plot - and data - conceived as schemes of intellect of the facts - are involved in the models" (quoted by Ynoub, 2015, p. 41, translation by the author). In order to do so a three-stage methodology was created, that involved the following steps:

- A first stage focused on visualizing whether we could find traces of certain primary concepts used for the construction of autopoiesis theory. The initial

concepts originated from the General Theory of Systems-TGS (Bertalanffy L. , 1989), but where reformulated by Varela, Maturana and Uribe (1974), in order to avoid equivocally generalist or transdisciplinary definitions. A design bibliographic review was conducted, and the same concepts were illuminated in design. The first correspondences were found.

- The second stage made an exploratory sweep of the disciplinary tradition and state of art, in search of components that could be identified, and that have persisted the transformations that arise from the disciplinary becoming. This is when certain ideas arise, because generally they were not expressed and that nevertheless lied underlying in the academic theoretical discourse.
- A third stage was to take the above concepts and expose them to a six-step method published in “Autopoiesis: The organization of living systems, it's characterization and a model” (Varela, Maturana, & Uribe, 1974), in order to determine whether or not we were facing an autopoiestic system. Based on it, a questionnaire was developed to highlight certain situations and elements defined in the two previous stages and see if it was feasible for the design community to account for them. The questions were organized so that they could separately illuminate the components and organizations present in design (Raineri, 2021).

In this third and last step, a worldwide survey was carried out in search of evidence that would allow for a characterization of design and its frontiers, components and organization. The survey involved more than one hundred and sixty certified designers that were filtered from a universe of over than three hundred individual that took the survey, coming from 35 different countries. The criteria for filtering were decided based on their design educational background, in order to guarantee a disciplinary perspective with internal observers. The purpose of this selection was to avoid distortions from non-design educated professional or autodidacts who usually conduct a “protodesign” form of action. The term protodesign comes from the conjunction of the greek term πρωτο prōto 'first' and the word design (Jurado, 2010). As a result of the conducted research the following outcome was evidenced.

Design Components

During the process, seven essential components were identified in the observed evidence. Its organization gave rise to a systemic design framework. The components are:

Human component or the referential dimension

Design takes place within the sphere of “heteropoiesis” or the human actions (Maturana y Varela, 1994); and as such is an exclusive activity of humans. Anything other than within this

sphere, even if it is a creative process like a bird's nest, should not be considered design. This definition has to do with the fact that, for design as a discipline, it is necessary to be able to set limits. The designers surveyed, defined it and stipulated it. For them, humans are the ones that become design's soul. They are the ones who make decisions and for whom we design. Any decision made within or through design is referenced to humans. Within the answers given, three instances for humans relations related to design could be observed:

- **Users**; this is where the reason for the existence of the design arises, and where the problems, challenges or opportunities of which design takes charge appears. It usually is external to design as a discipline, but could be temporally incorporated into it as an input, as in participatory design.
- **Client / Manufacturer**; this couple moves at the border of design. The client usually (but not always) is an agent who prioritizes his interests over those of the end user. Neoliberal capitalism arises. The manufacturer is the one who materializes the design output. It can also be the same customer or the designer, as is the case with author design or when using digital manufacturing.
- **Designer**; the designer himself is a component. They are the ones that define the boundaries of design as a discipline. It is their decisions and its limitations that define how far design goes. The continued re-relief of the members of the discipline, is constantly introducing new ways and perspectives to address the problems that arise. Each new designer will generate a new way of designing. In general, everyone will carry out their work within fairly standardized and accepted parameters (the seven components here stated), but there will be those who will decide the path of research, innovation and experimentation beyond what each project requires, so they will be the ones pushing the boundaries of the profession.

The complexity of human beings makes it impossible for design to define it in its entirety, just thinking about it is a nonsense. Other disciplines must come into action and help design do so. We must remember it is possible to see the humans as a single individual and as a social, collective entity. In addition, every individual has a physical side and an intellectual-psychic side, full of intersecting facets from which it is possible to observe it. The arena where design works is probably the most complex one confronted by any other discipline.

Teleological component or the causal dimension

Every action in design is born in the human being. Its origins are born in the cognitive capacity that humans have, differentiating it from the rest of the species in the sphere of the biotic. Humans enter an internal questioning of the proper actions and the consequences that his actions could have. It has ethical questionings. The collective of designers defined three variables that could be identified in which the Teleological Component or the Causal Dimension manifests itself, namely:

- **Desire / Need**: desires and needs are given outside of design, in the ecological niche or the space where design acts. They can be from the end user or the client and reflect their interests; is where the initial conditions of any design project occur. A designer could become a dual actor, become de user at one moment and the designer in other, maintaining his role specificities.
- **Negotiation**: the border becomes the point of exchange between design and its ecological niche. This is where external inputs are received, and outputs produced by design are delivered. In this way there is a negotiation between the wishes and needs present in the users and those of the clients and manufacturers. Designers should act as a mediator among the expectations of each, seeking an equitable and harmonious balance within desires and needs.
- **Opportunity / Problem**: through the negotiation and as a result of the interaction of the other six components, the designer is able to transform those initial desires and needs into opportunities and design problems. This, in order to be able to face the challenge that is presented to him, is the way to establish a path of action to hold on to.

This questioning leads design to define priorities that generate needs. Those needs are what design seeks to meet. If there is a situation where a creative process lacks a teleological component, as perhaps can occur in art, we are not facing design as declared by the observed community.

Operational component or the procedural dimension

The third component (as all others) is the conjunction of the remaining six components, and this is based on the dialogue that occurs within the discipline. Designers are the ones who define their ways of operating, of doing things, and they do this through consensus and group agreement. The methodologies, procedures, the way of operating inside design were manifested in the following variables, according to the observed evidence:

- **Own**: originally all design methodologies, at some point were configured from those that were developed externally in other disciplines or that originated from the interaction with them. Each design project will require modifications to the way it operates, as the result of the particular needs and decisions that designers must make. Subsequently, the consensus arising from the evidence from the empirical experience will lead to define and establish methodologies in the collective. Making them constituent of design, after they have been considered appropriate and have been validated by the community.
- **Experimental / shared**: Design has limitations. Design has limited capabilities and is able to take care only of what its ways of operating allows him. For everything else you must dialogue with other disciplines and partner with them achieving a synergy necessary to face complex problems. If there are no possibilities of association, design experiments.

- **Commissions**: there are situations in which design does not participatie in portions of the process, because it is not constituent of the project in which it is working or is unable to perform them. It only requires the output of that process. In these cases, it will carry out a commission for another discipline in which the process will be defined and executed. Design will only participate as a client and will receive the result of such operation. This may also be the case in which, once the design process is finished, the mass production of the result generated by design is executed.

Every process is dynamic, which involves a before, an after and the set of actions that makes it up. There are many ways to achieve a goal and design is constantly looking for more efficient ways to achieve this.

Transitional component or the temporal dimension

Design has been defined as a projectual discipline. Projecting is to throw forward, into the future, towards a better future that should eventually come to our present. What is projected comes from an origin, prior to the moment it is projected, is nourished by what was before, from what was designed beforehand. The concept of discipline implicitly brings the fact that it is a progression from a rudimentary beginning, where knowledge has been accumulating, generating greater complexities. Design has a past, a today and a tomorrow:

- **Past**: it is known that it is essential to look for giants on whose shoulders should we stand, in order to see beyond our predecessors (Eco, 2001). Disciplinary tradition is here to teach us what to do and what not to do. Even having the evidence of its negligent past actions, design continues to act in the same way, especially on environmental issues. It is from the past that design should project into the future.
- **Present**: the present serves as a turning point between the past and the present is where design happens. Being able to anticipate what is about to happen and generate the conditions for it to happen in the way you want or need it to happen, is what design does in the present.
- **Future**: the future doesn't look promising if nothing is done. At this moment it is necessary to remember a quote from Carnegie Mellon School of Design:

  > “Fundamental change at every level of our society is needed to address the issues confronting us in the 21st century. Climate change, loss of biodiversity, depletion of natural resources and the widening gap between rich and poor are just a few of the ‘wicked problems’ that require new approaches to problem solving (2017, p.1).

In those moments when it has stopped questioning himself, stop evolving, design has given the worst answers. When he starts cloning himself, he begins to deliver "answers" per mold, without considering the particularities of each case. Fashions appear, pollution rises.

Relational component or the spatial dimension

Since its disciplinary origins, design has associated with other crafts and disciplines. The work of designing on the one hand is increasingly open and exposed to external influences and contributions. These swings shape the type of relationships that occur inside and from the design, which configure the following variables:

- **Disciplinary**: the term discipline has been used in design to differentiate it from other fields of knowledge. Making it especially difficult, when design is being used in so many different ways. Sometimes is an artefact, others a process, an attribute and sometimes it's a system.
- **Interdisciplinary**: it's the process where diverse disciplines work in conjunction with design. Blurring at certain moments their boundaries, provoking an enhancer synergy.
- **Transdisciplinary**: Usually related to problems that can't be solved by the sole presence of design.
- **Multidisciplinary**: it's a group of professionals, each with its unique disciplinary characteristics, working together in a common project (Erlhoff & Marshall, 2008).

The variety of ways in which design relates, allow him to face the complexities present in the human being and in the complex problems it faces. The elasticity of these relationships allows him to face changing and diametrically different realities, without losing its integrity, it's state.

Observational component or the cybernetic dimension

It is from the results of a profound observation of the environment and especially of the human being, that the necessary foundations for informed decision-making can be found; not doing so, is not design and your decision will be guided only by assumptions or personal tastes. First Order Cybernetics is where you see your self performing an action. Second Order Cybernetics is where the observer, observes not only a phenomenon, but also observes the developer and/or who observes that first observer all at the same time (Bateson, 1972). Both of them are present in design and leads it to present three ways of observation set out below:

- **Introspection**: Design can only observe itself with the tools available to it, either by external adoption, reconfiguration or inner creation.
- **Dialogue**: it is at the frontier of design that dialogue takes place, which is the form of communication and transfer of information between it and its ecological niche. It is by observation were the fluctuations and variables that each project needs are verified, making design a dynamic discipline.
- **Learning**: Design must always have a holistic look, because it needs a general overview of all the components for a proper decision-making process. However,

> at the same time it suffers from selective blindness, lacking the necessary tools for certain type of observations, and that is where it requests external assistance.

Umberto Eco (2001) noted that "it is difficult to move in a vacuum and institute an ab initio reasoning" (p. 31), and design requires these unique, specific, accurate views of the necessary variables for a correct resolution of the increasingly complex challenges it faces.

Allopoietic component or the physical dimension

This last component refers to those elements, with which design materializes its responses in the form of larger and more complex systems. It is important to note that these materials are not only raw materials such as wood or plastics. They can also constitute more complex systems such as an electrical circuit or non-corporeal elements such as light. They can even be tools that participate and condition the production process, or the spaces where a particular project is located. They are small gems that come to enrich the lexicon on which the designer can work. You can define them according to their origin by the following variables:

- **Own**: design performs research to create materials in different ways as stated by Pontis (2019), pointing out three modalities: research for design, research through design and research by design.
- **Shared**: design is a discipline that permanently interacts with its environment. This dialogue can occur in the creation of new materials in an associative manner with other disciplines or it may be the case that in two or more disciplines they are used in parallel. The use it is given, may be identical or diametrically different.
- **Outsiders**: just as in the other components, design interacts with its ecological niche and appropriates what has been generated in other disciplines, crafts for example. It also resorts on bringing materials or those elements that may be useful to achieve its goals.

The use of material should not be defined in advance, however it is necessary to remember that materials incorporate certain conditions of their own, which make them more susceptible to one type of use, above others. "Materials are already in form (in-formed), since they have characteristics that make them suitable to become a particular object" (Bevilacqua, 2019, p. 34).

Design as an autopoietic unit

Design is a discipline that is circumscribed within heteropoiesis, which means that it is a human activity. The human being, as a collective entity that defines his actions through collaborations. And even though there is freedom of action, the permanence and settlement

of behaviors is produced by collective consensus. Design is the product of a group of individuals, who for a period of time have dialogued with each other. And together they have decided that a certain set of components and the way in which they unfold, constitute the system that has been called Design. The autopoietic systems, according to Humberto Maturana, are those that are "organized in such a way that their processes, produce the same components necessary for the continuation of these processes" (Mingers, 1995, p. 11).

The internal processes of design and its historical development generates a dynamic that configured certain components which had not been previously identified or illuminated by the design community. Subsequently, this research was able to confirm through internal observers the existence of these components. It is feasible to assure that we are facing a composite unit.

It is well known, from what has been observed, that design has been in a process of continuous transformation and has been constituted from the relationships it has managed to form. It is possible to ensure that design is a mechanistic system, where the interactions and transformations that occur in it are the product of the relationships that have constituted its components.

It is design based on its own actions, who defines its limits, its components, its organization and its structure. Since it is design that builds itself, it is in this act, that he defines his limits. Preferential relationships in design are the ones that define and provoke the decisions it internally makes. That manifests in its interactions with its ecological niche, giving rise to its limits, and constituting himself as an autopoietic independent system.

This new understanding allows design to define clear disciplinary boundaries. Regulating its response within those parameters in order to guarantee a continuity in its operation through the generation of an output that is integrated into its ecological niche. A deep understanding of design ensures sustainability. Knowing the presence of these concepts in the collective discourse makes it possible to think that a design disciplinary detachment from their immediate ancestors is feasible. A free flight is necessary to be able to guarantee the generation of new instruments that allow the evolution and maintenance of the discipline. It is in the act of self-determination and differentiation, where disciplines reach maturity.

Abstract | COVID-19 threats have been impacting disadvantaged communities even harder. This paper looks into challenge areas and community responses to those in Brazilian informal settlements during the COVID-19 pandemic. These were identified through online roundtables with community members and representatives of NGOs in five Brazilian informal settlements. Our findings show how community members unconsciously design, deploying community-led (or diffuse) design capabilities to tackle COVID-19 challenges. These capabilities have been critical to coping with the immediate effects of the pandemic in communities. However, they are limited to short-term and reactive strategies. We argue that these natural problem-solving skills can be enhanced through a transition from diffuse to co-design capabilities to further harness community creativity towards better futures; extending community-led design capabilities into challenges and opportunity areas in a more strategic way for communities. This research contributes to filling the gap in design studies on how and to which extent communities unconsciously design.

KEYWORDS | COMMUNITY-LED DESIGN CAPABILITIES, CO-DESIGN, COVID-19 PANDEMIC, COMMUNITY RESILIENCE

1. Introduction

This paper looks into key challenge areas that the COVID-19 pandemic has created or exacerbated for informal-settlement communities in Rio de Janeiro and Belo Horizonte (Brazil) and identifies the design capabilities deployed by community members to tackle those. We call these as community-led or diffuse design capabilities (Manzini, 2015a, 2015b). Our analysis shows community-led design capabilities that sheds light on *how communities unconsciously design*. We discuss how these community-led design capabilities can be extended into co-design capabilities to build a resilient and better future for communities, harnessing their creativity and potential.

In the literature on resilience, community resilience is mostly related to natural disasters. Design skills, approaches, processes and methods are still under-researched in this context, although the COVID-19 pandemic has recently attracted attention in emergency and recovery contexts in design practices and research (e.g. BBC, 2020; Marchese, 2020; ED-UEMG, 2020; UFMG, 2020). Resilience of communities is related to building or enhancing community capabilities throughout *co-development processes* of self-organising, accessing resources, strengthening network, harnessing collaboration, and creating mechanisms that contribute to holding community-led plans and efforts accountable (Berke, et al, 2011). Recognised worldwide, guidance on hazards mitigation and recovery are approached from a risk management perspective (UNISDR, 2015; UNISDR, 2016) often neglecting sociocultural determinants and livelihoods' diversity.

This paper presents barriers, challenge areas, and adaptive strategies of communities during the COVID-19 pandemic. It analyses, frames and defines how community members have been deploying their natural design capabilities to tackle these challenges in Brazilian informal settlements.

1.1 Context and problem

Around six per cent of the Brazilian population lived in favelas in 2010 (IBGE, 2010). The largest population living in informal settlements is in Rio de Janeiro city with 1.4 million people in 763 agglomerates. In Belo Horizonte, 307,000 people lived in 169 agglomerates. Although the 2020 census was not concluded due to the pandemic, the figures for households in 2019 show that around eight per cent of Brazilian households were in informal settlements, Rio de Janeiro and Belo Horizonte had respectively over 19 and over 11 per cent of households placed in informal settlements (IBGE, 2020).

The characteristics of informal settlements vary across Brazil. However, there are similarities between these areas related to the historical migration from countryside to cities that unfolds the emergence of informal settlements, particularly favelas in the 1940s in Brazil. Informal-settlement conditions are generally related to the limitations of the physical infrastructure of cities (e.g. water and sanitation grids' extension), including geographic features that are not favourable to regular and safe urbanization, the lack of basic services

(such waste collection, sewage treatment, water and energy supply, etc.) and the absence of a formal address (IBGE, 2010). Populations are predominantly composed of black people with low levels of formal education (Musumeci, 2016). Income sources are usually based on informal or low-income activities (e.g. cleaning, construction work, and waste picking and collection), and families are often female headed (Musumeci, 2016).

On the 11th December 2020, there were 68,845,368 confirmed COVID-19 cases worldwide and around 10 per cent of these confirmed cases of COVID-19 (6,728,456) were in Brazil, with 178,995 deaths (WHO, 2020). In Minas Gerais, 453,364 cases were registered (with almost 10,499 deaths). In the State of Rio de Janeiro, there were 381,644 confirmed cases, with 23,546 deaths (Microsoft, 2020).

There is a significant underreporting of cases of COVID-19 infection (Monteiro, 2020; Prado, et al, 2020; Veiga e Silva, et al, 2020) in Brazil. The actual number of cases is estimated to be about 10 to 11 times higher than the ones shown in official figures (Monteiro, 2020; Prado, et al, 2020). Low testing rates and diagnostic difficulties have contributed to underreporting and to keeping the disease spread (França, et al, 2020; Oliveira & Araújo, 2020), leading (in Minas Gerais) to a projected sub-notification of around 42 % by the end of the year (Amaral, et al, 2020).

The Brazilian situation is also aggravated by the current government health policy which includes scientific denialism; ethical-political issues linked to human rights; and biopolitical strategies influenced by neoliberal reasoning (Caponi, 2020). Although the first COVID-19 cases in Brazil (as of February 2020) were related to white upper-, middle-class people returning from Europe, the virus was quickly transferred to the favelas. By the end of May 2020, there were a total of 260 deaths in the Rio de Janeiro's large favelas, while in São Conrado, an upper-class neighbourhood bordering the Rocinha favela, only three deaths were recorded by the middle of the same month (Oliveira, et al, 2020). Nevertheless, minority groups' disparities prevail not only in Brazil (see for instance Milam, et al, 2020). They are especially impacted by the COVID-19 pandemic.

In response to this, communities have deployed their strategies to mitigate COVID-19 immediate impacts. We analyse those in the context of 5 informal-settlement communities in Brazil. Although design capabilities have been explored to a certain extent in design domains and organisational studies, there is little empirical evidence of diffuse design capabilities deployment determining to which extent the lay public unconsciously design.

2. Capability, democracy and design

The term 'capability' relates to people's knowledge capital, skills, competencies and prior experiences. It is also seen as what someone or a group of people can do/make in order to achieve a (shared) aim. It refers to the ability to adapt prior knowledge to new purposes. For

this study, we adopt the Sen's capability approach as a starting point to discuss design capabilities for community resilience in this research context.

Sen (1999) defines capability as the potential of people to lead "the kind of lives they value - and have reason to value" (p. 18). He argues that the extent to which capabilities are deployed are influenced by interconnected factors such institutional arrangements (see also Acemoglu & Robinson, 2012) that determine economic opportunities, political liberties, social powers, enabling conditions of health, access to basic education, and by an environment that fosters initiatives.

Therefore, citizens ideally have the liberty to participate in social choice and public decision-making, being a fundamental agent of change through participation in economic, social and political public life. Sen highlights the need for the "effective use of participatory capabilities by the public" to influence "the direction of public policy" (p. 18) in a two-way relationship, pointing out participation as a key factor in democracies. Participatory design is the design field dedicated to the public participation. In this domain, Sanoff (2007) emphasises the importance to provide participants "with the information they need to (1) participate in a meaningful way and (2) be informed how their inputs affect the decision" for effective participation (p. 59). These aspects are also emphasised in post-disaster situations (Vahanvati & Rafliana, 2019).

Participation is a means to establish a dialogue between citizens and public officials (Sanoff, 2007). Active participation goes beyond voting and choosing amongst pre-set options, being related to citizens' critical role in creating and shaping the future of their environment and influencing public decision-making (Sanoff, 2007). Participatory design that aims to foster and deploy collective intelligence is a potential means to empower communities, citizens, and democracies, providing enabling structures for integrating communities into public decisions that affect their lives and contribute to shaping their future.

2.1 Design capabilities

> "Design is all around you, everything man-made has been designed, whether consciously or not" (Hunter, 2014)

Manzini (2015a, 2015 b) distinguishes between three typologies of design capabilities: expert design, co-design, and diffuse design. Expert design concerns the use of design by the design community who has specific design skills and culture. Co-design is the design process resulting from the transdisciplinary interaction between different stakeholder groups, including, for instance, expert designers and the lay public. Diffuse design concerns the natural human ability to design based on creativity, critical and practical sense. Although found in a fragmented literature, design capabilities can be identified in design research and organisational studies taking as a reference Manzini's framework: from expert to diffuse design capabilities.

Expert design is often approached in design management (Acklin, 2013; Borja de Mozota, 2011; Bruce, et al, 1999; Chiva & Alegre, 2009; Jevnaker, 2000; Mortati, et al, 2014) and policy (Maffei, et al, 2014), organisational studies (Boland and Collopy, 2004; Michlewski, 2008), product development and engineering (Baxter, 1998; Pugh, 1991; Ulrich & Eppinger, 1995), service design (Morelli, et al, 2021). Participatory design and co-design capabilities are found in participatory design (Huybrechts, et al, 2018; Sanoff, 2007), co-design (Sanders & Stappers, 2008), service design (Morelli, et al, 2021), social innovation (Murray, et al, 2010), design for policy (Bason, 2014; Julier, 2017; Junginger, 2014; Mortati, et al, 2016) and business fields (Brand, 2017; van der Pjil, et al, 2016). Diffuse design capabilities are discussed in social innovation (Manzini, 2015a, 2015b, 2019; Murray, et al, 2010), urban design (Dong, 2008), design management (particularly Gorb & Dumas' [1987] silent design). However, there is a lack of empirical evidence on diffuse design capabilities, specifically on how communities *unconsciously design* (strategise and act to solve their problems, envision opportunities and shape their future).

Design capabilities of the public (or diffuse) were discussed by Manzini and D'Elia (D'Elia, 2018; Manzini, 2015a, 2015b, 2018, 2019). They suggest that a design culture (*cultura del progetto*) will be the next basic competency of communities - as literacy was in the past, becoming a community patrimony. On the other hand, the need to bring design capabilities into policy-makers' skills set is also stressed (e.g. Bason, 2014; Julier, 2017; Junginger, 2014; Mortati, et al, 2016) to capture the needs of communities in policy-making processes (Junginger, 2014). Participatory design serves as a bridge in this context, building dialogues and actions through collaboration between citizens and stakeholder groups.

2.2 Who is willing to exploit creativity?

Community creativity plays a critical role in co-design processes. However, we cannot take for granted that communities are prepared to go through a collective creative process related to complex problem-solving or setting visions for the future. Although human beings are creative by nature, different levels of co-designers' involvement in creativity processes are identified ranging from 'doing' to 'creating' (Sanders & Stappers, 2008).

Furthermore, throughout life, the way we are educated and schooling tests are framed as "wrong-answer-right-answer" hinder our creativity or divergent thinking capacity, affecting our ability to solve complex problems that do not fit in the "right-wrong" answer framework and inhibiting us from taking the risks involved in innovation processes (Sternberg, 2006, 2012).

Hence, creativity is not seen as an inborn trait of human beings by some scholars in the psychology field. It relies on external environment and personal factors that contribute to the decision to hamper or to harness our creativity use (Sternberg, 2006, 2012). Creativity is at the core of design processes, involving exploration and deployment of divergent thinking to establish connections between ideas not related to one another before, so they are often controversial when innovative. Innovation is facilitated when people with diverse

backgrounds participate and also involves failures and the ability to timely learn from those and persist (Poirier, et al, 2017). Thus, there is a tendency to "follow the crowd" and not to step out a "comfort zone" rather than investing in the effort that creativity deployment requires (Sternberg, 2006, 2012).

3. Methodology

Our research reasoning is inductive, and the approach is qualitative and exploratory. We first listened to community members to understand how they unconsciously design. The case study was built upon triangulation of methods (Eisenhardt, 1989; Stake, 2000; Yin, 1994) and analysis of multiple data sources.

Primary data was collected through three online roundtables with community members from five informal-settlement communities, two in Belo Horizonte and three in Rio de Janeiro, and representatives of NGOs who have been engaged in solving COVID-19-related issues in these communities. The following tables describe the online roundtables composition:

Table 1. Belo Horizonte online roundtable.

Roundtable role	Gender	Related Community / Role
Participant 1	Male	Community A / NGO representative and community member
Participant 2	Male	Community A / NGO representative
Participant 3	Female	Community B / Kindergarten teacher, community member and volunteer
Participant 4	Male	Community B / NGO representative and community member
Mediator	Female	Lancaster University / Research Associate
Time moderator	Male	UFMG / Master student
Observer 1	Male	UFMG / Professor
Observer 2	Female	UEMG / Professor
Observer 3	Female	UEMG / PhD candidate

Table 2. Rio de Janeiro online roundtable.

Roundtable role	Gender	Related Community / Role
Participant 5	Female	Community C / Nurse, doula and community member
Participant 6	Female	Community D / Journalist and community member
Participant 7	Male	Community D / NGO representative and community member

Participant 8	Female	Community D / Educational project founder and community member
Participant 9	Female	Community E / Social movement representative and community member
Mediator	Female	Lancaster University / Research Associate
Time moderator	Male	UFMG / Master student
Observer 2	Female	UEMG / Professor
Observer 3	Female	UEMG / PhD candidate

Roundtables were run in the first language of participants. The talks of participants were transcribed and translated. Conversations were drawn around the following topics: sources of information, communication means and impacts on routine; prevention; diagnosis and treatment; support, and change. The researchers mapped speeches of participants using Affinity Mapping (Service Design Tools, n.d.) to identify problems, adaptive strategies, needs and the related areas of challenges regarding each topic through cross reference. The maps were validated by community members during a third roundtable, enabling reflection and further discussion in a participatory process.

Secondary data collection included public data (from NGOs' and community members' Instagram and Facebook posts, websites, press news) and literature review focused on: design capabilities; participatory approaches to community resilience-building in emergency and recovery contexts; COVID-19 in the world and in Brazil with focus on the disparities and demographics of favelas in Brazil.

The results clarify barriers, challenge areas and diffuse design capabilities which were identified and mapped according to each area of challenge. The next section describes those. Our discussion shows the community-led strategies underpinned by diffuse design capabilities in community practices.

4. Challenge areas and community-led design strategies

4.1 Communication

The language used in COVID-19 public messaging is misleading and confusing for community members. Hence, access to COVID-19 information occurs mainly through television and social media (e.g. Facebook and WhatsApp) although access to the Internet is still a barrier. Furthermore, who is communicating the message defines whether the information will be considered by communities. For instance, if a distrusted politician communicates the information, people will not listen to their message. Community members rely on messages from WhatsApp groups, local community leadership and personal relationships.

In response to these, communities have created rap lyrics that are disseminated by a car with a sound system; children created educational videos talking about prevention which are disseminated amongst communities through Facebook and WhatsApp.

4.2 Education

Brazilian public schools remain closed although an official national lockdown has not been declared and decisions regarding restrictions have been usually made at the local level by municipalities and state governments across the country. The lack of access of children, teenagers and other students to information technology resources (e.g. laptop, tablet, Internet) in informal settlements exacerbates the learning conditions, in the absence of the physical infrastructure, services and staff support from schools. Children at risk are also an important issue.

Two community strategies were adopted to cope with this situation: a project dedicated to improving home-schooling conditions, providing children with materials and activities, and the reformulation of the school planning.

4.3 Employment and income

Community members often work on elementary services or businesses, such as supermarkets, hospitals, pharmacies, healthcare centres as informed by participants. As such, they do not have options for remote work. Many others lost their jobs and those, who did not, needed to continue commuting and working to provide for their household. The lack of access to the Internet also hampers the possibility of remote work for community members. Besides, informal workers that offer, for instance, cleaning services and earn on a daily basis and local businesses in informal settlements, such as small grocery stores, have been suffering the effects of the crisis. This situation is aggravated by the businesses' practice of overpricing hygiene products and food.

Social Assistance Reference Centres (CRAS) provided benefits to residents such as voucher cards that enable them to buy food parcels in businesses close to the community, reducing the economic impact. However, these services were closed in Belo Horizonte when this study was conducted and the access to these were through Internet and telephone. This hindered community access to those.

As a response to these, local NGOs' representatives helped community members access benefits, for example, filling out electronic forms and providing food-kit donations and hygiene products as a result of partnerships with private companies and solidarity of citizens. Hand sanitizer and masks were distributed to workers at dawns. Grated soap and water mixture stored in reused oil cans was also a strategy, however, the effectiveness of the latter was not assured.

4.4 Culture, leisure and behaviour

Social distancing and other preventative measures are influenced by the street culture and games that prevail amongst children, young people who keep partying (especially the “Funk Parties”, typical of favelas), adults that often go to bars to have beers as usual, and older adults who want to keep their habits as before the pandemic and have difficulties in adopting preventive measures. The COVID-19 virus was seen as an invisible threat contributing to people’s disbelief in the disease.

In addition to communication strategies, handwashing and hand sanitizer check points were implemented at entrance and exit of community areas.

4.5 Public administration and politics

Public information systems which enable citizens to access benefits failed to reach everyone in need. Sometimes, citizens data that should be transferred from one Government department to another are not making some citizens invisible.

The access to some benefits depends on the access to the Internet. Otherwise, people should get these in person at banks. This potentially generates overcrowded banks and long lines. Besides, it is common amongst communities, people who have not a bank account and will need to handle values in cash and still use cash for transactions as well as others in need of Emergency aid (600.00 BRL) who have not it approved. The Social Assistance Reference Centres (CRAS) that could help citizens with these issues were closed in Belo Horizonte during this study and NGOs were replacing their roles and facilitating community members communication with CRAS and other public bodies.

Police officers are usually associated with violence against community members and vice-versa although their initiatives to encourage preventative measures were recognised at the beginning of the pandemic in one of the communities. Their absence in favelas is felt throughout the pandemic evolvement. For instance, warning and hindering parties as they usually did before the pandemic. Notwithstanding, community members wish to build dialogues and collaborations with them.

The lack of politicians’ initiatives against COVID-19 disease is noticed in communities as stated by a participant: “The State did not arrive to beat COVID-19”. Their presence in informal settlements is often directly related to poll objectives (e.g. bribing community members for votes). Disbelief in the COVID-19 virus is also motivated by political instability involving power disputes and corruption as mentioned by a community member: “Is the virus an invention motivated by political interests?”.

In some communities, there is also the lack of access to water and sanitation grids or the provision of those basic services does not work well.

Social organisation has underpinned most community strategies to cope with these challenges even though it is considered challenging amongst community members. These

strategies involve mutual help amongst households, design and manufacturing of masks which are made and distributed by community volunteers, the establishment of a community leadership unity known as collective mandate composed of community members actively engaged in solving community problems, the donations of food parcels and hygiene products by citizens and socially responsible organisations. The problem of lack of access to water is still being solved with the purchase from a water tank truck.

4.6 National Health System

There was the lack of protective gear for health professionals in the public sector and COVID-19 tests were not available for free at the time this study was conducted.

People did not trust the public health system's diagnosis in the absence of tests due to the confusion between COVID-19 and other diseases' symptoms, such as dengue and chikungunya. Also, the need amongst healthcare workers for access to reliable information and knowledge to provide diagnosis and treatment was mentioned. Additionally, there was the distrust in medical appointments made on the phone.

Recommendations are often not suitable for informal-settlement communities since measures such as to 'self-isolate' are not possible to be followed in overcrowded and intergenerational households and high-density areas.

In order to tackle these, some communities raised money from their own members to have a diagnosis, or to provide healthcare workers with protective equipment. Traditional knowledge was used to improve immunity, such as lemon, ginger and saffron teas and sunbathing to strengthen vitamin D. Other adopted strategies in the absence of access to proper healthcare include private medical appointments and harmful ones, such as self-medication based on media speculation and prescriptions' sharing.

These areas of challenges are often interwoven. For instance, employment and income problems aggravated by the COVID-19 pandemic also influence the ability to access hygiene products and food as those were overpriced and the government benefits did not reach everyone in need. Hence, affecting the ability to follow preventive measures globally recommended.

5. From diffuse to co-design capabilities

Community members unconsciously design when translating information, empathising, self-organising, developing and implementing strategies to tackle the pandemic issues. They create, plan and implement feasible and viable actions to deal with barriers related to infrastructural, political, public policy and/or service, behavioural, cultural and socio-economic determinants (Figure 1).

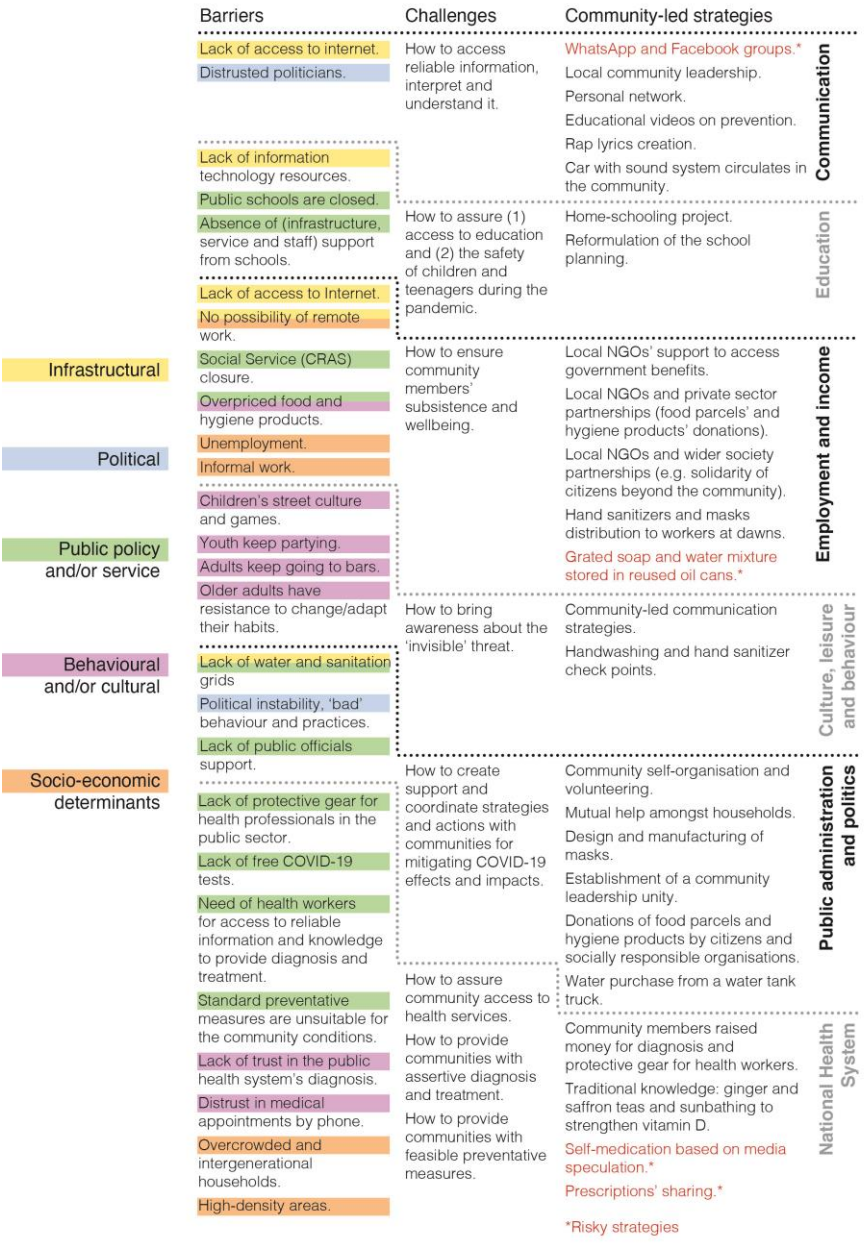

Figure 1. Barriers, challenges and community-led strategies for tackling the COVID-19 pandemic.

Many barriers and challenges are part of the lives of communities even before the pandemic. For example, communities have their socio-economic conditions aggravated by the COVID-19 threats, but these were already persistent problems in communities.

Most community-led strategies were critical to tackling the immediate impacts of the pandemic. However, as recognised by community members, there is the need to sustain and scale up those, making them sustainable. Furthermore, a few strategies mentioned are risky and can harm community members or may not be effective in preventing COVID-19 contamination.

These risky strategies can benefit from co-design. For instance, involving health experts to check information before disseminating it through WhatsApp and Facebook groups, and designers to 'translate' complicated messages into accessible communication. This can contribute to beating false information which leads to medicines' misuse, bringing awareness of potentially harmful practices (e.g. prescription sharing and self-medication) and of the prevention importance.

Also, there are problems that are beyond the current possibilities and control of communities (e.g. infrastructural, political, public policy's and service's access and quality), requiring (from short- to long-term change in) co-operation, collaboration, commitment and interest of public officials. Community members demonstrated the will to build dialogues with public officials despite the feelings of abandonment and disappointment which were exacerbated during the pandemic evolvement.

Co-design at the political and policy-making levels can contribute to putting scientific knowledge and community needs, voice and livelihood diversity in policy-making processes and in the political agenda. Designers are facilitators in these co-design processes, empathising with community members, understanding community needs, translating scientific knowledge into accessible messages and stimulating their creativity and potential. This contributes to building *bridges* (*dialogues*) between and *strategies* and *solutions* with communities and different stakeholder groups.

This is a mutual learning process. On the one hand, community-led strategies are reactive and can benefit from designers' forward thinking, extending community-led problem-solving skills into future-oriented strategies that can bring long-term benefits. Reflection and learnings from these co-design cycles can be better shared and discussed in communities, building a legacy of community-led design capabilities. On the other, designers and other stakeholders can learn from communities especially regarding their ability to establish partnerships, quickly finance and implement strategies in uncertain and complex environments.

Cross-Team Brainstorming and a Comparison of Online to Physical Version

Heng-Yi Mie[a], Hsi-Jen Chen*[a]

[a]Department of Industrial Design, National Cheng Kung University, Tainan, Taiwan
*hsijen_chen@mail.ncku.edu.tw

Abstract | Brainstorming is a method commonly used in design thinking workshops. As a representative method for idea generating, brainstorming has been evaluated and modified in order to achieve better performance. As for workshops, the concern of lacking diversity of ideas have existed. Therefore, the article proposes the Cross-Team Brainstorming approach. Based on a combination of the Crazy Eights and the KJ method, the idea is to let teams in a workshop brainstorm over each other's topics, in pursuit of expanding the breadth of ideation. An online version is further tested in comparison to the physical version. The findings suggests that the approach does bring changes to traditional brainstorming, and the online version shows advantages that matches former researches.

KEYWORDS | DESIGN THINKING, BRAINSTORMING, ELECTRONIC BRAINSTORMING, DESIGN THINKING WORKSHOP

1. Introduction

Design thinking has been known as a mindset or tool that could be learned, practiced, and, developed by anyone (Cross, 2001). Today, companies and governments are importing design thinking into projects (Brown, 2008); Academies of all domains and levels of education are including it into courses' syllabuses as well (Matthews & Wrigley, 2011).

Over these years, models and theories proposed by scholars and designers have been pushing the application of design thinking forward. Methods, tools, and techniques are used to support problem defining and solution generating.

Among the tools and methods, brainstorming, as Jonson (2005) described as "a matter of generating, developing and communicating ideas", stands out as a representative method to generate creative ideas. As brainstorming being widely tested and evaluated in pursuit for better performance, studies and experiments have revealed the benefits, dominant, and possibilities of this iconic method, as well as its disadvantages.

Based on the lack-of-breadth in brainstorming, which appears in time-limited conditions such as workshops, the article proposes "Cross-team brainstorming" as a refinement to provide more diversity. And finally, as electronic brainstorming being more widely used (especially under the cause of COVID-19), an online version is compared to the physical version.

2. Brainstorming

As Schmid (1996) points out that creativity requires constructing and reconstructing of knowledge, the basic concept of brainstorming has been generating creative ideas through the collision of thoughts, knowledges, and perspectives. Proposed by Osborn in the 1954 publication, *Applied Imagination*, brainstorming has been phrased for its high face-validity, simple rules, and an increase of "synergy" in the team (Gallupe, Dennis, Cooper, Valacich, Bastianutti & Nunamaker, 1992).

Listed to be one of the key gains of brainstorming (A. R. Dennis & Williams, 2002), synergy is a reaction which a team member's idea activates another member to generate new ideas. Further studies proposed the concept of "idea pool", claiming that synergy comes from the pool of ideas exchanged by team members conducting brainstorming (Nagasundaram & Dennis, 1993). With team members outputting the ideas to the "idea pool", other member may be stimulated thus produce more ideas, and the continuing stimulation would thus increase gain in synergy (A. R. Dennis & Valacich, 1999).

Similar statements can be seen in the study proposed by Nelson, Wilson, Rosen, and Yen (2009), listing 4 criteria for evaluating brainstorming:

- Novelty: the degree of unusual of ideas.

- Variety: the degree of dissimilarity of ideas from single individual.
- Quality: the degree of feasibility to put ideas into practice.
- Quantity: the number of different ideas generated by individual.

Despite other factors should as well play a part, the number of ideas is indeed the key to a good-qualitied brainstorming with diverse creativities.

2.1 Brainstorming in workshops

Originated from Staatliches Bauhaus, workshop is a form of educating that emphasizes learning through practicing. Design Thinking, in many ways, welly fits workshops. The form of workshop provides the environment and instruction, which are especially needed since implementation plays a key part in design and design thinking (Wrigley et al., 2018). Taking a project-based foundation further provides a target for the theories, tools and knowledge to be practiced.

In a Design Thinking workshop, the process mostly follows from problem-defining to solution-generating. While problem definition is a process of converge, solution generating seeks for divergence through ideating, which is where brainstorming takes place. Brainstorming in workshops stands for the key point to explore the view.

However, the fact that workshop is a refined structure including with receiving knowledge, digesting information, and applying theory all included, the time spent on each stage is limited. Under limited time-spent, teams may lack of enough understanding and knowledge that are essential for generating creative ideas. Another concern is that solutions may pop out during the problem defining phase. Chances are that the team, especially when team members are not familiar with design thinking, might stick to and certain solution too early and not being able to jump out (Howard-Jones & Murray, 2003).

Therefore, to fully bring brainstorming into play, the task falls in expanding the diversity of ideas.

2.2 Electronic brainstorming

As technology being developed, brainstorming no longer requires to stick in verbal form. With the support of hardware and software, electronic brainstorming (EBS) has become the second stream of brainstorming (Gallupe et al., 1992). Moreover, even in traditional verbal brainstorming, EBS tools can be used to support in recording and analysing. In fact, Kay (1995) proposed the advantages of EBS, being:

- Parallel entry of ideas: thoughts could be expressed at the same time.
- Anonymity: expressing without the worry of criticism.
- Novelty: faster information processing, more passion, and less time spent.
- Size: a higher maximum in the number of people participating.
- Proximity: flexibility in time and space.

- Memory: results could be recorded more accurate and efficient.
- Equality: members' voices are equally expressed and treated.

One main difference between EBS and traditional brainstorming lies in synergy. (Valacich & Dennis, 1994). As mentioned above, synergy is related to the number of ideas produced and the size of the group. Dennis and Williams (2005) further pointed that a significant factor of the performance between EBS and traditional brainstorming is the group size. According to their findings, EBS groups shows a better performance than verbal groups when group size reaches four people.

With the advantages, EBS has been accepted increasingly. The COVID-19 brings another upheaval to EBS. As campuses being shut down one by another, students are sent back to their hometown, turning all courses online. Courses that requires implementations such as studios turn out into a virtual-workshop-similar form, thus resulting in an increase in the use of EBS.

3. Methods

3.1 Cross-Team Brainstorming

The need of improving the breadth of ideas being the existing task, the problem falls into "how to achieve the goal without expanding time-spent". Therefore, the "Cross-Team Brainstorming" approach is proposed.

Since brainstorming is a technique of gathering the strength, knowledge, and intelligence of a group of people, the Cross-Team Brainstorming approach is to further expand the size of the "group". The concept is simple, by letting the teams, the small groups of people, brainstorm over each other's topics, each team may receive extra ideas form other teams.

The whole process is based on a combination of three rounds of ideating and two rounds of categorizing (see Figure 1). During the three rounds of ideating, each team will take turns ideate over two other teams' topics. This is to ensure that in the end of this approach, every team may receive three sets of ideas, including one set from themselves and two sets of "extraneous ideas" from other teams. The topic of each round of ideation will come from the two teams ahead and each team's own one (see Table 1). To exclude the effect of proficiency (through rounds of practicing), the the last round would be each team's own topic.

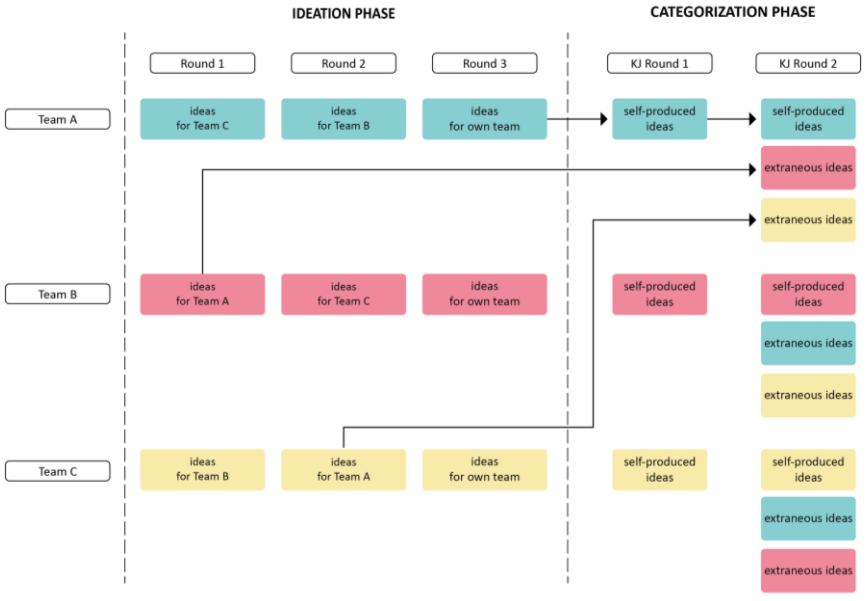

Figure 1. The Process of Cross-Team Brainstorming. The colour represents "from whom the ideas comes". The concept is that by the end of the approach, each team will receive not only ideas generated by themselves, but form others as well.

Table 1. Topics for each round of the ideation phase. If 5 teams were to participate, Team 5 would ideate over topics of Team 3, Team 4 and their own topic; while Team 1 would ideate over topics of Team 4, Team 5 and their own topic.

round \ team	Team 1	Team 2	Team 3	Team 4	Team 5
1st Round	topic 4	topic 5	topic 1	topic 2	topic 3
2nd Round	topic 5	topic 1	topic 2	topic 3	topic 4
3rd Round	**topic 1**	**topic 2**	**topic 3**	**topic 4**	**topic 5**

A host is required to hold the time and condition. For equipment needs, post-its are used as carriers for single ideas, and boards (could be large pieces of paper or plastic boards) to carry the post-its.

To ensure that every team in the group has a basic understanding of each other's topic, each team is required to explain their topic and answer questions from other teams before starting. Following that, is the ideation phase and the categorization phase.

Ideation phase

The ideating phase is based on the method of Crazy Eights. The fact that the technique encourages divergent thinking (O'Leary et al., 2018), as well leave a visual output needless of additional recording, are the reasons why the method is chosen.

Within each round, three steps are included:

1. 8 minutes of drawing
2. 2 minutes of noting
3. 5 minutes of sharing

The first step is to output the ideas by drawing rough and quick sketches on post-its. If the idea is hard to visualize, writing is allowed as well. The goal of this step is to produce as many ideas as possible, despite any concerns such as feasibility, usability, or costs (O'Leary et al., 2018).

The second step, "noting" is a preparation for the categorization phase, which is not in the original Crazy Eights method. Due to the fact that the rough sketches from step one could be hard to understand, there is the need of brief instructions. In this step, "keywords" are to be added to the ideas, such as the core concept, used technology, or references that help describe and explain the ideas, so that others are able to understand them at first sight. Whether the keywords should be written on the sketched post-its or new blank ones is open to option, while they should be stuck together if choose the latter.

The last step is to share the produced ideas with the team, which is one of the main purpose of brainstorming, to seek for inspiration and generate creative ideas through divergent thoughts and perspectives. Another purpose of this step is to double check the legibility of the ideas. Despite the noting step is to ensure legibility, this is in case that the ideas are still hard to understand. The five minutes provides a chance to patch the ideas as well.

The three steps together makes one round of ideation. While new ideas may pop out during step 2 and 3, they are allowed to be added at any time, as long as it is still in the same round.

To distinguish whom the ideas are from, each team is assigned a colour of post-it, and is only allowed to use that colour (see Figure 2).

Figure 2. The Crazy-Eights Method. Normally the method uses an A4-sized paper, divided into eight blank spaces, as carrier for the sketches. For the ideas to be movable in the categorization phase, this approach uses post-its as idea-carriers in replacement. By limiting to one per team, the colour helps identifying the origins of the ideas.

Categorization phase

Following the ideation phase is the categorization phase (with a break time between the two phases). Based on the KJ method (Kawakita, 1991), the aim of this phase is to classify and group the outcomes of the former phase, in order to see how many "types of ideas" are in fact generated. Though the original KJ method should require repeating in order to create layers that are more general thus revealing the cause and effect, this approach simply borrows the feature of analysing, thus finding connections and similarities (Ohiwa et al., 1990) to create categories for the ideas.

Two rounds of KJ method will be conducted in this phase of categorizing. The first round follows right after the last round of the ideation phase. For this round, teams only requires to categorize the "self-produced ideas", which is the ideas the team generated over their own topic (see Figure 3).

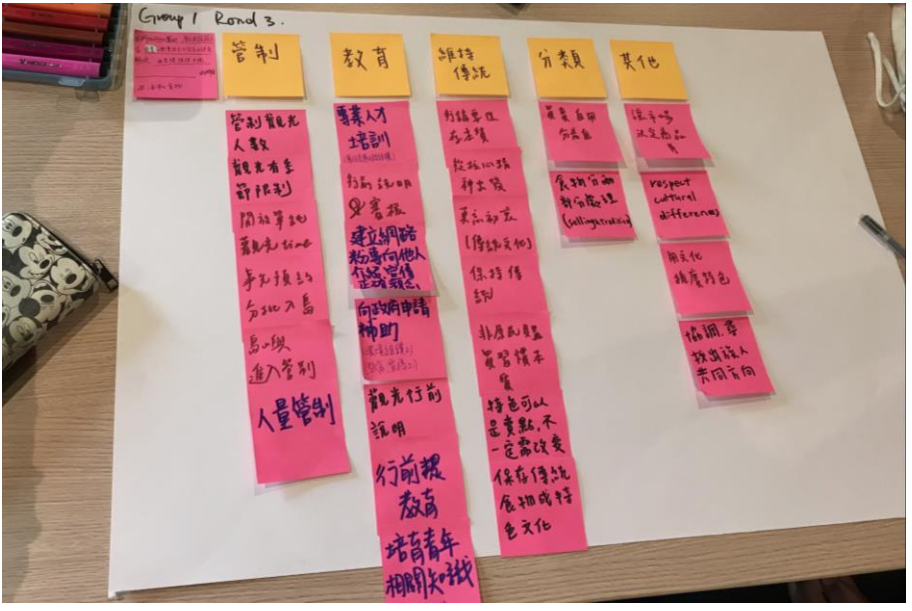

Figure 3. First round of KJ method. The KJ method is a technique of classifying through analysing the similarities, connections, and patterns of information, in this case, the generated ideas.

The second round is based on the result of the first round, but with the "extraneous ideas" from other teams (first two rounds of ideation) joining in (see Figure 4). For this round, it is not necessary to abandon the existed categories and start from scratch. Whether the extraneous ideas should be classified under the existed categories, or should some of the classified ideas be extracted and open new categories with extraneous ideas, the strategy and basis is up to the teams.

Figure 4. Second round of KJ method.

A fourth and fifth colour (other than the three colours representing each group) of post-it is needed for the categories and popped-up ideas during classifying.

For the categorization phase, both rounds are set for 15 minutes. However, the time-spent could be adjusted depending on the actual situation.

Criteria of outcomes

This approach is aimed to increase the divergence of ideas, in order to expand the breadth of ideation, thus generate better creativity. Therefore, the focus is on how many kinds of ideas are generated. As the KJ method being used to classify ideas, in this case, the number of categories produced in the categorization phase stands for the divergence of types of ideas the research seeks for, which is the quantitative data to be collected.

Qualitative observation is as well conducted, such as the content under each category, from whom are the ideas generated, the difference between two rounds of KJ methods, and conversations or questions from the participants.

3.2 Data collection

Physical version

In order to have a further understanding and applying of this approach, a physical version and online version is compared.

For the physical version, data was collected from one course and one workshop, with 6 teams in total (3 teams from both). The team size varies from 3 to 5 members. Each teams were given 30 to 60 minutes to define and present a topic. The rest follows the process of the cross-team brainstorming approach.

A camera is used to record the production of each round of ideation and categorization.

MIRO: the online version

The online version uses MIRO as the platform, with 3 teams participating.

MIRO is a website support different kinds of electronic brainstorming. By joining in the "team", team members may have the access to the tool boards such as "Mind map" and "User Story Board". To conduct the Cross-Team Brainstorming approach, the "Brainwriting" board (see Figure 5) is chosen.

Figure 5. The "Brainwriting" board of MIRO. The board works similar to cloud documents, anyone with access is able to edit the board. For the research, colour yellow, blue, and pink each represents Team 1, 2, and 3, while the purple ones are categories. Written on the big post-it is the team's topic. In Figure 4's case, this is team 3's board.

Several adjustments of the work flow are made to fit the function of MIRO. First, each team is assigned to a board (i.e. Team 1 is assigned to Board 1) and write down their topic. As the ideation phase begins, they will visit each other's boards in a round-table way and conduct Crazy Eights on that board. For example, for the first round, Team 1 heads to Board 3 (team 3's board), while Team 2 goes to Board 1 (team 1's board) and Team 3 to Board 1 (see table 2)

Table 2. Process of the ideation phase for the MIRO version.

round \ team	Team 1	Team 2	Team 3
1st Round	board 3	board 1	board 2
2nd Round	board 2	board 3	board 1
3rd Round	board 1	board 2	board 3

Once the participants are clear with the process of the approach, a demonstration to the function of the website and the "Brainwriting" board is given. Same as the physical version, the teams are given 30 to 60 minutes to define and explain their topics.

To imitate the condition of virtual workshops, the three teams are respectively assigned to different rooms. Team members may have conversations and move around, but are not allowed looking and pointing directly to each other's screen.

The host, in this case the researcher, will give instructions of the start and end of each round and phase. At the end of each round, screenshots will be taken to record the outcomes.

4. Results

For the results, the number of categories as well as the amount of ideas for each round were calculated, with team size being noted as well. Table 3 and 4 each shows the result of the physical version and the MIRO version.

For the physical version, the number of categories for each round is 4.7 and 7.5 in average, as 2.8 more categories were added in the second round of KJ method. As for the MIRO version, an average of 8.7 and 11.3 categories of ideas is generated in each round of KJ methods. The increased number of categories is 2.7 in average.

Table 3. Results of the physical version.

Course	Team	member	Ideas generated (round)			Amount of categories		
			1st	2nd	3rd	1st	2nd	increased
A	Team 1	3	26	24	26	6	8	2
	Team 2	3	22	27	24	6	7	1
	Team 3	3	24	22	24	5	7	2
B	Team 1	4	33	33	29	6	10	4
	Team 2	4	18	24	22	4	5	1
	Team 3	4	36	28	24	1	8	7
average						4.7	7.5	2.8

Table 4. Results of the MIRO version

Course	Team	member	Ideas generated (round)			Amount of categories		
			1st	2nd	3rd	1st	2nd	increased
C	Team 1	4	26	24	26	11	14	3
	Team 2	5	22	27	24	9	10	1
	Team 3	4	24	22	24	6	10	4
average						8.7	11.3	2.7

Table 5 presents a comparison of the numbers of classified categories between the physical version and the MIRO version. The average number of the teams of the MIRO version does seem to be more than the teams using physical version in both rounds of categorizing. However, the average increased-number of the two versions are nearly the same.

Table 5. Comparison of the two versions in number of categories.

Version	Amount of categories		
	1st KJ	2nd KJ	Increased
Physical	4.7	7.5	2.8
MIRO	8.7	11.3	2.7

5. Discussion

Tested in actual courses, the approach of Cross-Team Brainstorming took around 1 hour and 20 minutes to complete. Although a few participants appeared to be slightly tired as reaching to the end, the teams had shown quite commitment during practicing. In fact, several participants had replied the approach to be “fun” and “enjoyable”. Generally, the approach received positive comments.

While the efficiency of this approach requires further testing and evaluations, notable findings have been discovered. The findings will be discussed in two parts: 1) the effect of the extraneous ideas, and 2) the comparison of the MIRO version to physical version.

5.1 Extraneous ideas and new categories

The result of testing shows that in both versions, the categories of ideas increases by around 2.8 categories as extraneous ideas being imported.

As expected, new categories were added when extraneous ideas were brought in. To be clearer, the added categories basically fell in two types: sub-categories and brand new categories.

Sub-categories are generally more detailed and specific. For example, in one case, category “Events” was put in the first round, but divided into “Good Events” and “Bad Events” in the second round. Such findings reflects that the extraneous ideas may have provided resource for more detailed categorizations.

Compared to sub-categories often came from large categories in the first round of KJ method, under the brand new categories were usually ideas that could not be classified or even absent in the first round. Aside from the “isolated” ideas, popped-up ideas during classifying was another source of brand new categories. In this case, two new ideas were added under the same category during the first round of KJ method, however, they were respectively moved to new categories in the second round as it turned out that there were plenty of similar ideas from other teams.

Another finding the brand new categories reflected is worth noting. According to a participant during the second round of categorizing, there seemed to be different tendencies in the types of ideas for each team. In this case, the topic is “Encourage elder family members to keep the habit of exercising through interactions on smartphones”. While the topic-proposed team generated mainly ideas about operating and devices, many of the extraneous ideas were about increasing motivations and interaction with people.

5.2 MIRO as platform

The comparison of the two versions in number of categories (Table 5) shows the MIRO version to come up with more categories in both rounds, but not in the increased number.

Further findings in the content shows that the difference between the physical version and the MIRO version is mainly in the process.

In the test of the MIRO version, the discoveries mostly matches Kay's (1995) claim of the advantages of EBS, such as a better quality in recording, more efficient tools in evaluating, and parallel movements at the same time.

First of all, in the MIRO version, there's a significant difference in step 1 of the ideation phase. Due to the limitation of MIRO's function and hardware, in step 1, "drawing" is replaced with "typing", which leads to the loss of visualizing, one of the main features of Crazy Eights. However, without a clear image provides ambiguity and flexibility for interpretation, which is one factor of creativity. Furthermore, from the process's perspective, the fact that typing requires much less time than drawing, resulted in reduction of time-spent in the MIRO version.

The adjustable screen size gives flexibility between a detailed and overall look of the ideas. Being able to have a holistic view, it may be easier to find patterns

From the host's perspective, the MIRO version gives convenience in recognizing the situation and each team's performance by simply switching the screen. This brings another advantage in qualitative observing. Thanks to the immediate update of the changes made on the boards, the more detailed content and process are much easier to observe and even record. However,

In general, the approach of Cross-Team Brainstorming is 1) well accepted and commented by the participants. 2)

5.3 Conclusion

This article proposes Cross-Team Brainstorming, an approach based on a combination of the Crazy Eights and KJ method, aims to expand the amount and diversity of ideation by providing "extraneous ideas" together with "self-produced ideas".

With the extraneous ideas importing to the ideal pool, more detailed categories and new categories were expected to appear, which had been found in the collected data. By comparing to rounds of categorizing, the approach allows the teams to 1) have more detailed look to the ideas and 2) look at the topics from perspectives they did not think of.

To explore the use, the approach was further tested in an online version. Using MIRO, a virtual meeting imitating test was conducted. Generally, the MIRO version shows advantages in:

- Accuracy and completeness in recording the outcomes
- Convenience in operating
- Immediately and holistically recognizing the condition
- More fluent and less time-spent in the process

The result appeared to match scholars' study for electronic brainstorming, with other findings suggesting that the approach could fit well in the form of electronic brainstorming. As more data being collected, the effect of group size, level of proficiency, or even the topic and members' backgrounds are expected to be revealed.

Design Education in a Pandemic Context

Harald Skulberg

The Oslo School of Architecture and Design AHO
Harald.skulberg@aho.no

Abstract | The Covid-19 pandemic has constituted a global health crisis which influence our professional activities, including the operation of academia and higher design education. When the pandemic struck, we -as educators running a master study of design- experienced how the external regime of infection control forced us to change our teaching and tutoring procedures of running our curriculum almost overnight. We wanted to investigate this new situation from the students' point of view. Through a qualitative survey, we asked our design students how they experience the new regime of their everyday study, and we also asked for new and radical ideas to reduce the negative impact from the pandemic, aiming at damage reduction - or even improvements - of our teaching and tutoring. The outcome of this survey has gained new knowledge and proved fruitful to enable us to reorganize and adapt to a new normal.

KEYWORDS | DESIGN EDUCATION, PANDEMIC CONTEXT, QUALITATIVE SURVEY, RADICAL IDEAS, IMPROVEMENTS

1. Introduction

After the Covid-19 pandemic evolved from its origin in Asia towards Europe in the beginning of 2020, Norwegian health authorities issued all-encompassing restrictions in all sectors of society at the point when the massive breakout of the pandemic hit Scandinavia. In our academic institution, we experienced a rather sudden shut-down in mid-March 2020.
Due to the major infection restrictions being issued, and as a consequence of the sudden shut-down in the higher education sector, teaching and tutoring activities were moved over to digital platforms providing online learning, while still allowing some few critical courses - amongst them our diploma candidates - to attend campus.
As our school was largely closed down, staff were forced to utilize digital tools in order to run our curriculum. This situation led to major practical challenges relating to how to execute our teaching and tutoring methods while still maintaining responsible infection control procedures. This regime included constraints on the physical location of students, restricting the concentration of students within our studio and workshop spaces, as well as forcing us to radically reorganise all student activities. Lecturing, tutoring and evaluation activities were carried out using the digital platform Zoom, which all staff were asked to implement in their daily routines.
Retrospectively, we acknowledge that the way we as educators have been forced to reorganise our educational methods, have influenced the way our students learn. Exactly how this manifests itself is yet to be evidenced, as we assume that the effects take some time to fully understand, and it is likely to assume that the effect depends of the duration of the pandemic. Furthermore, as we do not know the time-span of the pandemic, we cannot completely assess the advantages and disadvantages retrospectively until the pandemic is terminated. Our ambition is to investigate how this process has evolved until today through a case study, in order to understand the effects of this methodological shift.

We have searched for empirical research work on the covid-19 pandemic and its implications on higher design education. Due to the recent outburst of the pandemic, and the fact that this is an on-going crisis, there is yet a limited number of comprehensive academic research papers constituting a solid empirical body of literature discussing the implications of the pandemic in higher design education. However, we have found some sources that have been useful in our research on the topic. Regarding the challenges of predicting the effects of Covid-19, The Lancet (2020) states that:

> "…Considering health research and education as a system, rather than focusing on individual components, can help build a more complete picture of the challenges and opportunities ahead. Many of the effects of COVID-19 on health research are likely to be difficult to predict and could produce a combination of desirable and detrimental outcomes. Online learning, for example, could make education more accessible for some students, while disadvantaging others if an equitable approach that takes a system-wide view is not implemented." (Editorial, Volume 396, Issue 10251, P583, August 29, 2020).

This quotation aligns with our view on taking a systemic approach to develop the best possible learning tools for students, especially if a prolonged pandemic becomes a reality.

ACE, American Council on Education (2020) states that it is the executive leader's responsibility to respond to the pandemic, and that those responses to the crisis will make an imprint on their institutions for years to come.

To establish a backdrop for our case study, and to fully understand the magnitude of the pandemic in academia and its implications, we found it relevant to refer to a survey that examine the health-wise impacts from the pandemic. In April 2020, Active Minds surveyed 2.086 college students in the US regarding the impact of Covid-19 on their mental health. The survey concludes that:

- 1 in 5 students say their mental health has significantly worsened under Covid-19
- For 80% of students Covid-19 has negatively impacted their mental health
- 76% have trouble maintaining a routine
- 73% struggle to get enough physical activity
- 63& find it challenging to stay connected with others
- 85% say that focusing on school and work despite distractions has been the most difficult thing about the stay-at-home orders.
- More than talking – especially about Covid-19 – students say the number one way parents can support them is simply spending time with them.
- More than half of students (55%) say that they would not know where to go if they or someone they knew need immediate professional mental health service.
- Students are finding tools that promote social connection most helpful for caring their mental health. These include video call, digital social gatherings, phone calls and in-person conversations.
- Despite Covid-19, 79% of students feel hopeful about achieving their school-related goals and their future job prospects.

In the same survey, according to students, the most important thing for school leaders to be thinking about in the short term and long term for student mental health during and after the pandemic include:

- Increased academic support: Leniency, accommodations and flexibility.
- More mental health resources: Increased investment in counselling and coping resources.
- Focus on soft skills: Empathy, compassion, communication, understanding, and validation for the burdens students are experiencing.
- More opportunities for social connection: Replace cancelled events, services, and classes with virtual ones.
- Engagement in long-term planning: Colleges need to be prepared to help students heal and recover when they return and put in place improved practices and protocols to more easily pivot to remote learning in case of another similar crisis.

This feedback resonates with findings by Horne (2020), providing a study of Healthy Campus Awardees, where five campuses highlight the importance of:

- Moving services online
- Meeting student's basic needs
- Proving workshops and discussion groups
- Clearly communicating the college's / university's response
- Supporting marginalized students
- Infusing wellbeing into the curriculum
- Elevating student-led organizations' activities
- Showing empathy and compassion to students

Recent surveys of college presidents in the US indicate that over 90 percent of these reported being very or somewhat concerned about student mental health during the COVID-19 crisis, making it their top concern, Lederman (2020).
As the link between students and staff is crucial in a university, it is also important to consider the working conditions on campus for the staff, as not only students, but also staff seem to be highly influenced by the pandemic. According to Inside Higher Ed (2020), professors in academia are stressed from Covid-19 related changes to teaching and from dealing with student's mental health, with implications for their own mental health. Amongst staff, faculty worries about the pandemic have morphed into chronic stress. According to the results from a survey by Course Hero (2020) in the US, half of college faculty report signs of professional burnout, with 40% of these considering leaving their current jobs. The data likely reflects presidents' fears about how the disruption and uncertainty of school closings and distance learning will affect students' already-rising rates of anxiety and depression.
In our own institution, the practical organising of infection control measures constitutes a major challenge. Currently, all of our studios and workshops are subject to restrictions regarding the number of students being present at the same time. The infection control routines have changed frequently, and as one example, all teachers were asked to wear masks when tutoring students closer that one meter, but not when giving lectures. This principle easily leads to enhanced feeling of security, but limits the level of communication due to hidden facial expression and reduced vocal clarity.

1.1 Risk factors

According to CDC, Centers for Desease Control and Prevention (2020), the highest risk of virus infection in higher education occur in these situations:

- Use of public buses, campus buses/shuttles or other high occupancy enclosed vehicles with limited ventilation and/or that require students, faculty, or staff to have sustained close contract with others.
- Students, faculty, and staff are not required to follow steps such as proper use of face masks, social distancing, hand hygiene to protect themselves and others.
- Students and faculty regularly engage in in-person learning, activities and events.

- Students, faculty, and staff attend large out-of-class social gatherings and events.
- Students and faculty freely share objects.
- Irregularly scheduled cleaning and disinfection of frequently touched areas.

During the pandemic, our local health authorities have issued restrictions that focus on personal transport as well as physical density of people. These largely comply with the risk factors stated by CDC.

1.2 Scope

Through a case study this paper aims to investigate how a pandemic crisis influences the operation of our teaching and tutoring methods seen from the student's perspective, and to gain knowledge from this feedback. In addition, our paper aims at stimulating new ideas for improving students' situation in their everyday study, in order to obtain a responsible and robust operation of our curriculum despite these extra-ordinary circumstances.
The scope of this case study is the total of 230 design students participating in our curriculum. Our master of design degree constitutes five years, consisting of three year's foundation study in BA level, in addition to two years on master level.
We believe that all experiences gained since the pandemics' impact -starting in March 2020- are crucial in order to learn, and we decided that the most effective approach was to take the student's perspective using a questionnaire, in order to obtain individual feedback in a concrete and realistic manner.
At present time, our scope reflects a quit dramatic combination; A doubled number of students -from 30 to 60 students in the first year's introductory course in design- combined with a widespread pandemic, and this happening at the same time.

1.3 Context

In order to contextualize this case study, we need to establish an overview of our student mass, and the distribution of students throughout our curriculum. In table 1, the gender distribution is displayed, in addition to the total number of students. As the gender distribution comprises 83 male and 147 female students, there was a substantial potential overweight of female respondents in our questionnaire.

Table 1. Student gender distribution and total number of design students at AHO, Fall 2020

Course categories	*Male*	*Female*	*Total*
Foundation courses	39	80	119
Master courses	29	51	80
Self-programming, Diploma, leaves, international exchanges	15	16	31
Total	83	147	230

To establish a backdrop for understanding the level of student satisfaction in our institution under normal conditions, we refer to national statistics on study quality produced in 2019, as a reflection of the normal 'pre-covid-19' situation.

The study barometer 'Studiebarometeret' (2019) is a national survey that is distributed to students in higher education each year. The survey monitors students' perceptions of quality in study programs at national colleges and universities. Table 2 describes some of the findings in the most recent questionnaire from 2019, providing student's answers to a list of qualitative questions, reflecting to which degree they feel satisfied with different aspects of our school. The total percentage of respondents in the questionnaire is 36,4. The score 1 = not satisfied, while 5 = very satisfied.

Table 2. 'Studiebarometeret', student satisfaction survey with focus areas

Main area	*Description*	*Institutional score*	*General score, visual arts and crafts in Norway*
Teaching	Dissemination and teaching	4,4	3,8
Feedback	Feedback and guidance from Professional staff	4,4	3,8
Expectations	Academic staff's expectations of students	4,5	3,7
Learning environment	Social and professional environment, facilities and equipment	3,8	3,6
Organization	Information, administration and professional context	3,5	3,0
Inspiration	Whether the study produce challenges and engagement	4,4	3,7
Overall assessment	Overall satisfaction with the study program	4,3	3,9

Given the time of capture, these data reflect a pre-Covid-19 situation and must be assessed in that view. Our institution scores higher than average, however these questions are - being part of a national surveil - quit general, as they are given to all institutions within the visual arts and crafts sector, without questioning or considering local aspects that may be specific to each institution.
In order to monitor a current Covid-19 state of student satisfaction, we need more specific input from the students based on our daily routines and local considerations concerning the way we practice teaching and tutoring, and how student's well-being is experienced.

2. Research methodology

Before boarding this case study, we found it necessary to plan our approach on how to receive robust and qualitative feedback, aiming at personal feedback from individual student experiences. Considering the magnitude of the pandemic and its all-encompassing implications, we found it important to receive feedback from the largest possible student body to maximize the number of respondents, in order to build the most describing picture possible of how the students regards their own situation. As personal feedback reflecting individual experiences from a pandemic is likely to be of a sensitive character, the principle of ensuring anonymity is crucial, and therefor the process of data collection has been

designed to prevent any personal identification. In accordance with current GDPR regulations, we developed the questionnaire based on full anonymity, ensuring all student's privacy rights in accordance with current GDPR legislation. We reported our questionnaire in advance to The Nation Centre for Research Data -NSD- providing extensive documentation required, of how to maintain privacy measures, and awaited their approval before launching the questionnaire.

2.1 Hypothesis

Our hypothesis is that the covid-19 pandemic has negatively influenced students' every-day study in our institution. Therefore, our questionnaire asks for response from how the pandemic has influenced their student life, having the academic arena as a demarcation for the questions.

2.2 Structure of the questionnaire

In order to obtain a highest possible qualitative value of the feedback from the students, we chose to divide our questionnaire (table 3) into two different sections.
The first section comprises questions about how the students feel that the pandemic has influenced their own student situation until now. A set of multiple answer options enables qualitative response to our questions. In order to capture different nuances of opinions, some of these questions invite additional free-text answers.
The second section invites free-text answers providing new ideas for future change and improvement. The original survey is multi-lingual, written in both Norwegian and English, to reach all students at campus. Four answer options are chosen to prevent a 'non-indicative' mid-option, and to make the student take a position.

2.3 The questionnaire

1. To what extent have you experienced an increased feeling of isolation as a result of Covid-19?

Table 3. Student questionnaire (separated into 10 sections)

Answers	*Number of respondents*	*Percentage*
To a large degree	8	**15,7 %**
To some degree	29	**56,9 %**
To a small degree	11	**21,6 %**
Not at all	3	**5,9 %**

2. Do you feel that Covid-19 has led to reduced contact with teachers?

Answers	*Number of respondents*	*Percentage*
To a large degree	5	**9,8 %**
To some degree	24	**47,1 %**
To a small degree	15	**29,4 %**
Not at all	9	**17,6 %**

3. Have you experienced that reduced contact with fellow students has been a problem?

Answers	*Number of respondents*	*Percentage*
To a large degree	14	**27,5 %**
To some degree	18	**35,3 %**
To a small degree	11	**21,6 %**
Not at all	9	**17,6 %**

4. Have parallel lectures (physically on the big screen + digitally on Zoom) worked well?

Answers	*Number of respondents*	*Percentage*
To a large degree	7	**13,7 %**
To some degree	30	**58,8 %**
To a small degree	11	**21,6 %**
Not at all	5	**9,8 %**
Not relevant, not been done*	2	**3,9 %**

** If it did not work well, please specify why.*

10. Suggestions for improvement.

You are hereby challenged -as a designer- to suggest improvements that can make your own every day study during covid-19 better or more efficient. Think outside the box. As a designer, we seek opportunities! Feel free to think radically and untraditionally, innovative and visionary!

4. Findings

Due to different technical reasons, our invitation to the 230 registered students only reached 206 students. Of these, 51 students responded and answered the questionnaire. This makes a participation rate of 25%. This rate is quite low, therefor we must assess the answers having an indicative view. All free-text answers are written in Norwegian, so we may assume that all respondents are native students. When assessing the percentage bars, some questions indicate a quit even distribution of response without any clear indication. We have chosen only to comment specifically those bars that stand out with high percentage scores providing significant responsive concentration, or otherwise being alarming.

4.1 Multiple choice section

- In question 1, a large group of 72,6% reply that they to a large or to some degree have experienced an increased feeling of isolation as a result of Covid-19, resonating with our assumptions.
- In question 2, a group of 56,9% reply that Covid-19 to a large or to some degree has led to reduced contact with teachers, resonating with our own concerns.

- In question 4, a group of 58,8% reply that parallel lectures (physically on big screen and digitally on zoom) to some degree has worked well. This has been one of our practical concerns.
- In question 7, a group of 47% reply that our infection control to a small degree or not at all is adequately practiced, indicating that our infection control routines should be improved.
- In question 8, a group of 56,9% reply that their home / dormitory / apartment works to a small degree or not at all for long-term self-study, indicating that student housing is less appropriate and does not fulfil students' needs in a pandemic situation.
- In question 9, a group of 70,6% reply that the pandemic to a small degree or not at all has brought something positive to their everyday study, indicating a strong negative feedback.

4.2 Free-text sections

- Connected to question 4 regarding parallel lectures, the students specify the following problems:

- Inadequate technical know-how / expertise amongst the teachers for facilitating clear sound and picture based on the physical constraints of the studio.
- Teachers' lack of using appropriate microphones and cameras, and teachers lacking experience from using these devices in the right manner.
- Poor quality of communication while using zoom, as the dialogue often loses rhythm and continuity caused by technical / audio-visual delays.
- Tendency to neglect those students being at home on zoom, as they often feel not being part of or not included in the conversation in the physical auditorium. This is often caused by that questions from the audience are not repeated into the mic, so those students being at home on zoom do not hear the questions.
- Teachers tend to forget to follow up questions in the chat in zoom.
- Hard to concentrate when taking part in digital lectures on zoom, caused by poor working conditions at home; poor space, bad air, lack of movement.

- Connected to question 7 regarding infection control, students report these observations:

- Too many students in one space
- too short distance between students because they forget themselves
- inadequate cleaning of surfaces

- Connected to question 9 asking if the pandemic has brought something positive, students argue for:

- freedom and flexibility in their everyday life
- less monotony
- better sleep
- stronger awareness on personal hygiene
- learning digital communication tools - like zoom

- the possibility to seeing things from a new perspective

• The final question 10 led to considerable engagement. Apart from the majority of ordinary ideas -like more frequent cleaning routines- the students suggest these ideas:

- Wearable tech; a measuring device that alarms when people get too close to each other.
- VR-tech building holograms in meeting rooms, using virtual reality technology to make absent students 'appear' in the room.
- Introducing infection tracking system utilizing the student's admittance card to register movements in and out of campus.
- Compulsory zoom-courses to all teachers to make them skilled zoom users.
- Establish trans-course colloquium groups enabling more discussion and contact.
- Providing a starter-kit to those working at home, covering needs and comfort.
- Compulsory walks outdoors for more fresh air and general restitution.

5. Conclusions

Overall, our findings suggest that Covid-19 has produced a negative impact on student's study life, confirming our hypothesis. Amongst other, the pandemic seems to have triggered an increased feeling of isolation, which causes mental health concerns. One other aspect we should seriously take in consideration, is that 47% of students reply that our infection control routines are inadequate. Furthermore, a large group of students struggle with their home as workplace, indicating that we should facilitate presence at campus as much as possible. When a group of 56,9% students report that Covid-19 has led to reduced contact with teachers, we also must find ways to strengthen this contact. However, in the current situation of very strict infection control, it seems that only online solutions are possible to utilize in order to reduce or eliminate this problem.
We acknowledge the obvious need to establish better audio-visual facilities that may enable efficient hybrid solutions for students being present and digitally for those being at home. Regarding technical challenges when practicing parallel physical and digital lectures, there are many problems to be solved, but primarily the main challenge is to build experience and competence from utilizing digital learning platforms as effectively as possible.
Although we find the majority of the suggested ideas maybe less radical than expected, we find the mentioned ideas fruitful and inspirational, and valuable for consideration when discussing how to optimize our future practice.

6. Discussion and future challenges

When doing research on qualitative issues related to health and well-being, we acknowledge the importance of accepting that any given feedback in a survey reflects individual, subjective experiences, not necessarily objective facts or conclusions. Therefor we must

assess the answers given in our survey as indicative feedback allowing a certain amount of interpretation.
In the big picture, we assume that our efforts in reducing negative impacts from Covid-19 largely depends on the duration of the pandemic. If the pandemic continues over long time, we assume that we will experience a large portion of classes working from home, as they are reluctant to attend campus due to personal health and infection risk.
The pandemic situation raises many questions. Suddenly our ordinary class-rooms become audio-visual studios. How should this be managed? Due to overloaded IT-support staff, should teachers spend a substantial amount of working hours trying to become audio-visual experts rather than spending their time teaching their profession? These are amongst the questions we would like to invite discussing at the approaching Cumulus conference.

Design for Sustainable Healthcare. Cutting the impact of medical products through disposable packaging

Gabriele Maria Cito[a], Angela Giambattista[a],

[a]Sapienza University of Rome
gabriele.cito@uniroma1.it, angela.giambattista@uniroma1.it

Abstract | The pandemic emergency has highlighted a critical issue in the health sector: the environmental impact caused by the use of disposable products, currently based on the use of plastic polymers, which are difficult to recycle and not compostable. According to the National Institute for Environmental Protection and Research, the numbers generated by the Covid-19 emergency would amount to between 150 and 450 thousand tonnes (ISPRA Report, Waste consisting of used PPE, May 2020). Researchers at the University of California, San Francisco Medical Center, estimated the waste of $2.9 million in neurosurgical supplies in one year in one department alone (Allen, 2017). The incompatibility between the health need to use these devices and the environmental need to reduce products with a high polluting potential, poses the Design Discipline with a challenge that research must be able to meet through the development of real and sustainable solutions.
In an attempt to respond to these critical issues, this paper reports on research conducted on single-use surgical products, in particular on the redesign of a single-use procedural kit, with the aim of rethinking design from a systemic sustainability perspective.
The research was conducted through desk research, based on a literature review of reports and documents demonstrating how to achieve sustainable healthcare. At the same time, through field research and the HCD approach, using a number of specific tools in the different phases of the design process, it led to the definition of a product capable of satisfying both the needs of healthcare professionals, doctors and nurses, who are the direct users, and the needs of hospitals and companies responsible for the disposal phase. The result is a framework for identifying the most challenging surgical departments.
The research required a multi-disciplinary approach to develop new sustainable layouts starting with the details, requirements and needs for the design of an adaptable and versatile procedure kit were highlighted.
The design solutions that led to the realisation of the prototype are: design of a biodegradable EPP tray, functional for disposal by incineration; design of a recyclable PETG tray, divided into

3 compartments. The first one contains instruments that need to be ready to use. The second contains instruments at risk of falling/breaking. The third compartment contains instruments that are not always used. The three compartments are fixed on a cardboard layer that replaces the individual compartmentalisation per instrument, making the kit customisable for any type of single-use procedure, as well as being able to make the PETG tray sterile. The project will reduce production costs by using less plastic material to be thermoformed and a single negative for the production of the customisable tray, leading to the creation of a new product/service flow, centred on: returning packages to the manufacturer, placing them in the additional instrument tray, so that they are not necessarily ready for use; reducing the amount of biohazard waste burnt in the incinerator. The use of an organic-based tray minimises pollution; advantageous recycling of trays and procedural tools that were previously discarded in general waste or even biohazard.
From an environmental point of view, there are benefits to be gained from reducing incineration by reducing unused waste. A biodegradable tray to handle infectious supplies and disposal in an incinerator can minimise air pollution. Other time-saving benefits come from the individual packaging of additional customisable instruments. This solution has reduced the possibility of having to open a second kit to obtain a duplicate instrument.

KEYWORDS | HEALTHCARE, MEDICAL PACKAGING, SUSTAINABILITY, CIRCULAR ECONOMY, PROCEDURAL KIT

1. Introduction

Healthcare represents one of the most critical sectors for the development of society's well-being and it involves not only the development of new treatments and new drugs, but also the development and innovation of products and services aimed at "preventing, diagnosing, curing, rehabilitating"(Italian Ministry of Health Declaration). The current situation due to the Covid-19 emergency has shown that alongside treatments and devices with a high technological impact, a series of medical devices called "soft medical devices" are equally crucial. In terms of the market, these are identified as "disposable and medical consumables" and accompany every medical device for treatment in hospitals but are also widely used for treatment in the local health center and in the home environment as well. A clear example of "disposable and medical consumables" are the surgical masks which are one of the essential factors for proper prevention and treatment of the epidemic in the current emergency due to Covid-19.

In the very first phase of the epidemic, among other things, the enormous demand worldwide for these devices led to a great scarcity and the European Commission was forced to turn to trade associations (from the textile sector to that of materials plastics, to the additive manufacturing sector) asking to reconvert their productions and allocate them to the medical consumables sector.
Furthermore, the pandemic emergency has highlighted one of the critical factors in the sector: the environmental impact that determines the massive use of "disposable" products,

which at the moment are mainly based on the use of plastic polymers, which are difficult to recycle and not compostable.

Regarding the projection of the quantity of such medical waste, according to the Italian National Institute for Environmental Protection and Research, the numbers generated by the sanitation emergency due to Covid-19, would amount to a number between 150 thousand and 450 thousand tons (ISPRA Report, Waste consisting of used PPE, May 2020).

Waiting to know what the final balance will be, according to Ecocerved, a consortium company of the Italian Chamber of Commerce system, in 2018 the Italian production of medical waste stood at around 180 thousand tons.

For the most part, such waste is hazardous with infectious risk (78% of the total), mainly coming from public hospitals, especially medium-large sized ones (almost 60% from public centers with at least 150 beds). At a national level, medical waste has no other destination than incineration, for 65% of the total, and activities aimed at disposal for the remaining 35%, with percentage differences between region and region (Ecocerved, 2020).

The evident inconsistency between the health need for the use of these devices with the environmental need to drastically reduce the use of products with a high pollution potential places the Design Discipline in front of a challenge that research must be able to grasp through the development of real and sustainable solutions.

In an attempt to respond to these critical issues, this paper reports research conducted on the case study of surgical disposable products, in particular surgical trays, with the aim of rethinking the design with a view to systemic sustainability.

Through the Human-centered design methodologies, the research aimed to meet both the needs of health workers, doctors and nurses, who use the product directly, and the needs of hospitals and companies responsible for the disposal phase.

1.1 Research summary

Background: The ever-increasing costs associated with health care are leading economic decision-makers in all developed countries to look for ways of reducing waste costs and maximising hospital efficiency. In the case related to "A new sustainable perspective for disposable procedural kits", the role of surgeons is fundamental for the evaluation and redesign of procedural kits that contain all the necessary instruments that are then used in a specific procedure. The aim of the research is therefore to assess the costs and reasons for discarding materials as part of the activities carried out in operating theatres, which are the primary source of hospital waste. Inspired by recent publications, reducing the operational costs associated with the purchase, packaging and transport of unnecessary supplies can lead to considerable savings.

Objectives: The primary objective of the research work is to reduce the waste of disposable surgical instruments, contained in the trays that are usually used in the course of surgical

interventions of various nature and that are often discarded without being used completely, exclusively because they are no longer sterile and cannot be recovered for use. Future perspectives, which have emerged from the literature research, suggest innovating/transforming the packaging of surgical supplies, achieving the same safety expectations/results while saving on products, transport and waste production.

Methods: The study was conducted, firstly through a quantitative research that consisted of the study of healthcare articles and the most recent publications concerning the waste in the healthcare sector and the possible reduction of unused disposable healthcare supplies in multiple procedures. Secondly, a qualitative research was developed by submitting a questionnaire to surgeons and instrument nurses working in the different sectors, in which all the peculiarities, both positive and negative, of disposable surgical supplies were highlighted. This resulted in a framework for identifying the most challenging surgical departments. A multi-disciplinary approach was required to carry out the research, which made it possible to develop new, sustainable layouts from the details.

Results: At the conclusion of the research, a single-use tray was redesigned, containing the necessary instruments, all in one package, customisable with single-package instruments. The tray is optimised by selecting the instruments used, only in special situations or overused and therefore at risk of falling/breakage. The advantages are economic, environmental, time and safety.

2. Challenges and opportunities for Sustainable Healthcare

2.1 Healthcare waste

Approximately 85% of the total waste produced by healthcare activities is generic, non-hazardous waste comparable to household waste. The remaining 15% is instead considered hazardous material, which may be infected, of chemical or radioactive origin (Chartier, 2014) . It has been estimated that in high income countries, on average up to 0.5 kg of hazardous waste is generated per hospital bed per day; while in low income countries, on average 0.2 kg is generated (Chartier, 2014). However, in low-income countries, medical waste is often not separated into hazardous or non-hazardous waste, which makes the actual amount of hazardous waste much higher (Ranasinghe, 2020). In 2012 the National Academy of Medicine estimated the U.S. healthcare system squandered $765 billion a year, more than the entire budget of the US Defense Department (Allen,2017). Researchers at the University of California, San Francisco Medical Center, for instance, recently estimated that in a single year the hospital wasted $2.9 million in neurosurgery supplies alone.On wasted supplies in just one department (Allen, 2017).Considering the carbon emissions produced by the health care sector: if healthcare were a nation, it would be the fifth largest emitter of greenhouse gases on the planet, according to the non-profit organization, Health Care Without Harm. It

is a carbon contribution equal to the emissions of 514 coal-fired power plants, or 4.4% of global net emissions (Ngo, 2020).

Operating theatres are, from an economic point of view, those facilities that generate the greatest revenue and at the same time they are the most of the waste comes and consequently "the greatest costs for disposal, accounting for 30% of the total amount of hospital waste" (Babu, 2019). In the management of medical waste, there are tools that have to be disposed of immediately, while others can be recycled over a longer period of time, with the help of specialized organizations. One such organization is Stryker, a recycling company for the medical industry. Materials that are accepted by these organizations include laparoscopic devices, wristbands used for blood pressure measurement, surgical product casings and more. For supplies or equipment that are no longer useful but have not expired and are still in working order, they are collected by organizations such as Med Share who, after collecting them, distribute them to medical facilities that cannot afford to purchase these items probably due to cost (Tine Health, 2017).

Medical products are often wrapped in plastic, cardboard boxes or blue polypropylene plastic wrappers. Since these products are opened outside the operating room, to avoid the risk of contamination, they can be recycled by NGOs to be transformed into aprons, tote bags or other by-products. The disposal of biohazard hospital waste costs about 0.62 cents per kilogram (Tine Health, 2017). Their recycling can certainly reduce the overall cost of waste disposal. At Johns Hopkins Health System in Baltimore, the Neurasthenia Division was able to save $5 million in 2010 and 2013 for its reprocessing program. But recycling is not always applicable for all items in the operating room; especially if there is a risk of infection. Patient safety is more important than sustainability (Tine Health, 2017).

The key to minimising and effectively managing medical waste is the separation and identification of waste. Proper handling, treatment and disposal reduces costs and is very helpful in protecting public health. The most appropriate way to identify categories of medical waste is to sort the waste through the use of colour-coded plastic bags or containers. Do not forget to use the biohazard symbol on the packaging so that medical waste can be immediately identified.

2.2 Medical packaging

As a result of the numerous studies carried out, a number of critical issues in waste management within the hospital environment were highlighted. It was therefore decided to focus the study on two parallel aspects that have a strong impact on the hospital economic system.

The first part of quantitative study aims to highlight which and how many materials are most unused in an operating theatre, where up to 70% of hospital waste is created, and up to 90% of operating room waste is improperly sorted and sent for costly and unneeded hazardous waste processing. (Lee, 2012). In particular, a Nederland Circulair initiative of the Dutch

Ministry of Infrastructure and Environment contributed to the overall objective of creating a single stream of plastic packaging in hospitals by analysing the typical plastic waste streams of the OLVG hospital. The largest category of plastic products found in OLVG hospital waste bags is single-use packaging, which accounts for more than 50% of the total plastic waste. The largest estimated types of plastic used in disposable packaging by weight are Polypropylene (PP), followed by Polyethylene Terephthalate (PET), High Density Polyethylene (HDPE) mixed with medical grade coated paper, and Polyvinyl chloride (PVC). The second largest plastic product by weight is bubble wrap - which makes up 25% of the total plastic waste - and the largest single mono material plastic product - made from a single material, low density polyethylene (LDPE) (Netherland Circulair, n.d.).

The second part of the research paid attention to what may be the biggest economic wastes within operating theatres. The research is based on multiple academic publications on various online platforms in the sector, in which the waste stream is no longer assessed from a quantitative but a qualitative point of view, going on to identify real waste of disposable instruments that are not always used during certain surgical procedures and consequently create a significant burden on healthcare costs. Specifically, in a study published in the Journal of Neurosurgery, Dr Corinna Zygourakis, a leading neurosurgeon at the University of California, San Francisco, said in February 2017 that "accounting for the different case distribution in the 58 selected cases, the authors estimate approximately $968 of OR waste per case, $242,968 per month, and $2.9 million per year, for their neurosurgical department" (Zygourakis, 2017).

The waste Dr. Zygourakis refers to in her study is the result of a mentality that brought disposable surgical instruments into the operating room "just in case" the surgeon needed them. In such situations, however, at the end of the surgical procedure, even if they were not used, they would be discarded as they had been removed from the sterile packaging and would therefore be considered contaminated (Allen, 2017). Dr Zygourakis and a team of colleagues contacted 58 neurosurgeons with the aim of analysing what and how many supplies were present in the operating theatre, which, if not used, were subsequently discarded. Out of 26 surgeries performed, it turned out that all the blood clotting materials had not been used, at a total cost of $3,749. A similar result was found in 16 operations in which an expensive tissue adhesive was not used, at a cost of $3,495. Another example was surgical screws, which were also not used on several occasions, at a total cost of $3,144 (Allen, 2017).

In addition, the majority (85%) of OR waste comes from individual disposable items, rather than items in larger packs. This indicates that if we educate surgeons and nurses about OR waste, clean up preference cards, and encourage communication at the beginning of each case about what items will be needed, we may be able to significantly reduce OR waste without having to completely overhaul our entire supply packs (Zygourakis, 2017).

2.3 Towards a circular medical design

During the Virtual Engineering Week discussion, 'Recycling & Circularity in Healthcare Plastics' it was highlighted that the global medical packaging market has almost reached £15 billion. It is expected to grow by 5% per year to reach £18 billion in 2025, explained Peylina Chu, executive director of the Healthcare Plastics Recycling Council (HPRC)(Shepard, 2021). Chu discussed recycling challenges and opportunities with industry experts Nick Packet, MD&M specialist and packaging engineer at DuPont, and Bob Render, business development manager for sustainability at Ravago Recycling Group. The panel also discussed the challenges and opportunities in recycling healthcare plastics during the COVID-19 pandemic (Shepard, 2021). Chu asked Packet to remind planners of some practices that make recycling packaging easier and more attractive to recyclers. Packet acknowledged that it is a hard challenge to switch materials in a regulated market, but that there are some opportunities. "Designing a package made up of one type of polymer would be ideal because it creates a cleaner flow of materials than having different types of polymers," he said. Size also matters and looking at packaging that can be compressed easily is key (Shepard, 2021).

Healthcare Plastics Recycling Council (HPRC) has led projects to develop hospital waste diversion strategies, but single-use plastics still dominate in healthcare environments. At last count, about 2,800 to 3,500 tonnes of plastic packaging and plastic product waste from US healthcare facilities is generated daily, according to the HPRC. Most of this goes to landfill or is incinerated (Danigelis, 2020).

Medical waste should be managed with the aim of reducing its hazardousness; reuse, recycling and recovery should be encouraged; collection, transport and disposal should be optimized (Tine Health, 2017). To this end, it must be encouraged:

- the organization of training courses for the staff of health facilities, on the proper management of medical waste, especially with the aim of minimizing contact between non-infected materials and potential sources of infectious waste, thus reducing the production of waste that needs incineration procedure costs;
- the separate collection of non-hazardous health care waste, which is assimilated to urban waste produced by health care facilities;
- the rationalization of the supply and use of reagents and drugs in order to reduce the production of hazardous health care waste at infectious risk and non-hazardous health care waste;
- the preferential use, where technically possible, of products and reagents with a lower content of dangerous and polluting substances;
- the use of technologies for the treatment of medical waste, aimed at promoting the recovery of materials and energy. The health facilities must, therefore, provide for the management of waste produced according to safety criteria.

Elizabeth McLellan, a registered nurse from Portland, USA, conducted a study on hospital waste disposal. She was shocked to find that waste was being discarded in her hospital, so

she asked the Health Department of her hospital if she could pick up the waste herself. In 2009, she founded Partners for World Health, a non-profit organisation, which currently has four warehouses in various parts of Maine in the north-east of the USA. Currently, Ms McLellan and hundreds of volunteers collect medical equipment and supplies considered to be waste from a network of hospitals and clinics, ensuring they are sorted and shipped to lower standard countries (Allen, 2017). "This is money", said Elisabeth McLellan, referring to the wide range of supplies wasted. Providing a further note, addressed to her compatriots, stating that "this is one of the reasons why your health insurance is so expensive" (Allen, 2017). Elisabeth McLellan called this range of products, considered to be waste, 'gold junk' and it includes a whole series of categories:

- discarded equipment for model upgrades
- supplies discarded after changing suppliers; unused medical supplies donated by families of deceased patients;
- materials that have passed their expiry date or have been declared unusable by strict control procedures but can be used safely.

Once items are opened in the patient's room or surgical suite, they can't be reused in the hospital. Every day her organisation collects 10,000 to 20,000 pounds of unused material, not including durable medical equipment, from healthcare facilities in the Northeast. Their collections range from unused exam gloves and wound care supplies to unneeded anaesthesia machines (Kaplan, 2021).

3. ECOPACK. A new sustainable perspective for disposable procedural kit

3.1 Research Methodology

From a methodological point of view, the research was conducted through the Human-centered Design approach, basing the activities on the involvement of operators in the different phases of the design process and considering different conditions (from efficient materials to usability, from high operational performances to safety of the environment).

Through this methodology it was possible to consider the needs of constituents in new ways, create innovative solutions to meet these needs, and deliver solutions with financial sustainability in mind (Ideo, 2011).
The research activities were approached following 4 steps:

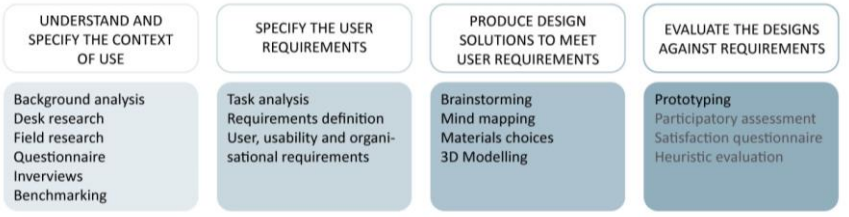

Fig 1. Methodology and Tools

1. *Understand and specify the context of use*

As a result of the numerous studies carried out, a series of critical issues in waste management within the hospital environment have been highlighted. It was therefore decided to focus the study on two parallel relevant aspects, which have a strong impact within the hospital economic system. The first part aims to highlight which and how many materials are most unusable in an operating theatre, where up to 70% of hospital waste is created. The second study pays attention to which is the most spread economic waste inside the operating theatres. Substantial problems have thus emerged, which can be tackled with design methods, with the aim of optimising waste in such a delicate area. Quantitatively, a study has been carried out, through a variety of organisations in the industrial sector that have come together to jointly identify methods to make the economic activities of hospitals more efficient and less impacting on the environment. Qualitative research is based instead on multiple publications on various online platforms in the sector, where the waste flow is no longer evaluated from a quantitative but qualitative point of view, identifying real waste of disposable instruments that are not always used during certain surgical procedures and consequently create a significant burden on health care costs.
The user research was initially carried out with an overview of the different roles of nurses within the operating room. Subsequently, the user requirements were defined, which were obtained by submitting a questionnaire to surgeons and instrument nurses working in the different sectors, in which all the peculiarities, both positive and negative, of disposable surgical supplies were highlighted. The questionnaire was completed by some 11 surgeons from different hospital departments, including general surgery, urology, ophthalmology, gynaecology and bariatric surgery. Procedures requiring disposable kits were highlighted including Endoscopy, Videolaparoscopy, Orthopaedics, Prosthetics, Colon Cholecyst, Craniotomy and Ophthalmology. The questionnaire asked which instruments were most and least frequently used in the specified procedure. In all 11 cases, it was noted that unused single-use instruments were disposed of and that each specific tray always contained the same instruments. The amount of disposable instruments at risk of breakage/fall was considered to be value 3 on a scale of 1 to 5. In addition, suggestions or considerations were asked about the problems submitted. One general surgeon, specifically in the gallbladder procedure, advised to "open only what is necessary to start the procedure, and then the

rest". Another surgeon from obstetrical traumatology suggested "bagging the disposable material individually, so that it can be opened when needed".
The aim was to identify the areas of use and any waste that occurs within an operating theatre, regarding disposable instruments that, although opened within the operating protocol, are not used, paying particular attention to those instruments that have a greater risk of falling/breakage.

The benchmarking has been carried out by collecting data on the different types of packaging for medical devices and disposable instruments with the aim to highlight interesting specific characteristics, functional to develop the product (Fig.2). The latter defined the various needs and showed how some of them respond to certain needs, often suppressing others, such as considerable waste and safety priorities.

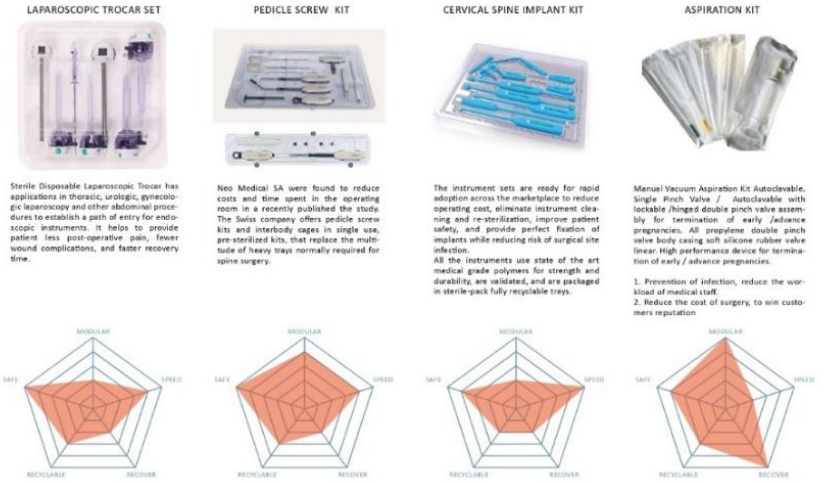

Fig. 2 Benchmarking

The research was then carried out in the field through visits that led to observations within the operating block of Orthopaedics at the [Hidden for blind peer review] (Fig. 3). An interview with the head of the operating theatre department and a neurosurgeon trainee allowed a comparison of which procedures could be optimised and suggestions on how to identify instruments that, based on previous surgical operations, were more or less used and more or less at risk. In addition, the interviewees were open to future collaboration for evaluation and implementation.

Fig. 3 Incorrect disposal of hospital waste at S. Andrea Hospital

2. Specify the user requirements

Prior to defining the requirements, a task analysis was carried out to identify the sequence of actions that operators perform during a surgical procedure using disposable kits (Fig. 4).

- It was ascertained that on several occasions the following dynamics occurred:
- Fall of a disposable instrument, leading to the opening of a second kit for the rapid continuation of the procedure
- Breakage of a disposable instrument, leading to the opening of a second disposable kit for a single instrument
- Non-use of some instruments in the disposable kit in most of the cases analysed.

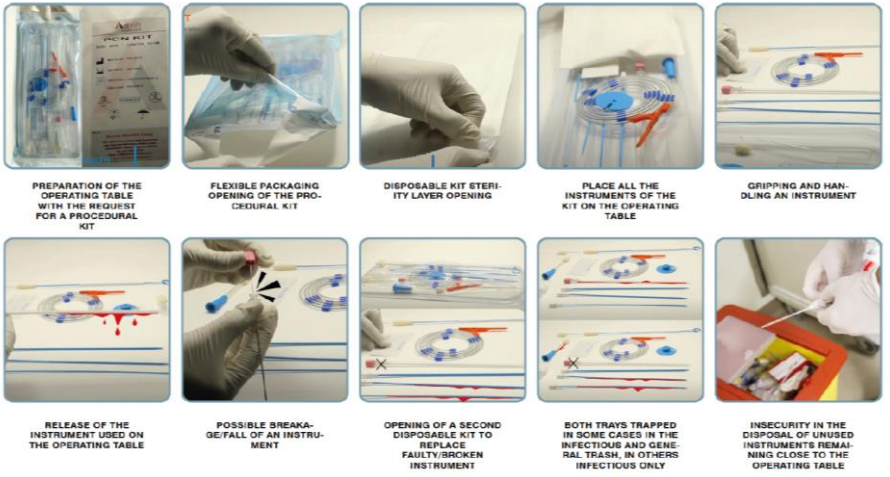

Fig. 4 Task Analysis

Subsequently, the following were identified specific requirements adaptable to many different procedures:

- smart labelling, that describe the product use and the proper disposal;
- shelf life efficiency, identifying possible packaging system failures and addressing them proactively during early design phases greatly increases the chance of successful validation and patient safety;
- packaging choice, where there are to consider questions like:
- Do you need a single or double barrier?
- Would a pouch or tray be better?
- What packaging type and material would be most compatible with the sterilization/incineration process required?
- What label requirements are needed?
- Shock resistance, package distribution test samples must contain a product or representative product (dunnage/simulant) that has been sealed at equipment worst case conditions and sterilized;
- proper sizing, the incorrect sizing of trays, boxes, and kits comes from noise or a lack of communication within the supply chain;
- integrity efficiency, done by documenting that the SBS system has no detectable path through, channels or punctures that may allow the introduction of microbes into the system.

3. Produce design solutions to meet these requirements

During the research phase, requirements and needs were highlighted for the design of a procedural kit adaptable to various procedures.

The design solutions that led to the creation of the product are: the design of a biodegradable EPP tray, dedicated to disposal by incineration, the design of a recyclable PETG tray consisting of 3 compartments

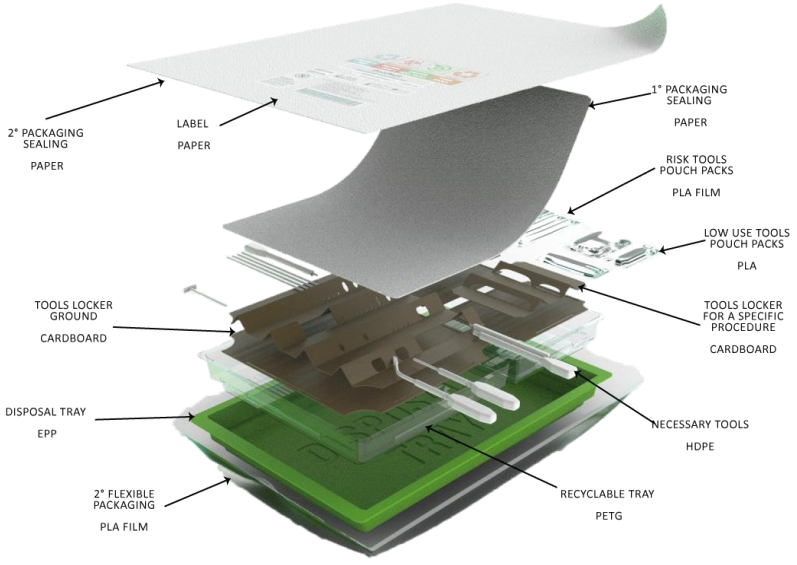

Fig. 5 Render

Regarding the usability aspect, one compartment of the kit contains all instruments used above 20% of the cases analysed in a specific procedure, therefore needing to be ready for use.

A second compartment dedicated to instruments that are at risk of falling/breaking in at least 15% of the cases analysed in a specific procedure, therefore needing to have two extra twin instruments in addition to the one in the compartment of the necessary instruments.

The last compartment contains instruments that have not been used more than 20% of the cases analysed in a specific procedure, thus needing to be packed individually and opened if necessary (Fig. 5)

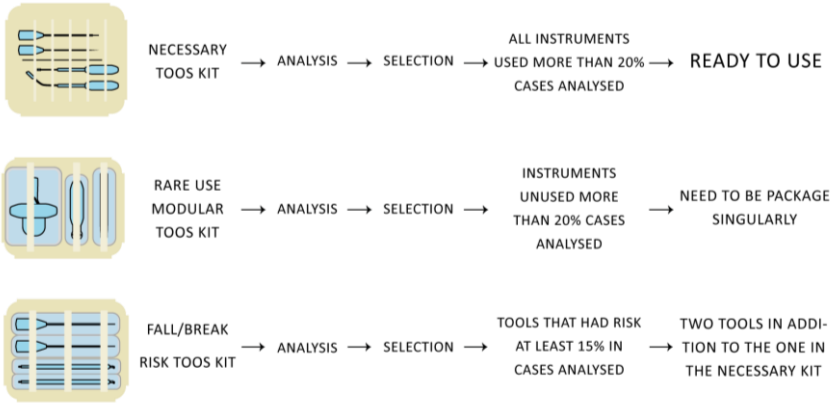

Fig. 5 Usability

All three compartments do not have additional individual compartments but are instead fixed on a cardboard layer that allows them to be removed from the PETG tray. The purpose of the cardboard replaces the concept of individual compartments for each instrument, making the kit customizable for any type of single-use procedure, as well as preserving the infectivity of the PETG tray. The new concept thus allows lower production costs, less plastic material to be thermoformed and a single negative to produce customizable tray.

4. *Evaluate the designs against requirements*

The design of this medical packaging would result of a creation of a new product/service flow focused on:

- returning the packaging to the manufacturer of those packages by locating them in the additional tool tray, so they are not necessarily ready to use.
- reducing the amount of biohazard waste burned in the incinerator. The use of an organic- based tray aims to minimise site pollution
- advantageous recycling for trays and procedural tools that were previously rejected in general waste or even biohazard waste

In particular, product aims to achieve the following expected results:

- Reduction of incinerator cost. The incineration costs of disposable incineration kits would be greatly reduced by maximising resources and reducing waste.
- Reduction waste. Significant is the reduction of infectious and general waste with a consequent increase in recycling activity. The less waste is produced the less hospital costs will be.
- Reduction of climate damage. A disposal biodegradable tray has been designed to minimize the environmental pollution generated by the incineration of

infectious waste in the operating theatre. Burnt bioplastics produce less CO2 and zero dioxin emissions than non-bio-based polymer trays.

- Increase supplies saved. Individually packed items, which were previously thrown into the generic and infectious, are now recycled or even reused if they are individually packed.
- Increase visual info. Intuitive graphics help to understand how the various components of the designed packaging can be disposed of, avoiding the previous insecurity of disposal of hospital personnel.
- Increase in operating room efficiency. The operating room needs ready-to-use equipment in an extremely short time. EcoPack offers additional kits useful for risky instruments and instruments rarely used in each procedure.
- Increase time during surgical operations. Product developed optimises time by offering, according to the needs of the moment, all the necessary equipment, anticipating risks and unnecessary use.
- Increase training staff. A better understanding and implementation of the waste disposal activity by the operating theatre staff is the first step towards an effective sustainable turnaround.

4. Results and next developments

At the conclusion of the research part, a single-use tray was redesigned, taking as example the Neo Pedicle Screw System™, Neo Medical S.A. (Abdalla, 2020). The concept developed is a kit containing the necessary instruments, all in one package, and customisable single-package instruments. The tray is optimised by selecting the instruments used, only in special situations or overused and therefore at risk of falling/breakage.

The advantages are economic, due to the reduction of hospital costs, incineration costs and time waste. Environmentally, multiple advantages could be achieved from the reduction of incineration process use due to the reduction of waste unused supplies. A biodegradable tray to handle infectious supplies and disposing it in an incinerator, could minimize the air pollution. Others are advantages in time, thanks to the single packaging of additional customizable instruments. This solved the problem of having to open a second kit to get a duplicate instrument.

At a later stage has been had the opportunity to get in touch with a resident neurosurgeon and the head of the operating block at [Hidden for blind peer review] hospital in Rome, who provided with precious elements for the realization of the prototype, offering his experience in the operating theatre and allowing me to optimize the functionality of the product made.

In the opinion of many of the people involved, the feedback and interest received are likely to be developed in subsequent stages.

Designing new learning experiences in pandemic time: how digital can support a new didactic in Service Design.

Andrea Taverna

Politecnico di Milano, Design Department, Italy
andrea.taverna@polimi.it

Abstract | The Covid-19 pandemic had a strong influence on several aspects of our lives. Among these ones, the didactic experiences had been impacted and the limits of traditional education emerged. In particular, the design field, based mainly on a design-studio based didactic, has been affected. In the last period, many teaching teams struggle with the challenge of translating course planned to be deployed in-person to remote didactic. The common question that arose has been: how to develop proper didactic experience for designers in a time of remote teaching and learning? To address this question a small experimentation using a digital platform has been designed to comprehend how digital could become a tool to enhance the learning process rather than creating barriers.

KEYWORDS | SERVICE DESIGN, EDUCATION, DIGITAL, LEARNING

1. Introduction

During 2020, the pandemic has affected how we were used to interacting, forcing us to rethink several aspects of society. If we look at the educational context, UNESCO estimated that over 1.5 billion students in 165 countries are out of school due to the worldwide health emergency (United Nations, 2020). The consequence of this situation is that universities are going through a series of considerations on how to adapt to this context and develop new strategies for the future.

These reflections come in a time of transformation of the educational context in which already previous pedagogical models are put in discussion, and several attempts, to understand how digital affects the learning process, are put in place (Radcliffe et al., 2008). The Covid-19 pandemic pushed on this last aspect, obliging universities to experiments with new model and activity that make use of digital platform. These experimentations sometimes proved to be ineffective given the short time to properly design the didactic activity and sometimes proved to be successful, allowing teaching teams to efficaciously deliver didactic contents to the students.

The paper aims to illustrate a digital learning experience developed during the covid-19 pandemic and draw some reflections on the feedbacks received. In particular, with this paper, the intention is to present a didactic initiative that investigates how remote teaching and learning could take advantage of digital platforms, elaborating and building something which didn't limit just to the digital replica of an in-person event, but use as well the virtual space with its potential.

The article is divided into four parts. The first section aims to provide a theoretical background for the experimentation, focusing the attention on the evolution of pedagogical models. Following, the second section illustrates the methodologies, illustrating the structure of the format of the didactical activity proposed and the structure of the surveys used to gather feedbacks upon the initiative. Subsequently, the third section outlines the analysis of the results of the survey. Finally, the last sections are dedicated to the discussion of these results and conclusion are drawn on those, highlighting the limits of the experimentation, and the possible future developments.

2. Theoretical Background/Framework

Literature of Service Design illustrates how it emerged as a research field during the last decade of the XX century (Erlhoff et al., 1997; Hollins & Hollins, 1991; Manzini, 1993; Pacenti, 1998). During the first years of 2000, some design agencies start to work specifically with SD, such as Livework and Engine, and it started a period in which the research around SD explored how it could integrate its tools into the design practice (Sangiorgi & Prendiville, 2017). From an educational point of view, it can be seen that SD appear as a subject in a design curriculum at KISD in parallel to the first research into the field, and later as a Master

degree course in 2005 at Politecnico di Milano and in 2009 at Laurea University of Applied Sciences (Ojasalo, 2012). Since then many other courses in Service Design emerged.

Nevertheless, the research on Service Design Education has been fragmented and not rigorous. In fact, the previous studies on the topic tend to consider, with a narrow frame, specific educational programme. Moreover, many contributions on this topic come from Touchpoint-The Journal of Service Design, a non-peer-reviewed journal, in particular the volume 3. No. 1 (2011) "Learning, Changing, Growing" and the volume 9, no. 1 (2017) "Education and Capacity-Building". The first attempt in the direction of a comparative study on service design programme has been developed by Ferruzca et al. (2016) however the criteria in selecting and collecting the data do not consider the development of the field and are based on the course provided by the best universities considering the World University Rankings 2015-2016. Later a wider effort to map the courses has been developed within a research project with the production of Service Design Map developed for ServDes aiming at building a database containing the educational offer in Service Design worldwide. Building on this, and integrating with other resources, Becermen and Simeone (2019) proceeded in comparison of the several courses offering Service Design programme, observing common educational threads and differences in the educational approach. Focusing our attention on the common aspects it emerges that the degrees in Service Design tend to combine "hands-on" project work with lectures and seminars, often accompanied by collaboration with external organizations, with the aim of exposing the students to a real situation to practice their ability to develop a service design project throughout the different phases. The teaching and learning methodology through which these objectives are achieved is usually the Studio-based Learning (SBL), traditionally considered the educational approach for the Design discipline, which combines different learning pedagogies, such as social constructivist, problem-based, and active learning to mimic real-world working experience (Kumar et al., 2020). At the base of SBL approach is the shared learning environment of a studio (Burroughs et al., 2009) which enable the learners to engage both among peers and with experts (Schön, 1985). The pandemic situation required universities to change the modalities of teaching to reduce the chance of transmission of the Covid-19 virus. Therefore, it has been missing an essential component to the learning process according to the SBL approach. Given the situation of the emergency, several actions have been put in place (Crawford et al., 2020). These can be cluster into two main areas, first, those actions that have been structured to guarantee the didactic and can be considered as temporary and emergency solutions. Secondly a cluster composed by those initiative aimed at researching and experimenting new activity, which does not limit themselves into moving online and remotely the teaching activities but try to take advantage of the digital to create new possibilities for students to learn. These second cluster of actions have accelerated the research in the intersection between digital and education and has been built on the knowledge of the recent research in innovative didactics models (Sancassani et al., 2019). This paper, although is based on a small experimentation, try to fit into this area of research, considering as field of application the discipline of Service Design.

3. Methodology

This paper is based on the didactics experience the author had during the 2020 (Taverna, 2020) in the M.Sc. course of Product Service System Design in Politecnico di Milano (Italy), which due to the Covid-19 pandemic has been translated remotely during the early part of the year, and then in the second part has been structured in a blended setting, where students could follow both in-presence or connected remotely, and finally moved again all remotely, when the situation required to take precautions. Specifically, the considerations are built on the DE-BRIEF initiative, in particular taking into account observations of the students during the process, and a set of two surveys submitted both to the students taking part and to the larger audience participating in the final public event.

3.1 DE-BRIEF format

The DE-BRIEF format considered in this study is a didactic experience developed for students participating in an event. The outline of the initiative is made of four phases: students' application, source event, elaboration, and final event. First, it has been requested to the students to present a motivation letter to participate in the initiative, once selected they took part in the source event, which in the case considered has been the SDN conference "Virtual Service Design Global Conference 2020 – Embracing Change", later some meetings have been held to arrange the work of synthesis of the conference and give ownership of the topics to the students and, in the end, the participants illustrated to a broader audience a series of conceptual maps representing the contents of the conference in a final event.

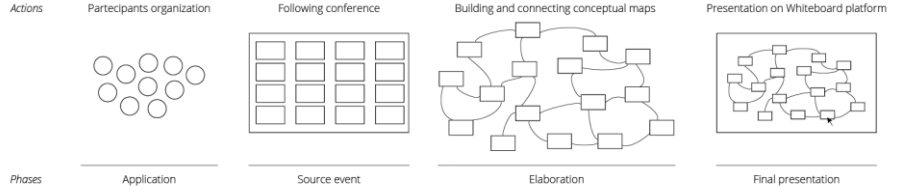

Figure 1 Phases and actions of the format DE-BRIEF

The activity aims to make students reflects upon the talks provided in a conference and to be able to present those to the rest of the course who did not follow the event. The main didactic component of the initiative is the reflection on the topic presented during the conference event. Students are requested to synthesize the themes into a conceptual map and to create a link among the various talks. The workflow of the activity has been designed considering the limits as week as the opportunities given by the actual context of the pandemic, in which in-person interactions are limited. Therefore, the challenge is deployed by using a collaborative digital tool which can support the interaction and is versatile to create and connect conceptual map. The tool of choice, in this case, has been Miro, an

online collaborative whiteboarding platform that enables distributed teams to work together. The peculiarity of the format is that the final event was managed using the same board on Miro as the one used to elaborate the topics. The board was shared with the participant who could navigate on their own and interact with the contents.

The learning outcomes of the didactic initiative expected for the students participating in it are to be able to select the important contents to explored in the conference, being able to take notes on the major elements, build a critical reflection on these topics and synthesize it in a conceptual scheme. Throughout the activity, it is requested for the students to interact with colleagues and take responsibility over some thematic areas in order to present a portion of the contents to a broader audience of students.

3.2 Surveys

Both the forms had the aim of understanding how the format used in the pilot could be improved in the following iteration during future events. The survey is structured to contain a mix of quantitative and qualitative question, the first ones, quantitative, in order to have a comparison scale among the answer and for future initiatives, the second one, qualitative, in order to deeper some understanding and receive insight by the people taking part in the initiatives.

Both the survey contains a series of question which aimed to understand how the initiative performed and it has been promoted, in order to comprehend the area in which future iteration might need an improvement. The first form directed to the students taking part in the initiative had the objective of comprehending the effectiveness of the experience in term of didactics. The second form directed to the audience had the goal to analyse the value of the output event.

4. Results

The DE-BRIEF results here illustrated are collected through direct observation, to describe the initiative, and the analysis of the survey, to understand the value for students and the audience that participated in the final event.

The analysis of the results has been developed by reading the answer provided to the form and discussing those with a student that took part in the initiative and support the whole process.

4.1 The Initiative outline

The DE-BRIEF initiative took place between October and November 2020. The selected participants to the initiative were 10, nine were students from the second year of the master course and one an alumnus. The group of participants had a first meeting to organize and

distribute the ownership of the conceptual maps referred to the talks followed in the conference. During the meeting, each student took the responsibility to synthesis one or more talks and to review the conceptual maps of other students.

Later the working group held two meetings to discuss the advancement of the conceptual maps and to co-design the final event structure. In the first one, students focused on proposing for each intervention of the conference a set of keywords and quotes in the second presenting the conceptual maps (Figure 2) and connecting the talks between them (Figure 3).

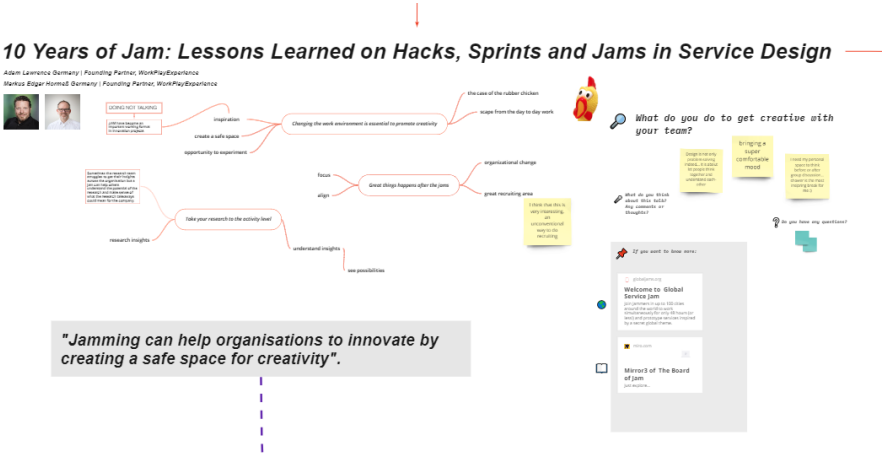

Figure 2 Example of a conceptual map produced during the initiative

Each conceptual map synthetizes a talk of the conference and it has been built following a semi-structured template co-designed with the participants of the DE-BRIEF initiative. It is composed of the following elements:

- Title of the talk
- Author and affiliation of the speakers
- Conceptual map
- Quote
- A question for the audience
- A space for question from the audience
- A space for deepening the topic of the talks with link to extra resources

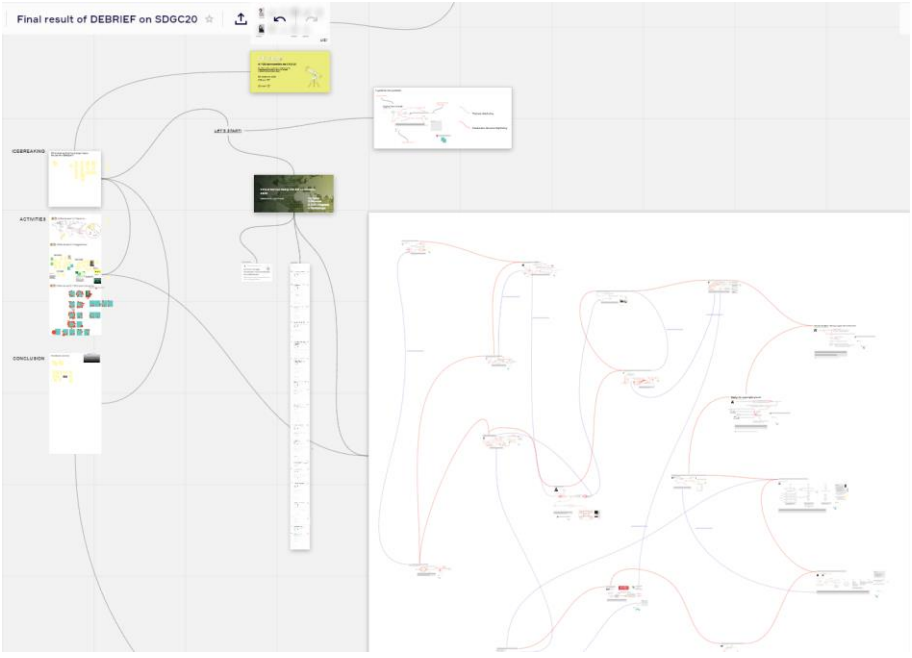

Figure 3 Overview of the whiteboard, with the proposed path and the connections between the different conceptual maps

Once the various conceptual maps have been developed, the students connected the topic of the talks to create a network of conceptual maps.

Before the final presentation, two sessions of rehearsal and review of the presentation material have been held in a collective moment where the working group took actively part in providing peer-feedback.

In conclusion, the final presentation has been held sharing with the audience the digital whiteboard through a twofold way: the audience was connected via web-call to the event and could see the shared screen, which followed the narration of the various talks or could simply navigate and explore the multiple connections and interact with the contents. This enabled an interactive approach to the presentation of the synthesis.

The final event has been developed dividing the explanation of the conceptual maps into two blocks and complementary activities have been designed to entertain the public. The activities aimed to create and facilitate interaction. The icebreaking activity consisted of asking a question regarding the theme of the conference: “What does embracing change means for you as a Designer?” and take confidence with the use of post-it in the virtual space. The other set of activities focused on recreating the informal conversation happening

in a coffee break during physical events, in particular proposing a set of question and leaving a space for a suggestion of books, movies, events and other various elements.

4.2 Students involved: survey analysis

The students directly involved in the didactic activity have been 10, selected to represent various years in the educational path of the master course, and involving an alumnus as well. The survey has been answered by 8 of the students. The first set of questions aimed to understand if there were any weakness in the process, and it was asked to the students to scaling the elements of the experience on a Likert scale from 1 to 5, where the 1 means that the element needs significant improvement and the 5 means that the element was excellent. From these first answers, as we can see in the graph (Figure 4), we can consider the initiative a success, where no elements have a considerable negative note. The highest positive peak is on the communication with the working group and the lower on the ownership of the topics.

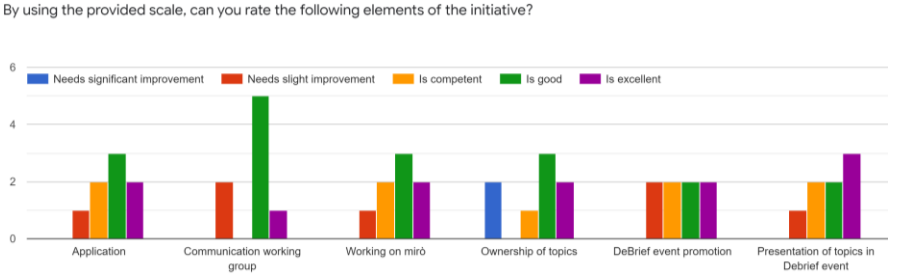

Figure 4 First set of questions

Considering the digital platform used as a working place for the elaboration of the conceptual map an important matter of the inquiry regards the interaction between the students. As shown in the figures (Figure 4Figure 5, Figure 6) there is a difference between the actual interaction compared with the desired one.

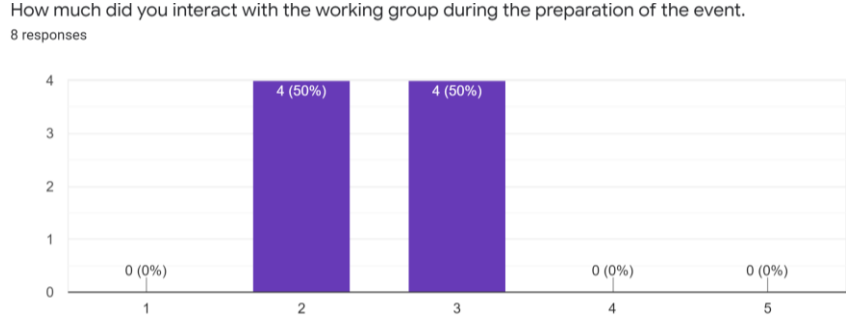

Figure 5 Interaction during the activity

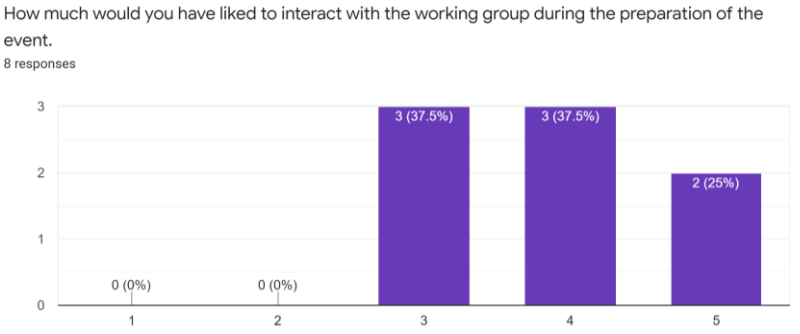

Figure 6 Expected interaction during activity

All the students considered that the De-Brief format adds something to the comprehension and the understanding of the conference contents. To understand how the experience enriched the participants, it has been used an open question; the answers provided converge on one main insight about the elaboration, which has been an opportunity for them to reframe some aspect of the talk and build a personal point of view on the matter. The main set of questions posed to the students focused on comprehending which among the expected learning outcomes were the most achieved with the format and which others were not considered fulfilled by this experience. Also, in this case, it has been used a Likert scale from 1, which corresponds to "This experience didn't teach me this", to 5, which is equivalent to "This experience absolutely helps me to improve this".
Looking at the graphs (Figure 7), we can say that the students generally perceived that the experience meets the expected learning outcomes.

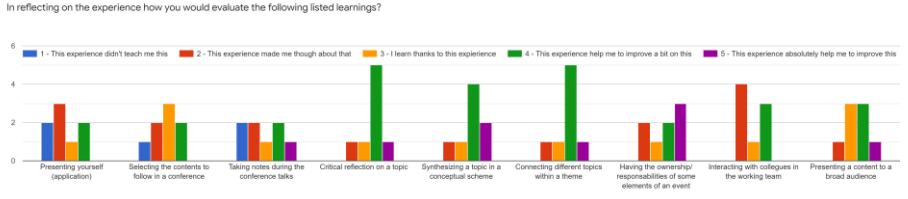

Figure 7 Evaluation learnings

The learning outcomes which scored the lowest score, therefore considered the less achieved, corresponds to the first three: Presenting yourself (application), Selecting the contents to follow in a conference and Taking notes during the conference talks. On the other hand, the learning outcomes which gained the highest value are the one corresponding on the elaboration of the topic, hence: Critical reflection on a topic, synthesizing a topic in a conceptual scheme, Connecting different topics within a theme.

It is as well interesting, considering the need for improvements on the ownership elements in the figure, to see that the learning outcomes regarding the ownership of the topic have scored a positive score.

4.3 Audience: survey analysis

The feedback from the audience has been gathered in multiple ways, the main and more structured one has been the form shared with the participants at the end of the event, but as said given the digital medium used during the final presentation, some unstructured feedbacks has been provided on the board used for the event.
The audience was composed of students, professors, and alumni of the Master course, for an average number of people connected of 70 (highest peak of 78), only 6 answered the questionnaire. To evaluate the final event, it was asked to the audience to scaling the elements of the experience on a Likert scale from 1 to 5, where the 1 means that the element needs significant improvement and the 5 means that the element was excellent. Looking at the graphs (Figure 8), it can be observed that none of the elements has a negative aspect, considering that the highest score has been considered the schemes produced by the students and their presentation, and the welcome part and the questions and answer (Q&A) element collected the lowers score.

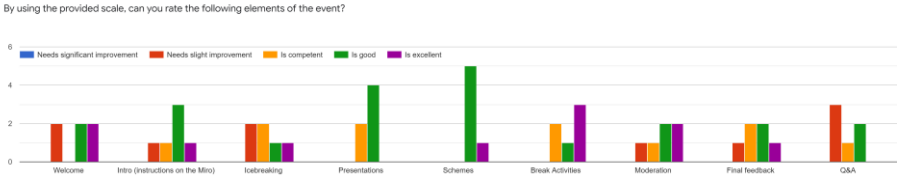

Figure 8 Evaluation elements of the event

5. Discussion

According to the feedback received, the initiative can be considered a success in term of experimentation of a new approach to didactical activity. It highlighted the strength of the format, such as the potential of achieving the learning outcomes and the positive response from the students taking part in the experimentation to the format.

In general, the versatile use of the virtual whiteboard, not only as a tool of design but also as a medium of presentation, prove to be an innovative way to use digital instruments to overcome barriers given by the distance. Furthermore, the choice of using an unconventional medium to present, such as a digital whiteboard, allow the audience to have a freer approach to the presented contents. Built on this aspect and on the development of complementary activities the format enables to perceive the event as a conversation rather

than a frontal lecture of the synthesis bringing stimulus reflection to open up discussion and create a connection with the audience.

The results of the survey directed to the audience provided a set of metrics as well to understand the value of the initiatives and to compare with future experimentations in this direction. In particular, the highest scores collected in the core contents of the final event underline the efficacy of the digital tools for delivering a set of conceptual maps, on the other hand, the lowest score (the welcome and Q&A), the elements that imply an interaction (Icebreaking and moderation) and the elements that relate to the presentation of the tool itself present some limits of the virtual environments. Moreover, the difference between the desired and the expected interaction during the activity highlights that digital can sometimes limit natural interaction that might happen if the activity would take place in a classroom.

6. Conclusion

Taking into consideration the presented experiments and its result the following conclusion are drawn. The use of a whiteboard digital platform, besides the web-call, can support didactics, when dealing with complex themes, on three aspects: collaboration, non-linearity and asynchrony.

Considering the limits of the SBL approach when translated remotely, the possibility to emulate a virtual shared environment thanks to the digital platform can provide a major connection over a simple web-call, when it comes to collaborative work. The use of a digital whiteboarding platform with a potentially infinite space provided a medium in which the complexity of some topics could be represented taking into consideration all the non-linear interconnections. Moreover, the possibility to access asynchronous to the virtual working space made it possible for the students to adapt the working time to their schedule, enable them to customize the activity according to their needs, and not forcing the whole didactic process in a specific time and space.

The experimentation presented is a small initiative, therefore, is not immune by limits, therefore it is important to follow up with iteration of the initiative and new experimentation to inquiry unexplored research space and digital tools to strengthen the didactic process.

Acknowledgement

The author would like to acknowledge the M.Sc. course of Product Service System Design of Politecnico di Milano, its coordinator Anna Meroni for the support in the development of the PSSD DE-BRIEF initiative. Furthermore, a thanks go to the students taking part in the initiative.

Abstract | The COVID-19 pandemic has created an urgent demand for proximity life services. However, there is a lack of platforms that are designed by communities themselves that allow residents to take part in larger conversations and build life services together. Therefore, this study seeks to propose an ecosystem framework that allows people to build their own community life circles. We summarize the design strategy for developing enabling ecosystems through analysing communities of practice and community cases. This paper introduces (1) a Community Operating System (COS) framework, (2) a life project process, and (3) community life circles for incubating life projects that satisfy people's daily needs. The above three parts constitute a life project-centred ecosystem framework that seeks to cultivate a design culture and responds to complex problems through collective reflection and co-creation.

KEYWORDS | ECOSYSTEM FRAMEWORK, COMMUNITY LIFE CIRCLES, LIFE PROJECT, COMMUNITY OPERATING SYSTEM

1. Introduction

The sudden COVID-19 crisis has not only placed a great burden on global society, but has also deeply impacted our lifestyles. Therefore, it is necessary to examine our living environments and comfort levels. During the pandemic, while using digital technology to assist daily life, we also began to rethink the convenience of surrounding communities. In the post-pandemic era, the demand for this kind of proximity community services will increase. Therefore, we need to know how to integrate online and offline collaborations for supporting local residents in building their own community life circles. This paper introduces an ecosystem framework for local communities based on the life projects. That is, this paper seeks to promote the collaborative lifestyles and the establishment of sustainable community life circles by setting up a platform for collective conversations. An enabling ecosystem can help foster a hybrid community with an environment where physical and virtual spaces co-exist and interact. The key design strategies are extracted from the literature review of the communities of practice (CoP) and case studies. Based on these strategies, we designed an enabling ecosystem, which can help foster a hybrid community with an environment where physical and virtual spaces co-exist and interact. Democratic participation that is centred on life projects offers new meanings for community spaces and facilitates various creative efforts.

2. Community life circles based on life projects

Community life circles usually centre on residents within a specified radius. These circles cover a variety of spaces where services necessary for daily life are provided. For example, the mayor of Paris, Anne Hidalgo (Hidalgo, 2020)(Hidalgo, 2020) proposed the “LE PARIS DU 1/4 HEURE” (a quarter of Paris), which aimed at changing the daily lives of Parisians and the organization of the city. The mayor of Barcelona, Ada Colau (Colau, 2016), introduced the concept of “SUPERBLOCKS” to encourage the construction of small democratic sites designed to alter city space. The Shanghai government (Shanghai Government, 2016) proposed the “15-MINUTE COMMUNITY-LIFE CIRCLE”, which proposes providing basic services and public activity space within a 15 minutes walking distance of residents. Although they are all based on common ideas, the designs are also different, which depend on the local environment and people's living habits. Assuming that local residents participate in community service design according to their own life trajectory, the adaptability of problem solving and feedback may be stronger. These interventions could include development of services that, using resources in communities, create new social and operational values for them (Manzini, 2009). In the process of community design, the voluntary formation of bottom-up collaborative organizations by local residents based on consensus is the main force to ensure the implementation of life projects.

3. Related Studies

3.1 Communities of practice (CoP) from the bottom-up

In this section we briefly review literature on the role of communities of practice (CoP) in cooperative projects and the principles of cultivating CoP, as well as methodological clues sought to improve community collaboration capabilities. Wenger introduced the concept and research scope of CoP, which describes groups of people who share a concern or a passion for something they do, and who learn how to do it better as they interact regularly (Wenger, 2011). Three characteristics are essential in CoP: domain, community and practice.

> "**The domain:** A community of practice is not merely a club of friends or a network of connections between people. It has an identity defined by a shared domain of interest. **The community:** In pursuing their interest in their domain, members engage in joint activities and discussions, help each other, and share information. They build relationships that enable them to learn from each other. **The practice:** A community of practice is not merely a community of interest. Members of a community of practice are practitioners." (Wenger, 2006)

An effective community self-organization requires voluntary organization based on a common and intentional topic, and each member actively contributes knowledge and skills and learns in practice. The goal of community design is to bring out the community's own internal direction, character, and energy, i.e., community DNA. In Cultivating Communities of Practice, seven design principles are introduced to promote the development of CoP:

1. Design for evolution;
2. Open a dialogue between inside and outside perspectives;
3. Invite different levels of participation;
4. Develop both public and private community spaces;
5. Focus on value;
6. Combine familiarity and excitement;
7. Create a rhythm for the community.

We are particularly interested in the first five points, which inspires our attention to the self-organizational collaboration approach in community design. Usually, dialogue and collaboration based on problems in a specific scenario can be more effective. With continuous project practice, rich knowledge and experience can be accumulated for the community. The services provided by members involved in collaboration bring value not only to the members themselves, but also to the overall welfare of the community. On the other hand, participants need interoperable, flexible and specific collaboration tools to support their work (Liliane & Romain & Frederic, 2006). We find that digital community platforms can provide resource information and organize management activities. However, the limitations and difficulties of CoP are reflected in the lack of trust, time and leadership among its members.

> "Although participants are somewhat familiar with the tools, they mostly seem content with receiving and accessing information, not searching for a more active participation […]The fact that members come from different organizations, are not as strongly bound by the same objectives, and need time to build trust between them explains the difficulties in creating a CoP […] they need to build trust relationships, to get to know each other, to also try to function in the same timeframe…it is true that partners tend to be more active in specific research projects than in the general knowledge sharing which is one of the objectives of the CoP/research project." (Tremblay & Psyché, 2012)

To sum up, creating the vitality (or motivation) of collaboration in CoP is a real challenge. We believe that the real motivation comes from the rigid demands of local residents. These demands can achieve resource matching and organizational management through a platform. On the one hand, local residents organize and practice around the demands under the specific scenario, on the other, they rely on community online platforms as flexible tools to participate in community design to achieve resource expansion, knowledge sharing, and project management. In short, building a bottom-up life-oriented socio-technical system requires not only active collaborative practices among members of physical communities, but also a digital technology platform to support the construction of community ecosystems. The following is a comparative analysis of case studies.

3.2 Case studies for community design

The following three cases are "Nextdoor" in the United States, "Dingdong Community" in China and "Sungmisan Community" in South Korea. Through comparative analysis, it puts forward design strategies to rely on local residents to build sustainable community development. Nextdoor is an online social networking website launched in early 2011, connecting residents of specific communities. Each community has its own Nextdoor website, which can only be accessed by community residents. New users can only join the community after confirming that they actually live in the community. In addition, Nextdoor requires the use of real names instead of pseudonyms, and is visible to other users throughout the system. It aims to create a safe, trusted environment where neighbours can connect with each other. Further, Nextdoor provides advice on that content, with "Frequently Asked Questions" that suggests users post about service recommendations, crime reports, lost pets, event promotion, and so forth; it also explicitly states that self-promotional messages are inappropriate and will be deleted (Masden & Grevet, 2014).

Dingdong Community is an online neighbourhood social platform launched in 2014, claiming "social", "Online-to-Offline (O2O)", "life link" as its three major characteristics. It is an APP for daily community life services, which calculates residents' social data and recommends surrounding business and community services. The product mainly provides three functions: fast delivery (express delivery, water delivery, fast food), community life (second-hand trading, carpooling, payment of utilities), home service (housekeeping, nanny, tutor).

Table 1. Case analysis and design strategies.

CASE STUDIES	NEXTDOOR	DINGDONG COMMUNITY	SUNGMISAN COMMUNITY
Focus on	Private neighbourhood social network	Social media attributes and business	Resident problems and needs
Content	Passing along crime statistics, notices of lost pets, and upcoming community events	Fast delivery, community life, home service	Co-parenting centre, K12 education, multiple life cooperatives
Advantage	Trust and safety	Extensive service information	Diverse community life
Disadvantage	"Islanding" effect Not conducive to the flow of community resources	Lack of attention to the real needs of users	Lack of an effective management platform after expansion
Key elements	Trust, local community	Social attributes	Endogenous development
Design strategy	1. Project design is based on the real needs and life trajectory of residents. 2. Support the development of solutions based on local community resources. 3. Provide a platform for dialogue that facilitates self-organization and collaboration among local residents. 4. Specific scenarios are more conducive to promoting collaboration. 5. Providing multiple role positioning for residents is conducive to dynamic adjustment of power and responsibility structure. 6. The perfection of community service is a process of gradual self-growth based on real needs.		

However, many factors ultimately led to the failure of the project. The main reason is that it is not centred on the real needs of users, but that of developers who define the needs of users, resulting in low resident participation.

The Sungmisan community is another success case. The Sungmisan community began in 1994, when about ten couples formed the Woori Co-parenting Centre, the first cooperative in South Korea to provide childcare services for neighbourhood families, because they were dissatisfied with the education provided by the public and private sectors (Yoo, 2010; Wui et al, 2013). People interested in co-parenting moved to the Sungmisan community. This implies that the Sungmisan community is a sort of post-conventional community formed out of "the reciprocal networks utilizing cooperative relationships" rather than any fixed conventional boundary (Lee, K., 2010, p.145). Five more cooperatives and one after-school care program have been established with the increase in demand. What community members do together has attracted the participation of new members, thus beginning a virtuous circle. As the children graduated from co-parenting to go to primary schools, after-

school programs were established; and as the children went to middle school, the need for an alternative school was brought up, and an alternative high school program was established in 2004. (Han & Shim, 2019, p.22). Sungmisan continues to enrich community services around the needs of residents, including co-housing, car sharing, food cooperatives, community restaurants, credit cooperatives, handicraft workshops, radio stations and theatres. It is worth noting that the Sungmisan community does not focus on online social platforms, but more on issues and needs than the first two cases. Cooperatives and participants that form the Sungmisan community network may best be understood as "a network of life communities"(Wui, 2013, p.61). Naturally, with the expansion of the community scale, it is necessary to establish an online platform to jointly manage community information and resources.

Based on the above analysis, we have refined some key elements and design strategies (see Table 1).

4. Ecosystem Framework - COS

Digital technology is particularly suited for promoting citizen activity, and it specifically helps citizens find their voice. Therefore, it is advisable to integrate online platforms and share researches, as well as mobilize community projects and promote broadcasting design experiences and culture. The various social services of digital social innovation as well as distributed production and consumption (Dekker, 2006) reflect a collaborative relationship between people. Within this network of individuals, personal and integral benefits can be realized at the same time. Manzini pointed out “a community too may be described as a mesh of interweaving conversations, and its nature will depend on the types of conversation taking place within it and what sparks them.” (Manzini, 2019). In other words, encouraging community members to find their own solutions by providing a conversation platform is advantageous. Therefore, we interpret a community to be an opportunity for exploring collective intelligence. The ecosystem framework for building COS can facilitate various conversations and promote cooperation, while also encouraging residents to build their own community life circles.

Online platforms have the unique ability to realize this aim. There are many platforms that provide social services, but the majority of them cannot cultivate a community for sustainable, collaborative living. This is due to people’s limited experience with adopting bottom-up collective solutions, and the relatively insufficient skills of participants. Through "Life Projects," members can conduct dialogues and experiments around themes of common concern in their life. On the one hand, stakeholders form designing coalitions (through self-organization) can analyse and solve common problems using low-cost practices. This allows them to continuously gain problem-solving experience. On the other hand, participants can be assigned different project roles based on individual skills and conditions in order to

encourage synergy between members and utilize collective intelligence. On this basis, we designed a COS framework and life project process.

4.1 COS Framework

COS takes community resources as infrastructure support, combining digital technologies to optimize the sharing of local resources and promote communication and collaboration. This can become a platform for supporting creative projects focused on life. COS understands the community to be a living organism, and uses an endogenous development model (Tsurumi & Tadashi, 1989) to incubate life projects. Through the transformation of resource at all three layers, COS activates local resources in order to nurture self-renewal and promote the sustainable development of the community. The diagram below demonstrates the operation framework of COS (Figure 1).

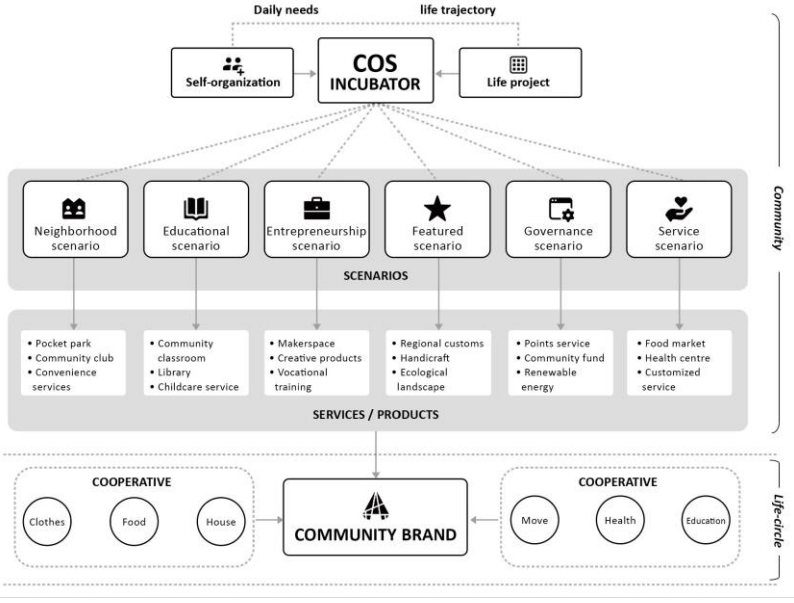

Figure 1. The COS framework. Using COS as a platform, we integrate community resources and promote cooperation among residents. This, in turn, gradually promotes the improvement of community services and lifestyle change.

The enabling platforms under this framework make the undertaking of new cooperative projects possible. Details are as follow:

- **The self-organization of members is established based on common problems and issues.** Life projects are planned by groups and incubated after gaining

support from professionals, policymakers, and residents. New resource values can be generated during this process. These are secondary resources.

- **Improve and perfect the service scenarios by combining the community life trajectory and daily demands.** It is necessary to make more accurate designs targeting project details based on life trajectories. It is also necessary to test these designs in real life.
- **The projects that fit the real demands will be transformed into actual products and services**. The project income belongs to participants and the community.
- **The majority of potential products and services can be regarded as belonging to the community brand and should be accurately managed through cooperatives.** It is necessary to promote community business start-ups and employment through the platform economy. Diverse community brands can satisfy the daily demands of the community, forming a life circle in close proximity to residents.
- **Diverse community brands enrich the ecosystem of regional services within the life radius.** Once the ecosystem is formed, the productive and consuming lifestyle of people will be changed.

The value of COS is that it facilitates a collaborative lifestyle. All people, families, neighbours, and cities can self-organize to carry out projects and share services. Each person is a node in a collaborative network, solving individual problems and, in turn, increasing the overall benefits for community services. COS can transform the experiences of the participants and teach them the value of sharing (Manzini, 2019). Once the number of users increases, the value of a project will grow as (Shapiro & Varian, 1999).

COS can create a hybrid environment, and all these life projects can operate in three dimensions: human society, the physical world, and cyberspace. This is different from pure online interactions that lack the possibility of being realized offline. However, in our view, offline face-to-face dialogue and action are indispensable. Interaction in the physical dimension and close proximity to others are the catalysts that can bring the project to the final stage of transformation. Online, big data can be gathered and analysed as a resource, and knowledge and skills can be shared. Offline, members live in the same space and are familiar and trusting with one another, as they empathize with each other over daily problems. Members self-organize around common problems and goals, and can publish their project proposals in COS. During the process, it is possible to combine collective intelligence to create a suitable solution.

4.2 Framework application - Life project process

A good enabling ecosystem is comprehensive and open, as this allows different people in the community to participate differently and take on different roles and responsibilities during the collaboration process. Participants can be divided into seven roles according to the processes of the project, which are shown in the Table 2.

Table 2. Seven roles in the process of a life project.

ROLES	RESPONSIBILITY	ACTORS
Seekers	Challenges	Residents;
Solvers	Solutions	Residents, Organizations, Government, Business;
Voters	Votes and comments	Residents, Experts, Others;
Experts	Feasible solutions	Residents, Experts;
Funders	Investments	Residents, Business, Government;
Co-producers	Production	Residents, Business;
Traders	Sales or Purchases	Residents, Business; Government

The overall design process of the life project includes four stages (Figure 2): challenge, integration, project, and operation. In the challenge stage, seekers raise questions in order to identify a challenge. These challenges mainly derive from the problems that seekers face in daily community life and corresponding life scenarios. These challenges form the data that is integrated into COS.

During this Integration, COS gathers problems raised by seekers. First, platform experts filter these problems to confirm that they are appropriate. Then, solvers come up with solutions, most of which derive from the solution paths built from experiences of everyday life. Seekers and experts select the solutions with the most potential to be developed into design opportunities. This is carried out according to the principle that feasibility, viability, and desirability are crucial to the life project.

In the project stage, voters cast votes and comment on life projects. The project that gets the most votes is regarded as a potential solution for raising funds and gaining support. Funds come from government subsidies, community funds, and investors.

After securing funds, the project enters the operation stage. At this point, local factories, communities, designers, enterprises, and craftspeople join the project as co-producers. Then, the given products and services are delivered to traders. Throughout the process, projects are iterated according to the use situation in the pursuit of development. During this process, roles can be changed to fit the process. The key is to determine the effect of reallocating roles and relations as well as the potential energy, and to encourage participants to create new values.

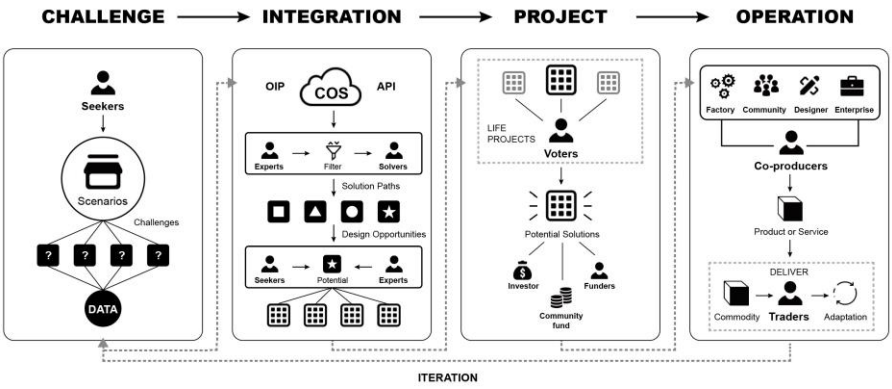

Figure 2. The Life project process. These four stages form a community of interest and reflect the values and responsibilities of the multiple roles in the process of cooperation.

We all possess and have access to design. “However,” as Manzini states, “like all human talents, it must be stimulated and cultivated” (Manzini, 2015, p.31). Therefore, through the framework design, COS aims to enable members to spontaneously create and enrich social systems of community relations through life projects, so as to realize people's own community life circles.

4.3 Community life circles

Diversified life circles form a distributed urban network. Complex urban systems were redistributed among network nodes that form a community. These nodes allow residents to best utilize existing local resources and learn from experiences (Murray, 2009). These experiences are part of the life trajectories of citizens. Therefore, it is necessary to encourage local residents to participate in building a community. As Manzini states, “Ultimately, this means that it is the people directly concerned who must have the power to decide what to do and how to do it” (Manzini, 2019, p.117). In other words, a community must be built by local residents. This approach allows residents to allocate basic services based on their life trajectories and the demands of daily life, e.g., 15-minute Community life circles (Figure 3).

De Certeau calls this activity productive consumption, according to which the consumer is the producer of new meanings (De Certeau, 1984). However, to realize the benefits that come out of people designing their own lives, a platform that promotes community dialogue and co-creation is necessary. For this purpose, we propose this ecosystem framework.

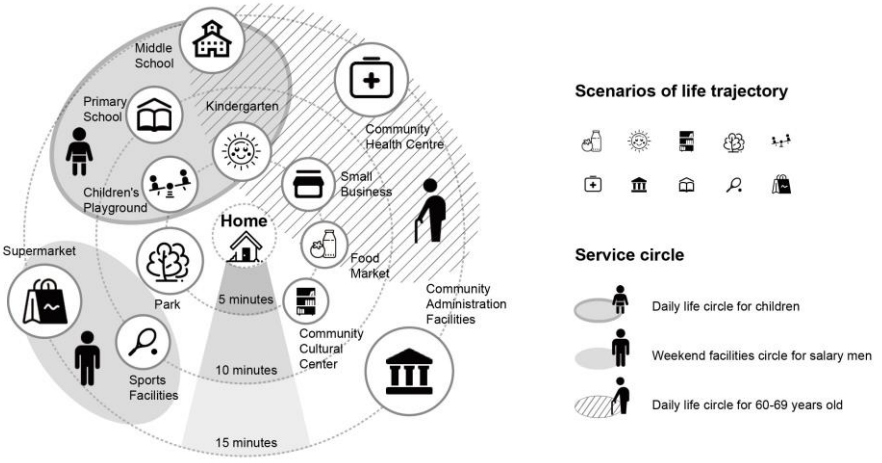

Figure 3. 15-minute Community life circles. According to the life trajectory, the circles can be divided into life services accessible at 5, 10, and 15-minutes distances. The circles can be divided into many spheres. In the children's daily facilities circle, various schools serve as the core, and the circle features many facilities, such as playgrounds and training institutions. The office workers' weekend facilities circle features places of entertainment, shopping malls, community cultural centres, sports facilities, and supermarkets. This circle helps office workers participate in community life on weekends. The elderly daily facilities circle includes vegetable gardens as its core, and adjacent to these gardens are green spaces, small businesses, training institutions, and other facilities. Source: Shanghai Urban Planning and Land Resources Administration Bureau, China, 2016.

5. Conclusion

As a vital basic unit of social governance, the community has shown new trends in community-oriented design. Local residents, as the main participants in the design, have gradually gained attention for building community life from local culture through bottom-up collaborative activities among their members. In some respects, this embodies a project-centred democracy that is achieved through participating in collective conversations, activating the public resources of the community, and building life circles. However, relying on the residents to achieve projects of common concern, the key is to transform community members into communities of practice (CoP), thus creating "functional" social conditions through practice. To this end, we provide the dialogue platform COS that facilitates the self-organization and collaborative practice of local residents. As an ecosystem framework, COS enables community members to connect with each other and actively participate in the community to create value through life projects. Our main contribution is two-fold. First, we planned a COS framework from within the community itself, revitalizing local resources,

designed life projects based on the real needs and life trajectory of residents, and obtained resource support and management through online platforms to gradually improve community services. Second, we demonstrated the roles and responsibilities of stakeholders involved in the life project process, and specified problem scenarios to stimulate the enthusiasm of the population and dynamically adjust the structure of authority and responsibility. We believe that improving the community life circle based on life projects is a biological growth process. As a preliminary study, this paper provides a theoretical framework for the future development of comprehensive web services and design toolkits for community life circles. Based on life projects, COS can activate the potential of collaborative creation and rebuild public services of the community in a low-cost way. In the future, it has the potential to build community life circles that are more adaptive to the daily demands and behaviours of residents.

Expansive Video Capture – Up close, personal & specific tutoring "performances"

Brendon Clark

Umeå Institute of Design, Umeå University
brendon.clark@umu.se

Abstract | Moving fully or partially online during the pandemic has exposed challenges in appreciating the nuances of sociomaterial design work in the design student / tutor encounter, while also offering opportunities for introducing "new" practices to otherwise resistant students and tutors. This paper explores a simple format for and practice of video capture that encourages students to provide detailed descriptions of up-close visual material, giving tutors a comparatively expanded view of the student work and the student or student-teams relationship to their work. By framing the video capture moment as a form of performance for both the tutor(s) and the student(s) involved in the video capture, the paper argues that the video-making process is a productive practice in and of itself, and a collaborative, dialogic one in concert with the tutor as audience, as well as its use as representational practice for tutor consumption.

KEYWORDS | ASYNCHRONOUS TUTORING, VIDEO CAPTURE, CO-PERFORMANCE

1. Introduction

The ongoing pandemic in the post-COVID-19 world has disrupted the way we organize taken-for-granted uses of space, physical and digital materials, and even interactions with each other, including ways of greeting, being together, and parting. What is deemed as acceptable and unacceptable behaviour is in flux, and how we view the individual in relation to different collectives, including governmental and institutional level initiatives and directives. This has great impact not only on how we organize education, but on the world the students we are responsible for educating engage in and will contribute to. The uncertainty of short-term restriction cycles and the unpredictability of course planning has caused a high level of distress and pushed many of us into new ways of organizing education. Along with the increased stress from abruptly moving teaching online in "Emergency Remote Teaching" (Green et al. 2020), the pandemic offers an opportunity to rethink what is possible, looking at past activities and experiences in a new light, and discovering new forms of engagement while imagining what is to come. This paper zooms into the spaces of the student/teacher tutoring encounter, where students present the progress of their work, receiving constructive feedback for further developing their work and their design practice. Moving fully or partially online during the pandemic has shifted how design educators engage in the progress of student work. In many cases, the spaces used by students and tutors to share and discuss have changed dramatically, changing the tutor's ability to rely on developed rituals for understanding, assessing, and contributing to student learning, and the material, spatial and bodily characteristics within these encounters. In describing the difference between Emergency Remote Teaching (ERT) and effective online learning, Hodges et al. (2020) and Jones (2020) warn that it is not possible to merely transfer what we have done while co-located to an online format. While ERT can produce innovations, they argue, effective online learning is the result of thorough systematic, iterative instructional design. Underlying this argument lies a position that the formats we use may be deceptively similar, but fundamentally different in how they support our intentions. In line with this sentiment, it is also important to remember that students not only learn the intended content of a course, but, in a Bateson sense of Stage II and III learning, students learn how they are taught (Engeström 2001). In this sense, it may not be enough to merely get by with given tools, but to find opportunities to explore and challenge the direction the tools we use push and pull us and our students. The changes in visibility of what students may be doing and may be needing, and how they are responding to their circumstances demands reconsidering the roles we play or can play in relation to student learning. Jones (2020) stresses the importance of developing simple and effective methods for checking in on students and their work progress when creating distance design courses.

Now a year into pandemic teaching, in our industrial design-based educational environment, it appears that ERT is giving way to some forms of a new normal, and effective online learning. Zoom video encounters and the use of Miro boards or shared screen presentations have become common place. The diversity in the physical, material engagement with sharing physical spaces where students work predominately in groups and teachers often

enter their workspaces for sharing and discussion, has given way to new practices of using digital-mediated, software-mediated spaces. Increasingly, tutoring activities are mediated by the opportunities and constraints of a video platform (Zoom or Teams) with face-to-face discussion allowing for verbal descriptions and visibility through the camera, and the use of screenshare options for showing material available on the computer whether organized sequentially in a PowerPoint presentation using text, visuals and video, or other software such as Miro, and the text-based comments, questions, discussions in the video platform chat box. In contrast to these types of synchronous interactions over distance, this paper puts forward asynchronous uses of video capture to replace or augment synchronous activities. This form of video capture, I argue, is expansive in two senses: it expands the spaces and material practices that become visible in the tutoring encounter, and the video capture performance puts students in a position to rehearse and put on display how they could demarcate the territory of their project, while enacting the narrative of their project in both its detailed specifics, and the relation of those specifics to the whole. Drawing on my own teaching and both informal and formulized discussions about new practices with colleagues, and a long history of exploring collaborative design practices and the use of video capture, here I draw on the diversity of two common tutoring scenarios to introduce and discuss the use of video capture, video viewing and feedback.

2. The Tutoring Encounter

In order to look at the tutoring encounter and the spaces for dialogue between students and teachers in relation to the ongoing project work, I use the notion of world-making. In project work, students develop a physical, visual, and conceptual relational world around themselves. It is this relational world they expose to their tutors and tutors support them in shaping one way or another through dialogue. In Schön's (1992:132) terms of a reflective conversation with materials of a design situation, whether virtually or on site, "the designer constructs and reconstructs the objects and relations with which he deals, determining "what is there" for purposes of design, thereby creating a "design world" within which he functions." In linguistics, contextual anchoring of self-in-space and time at any one moment puts the speaker at the intersection of the spatial and temporal *deixis* of a language, a ground zero that allows for the use of orienting language for those sharing context (Cairns 1991). That is, within a communicative event, the speaker is located at the center and refers to you and I, mine, yours and theirs. This one rather than that one. What happened before, where we are now, and what is coming next. It is in relation to this gestural, action world of design, the practice of designing, that I refer to "pointability" within the context.

Drawing on *ethnomethodology,* Goodwin (1994) provides a concrete set of criteria by which to analyse professional practice and understand what people are trained to see and do. By looking at the ***coding schemes*** people use to make sense of the world (what sticks out for them), what they *highlight and mark-up*, and how they *create, describe and use material representations*, we can understand the relevant perspectives of that practice.

> The shaping process creates the objects of knowledge that become the insignia of a profession's craft: the theories, artifact and bodies of expertise that are its special and distinctive domain of competence. Analysis of the methods used by members of a community to build and contest the events that structure their lifeworld contributes to the development of a practice-based theory of knowledge and action. (Goodwin 1994: 606)

Verbal and visual interactions using software such as PowerPoint allow for a combination of verbal interaction with close proximity to the imagery. While design work uses a wide variety of physical and digital materials depending upon type of design and the focus of any one class, introducing work-in-progress via presentation software such as PowerPoint is common in education and in design work in industry. Wakeford brings a Science and Technology Studies perspective to argue that ethnographic research presentations using PowerPoint are "'thick' social events" where it is precisely the combination of storytelling and showing that brings its value. At the same time, she argues that this type of software and event raises conflicts in masking the analytic work involved in selecting and sequencing these visuals, deeming analysis misleadingly invisible. "Crafting" a PowerPoint presentation affords certain styles of sharing in sequence and making available the work presented.

The sequential progression is not only for moving in one direction, as it also allows for returning to specific slides during discussion, creating a shared referential, pointability. Miro boards, a type of software whiteboard, provide a virtual space that can be populated without linear ordering. Rather, the space is much more similar to navigating a physical space with material located in different places. If we consider the "pointability" of material, where the student is able to point, both physically with a finger or cursor and verbally with the words that are used, to the area of interest, while speaking about the content. When logged into a shared Miro board space, participants can click onto the icon of the presenter, and "piggyback" on their view, allowing the presenter to dictate what the viewer sees within the space. Similarly, the presenter can click a function that brings all the participants in the space to their own location. These functionalities allow different types of practices to emerge for supporting the tutoring encounter.

While the pandemic has increased familiarity with the software formats and the emergence of valuable forms synchronous engagement online, Video platforms such as Teams and Zoom and collaborative spaces such as Miro boards are generally accessed while in a sitting position, navigating with mouse on a screen. They require that all material is either generated within the digital device or transferred to the device in order to "craft" the world narrative. Over the last year, a few colleagues and I have attempted to promote new ways of exploring the physical spaces we occupy before, during and after our distributed encounters. While using multiple cameras and turning the cameras away from our faces to open up our spaces has been a rather uphill battle in relation to synchronous activities, the use of video for asynchronous interaction has become more widespread.

2.2 One-shot video capture

In this paper I focus on the introduction and practice of a specific style of video capture that I have come to call one-shot video, with emphasis upon how the video is made, where it is made physically and what it shows physically, and the temporality of the video-making process. Much like the Danish Dogma 95 movie making movement that started as a specific purposeful format with strict rules for film production arising as a reaction to the overproduced state of movie making, I have been working over the years with a set of purposeful guidelines for video capture in the service of collaborative design activities and ethnographic work. Dogma 95’s set of rules stated that all filming must be done on location, without adding extra sounds, without time jumps but in the here and now using handheld cameras without giving credit to the director (Heckman 2020). Without such rigid rules, one-shot video was meant to be an easy-to-use style of video capture that uses a handheld camera to structure a summary of ongoing work by combining overview and detailed description, while pointing to relevant material. At the same time, the one-shot video making practice arises out of a specific set of concerns and interests in the authenticity of improvisational performance and the processes of collaborative enactment (See Clark 2014 for an instructional video). In May 2020 as the pandemic took hold, I introduced one-shot video as a “recipe” on the Distance Design Education blog for tutoring students with simple set of instructions. While the steps may appear straightforward recipe, to view one-shot video as an example of “expansive video capture” requires a more elaborate argument demonstrating its link to the learning and development of professional practice, the elevation of ordinary activities to a form of performance, and an interventionist approach to video in design.

Prepare: Choose your material, identify who will speak about what, and what path the camera should take.

- Have an outline script or core message
- Have something you will film as you talk about it
- Think about where the camera will go

Film in one take while describing what you are showing:

- Overview: Outline the topic and the purpose of the video
- The details: Talk through the specifics you wish to share. Give examples! Point to the material!
- Conclude: Repeat the most important point(s) to remember. Describe what happens next?
- As you film:
    - Hold the camera horizontally for best viewing
    - Get close to the content
    - Point at what you are talking about
    - Keep it rough
    - Dare to rehearse

Upload & send: Upload to your online learning system and share the link.

Figure 1. One-shot video recipe

When looking at the use of one-shot video in relation to student tutoring, there are three main components that may be separate in asynchronous interaction or combined in synchronous activities: the video capture activity of making a video, watching of the video, and feedback response to the video.

I. Individual student task and one teacher (Asynchronous): A student either is instructed or voluntarily sends a one-shot video to the tutor for feedback on their progress. The tutor watches the video and responds via email text, via a one-shot video, and/or during a synchronous discussion. For example, during the Spring term, students at the BFA and MFA levels work on their degree projects. Samuel spontaneously sends a video to Patricia the teacher asking for input on her user study strategy. The one-shot video shows a piece of paper with the sketched-out process visual with Samuel's finger pointing to the parts he describes. "At the first two interviews where I mapped out their urban gardening rituals…I created this tool for exploring the emotional journey of when they were contributing to their urban garden." He plans to return to the same people and re-engage them with his visualization of their activities. The teacher prints out the sketch, marks on it and creates a one-shot video asking if he considered using photos or sketches in return sending it back.

II. Team task and teaching team feedback (Asynchronous + asynchronous & synchronous): A project team creates a one-shot video ahead of the upcoming tutoring session with multiple tutors or teachers involved. Some give written feedback, the others wait until the tutoring moment. For instance, during a 10-week project involving 3 main tutors (two internal

teachers and one industry-based tutor), each student team is asked to send a one-shot video of their progress the day before each tutoring. All three teachers watch the video, but only two join the tutoring over Zoom. The student team is working together in a shared space. In the video, there is one main narrator, with the three other members describing one part of the work. Sonia starts the video showing her own face, saying hello to the tutors, and giving a short overview about their status. She then walks to each person on her team prompting that person to show and tell what they are working on at present. The video moves close to Vilma's computer screen showing the details of a 3D-model as she explains. Then over to Mathias, where he describes two cardboard prototypes, then to Hamed on a table with a city map, with cardboard and paper cut-outs. After each person presents, Sonia moves close to the whiteboard where they have done a brain-dump and grouping of the potential areas of focus. After watching the video, the teacher not joining the tutoring gives written feedback via e-mail on both the content of the project, and the one-shot video making process, and sends it to the student team and tutoring team.

The concept of performance brings focus to both the past and the future in the present, and offers a strong frame for re-assessing the past in relation to the future. This can be emphasized through the perspectives of Richard Schechner and Victor Turner. Schechner (1985:36) suggests that performance is "restored behaviour or twice-behaved behaviour." People draw upon their repertoire of behaviour as they enact a new version.

> "Restored behavior offers to both individuals and groups the chance to re-become what they once were—or even, and most often, to re-become what they never were but wish to have been or wish to become. (Schechner 1985:38)

There is an almost magical quality to a live performance. Once it starts, there are generally no timeouts. It unfolds unpredictably. It is bound by the social constraint that to break the situation has social consequences. This tension, or uncertainty, of an open frame gives cause to an original quality to performance.

> "…The rules may 'frame' the performance, but the 'flow' of action and interaction within that frame may conduce to hitherto unprecedented insights and even generate new symbols and meanings, which may be incorporated into subsequent performances" (Turner 1982:79)

Turner suggests that performance concludes a process. It is a type of curating mechanism for what took place previously in the process. The interaction between the performer(s) and the audience bring previous speculations to conclusion. "*To perform is…to bring something about, to consummate something…"(*Victor Turner 1982).

The video performance can be seen as a demarcation of the current state of the design world narrative. Students are coached to give specific detailed descriptions of selected material to exemplify their statements and connect to the whole. The moment the one-shot video is completed, unless the authors wish to re-shoot, the video is ready for sharing. The opportunity for editing falls before the video filming begins, based on how the room and materials may be set-up and/or identified in preparation for a live performance.

3. Expanding world making practices

Donald Schön (1983, 1987) focused on the difficulties of preparing students for the realities of professional practice. It was his conviction that successful professionals required, and rely upon, a kind of knowing ("reflection-in-action", Schön 1983, 1987) that most Western institutional educational settings were ill-prepared to provide their students. Reflection-in-action is a kind of bricolage. It is the designer's (or other professionals') skillful conversation with the unique problematic situations that frequently arise in practice; such problems are characterized by "uncertainty, uniqueness and value conflict" (1987:6). To be equipped to act within such situations, designers require an artfulness of practice that enable them not just to solve problems, but the ability to frame messy, real world, indeterminate situations as problematic ones, to improvise, to take uncertain actions toward their resolution, and to evaluate their own progress as they proceed. Schön frames this as a dilemma for the professional schools of 'rigour or relevance': institutions may choose to hold on to a traditional, formalizable, (academically) rigorous curriculum, but must do so at the expense of cultivating the skills on which able practitioners necessarily depend (1987:312-313). These are skills that are not taught, but 'coached' out of students' own experience of engaging in murky situations *before they know how to remedy them.*

From this perspective, a goal of design education is to provide occasions for students to rely upon and develop the improvisational practices of reflection-in-action, as performances available for teacher coaching. This is complicated by the trends of digitization, the use of sequencing software such as PowerPoint as a main communicative tool, and the overall favouring of crafted output rather than improvisational material explorations. As one colleague commented after one year of pandemic education, while his students are improving their presentation skills, he sees that they are neglecting the tangible design work and rather focusing on crafting design presentations. It is here that exploring expanded forms of engagement in material spaces and explorations in the multiple uses of video can play a role.

3.2 Video in research and design

Video has long been used within research and design (Blomberg, Giacomi, Mosher, Swenton-Wall 1993, Brun-Cottan & Wall 1995, Buur & Soendergaard 2000, Suchman & Trigg 1991, Ylirisku & Buur 2007). Drawing from the tradition of conversation analysis, interaction analysis demonstrates the value of video recordings to capture "naturally occurring interaction" among people, and people with artefacts in the context of use (Suchman & Trigg 1991, Jordan & Henderson 1995). Using video has predominately been hailed for the ability to capture what takes place in the wild of everyday life for multiple viewings and analysis (Jordan & Henderson 1995). In this tradition, generating long periods of video recording provides a data set large enough to find valuable sections for detailed analysis. The majority of the analytic work takes place after the exemplary sections have been identified and a detailed transcript has been prepared.

The value of video as representation often relies upon the up-close and intimate sense of being somewhere else that can be used to provoke an audience experience. Video in the use of re-presenting users has two main consequences: it brings the user into the design process, albeit through proxy of the video medium, and it establishes authority of researcher as having captured the authentic truth of the people out there in the wild (Nafus & Anderson 2006). In this version of video capture, the researcher is often edited out of the footage for effect. In contrast, *participant intervention* refers to the active role of the researcher as a "participant in the co-construction of meaning" (Karasti 2001:81). The researcher does not necessarily suppress their presence, but rather celebrates their view as one of many within a group.

Buur and Soendergaard's (2000) video card game is an example of using video to engage participants in design activity. This was part of a movement of turning selected video output into a form of design material (Buur, Binder & Brandt 2000). Moving "beyond video as hard data" to a playful design material that could allow for access of anyone sitting around the table. What did you see? It was precisely the format of inconclusiveness of the material that Buur et al. sought to employ as a prompt for engagement.

- Video to represent the user (Brun-Cottan & Wall 1995, Suchman & Trigg 1991)
- Video fragments to engage (Buur & Soendergaard 2000)
- Video as design material (Buur, Binder & Brandt 2000)
- Video as fieldnotes (Blomberg, Giacomi, Mosher, Swenton-Wall 1993)
- Video recorded design scenarios (Halse, Brandt, Clark & Binder 2010)
- Video capture as a design tool (Ylirisku & Buur 2007)

Figure 2. Uses of video in research and design

In collaborative design and participatory design prototyping activities, Mackay and Rayard (1999) and later Ylirisku & Buur (2007) demonstrate how the act of taking video shapes the collaborative design activities. It is used purposefully and tactically as a tool within the facilitation of ongoing activities, often to capture the flow of action of design concepts. It can therefore move the design process forward and trigger reflection activities for designers to make concrete the functions and use characteristics of the design. However, there is something different between using video as a playful intervention tool in design activities, to using it as an intervention tool in ongoing activities that do not fall under the playful umbrella of collaborative design. It is this link to professional practice that nurturing a new form of video capture practice seeks to nurture.

4. Conclusions

This paper makes the case that the simple tools that we adopt and the practices we develop can constrain and expand the collaborative potential of design world making practices. Project-based design educations provide opportunities for students and tutors to explore the messiness of everyday life even through our own practices. Virtual and physical studio spaces are sites of rich sociomaterial interaction. It is increasingly important for design students to learn how to engage in the complexity of dynamic everyday life through performing in that world, tackling the messy challenges of contemporary society. The current pandemic has prompted extreme changes in how daily life is organized, bringing emphasis to the need for and opportunities to rethink and explore the nuances of sociomaterial interaction. The tutoring encounter is one example of how students and teachers can codevelop new practices.

The use of one-shot video as a tool in the tutoring encounter was shown to relocate the student presentation of their current work from the synchronous activity in the presence of one or more tutors to a two-step or three-step process of student video creation and tutor viewing and response. Rather than the students expending time and effort in carefully crafting a world narrative about their work through selecting materials and sequencing the material for synchronous engagement with tutors, a hand-held camera can be used to structure a collaborative material performance curating shared reference, through moving through different locations and temporalities in the workspace, defining through selecting, highlighting, and representing aspects of available resources. The video capture format was shown to support students grounding their world making in the zero position of reference, a practice of locating self in space and time. Introducing the constraints of an expansive video capture, video made in a single sequence rather than merging or editing, occasions an open performance frame that suppresses negotiation of what will be said, introducing pressure to fill the frame, and to keep the flow moving prompting designers to demarcate the current state of their world-in-the-making. This practice re-orients video capture and production from a time-consuming crafting practice, to an interventionist tool for provoking world making performances. This use of video is a radical departure from the more common uses of video in design, demonstrating possibility for exploration and preparedness for professional practice.

Gamified e-Learning approached through Emotional Design in the Post-Covid-19 era.

Na Wei [a], Yong-Ki Lee*[a], Juyoung Chang [a]

[a]Dongseo University
*ykl77@gdsu.dongseo.ac.kr

Abstract | In response to the Covid-19 crisis, this article proposes a theoretical framework that combines e-learning, emotional design, and gamification on reviewing the three areas to meet the new need for a changed paradigm in education and e-learning. This research concludes that education needs to explore a new paradigm of gamified e-Learning. For this, the authors propose an education research model that provides an overview of three components impacting future learning. These are (1) the new importance of distance-education as a knowledge production platform, (2) the influence of emotional design on positive learner experiences, and (3) the role of gamified engagement for sustained learning motivations. This theoretical framework provides directions for education leaders on how schools should adapt to the 'new normal' of the Covid-19 era.

KEYWORDS | GAMIFIED E-LEARNING, GAMIFICATION, EMOTIONAL DESIGN, LEARNER ENGAGEMENT

1. Introduction

As the world is struggling with the effects of the Covid-19 crisis, many aspects of life as we knew it are questioned for their practicability. Among many other fields, Covid-19 has fundamentally affected education and challenges us to rethink, explore, and innovate how we will learn in the future. Thus, this paper answers the call for a 'new normal' concerning education, and that there is a need for novel learning formats. E-Learning is one of the disruptive new forms of teaching that brings many opportunities but also faces many challenges. On the positive side, e-learning has allowed us to keep schools and universities running during the Covid-19 crisis by shifting face-to-face classes to online meetings and increasing overall participation in Learning Management Systems (LMS). On the negative side, however, e-Learning still has to solve the problems of how to be engaging through a screen, how to facilitate social learning processes when it is hard for individuals to maintain motivation in isolation, or how to support studio classes and experiential learning that rely on physical & embodied interactions and experiences. Making e-Learning become the 'new normal' requires us to improve our understanding of its full potential. Yet, to do so there is a need for proposing targeted theoretical frameworks and new design methodologies.

To have a clearer view of the current state and future perspectives of e-Learning we propose a paradigmatic understanding of how education has changed throughout history. In the various generations of educational technologies, the way knowledge is conveyed has transformed from pushing teacher-defined content from a single source (e.g. the classroom) to having the learner actively pull learner-centred content from diverse sources (online and offline).

The Education 1.0 paradigm was about 'downloading information.' Similar to the early Web 1.0, which was the first evolution stage of the internet, the Education 1.0 model can be defined as centred around a top-down approach to delivering content. Keats et al. provide a comparison to Web 1.0: "Education 1.0 is, like the first generation of the Web, a largely one-way process. Students go to [school] to get education from [teachers], who supply them with information […]. Students are largely consumers of information resources that are delivered to them, and […] activities are for the most part undertaken in isolation or isolated local groups. Rarely do the results of those activities contribute back to the information resources that students consume in carrying them out" (Keats & Schmidt, 2007)

Education 2.0, in contrast, has highlighted 'open access.' As Web 2.0 is known as Participatory- or Social Web that emphasizes user-generated content, Education 2.0 is about new interactions among people and represents new ways of technology-enabled shared knowledge. It supports open discussions that take place directly and rely on peer guidance and mentoring. Similar to Web 2.0, Education 2.0 allowed more interactions among students, teachers, and learning content. With the use of cooperative and global learning, Zoom video conferencing, collaborative wikis, and blogs, education has shifted to a more connected, innovative Education 2.0.

Table 1. Education Paradigms

	EDUCATION 1.0	EDUCATION 2.0	EDUCATION 3.0	EDUCATION 4.0
CHARACTERISTICS	Downloading information	Open access to information	Personal knowledge production	Innovation production
COMMUNICATION	Static / teacher to student	Dynamic / teacher & student to student	Dynamic / teacher & student to student & teacher	Real-time / everybody to everybody
TEACHER'S ROLE	Source of knowledge	Guide to knowledge	Mentor to knowledge production	Collaborator for knowledge production
STUDENT'S ROLE	Passive receiver of knowledge	Active collector of knowledge	Active owner of knowledge	Responsible author of knowledge
E-LEARNING	Almost none	Blended	Mostly online	Ubiquitous
LEARNING OUTCOMES	Grades	Academic knowledge	Practical knowledge	Life competencies

Building on this, Education 3.0 was based on the premise that content is openly and readily accessible. It has expanded the idea of open access to include the new focus of 'personal knowledge production.' With a focus on structural changes, Education 3.0 pursues the breakdown of boundaries between teachers and students, in which the difference between the teacher and student roles, as well as space and time distinctions, become blurred. Education 3.0 has emphasized self-directed, interest-based learning where education is motivated by problem-solving, innovation, and creativity.

We have now arrived at the Education 4.0 paradigm, which is about 'innovation production' and in which a student grows into a dynamic knowledge and innovation worker who is a creative, imaginative, and inventive person working with anybody, anytime, and anywhere. In Education 4.0, knowledge is produced in practice by individual and team-driven activities. Communication technology is always evolving with learners as a source of development and creativity, while teaching is achieved in all stages of living, studying, and working by real-time feedback loops that are continuous and ubiquitous. There are no predefined teacher positions anymore as everybody, everywhere becomes an innovation production source. Accordingly, schools are situated in the globally networked human mind, innovatively supplementing and replacing classrooms. Table 1 offers an overview of how Education 4.0 compares to its predecessors.

Despite all the enthusiasm for Education 4.0's innovation, it struggles from a lack of social learning experiences, as individuals sitting in front of a screen will find it hard to maintain motivation in isolation. Therefore, we focus our research on ways to overcome this lack of engagement and motivation by learning from research insights in the field of gamification. The purpose of using gamification design in e-Learning environments is to extract game

elements that make learning efficient and fun and adapt them to the e-Learning process. In this way, learners can acquire knowledge easily and joyfully. Kapp defined gamification in the learning context as the use of game mechanisms, game aesthetics, and game thinking to attract learners, stimulate action, enhance learning, and solve problems (Kapp, 2012). Although gamification has brought some encouraging results, design approaches have brought significant risks, According to Browne and Urh (Browne et al., 2014; Urh et al., 2015) nearly 80% of all gamified applications would not achieve their targets due to poor design. We found that the main reason for these failures is that gamification as a new attempt in the e-Learning environment is still at the early exploration phase, most of the related research and designs over-emphasised the simple stacking of game elements and mechanisms while lacking a targeted theoretical framework and systematic design methods.

In this regard, the present study aims to firstly reveal the potential positive and negative impact of existing gamification practices on e-Learning, and on this basis, to propose a theoretical design framework for solving gamification design flaws for the Post-COVID-19 era. Our main research method involves a literature review and a subsequent theoretical modelling of gamified e-Learning.

2. The Impact of Gamification for e-Learning

In the past decade, gamification has received extensive attention in e-Learning. People are increasingly interested in its potential as a motivational learning strategy and the improvement of the learning experience.

2.1 Positive impact of gamification

Existing literature shows that gamification has advantages in improving learners' emotional, cognitive, and behavioural output.

The emotional benefits of gamification in e-Learning are mainly reflected in the learners' motivation, satisfaction, enjoyment, and even flow experience. Buckley (Buckley & Doyle, 2017) reported that the learners' extrinsic motivations can be successfully resolved by using game principles as external incentives or rewards. Adukaite et al. even contend that it can increase both the intrinsic and extrinsic motivation thereby inspiring learners to experience gamified learning (Adukaite et al., 2017). Scholars also have confirmed that applying gamification elements to training systems had a positive impact on the user's satisfaction. (Alcivar & Abad, 2016). In addition, gamification has provided a positive contribution to the enjoyment and flow experience (Zichermann & Cunningham, 2011) of learners. Research has shown that learners enjoyed the gamified learning context more than other training methods (Baxter et al., 2016).

Furthermore, previous studies showed that the behavioural benefits of gamification were reflected in the impact on engagement, interaction, and social connection. The results of

some empirical research revealed that the use of gamification elements is positively correlated with learning engagement (Çakıroğlu et al., 2017; Ding et al., 2017). Some scholars also proved that gamification design should rely to a large extent on the interaction support and social connection between learners to promote changes in learning behaviour (Abou El-Seoud et al., 2014; Chang & Wei, 2016).

Finally, cognitive achievements and learning outcomes are the most explicit purpose of using gamification in e-Learning, and some studies have also confirmed its positive benefits. Doyle (Doyle et al., 2014) found that gamified learning intervention produced a positive impact on learning achievements. This is similar to the results of another empirical study which showed that gamification can improve participants' academic performance and results. In addition, gamification can reinforce critical thinking and probe learners to examine problems from diverse perspectives (Paraskeva et al., 2010; Tan & Hew, 2016).

2.2 Negative issues of gamification

We can see that the benefits and potential for improving education in e-Learning have been praised in many studies. Nevertheless, this is still a controversial educational issue and has increasingly received much criticism in that gamification design for e-learning may not always be beneficial.

Some reports pointed out that gamification could not successfully increase learners' emotional benefits such as the need for satisfaction and intrinsic motivation, compared to those in a non-gamified learning environment (Hanus & Fox, 2015; Kyewski & Krämer, 2018; Mekler et al., 2017).

Under the theme of behaviour, gamification has obvious negative effects on self-engagement (Fitz-Walter et al., 2017), community support factors, and peer collaboration (Phung, 2020).

Other scholars have also proved the negative impact of gamification on cognitive learning achievement. They pointed out that not all learners can benefit from gamification and achieve the desired learning outcome, and even learners who engaged in the gamification context had lower test performances (Hanus & Fox, 2015).

3. Proposed Design Framework

From the previous review we found that although most researchers have proved the potential benefits of gamification in e-Learning, in many cases, gamification has not achieved the expected learning results. Therefore, this study aims to propose a new theoretical framework for combining e-learning design elements with Werbach's gamification model and Norman's emotional design theory to help guide the implementation of gamification design in e-learning.

3.1 Design Action's Three Elements in the e-Learning Context

The design action should at all times include three elements: person, process, and place(Chang, 2020). When designing for e-Learning, these elements would translate to learners, learning engagement, and e-Learning environment. The relationship between them is highly interdependent. The interaction among these three elements produces the e-Learning experience. We can regard these three elements as a three-layer relationship from the inside out. The learner in the dominant position is at the core. In a learner-centred context, the needs and learning goals of the learner will be the primary concern. Learners generally have stable characteristics, such as their identities, physical and sensory requirements, motivation, experience, and personal preferences (Beetham, 2007). Engagement is regarded as a direct pathway to learning (Lamborn et al., 1992; Skinner & Pitzer, 2012) and is interpreted as the psychological input and effort of learners to learn or acquire knowledge and skills. As an e-Learning learner, focusing on engagement is the most important key to success. The e-Learning environment is an external condition for learners to participate in the learning process, and it can support (or limit) learners' interaction. The e-Learning environment generally includes tools, resources, and artificial affordances in virtual and physical learning environments (Beetham, 2007).

3.2 Gamification Model

Kevin Werbach (Werbach & Hunter, 2015) proposed the top-down pyramid structure Dynamics, Mechanics, and Components (DMC) gamification model, which divides the gamification elements into three structural levels according to the role of each element in the gamification system. The dynamics layer determines whether the gamification can meet the user's internal needs and stimulate users to produce targeted behaviours. The mechanism layer is the process of advancing the game and user participation and is the context of the game. The Game Components layer is the external manifestation of Dynamics and Mechanics. Widely used game elements in gamification like PBL (points-badges-level) belong to this level. The different layers' gamification design for e-Learning should be based on e-learning design action's three-elements and combine them organically.

3.3 Emotional Design Theory Model

Donald Norman defined emotion as a special form of a person's reflection of objective reality, which is the experience of a person's attitude towards whether objective things meet human needs. Emotional design refers to the integration of emotional elements into the design process to meet the physical and psychological needs of users (Norman, 2004). Based on this, Donald Norman proposed a three-level emotional design model: visceral design, behavioural design, and reflective design. The visceral design refers to the immediate emotional effect, that is, the most intuitive and instinctive first feeling brought by a design, which is the starting point of emotional processing and aimed at the shape of artefacts to meet the needs of the senses. Behaviour level design is the play of design in the entire

behaviour, including the emotions generated during the entire use and interaction process, and focuses on product functions and performance. The level of reflection refers to the continuous thinking brought by the design to meet the higher level of human emotional needs. It is a non-intuitive emotional design and is affected by the other two levels. Emotional design thinking provides strategic guidance for product and system design, and it also applies to the gamification design of e-learning.

3.4 Proposed Framework

Therefore, this study combines the above three aspects to propose a new theoretical framework of gamification design for e-learning, as seen in Figure 1.

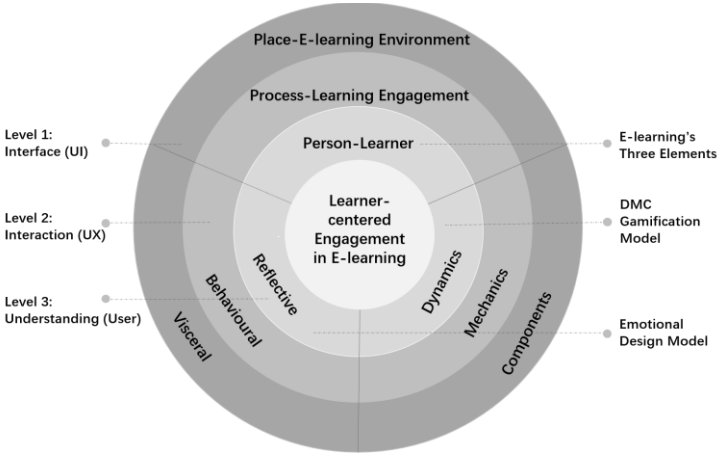

Figure 1. Theoretical framework of gamified e-Learning based on emotional design

- Level 1: Interface (UI). The first emotional design level emphasizes the game components, which refer to the learners' need for an intuitive user experience in the e-Learning environment. A clear hierarchical structure, simplified interface, real and vivid visual presentations, and other intuitive requirements are the concerns of this layer.
- Level 2: Interaction (UX). The second emotional design level aims at the construction of interaction between the mechanics of learning and gamification on applying scientific-educational methods and appropriate learning contents for design so as to help learners achieve their expected learning outcomes.
- Level 3: Understanding (User). The third emotional design level focuses on the user's benefits such as the learner's emotions, needs and goals. The gamification design should pursue a flow-state of gamified e-Learning to realize the

satisfaction of learner-centred needs and the stimulation of learning through intrinsic motivation.

5. Discussion and Conclusion

This article reviewed the research and practice of gamified e-Learning of the past ten years and discovered the possible benefits and barriers of gamification for education. On this basis, we put forward a guiding theoretical framework from a design perspective. This is a gamified three-level framework that takes into account the core needs of learners and the interaction with the e-Learning environment to obtain a good learning experience. This education framework provides an overview of the three components impacting future learning. These are (1) the new importance of distance-education as a knowledge production platform, (2) the influence of emotional design on positive learner experiences, and (3) the role of gamified engagement for sustained learning motivations. This framework contributes to the theoretical guidance for education and education leaders on how schools can plan e-learning and how they should adapt to the 'new normal' of the Covid-19 era.

As this study only covers a small selection of reviewed papers on gamified e-Learning of the past decade, further theoretical and observational experiments on the needs and engagement of e-Learning learners as well as the gamification design methods and processes for e-Learning are needed for future studies. The future research direction will be about how to support physical interactions over a distance: Face-to-face education in studio classes has the advantage of experiential and behavioural learning that teaches practical skills in natural rather than in GUI-mediated settings. Future work will have to answer the question of how to compensate for the lack of physical feedback and interactions in e-Learning through design methods.

Secondly, another research direction will be to understand further unintended consequences of Gamification. In our preliminary review, we found issues such as a lack of satisfaction and intrinsic motivation, negative effects on self-engagement, and an undesirable impact on cognitive learning achievement. However, the proposed framework needs to consider more topics regarding the ethics of gamification design. For example, we have to ask how to solve more advanced negative issues such as addictive behaviours, exploitative practices, and undesirable physical impairments (e.g., high sensory or cognitive load) and how to prevent them when applied to e-learning. The focus should not just be on the external reward elements of gamification but rather on the internal motivations that make the learning experience itself become the reward.

Abstract | The ongoing Covid emergency has highlighted some criticism in the Italian healthcare system, evident in the differences in access to care and in the difficulty of managing hospitals, overloaded by the number of patients: it is necessary to propose alternative models to overcome these problems.
The enhancement of outpatient clinics can contribute to a process of de-hospitalization of the system, making the infrastructure more sustainable, inclusive, democratic and widespread and adding value in a new normalcy.
The paper proposes a new approach for a vision of a decentralized and distributed healthcare, based on blockchain technology; it explores the potential of a new ambulatory format, where 3D printing and digital technologies contribute to the delivery of more targeted services; it shows a device designed following the hypothetical guidelines of an ambulatory, to describe its operational model. It seeks to highlight what the role of design might be in unstable contexts.

KEYWORDS | BLOCKCHAIN, DIGITAL FABRICATION, EXTENDED REALITY, DESIGN FOR TRANSITIONS, HEALTHCARE

1. Introduction

The pandemic has demonstrated the urgent need to rethink and modify our lifestyles, our development and consumption models, to find a balance with the world we inhabit: new approaches and new management methodologies, which deal with the creation of value and on with the use of digital technologies, are necessary to activate greater levels of coordination between the various stakeholders and to promote the development of services in the medium and long term.
The project presented in this contribution is part of a research still in progress. The expected developments will lead to the definition of management guidelines and to the formalization of a mvp of the product described later, to create an integrated model of socio-digital innovation.
The aim is to nurture critical thinking through the conceptualization and visualization of systemic and complex design hypotheses, which highlight the urgency of changes and transitions, and can contribute to the development of new paradigms of normality; to demonstrate that there is the possibility of hybridizing the current health system with alternative models of organization and management of welfare. In this way, it will be possible to promote inclusive and democratic processes, as well as to ensure the creation of value chains parallel to the traditional ones.
Design, in this scenario, can certainly act at different levels, take on various roles with different approaches, methodologies and tools: in this contribution we want to highlight how it could be a catalyst for processes of transition to new paradigms, able to cope with growing, distributed, widespread and global problems; how it could take on the traits of facilitator of processes of dissemination and democratization of certain types of knowledge. Similarly, certain technologies can have a disruptive social impact and create new relationships between the actors involved. The integration of blockchain, extended realities and digital fabrication in the system can help in generating solutions to emerging issues.

2. Motivations and goals

There are several reasons that led to carry out an applied research activity in this area: the first, as already stated, is represented by the ongoing emergency and the consequences that it is having in the health sector with the inevitable and contextual emergence of new challenges. Facing common challenges and identifying opportunities for improvement leads to define a sort of transversal platform on which to operate, allowing the valuable sharing of transferable skills from different disciplines and actors, to enhance the quality of life in all its facets.
The aim was therefore to reflect and devise a possible alternative model of healthcare, which can accompany the traditional ones, in order to make local structures more effective, encouraging a process of de-hospitalization and capillarity of personal care services. These services could then become more targeted and customized, generating benefits for both the

patients and the doctors, who will have the opportunity to build a more human and, therefore, more effective relationship.
Another motivation, closely related to what has just been stated, lies in the awareness that greater integration of certain technologies in the reference sector can foster systemic innovation, improving the current healthcare system and, consequently, the well-being of people.
Finally, it is believed that design should be able to support and to help processes of transition to alternative models able to cope with new and growing distributed, widespread and global problems (Irwin, 2018).
Furthermore, we want to demonstrate, through the project subsequently described, how this should be possible, applying methods and tools belonging to different areas of the discipline.

3. Context

The Covid19 pandemic is an event that has undermined our health and changed our daily lives, our work, and the way we interact with the outside world. It is also contributing to affect the ability to maintain life standards, causing important issues for the economy and, consequently, for social well-being.

3.1 Italian healthcare system

Since 2008, the Italian National Health System has undergone a progressive evolution and transformation towards a coordinated regional system based on collaboration and centralized planning, which limits the repetitiveness of delivery structures and certifies skills and needs; in this way it is possible to centralize management, to process functions and to standardize certain clinical and care practices (Babusci, Giachi, 2018).
Current legislation has allowed for greater regional self-sufficiency, in part by reducing the number of ASLs/AOs. On the other hand, the differentiation of business objectives across the territory has strengthened a systemic vision and unified planning (Giorgi, Pavan, 2018).
These factors favoured the adoption of co-planning methods and collaboration between actors, reducing the competition between public and private providers (Sarchi, 2016).
The Lombard model is an example of the effects of the legislation in place, which seeks to integrate the health system to the social welfare system, because they pertain to a single category of undifferentiated need (Sarchi, 2016).
In the Lombard case, the integration between hospital and territory is implemented in the adoption of care pathways based on the interconnected action of various professionals, with roles defined by their competencies (Cajazzo, Longo, 2018).
Institutional actors have the task of constituting a supply of services focused on the needs of the patient. The role, therefore, of the Lombardy Region, carried out through the Agencies

for the Protection of Health (ATS in Italian), is to plan and manage the system constituted by the different actors (Cattaneo, 2018).
On the guidelines provided by these institutions, the Presidi Socio-Sanitari Territoriali (PreSST) were established, which offer medium and low health and social-health services, both at outpatient clinics and at patients' homes; within these centres, it is possible to activate periods of hospitalization for simple inpatient stays, with little pain and little need for assistance.
Individual, appropriate and continuous care, creation of connections between hospital and territory, in order to reduce hospitalizations, and contribution to the economic sustainability of the welfare system are among the objectives of these places. They are configured as spaces of integration of knowledge and as models of organization and as flexible tools, able to connect the different territorial services.
They are effective in overcoming a model of care based on individual services integrated by the patient; in shifting the focus from the disease to the human being and his/her peculiar problems and disorders; in providing systemic services of care, which are fundamental especially in some cases; in building a network that enhances each professional operator (Curry, Ham, 2019).
The ideas presented in this contribution arise from the recognition of a potential effectiveness of models such as the one of Lombardy, and from the conviction that the introduction and integration, within them, of different technologies and knowledge, can contribute to a faster achievement of the objectives highlighted, also aware of the consequences that a health emergency may cause.

3.2 Enabling technologies and case studies

The role of digital technologies in nurturing innovation is undoubtedly transversal to all areas: those discussed in this paper, mediated by a design-led planning process, have an important and disruptive value in defining scenarios with a strong social impact, guaranteeing, at the system level, an unprecedented, but much sought-after fluidity in processes, especially in the health sector.
If applied and introduced more pervasively in the relevant sector, they may be able to change the traits of the current healthcare system and to create a range of opportunities and solutions in response to the critical issues highlighted. More specifically, the technologies are blockchain, digital fabrication and extended reality.
The blockchain can be defined as an alternative to the architectural infrastructure of the traditional web and constitutes the ecosystem of several applications, including cryptocurrencies, such as, for example, Bitcoin.
It has three main characteristics: the decentralization of the system, the security and immutability of the operations carried out within it and finally their transparency.
The first is guaranteed by the fact that each user is, at the same time, server and client of the network, since there is no central server, and, in addition to being able to consult them, has a copy of the registers containing all the data; the security and immutability of the

operations are instead allowed by a double-key encryption system, by a hashing system that transforms each type of data into an alphanumeric string and by a validation system that has the task of confirming and writing each new transaction in the next block of the chain; finally, transparency is guaranteed by the structure of the blockchain itself, articulated in blocks that contain information about itself and the previous block, viewable by every user of the network and potentially unalterable, due to the fact that the modification of a single one would make the whole subsequent chain invalid (Razzaq, 2019).
A key application is the smart contract, a digital contract based on an algorithm that certifies its execution, which automates bureaucratic processes, eliminating the need for a guarantor (Attico, 2018).
Most blockchain applications pertain to decentralized finance (DeFi): these include stablecoins, cryptocurrencies that have a unit value relative to the dollar; currency exchange platforms; lending and credit platforms; lottery systems; payment systems; risk insurance; and derivative instruments.
The blockchain infrastructure enables the creation of entities or groups that recognize value in something other than money: D.A.O.'s (decentralized autonomous organization) are organizations that define themselves, by their very nature, as autonomous with respect to traditional bureaucratic processes, and eradicate the concept of pyramidal organization, de-centralizing the power of governance and distributing responsibility to all members.
They make it possible for users to interact in internal activities and decisions through an e-voting system that, operating on a web 3.0 architecture, overcomes the risk of low security of operations carried out on similar 2.0 platforms.
The D.A.O. system is articulated on the delivery of digital tokens, not fungible, which are obtained by actively participating in the life and management of the organization and, proportionally to merit, give decision-making power to each user (Sims, 2019).
The difference between cryptocurrencies or coins, used in DeFi, and tokens, used in D.A.O., can be found in the type of applications accessible through the two tools: the former enable the user to participate in economic and financial dynamics, while the latter in social and organizational dynamics, since the assets given value within the reference blockchain are different (Sims, 2019).
Below, we are going to present a case study of blockchain application for the medical sector, to facilitate the understanding of its potential: Medicalchain, developed by Electronic Health Record, which aims to create electronic clinical records.
It enables users to give access to their data to doctors and other professionals, recording the interactions that occur with this data on the chain.
Medicalchain is working on developing two applications that can be accessed from the platform; a telemedicine service that connects patient and doctor, for a small fee, and a health data marketplace, in which users can negotiate commercial terms for the use of their data by third parties.
From the patient's perspective, the time taken for a consultation is massively reduced because there is no need to be seen in person by the doctor. By providing a telemedicine

service, Medicalchain is able to improve the patient experience by facilitating consultations from a visual perspective and by making the relationship with the physician more effective. In addition, the telemedicine service allows users to select the specific date and time for the visit; furthermore, they will be able to choose the doctor who will conduct the consultation, allowing them to establish a personal relationship with them, no matter where they are both located.

There are several benefits brought by the service for the doctor as well, such as, for example, the ability to conduct the visits from wherever they are; Medicalchain will also provide doctors with access to patients' medical records during the visits.

This case study is useful to show the potential of blockchain applications in the medical sector, capable of securing patient data, deepening the relationship between doctor and patients, and empowering them to not be passive about the care they receive.

Shifting our attention to the other technologies of reference - 3D printing and extended reality - they too, in their peculiar areas of reference, can bring a number of improvements and open up the creation of new dynamics, processes and relationships capable of producing solutions targeted to the needs of different users.

An interesting case study involving the 3D printing sector is represented by the Easy project by Isinnova, a company based in Brescia, in northern Italy.

During the first wave of the pandemic, the company was contacted by a former primary physician who submitted the idea of creating a 3D printed element to repurpose a snorkeling mask already on the market into a C-PAP, for sub-intensive care.

The company, together with the doctor in charge, got in touch with Decathlon, manufacturer and distributor of the Easybreath snorkelling mask, who immediately provided the CAD drawings; the product was then disassembled and studied to understand the shape of the new component, a fitting called Charlotte, immediately tested at the Chiari Hospital, with excellent results, although it did not receive any certification.

The company Isinnova therefore decided to distribute the digital model of the component free of charge so that any public or private structure equipped with 3D printers could produce the component and distribute it to those who needed it.

This case study is indicative of the opportunities offered by 3D printing and digital fabrication technologies to create solutions that are easily accessible and distributable in a short period of time.

The last case study highlighted, regarding extended reality technologies, is SIMNOVA, an interdepartmental centre of the Medical University of Eastern Piedmont, which deals with the provision of training for medical professionals.

The structure, as well as being equipped with a series of physical elements, such as mannequins, deputies to the simulation of physiological aspects of the human being, has inside spaces set up with a series of hardware, and managed by software, where learners, in small groups, can participate in various training sessions, aimed at obtaining and strengthening hard and soft skills.

The room used for training, called simulation room, is a white room on whose walls are projected images or videos at 360°, where there are physical elements and characterizing

tools, with which users interact in order to complete different tasks. The practice carried out in this room is observed by the instructors in the control room, through a system of video cameras. Instructors can act on the simulation by introducing new variables. At last, determined by the practice, students and instructors find again in the room of debriefing, where it comes to discuss what just happened, in a way to favour the processes of learning. This final case study shows the possibility to set up a more immersive space, where different activities can take place in order to improve capabilities or to address complex issue regarding behaviours.

4. Project

The project here discussed, which aims to be a system in which an articulated service component and a "multilevel" component of artefacts integrate and interact, can be divided into two parts: the first consists in the conceptualization of a local health system that integrates and implements the one currently present on the Italian territory, starting from the model of PreSST; while the second consists in the development and implementation of a medical device produced with 3D printing technology. The realized product is functional to make evident the potentialities of the hypothesized integrated model.

4.1 Clinic 4.0

The outpatient clinic will be located within urban areas (neighbourhoods), in order to relieve hospital facilities on an operational and bureaucratic level.
The blockchain infrastructure has to be integrated to decentralize and, therefore, to secure the data of different users. The activation of this ecosystem will depend on the collaboration with the current public health system, which is required to ensure the decentralized and closed structure, to be sure that the data will not be accessible to anyone. It will then be certified entities that allow user access to the network.
The D.A.O. system will instead regulate the voluntary relationship of the users with the clinic, who will be able to contribute to the activities of the same, obtaining tokens that can be used to propose new projects or management changes.
The clinic will be managed by doctors belonging to the public health circuit, in collaboration with health personnel and a network of volunteers, established among the users of the clinic. These, according to their skills, will perform different tasks such as, for example, contribute to the management of activities and projects of digital fabrication, take care of patients or spaces.
Through the volunteer activities carried out and according to the level of skills required, each user will accrue tokens that will enable him to become part of the D.A.O. dynamics.
The users of the clinic will interface with the structure and the services provided through an application that will also serve as their medical record and can be linked to that of the public health system. Access to the app will be through a SPID account, which will also integrate

credentials to access the decentralized web and blockchain infrastructure. The public health system will ensure the protection of sensitive data, as well as the activation of servers to enable the operation of the blockchain infrastructure.
Moreover, in this way, in case of hospitalization or need to access the hospital facility, the user will have the ability to share their medical records with doctors.
In addition to the more traditional spaces, it will integrate an area dedicated to digital fabrication with 3D printers and scanners that will create prostheses and instruments for personalized post-traumatic rehabilitation, produce consumables, and experiment with bioprinting.
The projects developed within the clinic will be free distributed to users and shared on the network, to encourage open innovation processes.
The figures involved in this area will be designers, biomedical engineers and technicians, who can be hired or work as volunteers.
Inside the structure will be set up an immersive room, with video projectors, screens, sensors and actuators, to increase knowledge and awareness of health, activate the possibility of carrying out rehabilitation therapies both physical and emotional and psychological, as well as give the opportunity to update the professionals of the clinic, through learning by doing and simulation.
The room can, for example, be used to allow elderly people to perform gestures and activities that they are now precluded from doing and to live certain experiences again, such as taking a walk in a park.
Still in a smart healthcare perspective, a service that the outpatient clinic will guarantee is the monitoring of patients through smart devices interconnected to those of the referring physicians.
One of the cornerstones of the outpatient facility is the concept of open innovation, evident in the "blockchain" management and operational area of digital fabrication, to be reflected also in the smart healthcare model, using open hardware and software.

Figure 1. Smart healthcare systems

Figure 2. Clinic 4.0

4.2 Model PT-1

The developed product, Model PT-1, is a class I medical device that enables the user to measure his/her own body temperature, to check the oxygen saturation in the blood and to communicate the collected data to the clinic doctors. The measurement of the parameters is enabled by an infrared thermometer and a pulse oximeter.
The shells and joints were produced through 3D printing, using PETG, a material that is easy to process; the hardware was purchased from online retailers and the control software was programmed ad hoc for the functions required.
In the most recent version, the device has been made simpler because some details were complex to print; for this reason, the joints between the shells have been replaced by inserts, which allow the object to be disassembled for maintenance and replacement of components.
The product has a simple and usable interface, consisting of a screen that communicates temperature and saturation parameters and buttons for power and navigation.
Using Bluetooth technology, the device connects to the smartphone and to the app where the user's medical record is stored.

Users, in addition to sharing data with physicians, will be able to decide to send it to the decentralized blockchain infrastructure to create a statistical base that can be used by the national health system.

5. Conclusions

The hypothesized system has the potential to change the current health structure, encouraging a growing process of adherence to more inclusive, widespread and democratic dynamics.

We want to reiterate how fundamental is the integration of the technologies taken into consideration, in order to allow, on the one hand, the streamlining of bureaucracy and an increase in the degree of security of certain sensitive data; on the other hand, to guarantee greater accessibility of personal care services.

As for the device actually produced and previously described, it is the vehicle of the expression of the potential that some technologies may have in being actors of a change in the logic of production and distribution of certain goods.

For these reasons, once the final version of the device and its digital interface are completed, the goal is to upload the entire project on open sharing platforms, such as Thingiverse and Github.

On the first platform the files to make the shells, the supports and other plastic parts will be shared: making these contents available to the public allows other people to intervene on the project, making changes and implementations, providing the community with a product in constant evolution and improvement.

On the second platform, instead, the firmware and the operating system of the sensors for the collection, storage and comparison of data will be shared.

Design is a complex discipline with many facets and applications. Several experts, such as Manzini, state that the role of the designer is that of a catalyst and director of complex and

systemic social innovation processes, which require the integration of vertical and different knowledge and a design methodological approach (Manzini, 2015).
In this project, design has the function of fluidizing the processes necessary for the establishment of the enabling structure, which involves the integration of a large number of interlocutors and actors: operators, guarantors, entities – public and private – potential users. An inclusive approach turns out to be naturally applicable to the dynamics and ecosystem hypothesized and could be declined in the creation of processes that involve a large number of social groups around issues of fundamental importance, trying to promote systemic transformations and high impact (Gheerawo, 2016): design therefore stands as an activator for the dynamics of reference.
Design had the role of understanding the nature of an innovation and, therefore, the possible degree of acceptance of it by the users identified; to interpret these aspects and to demonstrate to have mediation skills, not only between the actors involved, but also of the innovation process itself.
Two must be the fundamental characteristics of the designed model, based on a young, but potentially disruptive technology, such as blockchain: to be initially scaled on a local dimension, such as an urban district or a small centre; not to radically change the existing systems, but to hybridize them with features and functions referable to blockchain ecosystems.
Regarding the issue of open source and open knowledge, models of dissemination of projects and knowledge closely related to the digital sphere and 3D printing, it is argued that design can play the role of facilitator of the above, acting at the intersection of different knowledge and disciplines and having a set of tools and methods capable of fluidizing the necessary operations (García-Peñalvo, 2010).
An interesting and open question we want to briefly propose and partially answer to refers to the role of Design in tackling the negative aspects of the aforementioned technologies: can Design tune down these threats? In which way should it act?
We believe that Design processes should be guided by intentionality principles (La Ponte and Fishbane, 2019) in order to identify what attributes need to be prioritized at the expense of others: even before the implementation of technologies, potential social impacts and the misuse should be deeply analysed and understood, to prevent possible negative consequences due to their implementation.

Hospitals' decision-making regarding infrastructural adaptations in response to Covid-19

Abstract | During the first months of the Covid-19 pandemic, crisis management and fast decision-making regarding infrastructural adaptations were key as hospitals faced major challenges while attempting to ensure optimal care. This study aims to gain insight into decision-making processes regarding infrastructural adaptations. Interviews were conducted (in July 2020) with representatives of technical services, facilities and planning departments in six general hospitals in Flanders (Belgium). Interviewees illustrated changes made with building plans, photos and other supportive material. Based on the collected data we identify four main factors affecting decision-making about infrastructural adaptations: enforced measures, demand and supply 'on the ground', knowledge acquired over time, and stakeholders' identities. Whereas the initial approach was predominantly top-down, insights gained into the type of cross-departmental collaboration that was necessary and possible during the Covid-19 crisis may also have value under more regular circumstances to swivel between top-down requirements and design contexts 'on the ground'.

KEYWORDS | COVID-19, DECISION-MAKING, HEALTHCARE, HOSPITALS, INFRASTRUCTURAL ADAPTATIONS

1. Introduction

When the Covid-19 crisis was first labelled a pandemic in March 2020, public health advice urged people to stay at home as much as possible. In hospitals, interactions initially intensified, making it necessary to urgently curate activities taking place in and around these buildings. Activities in many sectors were put on hold or drastically diminished. In Flanders (Belgium), this was also the case for regular healthcare as the government instructed this be put on hold between March 16th and May 3rd. For healthcare organisations, this allowed focusing resources on the immediate crisis and simultaneously entailed re-organising care at multiple levels as (use of) the infrastructure was adapted. As such, the first phase of the Covid-19 pandemic can be seen as a time where new public behaviour and crowd practices were produced (Shields et al., 2020).

In this paper we focus on decision-making that took place within hospitals as they sought to respond to Covid-19, in particular by adapting their infrastructure. We consider this response to Covid-19 a design project with design decisions being made 'in house' and 'on the spot'. A key observation is that the various spatial strategies adopted by hospitals, to make distinctions in the use of space between potentially contagious people and 'stuff', affected the usability of these environments.

For the notion of usability we align our understanding with Van Kuijk et al. (2019). Usability is not an inherent quality of a design outcome but is defined as a function of the context and involves specifying use and user (Bevan & Macleod, 1994 in Van Kuijk et al, p. 140). Van Kuijk et al. develop a framework consisting of 'drivers of usability' which are each collections of factors that affect usability. Important for our use of the term is that the success and impact of usability practices is highly dependent on the organisational context (van Kuijk et al., 2019). User-centred design principles central to the notion of usability and the importance adhered to design methods that introduce knowledge about use and users, form a point of departure to consider 'ad hoc' design in a healthcare context.

Where it concerns architecture and design in healthcare there is a growing understanding that design and designers play a critical role in establishing medical ideas, ideals, roles and practices (Bromley, 2012; Martin et al., 2015). Both construction and experience offer angles to consider the design of healthcare environments and how they change 'in use' over time. Hospitals' response to the Covid-19 crisis offer a unique opportunity as - within a variety of building types - they all faced similar situations. Design quality of physical healthcare environments has been strongly linked to the social interactions and connections the environment facilitates (Anåker et al., 2017) and it is therefore particularly interesting to look closely at situations where spatial strategies are employed to separate Covid from non-Covid within healthcare environments.

A relatively recent shift towards person-centred healthcare entails that patients are addressed as people rather than approached from a strictly biomedical perspective (Lines et al., 2015). While patient-centred care incorporates the aim for a functional life, person-

centred care is seen to aim for a meaningful life (Håkansson Eklund et al., 2019). These types of developments in healthcare in turn affect the built environment (Bromley, 2012) while pandemics of the past have also resulted in shifts in hospital design.

2. Research approach

To gain insight into decision-making processes regarding infrastructural adaptations during the first months of the Covid-19 crisis, we made use of interviews with representatives responsible for these infrastructural adaptations in six general hospitals in Flanders. During these interviews we aimed to capture the culture of practice and professional situation in the respective hospitals.

In order to allow a rapid entry into the organisations to capture adaptations when they were still fresh in mind, hospitals were selected based on convenience in combination with pre-existing connections between the researchers and hospital boards. With this selection, we aimed to cover a broad range of hospital types: both urban and suburban, brand-new facilities as well as older ones, both centralised and dispersed organisations. Table 1 provides an overview of the hospitals, their spatial organisation and location, and the profile of the respective interviewees. Hospitals A and F inhabit brand new buildings taken into use less than five years ago. The other hospitals' infrastructure is older and has, to various degrees, been refurbished and added to over time.

Author 1 and 2 conducted the interviews online (in July 2020) while meticulously taking notes. Some of the interview questions focused specifically on how decisions regarding infrastructural adaptations were taken. Interviewees provided architectural plans, photos and other supportive material to illustrate changes made 'on their watch'. All interviews were recorded. These recordings were used to complement the notes taken in the moment. The notes and provided material formed the basis for the analysis focusing on themes related to the sources of information, people involved in the decision-making process, and prioritising.

Table 1. Overview of the hospitals included in the study.

hospital	interviewee	location	(spatial) organisation
A	director of care supporting services	sub-urban	1 central campus
B	technical and facilities director	urban	1 central campus
C	manager of engineering, infrastructure and master plan	urban	multiple campuses
D	director of facilities	sub-urban	1 central campus
E	manager of technical services	urban	multiple campuses
F	director of quality and strategy	sub-urban	1 central campus

3. Findings

3.1 Enforced measures

A primary factor that influenced decision-making, and how it was organised, concerned measures enforced by the government. In each of the six hospitals a central crisis cell or task force was established to communicate updates and briefings to all other staff. This cell was made up of various key figures and ensured uniformity in carrying out measures. It took responsibility for evaluation and control, and coordinated the hospitals response. Most decisions about infrastructural adaptations were coordinated at this level. Decisions made here were in turn informed by meetings with consultative regional or provincial governmental bodies, external to the hospitals' own organisation.

> "The hospital's Coordination Cell met daily throughout the critical phase and that's where all issues were discussed and communicated. Of course, in these meetings the expertise of the people on the ground was used and a cohort ward was thought through with hospital hygiene colleagues and staff on the ground, in terms of 'where do I enter, where do I get changed, what's clean, what's dirty?'. Nursing staff thought along but decisions were always made under central supervision."
>
> (interviewee in Hospital F)

A mandatory postponement of regular care allowed the various hospitals to repurpose (part of) their buildings and redirect staff to work elsewhere, the latter also affecting how spaces were used. Hospital E initially closed multiple campuses and redirected Covid patients and staff to a single location where both Covid and (a limited amount of) non-Covid care was offered. In other hospitals, entire units were freed up, thus enabling extra doctors to stay overnight, or care professionals to use an empty ward for rest and recuperation. Care professionals on the floor were often not involved in the decision-making regarding the temporary closure of their departments and units. For some, this closure resulted in different tasks and responsibilities and sometimes a new place of work. For example, the catering staff in Hospital D were retrained to work as cleaners when the canteens were closed. Also, for staff working on Covid wards many decisions were communicated in a 'top-down' manner by the head of a department, or through briefings resulting in tasks to carry out or new procedures to follow.

Priorities set by the healthcare organisations (i.e. the 'cells') to a large extent determined where (the focus of) resources were directed. Covid-related concerns 'overruled' many others and the examples illustrate how a 'top-down' enforcement was linked to policy guidelines and was deemed necessary to quickly and effectively roll out measures. Not all measures could be adhered to, as one interviewee illustrates. In their aged buildings, it was impossible to enforce the guideline that (Covid and non-Covid) flows of patients and staff be separated from each other.

3.2 Supply and demand 'on the ground'

The decision-making process necessitated a certain degree of improvisation from those involved, which was partly driven by supply and demand (questions from the ground). Supply refers to both the informal and tacit sources of knowledge, ideas and resources interviewees called on to respond to challenges at hand. Additionally, it points to both tangible 'stuff' (e.g. stocks of personal protective equipment, increased volume of waste, gifts of food for staff) and space (e.g. temporarily empty wards or adjacent buildings available due to renovation plans) which required decisions. Even though hospitals had crisis response plans prior to the pandemic, various interviewees noted that they were unprepared for the crisis to affect the entire region simultaneously. Also, few scenarios envisaged a crisis that would last for months and consist of multiple phases. The coordination of a response by technical services and planning departments were therefore also driven by the questions and demands they received.

> "A unit would hear that they had to start up again and everything had to be done really quickly, well then multiple people jumped into action to organise things. In the very beginning, that wasn't yet 100% coordinated and streamlined … So yeah, that's why people were organising things themselves as much as possible, which was good, right? But then it became really important that it was channelled and assessed by the same group of people, coordinated and only then realised."
>
> (interviewee in hospital C)

Many of the questions from the ground concerned the deployment of 'stuff'. For example, in Hospital C, they were cautious responding to requests for plexiglass screens because they were unsure whether they could keep up with the demand and provide these throughout the hospital. Elsewhere, doctors asked for screens and extra tables in order to distance themselves from patients in consultation rooms, but these were generally not granted as the personal protective equipment they were issued was deemed sufficient. In Hospital E, another example was given regarding a limited number of HEPA filters available to deploy to improve air quality. In theory, the hygiene department advised where these were best placed and the crisis cell made the decisions. However, in practice, they were occasionally deployed to 'show that they were doing something' and 'boost morale'. This resonates with how a technical and facilities director explained that the risk of exposure for staff and the associated fears played a major role in what kept him busy.

> "In those first weeks, we only did Covid, right? For a while there was nothing else … There was a lot of fear. For example, the food that came down from a Covid ward, for the people in the kitchen, yeah, you had to be able to handle that. For people who cleaned, who had to go and clean those rooms, it was similar. Not that obvious. So, that's what you're focused on and nothing else."
>
> (interviewee in Hospital B)

'Carefully listening to what was being asked for' led to new collaborations, often tapping into *what* and *who* was available. Most hospitals entered into intense partnerships with general practitioners to organise emergency departments' triage (Figure 1). One of the nearby university hospitals was considered an important source of practical guidelines and some initiatives were taken based on ideas that came from seeing (in mainstream media) what other hospitals were doing. Also, cross-departmental collaboration within the hospital was a way in which interviewees responded to needs expressed within the organisation. Within Hospital C, the interviewee had taken on additional responsibilities to support the logistics department concluding that a better understanding of another department improved her abilities to function within her own position.

Figure 1. Temporary infrastructure was taken into use extending existing emergency departments with triage facilities (left: Hospital D; right: Hospital C).

3.3 Knowledge over time

Initially, decisions were made under a significant amount of pressure, anticipating worst case scenarios. For most interviewees, the start of the pandemic was a busy and hectic time during which they were adjusting procedures continuously. Developing insights and knowledge that was accrued over time affected subsequent decisions. When the interviews took place, hospital organisations were collecting lessons learned and preparing scenarios in case of a second wave of Covid-19 patients. Interviewees highlighted the value of taking time to consult a diverse group of stakeholders before moving ahead, mainly to avoid making unrealistic or flawed plans. One interviewee explains:

> "The only thing we noticed, not that it was a huge problem, I want to emphasise that, but the only thing is that sometimes because of the acute nature [of the situation] we would work kind of independently. Then care would've gotten started already saying 'OK, we're going to do this and that', while facilities got involved in the second instance and found that we did have to set certain things straight and say, 'OK guys, be aware, you didn't think of this and this. We can resolve that but it's not ideal.'"
>
> (interviewee in Hospital A)

Knowledge that equipped decision-makers in their response was sometimes related to particular experiences gained prior to the pandemic. For example, in Hospital F, the interviewee indicated that they were organisationally well-prepared for the crisis, partly due to their recent move (less than 2 years ago) from 3 separate campuses to a single newly built facility. Coordinating the move (3 years of planning in order to move within 3 days) was considered an ideal preparation for dealing with the pandemic. In his specific role of director of quality and strategy, he described having close and good working relationships with medical, nursing, communication and administrative departments, and that they were accustomed to responding to unexpected issues.

This can be linked to the lifecycles of hospital buildings as recurring theme throughout the interviews. For example, at Hospital C a new building project was in the early design stage. The pandemic was therefore considered 'worthwhile input' as lessons learned could be incorporated in their plans. In Hospital B, planned renovations allowed spatial flexibility that would not have been available under regular circumstances. A number of (already) empty buildings were easily repurposed for use as triage stations and extra storage (Figure 2). The manager of technical services in Hospital E indicated that during the crisis, certain mandatory maintenance tasks were postponed, including the scheduled maintenance of elevators and medical equipment.

Interviewees commented that their own involvement as representatives of technical and spatial planning departments would have been more effective had they been involved early on and preferably within the crisis cell, alongside medical and nursing staff.

> "They were fully engaged with preparations in a medical sense, with logistics and cleaning. They had started up a lot but the infrastructural component was actually not taken into account from the start. You know, of course, once the crisis came 'round then yes, we were of course involved and very able to key into additional demands. Maybe, yes, we were still involved in time but we were less prepared than they were in other areas."
>
> (interviewee in Hospital C)

Figure 2. On-going renovations were interrupted to create a (temporary) waiting room (Hospital C, left). A former crematorium (empty) is taken back into use (Hospital B, right).

3.4 Stakeholders' identities

Finally, the various actors that were mentioned explicitly in the interviews shed light on hospitals' decision-making process. Types of people, groups of users and other stakeholders were labelled. Often the circumstances that interviewees were speaking about necessitated a variety of categorisations, some of which were common (i.e. patients, doctors, visitors). Others were newly introduced due to Covid-19. The specific circumstances of this crisis highlighted the existence of subgroups or brought new characteristics to the forefront. It was remarkable that an important way to distinguish between different types of patients, and users of the healthcare services generally, was entirely new, namely, based on one (being suspected of) having (or not having) the virus (Figure 3).

Interviewees expressed an active involvement in providing services oriented towards creating safe environments for staff and patients. Patients were spoken about as being somewhat at a distance from the daily practice of the interviewees, but were actively linked to infrastructural adaptations when distinctions were made between a) patients with a fever or Covid-suspect patients, b) confirmed Covid patients (seriously ill and more minor symptoms), and c) non-Covid patients. The Covid diagnosis and associated identities trumped any other diagnosis. An interviewee explained that specificities of patient groups were not always sufficiently taken into account.

> "What we perhaps had too little concern for was the differentiation in adult care … Because we repeatedly needed to shift wards to make room for Covid patients we sometimes didn't stop to think about where patients were being shifted to. And yes, at a certain moment we had to say, 'hey guys, the oncological patients need to stay far enough away from the Covid ward'. Because you start shifting that which is adjacent to the Covid ward [to expand it], we ended up with oncological patients coming too close to it, if you know what I mean ... In that sense we didn't have enough of a plan with respect to the patients that are most at risk if they were to come into contact with Covid, to keep them at enough of a distance."
>
> (interviewee in Hospital D)

Care for paediatric Covid patients was challenging in that being accompanied by a parent meant that zones with rigid separations between Covid and non-Covid non-staff persons could not be maintained. Also other patient groups were put forward as having required particular consideration e.g., for gynaecological, geriatric and psychiatric care. Furthermore, no visitors were allowed into the hospitals during the crisis phase of the pandemic. Exceptions (particularly in Hospital D) were made only for a single visitor or family member visiting a palliative ward or other (non-Covid) patient at the end of life.

Staff were separated as much as possible from non-staff. Any shared use of entrances or canteens with other hospital visitors was avoided. Doctors and heads of departments were repeatedly mentioned as being stakeholders who voiced concerns. Cross-departmental collaboration within the healthcare organisations increased and was supported by (cross-campus) thematic working groups. The persons the interviewees often referred to as being

at risk were the cleaners, those engaged in meal preparation and logistics workers. During the crisis certain maintenance technicians were in short supply.

New demands made of the hospital infrastructure required identifying new stakeholder identities. These helped define the aims and outcomes of infrastructural adaptations and in many ways, they co-determined the environmental qualities that were prioritised in the process.

Figure 3. A waiting room in Hospital A was split adding 2 additional spaces: a separate waiting room for (potential) Covid patients and a triage space (left). A nurses' station indicating only those who have not had direct (Covid) patient contact may enter (Hospital F, right).

4. Discussion and conclusion

To gain a better understanding of decision-making processes regarding infrastructural adaptations made in hospitals during the initial crisis phase of the Covid-19 pandemic, representatives of technical and spatial planning departments were interviewed. We identified four factors that shed light on the dynamics between the coordination of adaptations on the one hand, and input from a variety of stakeholders on the other. They are: enforced measures, supply and demand 'on the ground', knowledge over time and stakeholders' identities. Measures issued by the government were enforced in a top-down manner. If we connect this to the usability framework proposed by Van Kuijk et al. (2019),

the prioritisation of usability in our study seems closely linked to safety (from Covid contagion) as guiding value, co-defining outcome priorities and project priorities.

In the hospitals, adaptations were required in response to rapidly changing needs and a changing supply and demand (of space). On-site and ad hoc infrastructural adaptations made in hospitals can be considered 'design in use' (Redström, 2008), where an open-ended design process extends into what is commonly understood as 'use'. This complements related research in healthcare contexts such as Halpern and Anderson's (2020) analysis of an intensive care unit following the completion of a formal design, where on-going adaptations are necessary to rectify (design) flaws and extend the operational life of the unit. The time-frame is different but the processes have similarities. As we have found in previous research (Jellema et al., 2019), a diversity of perspectives is equally valuable to ensure the quality of this ad hoc type of design (outcome) as when it concerns a more formal and demarcated design process. Alongside these diverse perspectives our findings should be seen to complement varied research on e.g. spatial strategies employed to separate flows in hospitals (Annemans et al., 2021; Augustin et al., 2020); construction and furnishing of field hospitals (Ribeiro et al., 2020); supportive design collaborations in response to crisis (Rebola et al., 2020) and indoor air quality (Morawska et al., 2020).

Certain lessons can be drawn from this study for (decision-making in) design in general:

- Firstly, the reasoning behind decisions taken is diverse. As we have pointed out some decisions are directly related to measures enforced 'from higher-up' and the resulting supply and demand. However, alongside actual spatial needs, immediate concerns of users play a role and will sometimes 'accumulate' to result in adaptations being made. Examples include both effective, tangible interventions and initiatives addressing user perspectives but motivated mainly to change perceptions (e.g. to alleviate fear of contagion and boost morale). See Mattern, 2020 for a discussion on plexiglass as 'security architecture'.
- Secondly, the hospital context comes with a wide diversity of stakeholders, from those outside the organisation (e.g. government) and within, to those affected by adaptations, with and without a say in decision-making processes (e.g. staff, patients, visitors). The shifting nature of how these groups are defined raises a concern for a usability approach in terms of who may be overlooked. Nurses, for example were rarely mentioned in the interviews while some sources suggest that in the past they have been a vital link between management and work 'on the ground' but are no longer sufficiently represented in management (Van Merode & Brouwer, 2020). Although largely outside of the scope of this study, our findings also resonate with concerns about decisions to (temporarily) shut down select medical services impacting on some patients disproportionately (Chu et al., 2008). Further research is needed to investigate whether (permanent or semi-permanent) infrastructural adaptations employed during the Covid-19

pandemic have made physically accessing healthcare services more challenging for particular user groups.

- Thirdly, this study highlights the importance of reflection during and on design. Attitudes towards users can change over the course of a design process (Van der Linden et al., 2018). It may be relevant to keep in mind that knowledge has more value to a design team when available earlier in the process (even if considered less reliable) than when provided at a later time (van Kuijk et al., 2019). For crisis situations and ad hoc design, the urgency of the situation demands on-going reflection and incorporation of methods that can further support cross-departmental collaborations.

Limitations of the study include the lack of opportunity to explore experiences of the realised infrastructural adaptations, which could have potentially offered a more nuanced view on how user perspectives were addressed in decision-making. Furthermore, alongside the interviews, interviewees were invited to share relevant documents. The quantity of material provided differed significantly between hospitals and a more systematic approach could have enriched the analysis.

The insights presented may inform day-to-day healthcare facility design and may help to improve collaborations between design practitioners and (within) hospital/healthcare organisations. Supporting bi-directional communication is an important aspect of this. The crisis cell or task force that guarded the uniformity of infrastructural adaptations within hospitals and across campuses required intense communication throughout the organisation. Furthermore, actively anticipating the stakeholders that add particular perspectives or know-how to planned infrastructural adaptations can enhance outcomes. This study suggests that the type of cross-departmental collaboration that was necessary and possible during the Covid-19 crisis may also have value under more regular circumstances in order to swivel between top-down requirements and design contexts 'on the ground'.

Abstract | During the 2020 pandemic, telemedical consultation became a core tool for continuous access to healthcare. However, the skills required of medical teams to provide pediatric healthcare through telehealth are new and undeveloped. To address these issues, our pilot study focused on the interaction between the nurse, patient, and provider with telehealth technology. This study sought to provide evidence that training protocols for operation of a telemedicine system such as a telemedicine cart and its corresponding attachments are highly effective. Based on our results, users (nurse and provider) need to be familiar with the functions of the cart and its components. This suggests that an interactive training system consisting of hands-on learning and augmented reality can elevate a pediatric telemedicine visit, from a video call to a comprehensive physical exam. This research received a "Pilot Translational and Clinical Studies Program" grant from the US National Institutes of Health in October 2020.

1. Introduction

With telecommunication becoming more accessible, advanced, and affordable, telemedicine is emerging as a mainstream approach to increasing access to healthcare (Wooden, 2001). Telemedicine can broadly be defined by the delivery of healthcare services via telecommunication platforms, such as a smartphone or computer. The healthcare services provided by telemedicine are rapidly expanding and can include everything from a phone consultation with one's physician to sending health data to one's medical provider via a smartphone app. The use of this technology has increased dramatically since the 1990s in order to make healthcare more inclusive to marginalized populations (Perednia, 1995). There are various medical fields, such as psychiatry, cardiology, dermatology, surgery, ophthalmology, genetics, oncology, gastroenterology, dentistry, and geriatrics, that have utilized a telemedicine/telehealth approach frequently (Di Cerbo, 2015). During the 2020 pandemic caused by the novel virus SARS-CoV-2, telemedicine and telemedical consultation have become a core tool for continuous access to healthcare. Almost all clinical units, from hospitals to private practices, have adjusted their services to address the need for a low-contact healthcare delivery method required during the pandemic. While patients who once were only familiar with in-person medical consultation quickly became comfortable with teleconsultation, the rapid transition to telemedicine has left health care providers using a very limited version of this technology due to lack of experience or knowledge of telehealth capabilities.

A prime example of this dilemma is evident with the challenge of incorporating telemedicine carts into a nurse's routine. Telemedicine carts are an emerging technology that integrates traditional medical examination tools, such as a stethoscope or otoscope, with the telecommunication capabilities of video call and image transfer. Telemedicine carts often consist of a monitor and camera for video conferencing, with medical examination tools capable of transmitting images via video conference. Despite the extensive capabilities of the telehealth-compatible medical tools, most telemedical visits are limited to audio and general video communications. In the majority of cases, this is caused by the lack of proper training in using these sophisticated tools and equipment, especially for pediatric physical examinations. Studies show that employing a telemedicine approach can significantly improve the quality of pediatric care in a remote setting, and be greatly beneficial to distant clinicians (Makkar, 2018)(Noroña, 2020).

Also current telemedical equipment is generally adapted for use with school-age children and adults who can cooperate and communicate with the healthcare team during a patient encounter. The use of this equipment, typically configured as mobile carts, requires background knowledge of the devices and functions used during a patient encounter. Current available training is brief and occurs either offline or as part of a telemedical encounter. This approach may result in a less efficient process for encounters with preschool children, infants, and their parents.

Although augmented reality (AR) has been used as a training tool in many medical procedures, most existing systems are focused on highly trained practitioners (Albani, 2007). Examples include procedures such as neurosurgery (Tabrizi, 2015), laparoscopy (Leblanc, 2010)(Nicolau, 2011), and ventriculostomy (Yudkowsky, 2013). Recently there have been several research studies that have been looking into using Virtual Reality (VR) and AR in improving the clinical experience. For example, Mahesh B Shenaei et al. and Mariuna Carbone et al. have used virtual or augmented Interactive systems in their study for assisting remote clinical encounters. However, both their systems demand extensive funding to setup for the system operation. (Shenaei, 2011)(Carbone, 2016). For this reason, design concerns have been geared toward high precision systems and less emphasis has been put on user experience (Dey, 2018)(Smith, 2020)(Wang, 2020). While we are working to provide accessibility for rural populations with limited resources to make access to healthcare more inclusive, these types of setups and arrangements are not the best fit. Our hypothesis is that by understanding the context of the interaction between the telemedicine cart, its operator, and an infant/child during a pediatric examination, we can create an affordable and feasible multi-type interaction training system (combination of hands-on learning, online instruction and, AR) that not only can provide a reliable training at any time or location, but also can guide the operator through the examination procedures specified by the physician and the interaction with the cart equipment and interface (Privitera, 2015).

In order to use telemedicine to create inclusive access to pediatric healthcare in low-income and rural areas (Zachariah, 2012), a feasible training program for telemedicine cart operators can increase the quality and accessibility of care for young children and infants. Utilizing telemedicine, access to pediatric healthcare could be more inclusive in low-income areas and, considering the need for basic knowledge and understanding about telecommunication, young adults (parents) are an ideal target group for this technology. While the provision of telemedicine for adults is relatively mature, integrated telemedicine for the care of infants and children is undeveloped. Lack of training related to use of this technology for infants and preschool-age children leads to its limited use for this patient population. With the impact of the COVID-19 pandemic on online medicine, most of this population became familiar and comfortable to some degree with these telecommunications with their providers. Considering this population, and the special needs for physical evaluations, a reliable complete physical exam (e.g. including case management or detecting any possible condition) is needed (Zachariah, 2012). This physical exam consists of a multitude of steps and tools in addition to some level of technique, requiring the cart operator to repetitively practice to effectively interact with this especially challenging population. Much data needs to be clearly transferred between the physician, and the operator, using the cart and its parts, so seamless communication is critical for this information exchange. In this case study, we investigated the current status of a simulated telemedical encounter for infants and preschool-age children through a pilot study to provide the primary knowledge for a multi-type interaction training system for telemedicine cart users (primary and secondary user).

This transdisciplinary research was conducted at Carilion Clinic Center for Simulation, Research and Patient Safety during summer 2020.

2. PLANNING AND DATA COLLECTION

The pediatrician team member experienced frustrations related to communications and cart operation during encounters with school-age children, but completed them successfully. When asked by parents of infants and preschool children if they could participate in telemedical encounters saving up to 4 hours round-trip driving to appointments, he realized that additional training would be required, especially for the cart operator to interact with the parent-child dyad, and approached VT Industrial Design to address this need. We took the team science approach in forming a transdisciplinary team to address this problem that included design and usability evaluation, biomedical engineering, medical clinicians (physicians, nurses, and respiratory therapists), computer science, and psychology. We had access to the resources of the Carilion Clinic Center for Simulation, Research and Patient Safety; the Department of Pediatrics; and the Telemedicine Department; thus providing a rich simulated clinical environment and the equipment needed for design and testing within a clinical context. Complementing clinical access, we brought the technical resources of Virginia Tech's Industrial Design, Biomedical Engineering and Mechanics, Computer Science, and Psychology departments. This case study was conducted in four phases, 1) Observation and learning, 2) Experiment planning and preparation, 3) Data collection that included Simulated Telemedical Training and infant and preschool-age child clinical exam, and 4) Data analysis.

2.1 Current status of telemedicine practice in infants and preschool-age children - Observation and learning

In order to understand the current interactions between different stakeholders (nurse, provider, patient, etc) and the computational devices or systems involved in the telemedical encounter, our team participated in a hands-on experiential session with the Information Technology (IT) expert from Carilion Clinic to learn the technical and functional aspects of the telemedicine cart (Avizia CA750 Telemedicine Cart from American Well (Kim, 2017)). This investigation helped us to learn more about the device, its peripheral attachments, and their capabilities. This also gave a better understanding of all the entities and people involved in this hypothetical experience. In Figure 1., stakeholder mapping shows all the interactions and relationships between the stakeholders in this scenario. The arrow's direction shows the flow of information and interactions and the line thickness is the representation of the frequency of the interactions between them. During the primary data collection, we realized that the current training procedures themselves were still in the experiment phase, which influences the design of the experiment and data collection methods and tools. Figure 1. shows that the nurse (cart operator) is the primary user of the cart, and she/he needs to

have the most comprehensive understanding of the cart and its capabilities to create the most efficient communication with other persons involved.

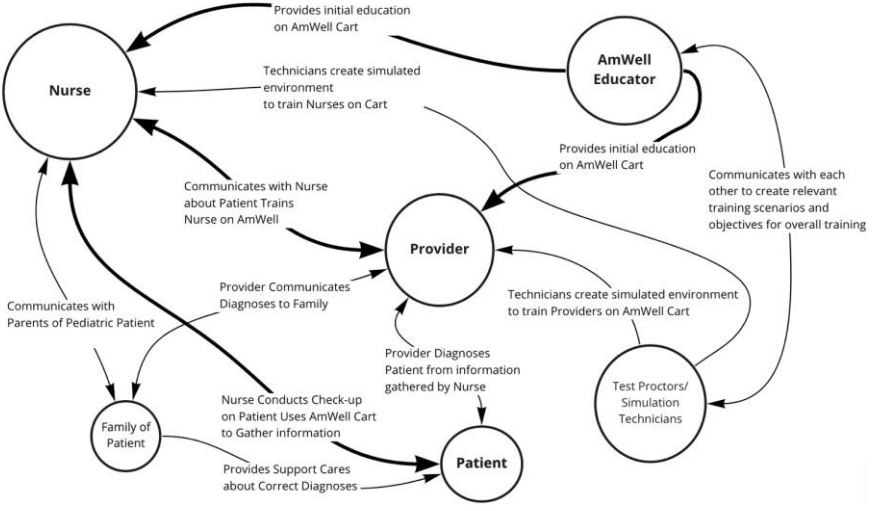

Figure 1. Stakeholders mapping for simulated clinical infant/preschool child evaluation completion during a telemedical encounter

The major components of the American Well Avizia CA750 Telemedicine Cart (Figure 2.a) consisted of an adjustable camera, a monitor, a navigation panel, a workspace, and drawers that housed the auxiliary medical scopes. The Avizia CA750 Telemedicine Cart served as the central unit for all tasks performed by the nurse. All patient information, collected by the auxiliary medical scopes, and communication were relayed through the Avizia CA750 to the remotely located provider. This cart also comes with four peripheral devices as attachments that expand capabilities for the operator, which are the main advantages of using this cart instead of simple video conferencing. Using this equipment can greatly assist specialists in early condition detection, and case management in teleconsultation (Zachariah, 2012). Our case study cart (Avizia CA750 Telemedicine Cart) peripheral devices consist of:

- Avizia Horus Scope and Charging Cradle Series 2 and “General Attachment” for collecting close up visual information from the patient. (Avizia Manual)
- Dermatoscope attached to Horus Scope for a magnified image of the skin.
- Otoscope attached to Horus Scope used for ear and nasal examination.
- Thinklabs One Digital Stethoscope, attached directly to the cart’s main stand to amplify heart, lung, and digestive tract sounds. (Figure 2.b)

Figure 1.a: (Left) American Well Avizia CA750 Telemedicine Cart, Figure 2.b: Peripheral attachment, (Middle top) Horoscope and General Scope, (Middle bottom) Dermatoscope, (Top right) Otoscope, (Bottom right) Stethoscope

2.2 Experiment planning and data collection

After preliminary data collection to understand the user journey analysis for primary (cart naive nurse) and secondary (provider) users, our team planned the experiment (including the training and physical exam) based on the available resources and specific needs of the stakeholder in a pediatric exam session. The goals and expectations for all individuals involved (telemedicine cart naive nurses and pediatricians, cart instructor, patient, guardian) were considered while forming this experiment and data collection (in a simulated infant physical exam). The experiment was planned in three phases:

1. *Training:* First, hands-on experiential learning of cart's functions (main components and peripheral attachment) was provided to both cart naive nurse and provider.
2. *Physician Routine:* Going through provider's exam routine prior to the patient's visit to enhance a feasible communication between the nurse and provider.
3. *Infant and preschool-age child physical evaluation:* simulated telemedical evaluation preschool aged child simulated telemedical evaluation.

Experimental tasks and data collection were also performed at the Carilion Clinic Center for Simulation, Research, and Patient Safety. The primary area of physical task performances conducted by the volunteer nurses and instructors consisted of a patient-centered observation room, equipped with three discrete cameras for recording the process. The recording center, a control room for the three cameras that also allowed real-time video analysis, was adjacent to the observation room, sharing a wall that included a one-way mirror. This enabled direct observation to take place without disrupting the workflow of the

nurse during the various telemedicine cart tasks or of the instructor giving the telemedicine cart overview.

In addition to using the patient-centered observation room to record behavior, interactions, and conversations, Tobii Pro II Eye-Tracker Glasses were used during the simulated child and infant exam by trained nurses. The Tobii Pro II Eye-Tracker Glasses track the wearer's eye and pupil movement as well as what the wearer is seeing and the length of their gaze time. The eye tracking data helped us gather information on how long it took participants to find each tool and button when operating the cart, as well as where they looked first if they were not able to immediately locate the correct location. This data can be used to improve the user flow and operation of the cart but indicating what features need to be emphasized within the interactive training system.

2.2.1 Research Tools and Methods

While reviewing the training for the cart functions and also physician routines, note-taking and observation were used, which was followed by thematic analysis. During the experiments, various qualitative methods such as fly-on-the-wall, discrete camera, and audio recording, and post-interviews were used for data collections by the research team. In addition to these more traditional data-collection methods, eye-tracking (Tobii Pro-II eye-tracking glasses) was used by the nurses during the child exam phase. Camera recording and note-taking were used specifically to comment on interactions between the nurse, physician, and telehealth cart. When applicable, close-up videos of the nurse and/or physician were taken to understand which components of the telehealth cart and software were either intuitive or difficult to navigate. Photographs were used to document the layout of the cart, individual room layouts with the cart that the nurses created, and ergonomics. The collection of data collected by these mixed methods were used to create thorough task analysis graphics with all the details about every step and breaking down the process into details, pain points. We chose various types of data collection which provided us with a mixture of data regarding, environment, interactions (human to human, human to devices and human to procedures), cognitive understanding and its relation to the interactions or actions that are happening in each stage.

Interviews were conducted at the end of the observational study of experiments, (including training stage, physician routine, and child exam) and audio recordings of each interview were taken for reference and clarity of information. These data provided an additional perspective on the challenges or advantages of the telehealth cart. Furthermore, by asking a set list of questions, we were able to compare answers across nurses of different demographics and also confirm our interpretations from observing their behaviors. All data were compiled at the end of the experiments and with thematic analysis tools we were able to turn them into trends, such as "successful communication," "points of technological difficulty," "specialist complications," "nurse complications," and "training forgotten." These trends were used to identify common points of success and difficulty.

2.2.2 Design Approaches

Prior to observational studies, a device breakdown of the Amwell Telemedicine Cart was conducted. The device breakdown categorized each component of the telemedicine cart into main component, component subset, physical description and ergonomics, function, and intuitiveness of use. With each component listed and described with the above qualitative marks, the research team was able to anticipate certain cart functions that may pose greater challenges to the user. The anticipated challenges helped construct the preliminary training protocol used during the observational studies.

Throughout the duration of the observational study, persona profiles were created and adjusted for the primary users of the cart, including the nurse (pediatric and non-pediatric), physician, child/infant, and parent. Profiles were created for a hypothetical user in each category, with the approximate age, education level, communication pathways, and barriers, and anticipated frustrations being considered for each persona. A preliminary draft of the persona profiles were created prior to any observational studies. These profiles were created based on literature review and anticipated trends from known demographics. After the preliminary draft was created, the persona profiles were updated after each observational study with the additional information acquired from in-person interactions with each user.

From the observations of the training and physician's routines, a user journey was created for the nurse and physician for each task. User journeys are characterized by the step-by-step breakdown of tasks, including the time to complete each task. With a user journey, a user's "pain points"(points where the user struggled to complete a particular task) and "gain points" (points where the user excelled at completing a task) can be identified. With gain and pain points identified, need statements were created to address areas of conflict between the nurse, physician, and telemedicine cart. These need statements helped guide the future observational studies and ideation of possible solutions.

3 CASE STUDY DATA ANALYSIS

The data collected during the experiments using different methodology and tools helped us to first, gain a better understanding of barriers to utilizing the telemedical equipment currently available for evaluation of infants and preschool-age children. Second, it identified the opportunities for education of personnel who evaluate infants and children, including the healthcare provider (physician, NP, PA) and the telemedicine technology cart operator (nurse, therapist, other). To identify the barriers in a hypothetical telemedical encounter that can create access to a full capacity pediatric visit, we mapped all stakeholder's user journeys (nurse, pediatric physician, instructor, infant/child, parents/guardian) and were able to identify pain points within the entire process of a telemedical encounter by task analysis. Here in Figure 3, you can see a brief for the task analysis of the infant/child evaluation completion during a telemedical encounter. Pain points discovered through this

analysis led us to actionable items for designing the interactive training program which can improve the entire experience for all stakeholders involved.

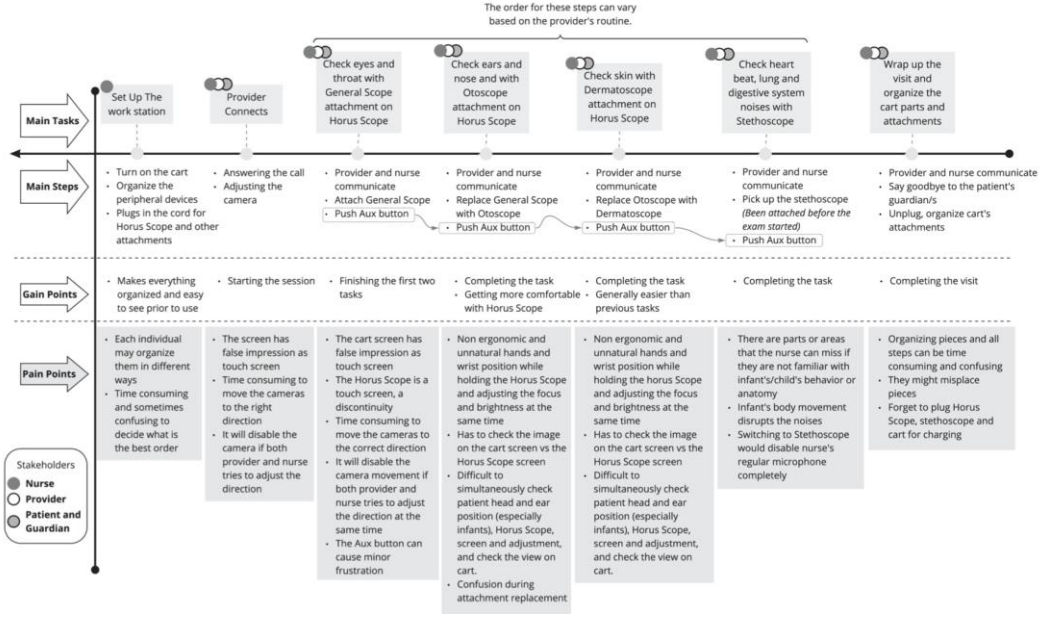

Figure 3: Task analysis for simulated clinical infant/preschool child evaluation completion during a telemedical encounter

In addition to the data collected through observation and interview, as mentioned before, the data collected by eye-tracking glasses (worn by nurses) was also used to measure the cognitive load during interactions with different parts of the computational system. The collected records were analyzed by Tobii Pro Lab software for each individual as well as all participants. In this case study, we chose to focus on two screens mostly used by the nurses, 1) Monitor on the main cart and 2) Horus Scope screen.

The monitor on the AmWell telemedicine cart provides the key interface for communication between the nurse and the provider. Over the duration of an exam, the nurse is tasked with answering the teleconference “call” from the provider, orienting the cart’s camera view to allow for a full-body image of the patient, navigating the auxiliary button on the cart panel for each digital tool, and ending the teleconference call. For each individual task, a numbered gaze plot on a reference image was created. After all tasks were recorded, a heat map was created for the entire duration of the patient check-up. These data provided a meaningful measure of the nurse's cognitive load that acted as complementary data in

exploring correlations between pain points revealed in task analysis and user's attention. For example, in Figure 4.a. you can see the heat map indicates some key areas of focus such as Auxiliary Button which was also repeatedly identified as a pain point during the observation and post-experiments interviews. The increased amount of focus time on the Auxiliary button indicates that this step in the process was not intuitive.

Also by analyzing the participant nurses' gaze patterns on Horus Scope and comparing them with the pain points gathered during task analysis we were able to validate the cognitive and physical interaction complications. These complications related to "Focus" or the "Brightness" adjustments, compromised the provider's ability to clearly assess the patient's ear and nose. (Figure 4.b.)

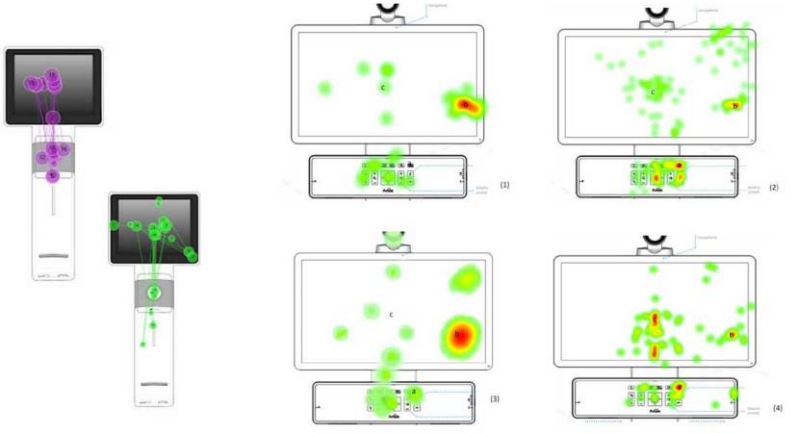

Figure 4.a: (Left) Horus Scope's gaze plot map for two nurse participants, Figure 4.b.: (Right) Cart monitor heat map for four nurse participants (All Reference images were collected from the user manuals for both the AmWell Telemedicine Cart and the Horus Scope II. For the workspace, a reference image was manually created in a simple design interface.)

Besides finding quantifiable trends through eye-tracking analysis to identify needs in training and protocols, these data also provide a series of infrastructural information for designing and prototyping our interactive training program (combination use of hands-on and AR) in order to enable an efficient and cost-effective education and training.

The suggested AR part of the training was decided as a result of a variety of findings during our pilot study. The need for accessibility at any time and location was one of the main reasons that makes AR a desirable alternative to an in-person training session provided by cart educators. Also, the possibility of programming the AR system based on the cart specifications or physician's routine makes this proposed training a customizable system. Additionally, the interviews showed concern about memorizing all steps to use the cart and peripheral attachments in the right order for the first time after the training and/or over

time. Overall this study suggests that integrating AR in this training system can be a great addition in providing inclusive access independent of a certain location or a person such as a cart expert.

3.1 Training System Design and Prototyping in progress

Currently, our team is working on confirming the plan for the training system steps with clinicians in order to provide an accepted level of reliability for different users' point of view. This Analysis will help us in designing and prototyping efficient and cost-effective education and training. Figure 5. shows a prototype suggestion of a possible AR view that a nurse sees through the wearable AR glasses. Although the identified current barriers in the telemedical evaluation of infants and preschool-age children clinical encounters can be overcome through education and training, this training program must meet the expectations for the successful completion of each element of telemedical encounters. For this matter, a reliable target threshold for successful completion of each element of telemedical encounters by identifying means to evaluate personnel as they perform simulated telemedical encounters tailored to the new training system needs to be established to evaluate the prototype.

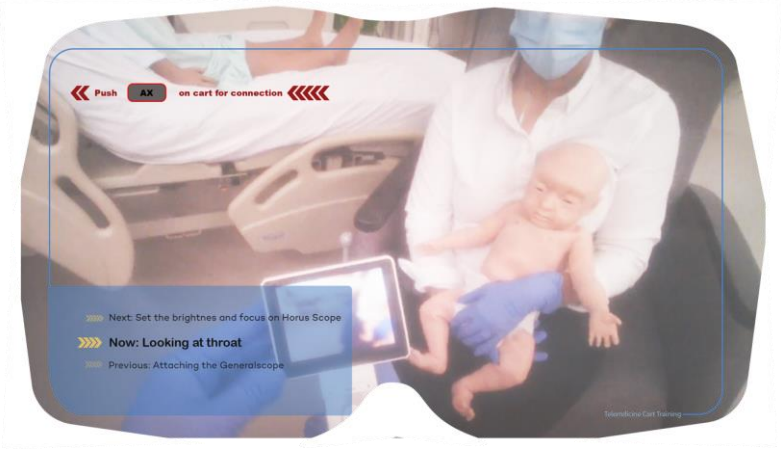

Figure 5: A Mockup of an AR screen as nurse's view (The background image is borrowed from preliminary testing during summer 2020)

4 CONCLUSIONS

Our case study demonstrated that a successful examination of an infant or preschool-age child requires the cart operator to possess additional skills related to working with both the parent and the child. Additionally, it is critical that both members of the provider and cart operator dynamic understand the technical aspects of cart operations thoroughly. In order

for this goal to be achieved, an interactive training program for providers and nurses can be designed. It is important that all participants are trained on the Telemedicine Cart functions and interactions and beyond general knowledge about apps that provide video-based telemedicine visits in a virtual office setting. This preparation can lead to a seamless experience for all parties involved, especially the patient. An understanding of both sides of the virtual interaction as well as a plan for the examination will facilitate effective communication between the nurse and provider in order to create a successful patient examination. To be properly equipped for this experience it is also critical that participants (nurses and providers) have the opportunity for hands-on learning with the screen of the cart and all accessory components, as they have a specific way of connecting and supplying the provider with patient information. By being familiar with the main cart, its attachments, and various functions, nurses and providers may assist each other in case they encounter difficulties during an appointment. To further facilitate smooth communication it is recommended that the nurse is familiar with the physician's routine and they take the time to set up a clear view of the patient in the environment before starting the exam.

This study suggests that creating an interactive system, using a combination of hands on learning and augmented reality, with the addition of labels and other organizational tools to the workspace can elevate a pediatric telemedicine visit, from a video call to a comprehensive physical exam.

In addition, within our case study multidisciplinary approach on various aspects such as forming the team, designing experiments and conducting the research allowed us to vet the efficacy of our approach from multiple aspects. Also community-based participatory research principles were critical additions in gaining a wide range of insights from multiple range of user groups and their needs in a procedure with a complex user experience process.

Abstract | This paper presents the process to build and maintain a collective project between five design schools in Mexico City. In 2018, the Inter-University Design Workshop started as an "innovative education project that understands design as a mean for linking students and design faculty to the construction of open, diverse, and collective platforms for the materialization and testing of intentions and solutions to the complex problems of contemporary urban Mexican society". In the context of COVID-19 pandemic lockdown, the project continued in a digital format, keeping the initial intention of bringing students close to one other, by action and will, for the guild's sake and for their capacity to collaborate. From the strategies and outcomes that TiUD (Taller inter Universitario de Diseño) member students reached, we take valuable conclusions as clues for the new normal in education for our Workshop to secure its continuity the following years.

KEYWORDS | EDUCATIONAL INNOVATION, HIGHER EDUCATION, DESIGN ACTIVISM, DESIGN FOR SOCIAL INNOVATION, DESIGN FOR SUSTAINABILITY

1 Introduction

“The City belongs to its citizens. Is conceived as a physical space, that brings civilization, citizenship, secularity and habitable for the full exercise of its possibilities, the equitable enjoyment of its goods and the pursuit of happiness.”

Art. 12th Mexico City’s Constitution (2016, p.31).

Mexico City is the archetype of a complex unequal macro-city. Local government and inhabitants struggle and live through a time of multiple challenges and constant interrelated transformations, intensified in terms of scale, complexity and lack of resources as time passes. In this context, there's not much alternative than look for a space of civil freedom and power to create and transform the spaces we inhabit as the most important exercise of our urban life. Understanding freedom and ability as a possibility to thrive, in search of what we have in common as Mexican designers, is the Interuniversity Design Workshop's pursued goal.

Having to cope with the great defiance and urgency to build a "More Liveable Mexico City for All", design as a discipline and designers as citizens are confronted with the question of "How to contribute to the creation of an environmentally sustainable urban context and a fairer society in which living is worth living?". An additional challenge for this task is unifying perspectives, keeping the fundamental differences while enriching our collective interpretations of the surrounding reality. Bringing together design students from various socio-economical-cultural contexts represents the City's richness and complexity; using these representations as a powerful tool to communicate and understand has been one relevant outcome and incentive to continue this work.

From this stance, design practice and its guild present valuable resource to find transformative answers, transcending the sphere of aesthetics with a potential to explore. In Buchanan words, "the role of design in sustaining, developing, and integrating human beings into broader ecological and cultural environments, shaping these environments when desirable and possible or adapting to them when necessary" (1992, p.10).

The third opened an opportunity to behold those questionings answering with a new one: How can we harness the design student's collective talent to design a better city for all? Our response as a collective-academic group was presenting students the occasion of open dialogue, understanding each other through empathy -or sympathy- and acknowledging that this is the City of ours, in a time we have to live in it. Shared responsibility and desire kept us together through the last three years: a wish for a better future for our time being and generations to come. The COVID-19 pandemic lockdown offered an overlapped dare that we accepted, not without caution. We are sure about the need to find new ways to survive and collaborate, being truthful to our commitment.

2. TiUD Origins

2.1 Mexico City as World Design Capital

Mexican designer's guild is an energetic and vibrant yet unlinked community. Often, we ran into each other in events related to design; we are glad to meet, but those encounters do not usually lead to networking or beneficial collaborations. Although, we can be good friends or acquaintances. In 2016, World Design Organization designated Mexico City 2018 World Design Capital (WDC) as:

> "The sixth World Design Capital™ and the very first city from the Americas to receive this title, Mexico City has a powerful story to share on the world stage, as a model for other megacities around the world using design to tackle the challenges of urbanisation and ensure a more liveable city." (WDC, 2017).

Laboratorio para la Ciudad (City Lab) was the government entity coordinating the guild and programs. The planning started with worktables by topics, including the "Design-Education Worktable", formed in its origins, at least eight different design schools from universities located in Mexico City. As the first outcome, the University Passport was rapidly developed in a popular program to bring students to the WDC events. Design students would collect points for attending each event, and the "best attender" -the student who got more points- won as a prize a scholarship for a course at the European Design Institute.

The following significant proposal was to build an inter-university class for design students. During the first weeks, that idea was more like a recurrent joke; but soon enough, the idea turned into a dream and later became a provocation for the worktable members. Every participant was a faculty member at a design school; consequently, the challenge to bring together our students and expertise seemed possible yet difficult. The initial consideration was conceiving the workshop as a participatory design activity, framed on the Smith, Bossen, and Kanstrup intention (Thirteenth Participatory Design Conference), describing the participatory design as a tool "to engage not only with the public sphere but also with everyday life, and as researchers engage stakeholders in experimental practices of innovation through a long-term engagement in technology design, social innovation and future-making" (2017, p.66)

The planning for the TiUD's first edition, supported mainly by the City Lab, allow the conditions to discuss struggles that might appear when merging students from different universities in one single project. The design team summoned experts in education and collaborative projects from several countries and disciplines (philosophers, activists, lawyers, and designers). After a few months, we reached a common objective: gathering design students as design activists, promotors of collaboration, to activate Mexican society. The study objects were the City's social issues; participants would collaborate to bring their

attention to each university tradition's strengths and opportunity areas, understanding that we all need each other to get stronger and better.

Thus, the learning objectives for the students were:

a) Understanding design concepts and constructs to leverage social change.
b) Applying methods and tools to face complex problems, using a systemic approach and through design research.
c) Developing collaboration and communication skills to involve the diversity of stakeholders and multidisciplinary work for the collective conceptualisation and visualisation of diverse alternatives to bring the solution of social problems.
d) Analysing the impact of "what is designed" on social reality.

Figure 1. Road map of TiUD 2017- 2020.

2.2 Framework

This century demands specific skills to train professionals to perform effectively and broadly in both social and professional environments, as in their leisure time (Dede, 2010; Yelland, Kalantis, & Cope, 2008). Socioeconomic development requires competent and responsive individuals, and at the same time, active and imaginative members of a society, promoting change in the search for equality. Also, the forms of employment available for designers, today and shortly, are diversified in terms of roles, broadness and focus (Kaygan, Ilhan, & Oygür, 2020, p.15). Consequently, this consideration brings several implications for design education institutions, especially in countries like Mexico, with fewer companies that might hire an in-house designer.

From an academic perspective, design education challenges prescribe the importance of understanding adaptations and improvements in adapting the curricula to the present and

future reality of the employment market for designers. Hence the value in finding an opportunity for an open, refreshing and honest dialogue among the Design-Education worktable members. Every university focus and tradition bring the possibility of bringing together every and unique capacity of our students to solve the complex problem of our city.

Every edition of TiUD takes place in the fall (August to December); consequently, some universities have to adjust their calendars to match others. Then, one can imagine it represents a great effort of coordination for the Faculties. Every student enrolled in the course receive credits for it as an elective topic in their curricula. Moreover, students have to answer the selection process by presenting a video and a letter to expose their intention to participate. Being part of the TiUD as a student comes with significant responsibility and requires the best disposition, for the students are the face of their University. The approach methodology is through Participatory Action Research (PAR). Participants are researchers on the task, following a systematic process and analysis with a vast potential of strengthening horizontal relationships among professionals, colleges, and communities (Anderson, 2017).

Figure 2. Mapping in TiUD 2018.

In collaboration with the Design-Activism worktable and having a sustainable design approach, we assemble a conceptual frame as one single priority for every university representative. The framework includes empathy (Coleman, Lebbon, & Myerson, 2003), context (Alexander, 2012; Primitz, 2018), design activism (Fuad-Luke, 2013; Julier, 2013), connectivity and commonality in a systemic approach (P. H. Jones, 2014; Lurås, 2016; P. Jones & Kijima, 2018). An actual result of how we connected these concepts, a construct emerged: common circuits, which in the TiUD context means logical combinations of notions and knowledge that facilitate understanding and communicating conceptual definitions, finding convergent and relevant elements of each concept.

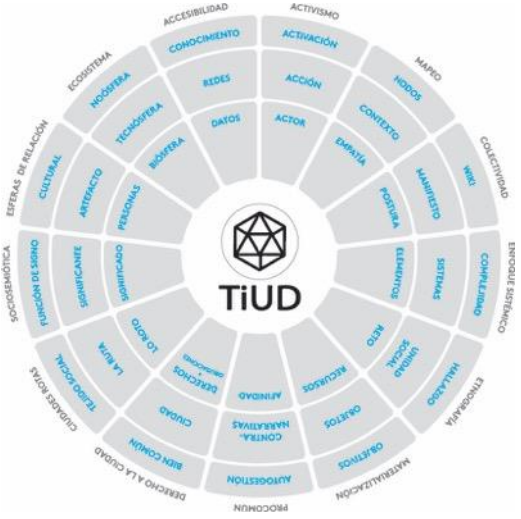

Figure 3. Interuniversity Design Workshop: Common Circuits.

The first edition took place in the context of Mexico City as the World Design Capital. As mentioned before, City Lab supported the project in logistics and promotion. On the other hand, Design Week Mexico™ offered their headquarters, Espacio CDMX[1], as a gathering place and a classroom. All along the course, it was a playful activity; 65 students and eight teachers from six different design schools found themselves discovering opportunities to learn and teach about design in a unique environment. Classes occurred in a garden or inside an old little train station that once was used to ride through Chapultepec park, and now is a memory of some teachers' childhood.

[1] CDMX is the acronym for Mexico City

Figure 4. Interuniversity Design Workshop at Chapultepec Park "Old train station".

The topic for the first edition was social activation; the instructions for students were to design an intervention in a selected local community to which they belong, engaging citizens to find solutions to the issues they faced in daily basis. In the first part, field research was relevant to gather enough information about the problem and the community in a neighbourhood or locality of the City. Eliminating preconceptions, misconceptions and prejudice, is the most challenging part for the group. As a result, we all succeed in identifying ourselves, first as humans, then as Mexican citizens and then as designers. Finding a common language, increasing communication skills and elaborating persuasive arguments were the students' gains up to this point.

For the project's sake and students' sense of achievement, it is always relevant to discuss the challenges that collaboration brings. On the one hand, communication should be fluent, constant and precise to promote equality and acknowledge diversity. On the other hand, as Fernández-Díaz, Gutiérrez, and Fernández (2019, p.80) explain, the promotion of links between contexts and reflections on participatory dilemmas, should be a priority. It means to set the question, "Is what is important for me, important for you in the same way?"

Through mapping the problems around the City, we were able to observe the dimension of the project. We all covered most of the metropolitan area, so we had the opportunity to bring a broth perspective into the analysis; finding the common elements might be the most relevant insights in searching for solutions. One significant case to show was the "Public Space Recovery" project at Iztapalapa. This municipality, located in the City's east area, is one of the most populated in Mexico City: it has more than 1.8 million inhabitants with a population density of 15 635,80 individuals per km² (Alcaldía Iztapalapa, 2019). A first edition participant is an area resident, so she invited her teammates to observe an urgent problem in her community. There was a park with infrastructure as a place for children to play, community members to gather together, close by an elementary school. Sadly, this place was used by drug dealers and for every possible illegal activity. The team members

interviewed some neighbours and discovered a recurrent answer: 'There are good people here ("Aquí hay gente Buena").

Iztapalapa's team came up with the idea of inviting the community to a public space intervention where they will paint the walls, plant some trees and play games with children and their families in the park. They choose to use the phrase taken from the interviews and use it as a model for other messages painted in the park: a reminder for the community of the people they live with – just good people. Community members responded gladly and participated the first weekend, asking for a second intervention the following week. So, the team did come back once more, and neighbours kept repeating the activity until the park felt it belongs to them again.

Figure 5. Aquí hay gente Buena. Public space recovery at Iztapalapa.

TiUD's second edition held 45 students and ten teachers from five universities; it followed five tracks: education, water, violence, food and migration. During an intensive boot camp to kick off the second edition, experts in these topics presented the context of the Mexican reality in these tracks. Students formed their work teams according to their interests and their curiosity in exploring these topics.

It is worth mentioning that talking and proposing discussions about their identity for this generation of students, as students from one University with its correspondent vision, was not challenging as it was talking about their ideology. The idea of representing their University's core capacities was obvious, so they showed no issues working with other school students. However, they found themselves very cautious about sharing political or religious ideas and stances. Providing a neutral space to talk, express themselves, find differences and common ground was the first challenge for this course.

One good example of this edition's outcome was "El Tortamundos"[2] a project about migration. The designed activity was to invite people from different nationalities to spend a couple of hours of their weekends in Parque México, in a central zone of the City. The invitation included the request of bringing any food or dish that belong to people's nation or cultural identity. Every plate should be shared by putting it inside a *bolillo* (a type of bread)

[2] "Tortamundos" is the combination of the word torta, a sandwich made with bolillo, a popular type of bread used in Mexico City, and the word *trotamundos*, which means globetrotter.

to divide the food and pass it among the guests. Once every person had a *bolillo* with a dish inside, visitors held in their hands a *Torta de Mundo* (a World Sandwich). Then, they get to talk about how they felt in Mexico as a migrant.

Valuable conversations occurred in that table; the community of locals -from different nationalities- shared a moment they had not shared before in the whole time they were living in Mexico. Some of the participants continued gathering during the weekends, bonding and assembling a supportive community among them.

Figure 6. El Tortamundos invitation and first test. Migration and lunch at Parque México.

3. TiUD 2020: A New Normal Education case

3.1 Planning

The emergence of COVID-19, for the first time in history, caused the whole of humanity to face the same set of challenges simultaneously (Dussel, 2020). The most evident state of emergency turned us inwards towards our communities. However, with the beginning of the pandemic and the lockdown, uncertainty became present in such a way that we felt compelled to reflect and extend the dialogue towards this issue so that we could be clear about the concepts through which we would build the third edition of our workshop.

To do this, we organized an online forum in which we invited international experts to share their views on how to identify, within what we denominated the "common emergency", what was worth sustaining after the pandemic. Based on the initial forum's information, we understood 'The Common Emergency' (*La Emergencia de lo Común*[3]), as the emergence of

[3] The word *emergencia* (emergency) has two possible interpretations, one referring to "urgency" and the second refers to "emergence". We used both meanings to explain what has been emerged as a shared value for our commonality.

shared values that we must sustain over time. We also know that some other elements we have in common that we should get apart from, to reach solid, integrated and responsible communities, in favour of fairness and equity. That which was common among us, arose at first in this group, as a disobedient will of the state of things and became what sustains us due to its repeated and renewed discovery in students' different rotation.

Thus, the 2020 edition observed civil society, searching for emerging creativity that arose from a crisis context due to lockdown. The design projectt focused on identifying "naive solutions", resulting from necessity and born from civil society. Consequently, opportunities arose where design can contribute to the development, dissemination and systematization of these initiatives. We have called these actions "Emerging Strategies", understanding that they arise out of necessity and will that they are, or could be, a source of inspiration for the design industry.

3.2 Development

Unlike the past two, the 2020 edition, was held entirely online: not an easy decision At the beginning we thought there would be at least a few sessions to face each other in the same space. In the end, we had to let that idea pass, or better, adapt it to the conditions that we considered most pertinent. One relevant concern we had was to bring the students to close since the beginning, so they felt a sense of belonging for they would be willing to bond as a community. To make that possible, we invite all the registered participants to an online breakfast, so we had time to know each other through the story behind the dishes. Some explained that they had their favourite mug that remembered of their grannie's coffee or those were the best tamales in the neighbourhood. By the end of it, we gain a bit of familiarity through those stories, to begin with, the collective work.

Instead of sharing a table, we shared ZOOM™ as a digital classroom and MIRO ™ as a digital board during this edition. These digital platforms were our tools to interact throughout the semester. While the conversation took place in audio and video with the first, the latter allowed us to create virtual idea boards to capture and share perspectives through texts, photos and videos.

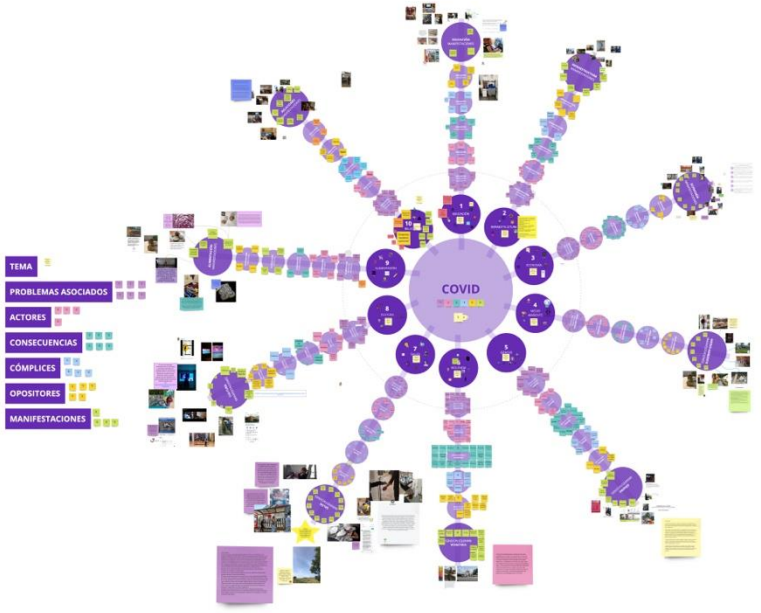

Figure 7. Miro Board. Emergent strategies analysis from Mexican civil society.

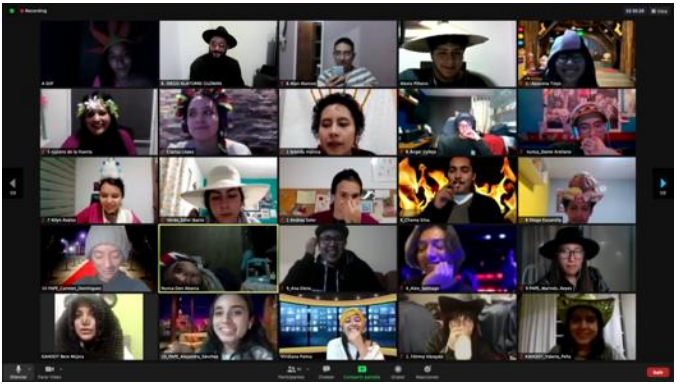

Figure 8. Zoom Party. Integration and bonding in 2020 TiUD edition.

The proposed methodology for this edition came from transition design approach (Irwin, Tonkinwise, & Kossoff, 2015; Kivimaa, Boon, Hyysalo, & Klerkx, 2019), with a vision that seeks the integration and diversity of multilevel perspectives (Geels, 2010, 2019; Moradi & Vagnoni, 2018). For this edition, we reinforce the theoretical framework by taking up

concepts such as the common (Carlisle & Gruby, 2019), sustainability (Garduño García, 2017) and activism (Narberhaus & Sheppard, 2015). We integrate causes-consequences of events analysis as a foundation from which they will make sense of their context and propose new narratives.

The project began in early September and lasted until mid-December, with interuniversity sessions on Wednesday afternoons brought together 65 students and ten participating professors from five design schools. In this edition, we added one extra day a week for professors from each university to meet with their respective students.

Two basic operations fixed the interaction throughout the process: exploring the systemic complexity from reality and fostering a dialogic interaction between participants. To simplify the collected information, drawings and visualization through diagrams allowed a glimpse of the complexity experienced. In such a way, when representing the knowledge acquired, they would make their position explicit concerning the event and, therefore, could communicate their discoveries, giving way to the next stage. The methodological process followed stages and steps in presenting the topics, developing a guided practice and applying the learning outcomes to students' project.

The following sessions schedule allowed us to set the pace and match rhythms between teachers and students. Topics were arranged through the course as follows: a) Problem mapping; b) Historical evolution mapping; c) Future views; d) Improvement stages; e) Designing ecologies; f) Call to action; and h) Presentation and final reflection.

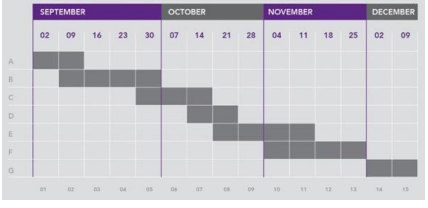

Figure 9. Sessions at 2020 Edition

3.3 Third edition results

The best ideas emerge from moments of crisis. In this emergency - and in others - the inhabitants of Mexico City demonstrated an enormous capacity for solidarity and great creativity towards offering solutions to the challenges that arose. Based on past experiences, this edition surged from the importance of activating our communities as a strategy to extend collective action.

In a virtual forum on December 5th, ten final projects were presented, divided into three conceptual blocks: education, equity and health. The students chose blocks according to

their concerns and the identified priorities. That distribution allowed us to interpret that the outcome brought to the participants to reflect on their situations.

Each outcome has the conditions to be implemented in the present conditions through social media or digital platform development. Students followed their initiative and focus on the result and impact these projects would have on people. It is still a question for us if the participants' commitment will remain after this edition ends.

The project "*México en Miradas*" (Mexico in gazes) presents the eyes' expressions as an authentic sight of emotions, as a side effect of the use of face masks. It invites people to share a selfie while wearing a facemask, describing feelings and emotions that they have experienced throughout this pandemic.

The project uses social media so visitors can find testimonies from other people to promote empathy. By sharing, they create content that fosters a sense of community and support among individuals to pursue the common good.

Figure 10. Mexico in Gazes. 2020's edition on-line project.

3. Conclusions

The Inter-University Design Workshop promotes a diversity of visions about the commonality: the guild of designers, the academic community and CDMX citizens. We have whiteness its manifestation in the shape of interests, purpose, values and, at the same time, dreams, wishes, emotions and commitment. From those manifestations, we hold a shared identity and the will to find solutions for our city and us citizens. As a group, we keep searching convergence, shared spaces and common ground, which sometimes are blurred, but when we reveal them, we get to define what kind of designers are we.

Each iteration brings learnings at different scales: from the progressive definition of the curricula to the diversification of roles. In the third edition, projects' complementarity is evident when observing the students' interconnection process beyond their teams through the coincidence of roles and concerns. During this process, professors guided the students, allowing them to choose their path. Results' quality was surprisingly clear, reached by commitment and compromise inside the teams. An important finding in this digital context was that students could perfectly navigate an ocean of ideas without losing their purpose.

For complexity visualization during the research stage, diagrams and digital boards were fundamental to synthesize, allowing the interconnection between multiple elements and ideas.

However, we did encounter several limitations, mostly related to the extension of the students work beyond the class, e.g., most projects were not linked to third parties nor external communities. These considerations open up new research areas for those interested: we suspect that the disappearance of our physicality withing online activities allowed for more intimate interactions to take place. In this *New Normal*, we founded what we were looking for since the first edition: a way to keep track in real time of the group's activities. By centralizing and recording the online interactions we can transcend time and space, making the context available for people all around the globe and at any time.

Abstract | The pandemic has played the fundamental role of catalyst, highlighting multiple challenges for the creative community needing to reconsider the human-being habits and environmental conditions, in order to rebalance the nature/artifice relationship in all its declinations.
Starting from consolidated and shared knowledge, the fields of design for kids, building physics and urban planning need to synergistically interact to respond to the renewed children's needs as a result of the pandemic, in terms of psychophysical well-being concerning their life in the built environment, with special attention to the urban context and its vulnerability. The research aims to outline an innovative approach identifying a series of actions to drive a new perspective on the urban spaces to better fit the kids-centric focus. The paper proposes a proactive strategy to combine interdisciplinary and multidimensional skills that bring together improved urban resilience and the mitigation capability of the urban environment for kids-centred design solutions. This strategy is applied to design innovative Pocket Parks for Kids.

KEYWORDS | POCKET PARK FOR KIDS, KIDS CENTERED URBAN DESIGN, CHILDREN'S WELL-BEING IN THE CITY, URBAN MITIGATION CAPACITY, URBAN RESILIENCE

1. Introduction and research background

The design aims to provide answers to extraordinary emergencies by turning limitations into new opportunities. The Covid-19 pandemic has forced human beings to rethink their habitat and redefine new forms of living and inhabiting in a multi-scalar perspective. All areas of the European Green Deal after COVID-19 pandemic emergency and within itself require considerable changes in societal practices and the behaviour of individuals, communities, and public and private organizations, from climate action to zero pollution, to anthropogenic pollution mitigation, toward hopefully a more healthy and resilient indoor and outdoor space for all the population groups and social contexts. These changes concern mobility behaviour, minimizing traffic-related emissions and energy/resource consumption, protecting or restoring biodiversity through holistic and nature-based solutions, etc. including changes achieved through collective and participatory processes or a sense of environmental citizenship and climate justice.

Special attention should be paid to the needs on kids' necessity for a high quality of living in the indoors and outdoors, especially in those urban contexts already compromised by huge concentration and densification, low air quality responsible for high sensitivity to respiratory diseases (Dixon, 2002) such as the COVID-19 pathology (Pastor Jr et al., 2002, Batterham et al., 1996), by urban over-heating and over-noising (Doyle et al., 2021, Huang et al., 2021, Kousis & Pisello, 2020). This is even more urgent while considering the United Nations report in World Urbanization Prospects 2018 (United Nations, 2018) which estimates that nearly 70% of the population will live in cities by 2050, and most of them will be under the age of 18.

Various researches in the field of medical sciences had already shown how contact with elements of the natural environment (trees, greenery, water, etc..) improves the health (physical and mental) of city dwellers (Hillsdon et al, 2006; Maas et al. 2008; Li, 2010; Schipperijn et al., 2013) and how staying in a green space produces an improvement in people's individual and social lives (Giles-Corti & Donovan, 2002; Browson et al., 2009; Baur and Tynon, 2010; Raanaas et al., 2011; Kardan et al., 2015; Lee et al., 2015). Epidemiological studies have highlighted the relationship between the presence of greenery in the proximity of the home and the overall health of the resident population, explaining how this phenomenon is due to the general strengthening of the immune system (Kuo, 2015). Other studies (Coley et al., 1997; CJC Consulting, 2005; Hartig al., 2014) have stated how high-quality green spaces encourage inhabitants to engage in outdoor physical activity and healthy behaviours in their everyday life.

Urban green spaces benefit all segments of the population, but especially children, by providing opportunities for intergenerational meeting and socialization. By encouraging physical activity in the open air, they also aim to implement policies to combat various types of disease (cardiovascular disease, cancer, chronic respiratory disease, diabetes, etc.), which are favoured by unhealthy eating habits and lifestyles, increasingly based on sedentariness and distant relationships. In this sense, an increase in physical activity corresponds to a 12%

reduction in the rate of obesity in children. In this sense, an increase in physical activity corresponds to a 12% reduction in the rate of obesity in children. Data (World Health Organization 2019) report that 23.5% of children engage in physical activity no more than 1 day a week, 33.8% of children engage in structured physical activity no more than 1 day a week. This is accompanied by an increase in sedentariness linked to the wrong use of technology by children.

On the other side of the issue, the urban environment has been affected by a variety of anthropogenic actions, producing detrimental comfort conditions, mainly due to air pollution, urban noise and urban heat concentration, dense urban areas with inadequate water bodies and green spaces (Jiang et al, 2021, Ngarambe et al., 2021, Wang et al., 2021, Pigliautile et al., 2020). These phenomena, that affect more vulnerable and exposed to stress and risks heat population, are typically framed under the umbrella of Urban Heat Island. Urban heat is generally counteracted through a variety of already acknowledged strategies, such as cool materials, greenery and water bodies, combined with sapient urban planning (Pisello et al., 2018).

A recent review of sustainability-driven innovations (Adams et al, 2016) showed how innovations for environmental and social benefits have evolved from a narrow technical, product and process focus to the holistic large-scale, system-level needed changes. For this reason, no single area of design is, by itself, sufficient to drive sustainable social development, but it is strategic design thinking that drives innovation. In this framework, a trans-disciplinary and cross-disciplinary effort needs to be implemented with the purpose to better focus the key issues and to propose pro-active, feasible and effective tools and solutions in urban resiliency design and urban wellbeing solutions kids centered. The paper aims to highlight how a solution can also begin with the design of urban parks for children, including appropriate equipment, the design of natural elements and integrating technology solutions for environmental sustainability and multidimensional comfort.

2. Motivation of the study

Urban parks and urban greenery in general, represent simple and effective solutions to face urban overheating and detrimental environmental conditions. In this framework, the COVID-19 pandemic has made the population all around the world more aware about risks we are subject to if environmental conditions are poorly resilient to any kind of positive and negative triggers, from climate change to other hazards, up to the pandemic conditions.

Indoor and outdoor space precise design strategies have become a crucial issue, especially in the framework of social and urban resilience. Disadvantaged and vulnerable social groups and communities most affected by this transition need special attention, that is the reason why this research is mostly focused on children requirements for keeping the high-quality of life and social and health (necessarily linked one to each other) wellbeing.

Several studies state that children who grow up in areas where there is a good presence of parks have a 55% lower risk of developing mental disorders as adults, and that green spaces create greater social cohesion, increases the level of physical activity and improves their cognitive development (Engemann, 2020; Vignati & Terenzi, 2019), also supported by the fact that the proximity to the parks can foster a better spatial working memory (Flouri, 2019) and greater problem-solving skills. Indeed, the playful activities within it promote the creativity of children, allowing them to play freely without any restrictions.

Besides, playgrounds allow better physical and motor development in children. Although physical movement is a natural aspect of human beings and their development, from certain age children are placed in a social system, starting from the school that does not encourage movement. Many studies show that good physical activity in children improves learning, increases concentration and attention, and reduces stress, anxiety, and depression. After all, the ability to practice healthy behaviours (walking, running, playing sports, bicycling, etc.) is directly related to the perception for safe spaces and self-confident behaviours.

Well-maintained green spaces can help educate children to respect the environment and public goods in general, but as the 2020 report of the National Environmental Protection System (Snpa) points out, in Italy, the percentage of public green spaces on the municipal surface is still poor and in two-thirds of municipalities there is a value below the average of 3%. Therefore, this is the moment to propose proactive and concrete tools and procedures to drive feasible alternatives.

3. Material and Methodology

In examining the methodology of designing spaces for children, is important to underline how the greatest ambiguity comes from a different way of seeing the world by children and adults (Day & Midbjer, 2007) but usually, the world is designed only by adults, including the products, services, and spaces that are used by children (Terenzi, 2018). For this reason, there is a need for a design that on the one hand declines the methodologies of UCD in a new kids-centered approach (Terenzi & Vignati, 2020) and on the other, operating in the field of urban design, highlights strategies, on different scales, that reinterpret the relationship between inhabitants and the urban context, including both social and natural ecosystems, with a sustainability-centered approach to public space (Fig. 1, Fig. 2, Fig. 3), ensuring appropriate levels of reception, protection and safeguard for all, that is, creating accessible places (Laurìa, 2017).

Within the holistic framework highlighted, this paper wants to propose a proactive strategy aimed at combining multidimensional skills toward better urban resilience and children-oriented urban design and comfort. This strategy is therefore triggered through innovative interpretation of Kids' Pocket Parks.

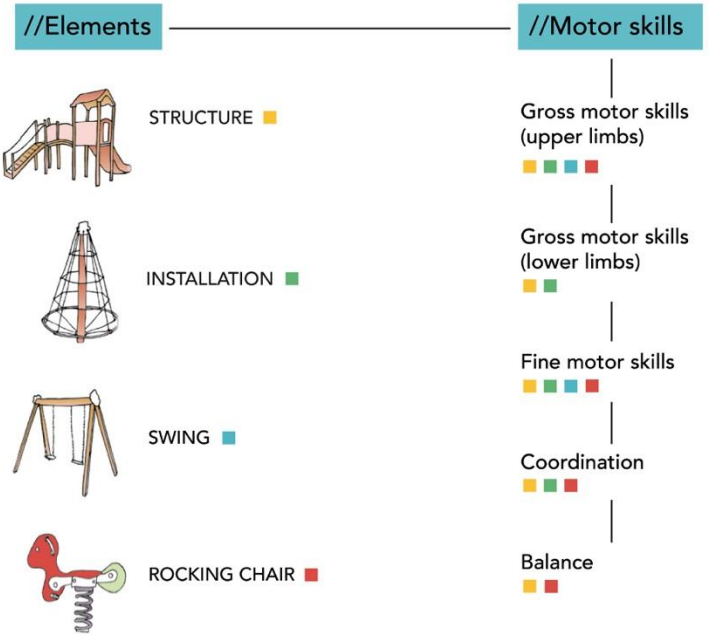

Figure 1. Analysis of traditional playground equipment according to effects on gross, fine motor skills, coordination and balance.

3.1 Pocket Park as innovative green urban area

The playground was one of the most promoted urban spaces in the mid-twentieth century. The playground is, without doubt, a significant space for the conformation of society and its transformative potential is unique. Historically, there have been two major proponents in the past century of this form of urban green space. The first was Robert Moses, Commissioner of the New York City Parks Department from 1934. He inaugurated the creation of nearly 700 new infant playgrounds in the course of 26 years. He defines parks are "the outward visible symbol of democracy" (Stutzin, 2015). The concept of vest-pocket parks was born in Europe after the Second World War as a way of recovering bombed-out urban areas located in spaces unattractive to other primary functions such as housing or commerce. Aldo van Eyck, the then debutant architect of Amsterdam's Public Infrastructure Department, would design in residual spaces and parks throughout the city in the following 31 years and that would become a central part of his career, giving the urban interiors, as they were used to say, a symbolic value in the Modern city they had in mind during the regeneration process.

Pocket parks are a particular declination of playgrounds. These are small public green spaces generally created by regenerating small residual or marginal areas within or adjacent to the most densely populated parts of the city (Bruce, 2017) and represent a viable strategy for the redesign of densified parts of the city.

In the 1950s the German landscape architect Karl Linn brought the concept of vest-pocket parks to the USA, where he coined the concept of "neighborhood commons on vacant lots" (Linn, 2007) intending to create neighbourhood connections in marginal lands to create new opportunities for city dwellers to meet and exchange ideas. Later Robert Zion popularized this new and different declination of the vest-pocket park through the Architectural League of New York's exhibition in 1963.

These “minor” forms of public spaces were designed as sharing and shared spaces aimed at fostering societal interaction, participation and democracy education. Pocket parks belong to different categories and their characteristics change in relation to their location, the privileged recipients (children, adolescents, adults, the elderly, etc.) and the facilities they house and their specific vocation. They can offer numerous benefits at the urban level, in both social and environmental terms, improving urban ecology. They can therefore represent today a new answer to the need for widespread green areas and under the house that large public parks often fail to meet (Laurìa, et al. 2020).

Having acknowledged pocket parks as proximity solutions, open to the public and democratic spaces for social interaction in smart urban contexts, this paper wants to bridge the gap between

1. urban space design for kids, after the pandemic,
2. urban environmental mitigation techniques,

promoting an innovative approach to identifying a series of actions to support the design of urban spaces for children. Starting from consolidated and shared knowledge, the fields of design for kids, building physics and urban planning get into system to respond to the renewed needs of children that have emerged as a result of the pandemic, in terms of psychophysical well-being concerning their life in the urban context.

3.2 Urban space design for kids, after the pandemic

Among the rights universally recognized to children, the right to play and free time is certainly of key importance. It represents one of the aspects that favour the psycho-physical well-being of the child, as a person with specific needs and requirements, autonomous from those of adults. The Convention on the Rights of the Child sanctions these prerogatives, in art. 31, par. 2 "States Parties recognize the right of the child to rest and leisure, to engage in play and recreational activities appropriate to the age of the child and to participate freely in cultural life and the arts". Unfortunately, these provisions meet daily obstacles that undermine the possibility of implementation, such as the social and economic condition of the family, or the educational disparity between families. But the presence of urban play

spaces for children, adequately equipped and usable by all, where it is possible to play a short distance from home, also becomes an element of great inclusion.

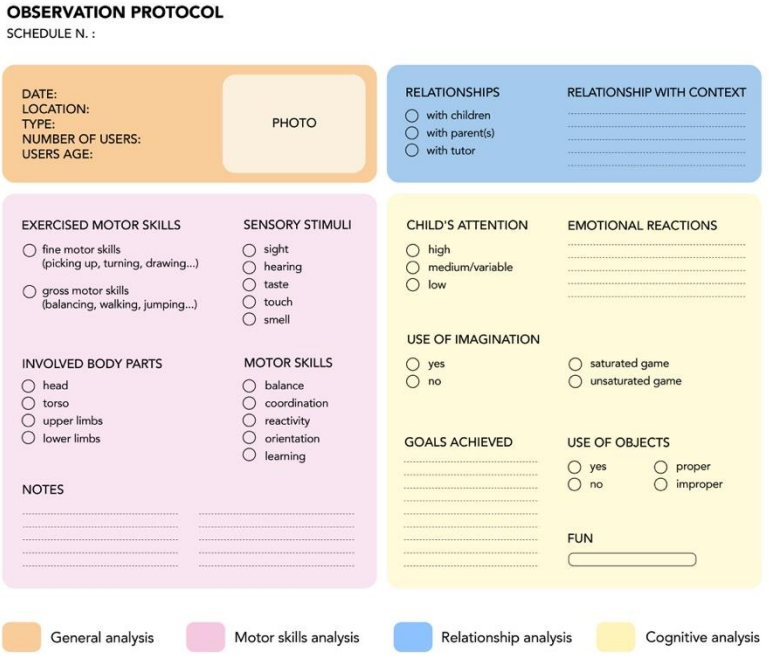

Figure 2. Canvas model for direct observation of children's activities during time spent at playgrounds.

The importance of the presence at the neighbourhood level of equipped urban spaces for children assumes a new value today, also in light of the restrictions implemented because of covid-19, but it was already present in art. 5 of the Charter of the Rights of the Child to Play and Work (1967): "In the community, free playgrounds should be provided, with convenient equipment and at a reasonable distance from homes, protected from the dangers of traffic and busy life, where children can carry out free play, cultural, recreational and sports activities, with the assistance of specially trained personnel and with the possible participation of parents and adults".

In this regard, during the period of restriction determined by covid-19, a normative act that offers considerable food for thought on this issue is attachment 8 to the D.P.C.M. 17 May 2020 (Presidency of the Council of Ministers - Department for family policies) containing the "Guidelines for the safe management of organized opportunities for sociability and play for children and adolescents in phase 2 of the covid-19 emergency".

First of all, the definition of the "right to sociability" in the binomial "sociability and play" is striking, underlining not only the need to guarantee socialization as an existential process, but also sociability that qualifies the person, as already outlined in the in art. 2, Italian Constitution and within the Convention on the Rights of the Child. The document reaffirms in various terms the right to time and space suitable for children and young people, as already stated in art. 2 of the Charter of the Rights of the Child to Play and Work (Rome 1967): "To carry out his activities of play and work, the child needs convenient human relations; as well as space, time, materials and instruments suitable for his age and adapted to his physical and psychic conditions".

From this document, it is clear that the Italian government has become aware of the need both to promote actions that guarantee a state of well-being for children and the role that public spaces and social relations play in this sense. In fact, this is in line with the "Create supportive environments" contained in the Ottawa Charter for Health Promotion of 1986 "Our societies are complex and interrelated. Health cannot be separated from other goals. The inextricable links between people and their environment constitute the basis for a socio-ecological approach to health".

3.3 Urban environmental mitigation techniques

Urban heat island and urban noise island are part of the same physical problem which consists of the local concentration of anthropogenic actions into a small territory, such as the urban environment (Kousis & Pisello, 2020). Most of the human actions and related emissions are indeed focused in such volume, therefore characterized by local overheating, bad air quality, noise and lighting pollution. These conditions are typically counteracted through a variety of factors. Urban overheating compared to the surrounding, also named as Urban heat island, is mainly imputable to low solar reflectance and impervious surfaces of the urban built environment, e.g. streets and squares but also building envelope. Therefore, the key passive cooling techniques are aimed at re-increasing solar reflectance of building envelopes and urban paving with “cool” material solutions, characterized by high solar reflectance and thermal emittance. On the other side, also evapotranspiration is used, with increasing greenery on building roofs, and in urban parks, for both shading purpose and also for remaking the groundless impervious in case of water runoff necessity. Water bodies represent also a further solution, typically implemented in the urban park also for microclimate mitigation (Pisello et al., 2018).

On the side of urban noise island, acoustic barriers concern the limitation of noise propagation from the source to the receiver, therefore they are much limited to a specific geometrical problem, in the case of localized acoustic pressure generation, e.g. due to piping systems, energy plants, etc. While urban paving systems are not much investigated to this aim, except for the urban roads, which are frequently designed with the purpose to limit vehicle-generated noise through rolling tires. Specific vegetation and trees are also conceived as acoustic barriers, with the purpose to visually and acoustically separate one

area from another, and therefore contributing to this urban pleasant layout which is still much needed.

The third uncomfortable condition is air pollution, counteracted using enhancing building energy efficiency, therefore reducing their CO2-equivalent emissions, and by using specific filtering systems around the emission sources. Recently also photocatalytic surfaces are under implementations, being able to exploit the photocatalytic triggered by Titanium dioxide to absorb NOx and other contaminants.

Despite the deep knowledge of all these elements, to date, there are no significant cases of urban green space design that take this knowledge into account in favour of child-friendly solutions, even if kids living the outdoors are maybe the very first population group to need such solutions in order not to create further morbidities, which may trigger to pandemic exacerbation, as shown during the COVID-19 crisis.

That is the reason why the new Kids' Pocket Park we propose through a pro-active roadmap is the place where combining such advanced cross-disciplinary effort.

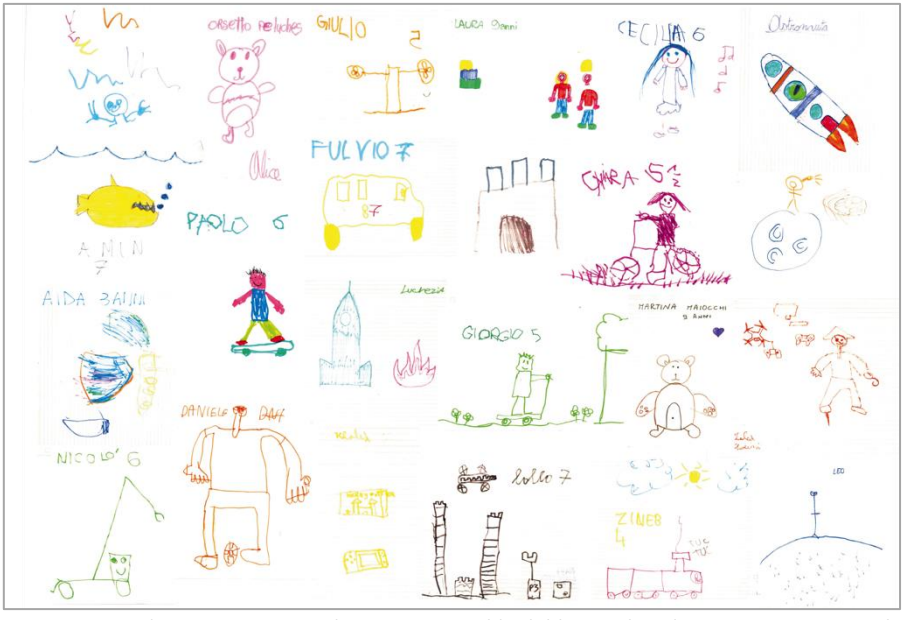

Figure 3. Co-design session with 3-9 years old children. The drawings represent the equipment of their ideal playground.

4. Design roadmap toward innovative Pocket Parks for Kids

Within the highlighted holistic framework, the research points to define a viable methodology to combine multidimensional competencies for improved urban resilience and child-oriented urban design. The innovative contribution concerns the transdisciplinary and trans-sectoral approach, linking different fields of research, local authorities and fundraising companies towards the shared goal of designing and exploiting Pocket Parks for Kids in urban contexts (Fig. 4).

The study identified the following step by step roadmap.

Preparatory multidisciplinary analysis

- urban planning investigation and identification of key areas for implementation
- identification of the relatively minor spaces where hosting the Pocket Parks for Kids analysis of the microclimate in terms of air pollution, over-heating and over-noising context to face
- societal acceptance surveys investigating people needs and their awareness and potentials about the proposed PPKs design in specific neighbours
- preliminary dialogue with local authorities (public administrations, private associations, citizens' associations etc.) depending on the context and fundraising

Integrated and inter-operative Design

- co-design session with users (parents, caregivers, children)
- design of the mitigation actions to be implemented
- concept of the Pocket Parks for Kids microclimate modelling and monitoring of the areas before implementation
- integrated and iterative design dialogue between urbanists, urban planners, kids designers, building physicists toward the final design
- final design elaboration including: (i) large scale urban conception, (ii) small scale design for kids solutions, and (iii) microclimate assessment and mitigation solutions.

Implementation

- identification of executive materials and solutions to be tailored for the social, cultural, climate context
- implementation of the Pocket Parks for Kids monitoring of local Pocket Parks for Kids microclimate in terms of air quality, overheating and noise pollution conditions through wearable and human-centered solutions
- re-submission of societal acceptance surveys on local population and Pocket Parks for Kids users

Final assessment report

- Financial report and assessment
- design quality evaluation and appreciation analysis
- microclimate evaluation and environmental quality final report
- social and regulatory framework proposition for fostering implementation a large scale in a variety of urban districts and contexts.

Figure 4. Key steps and figurative actions included in the proposed guidelines for Pocket Parks for Kids implementation and field final assessment.

5. Conclusions

This paper explores the possibilities for design to improve kids' condition, which encompasses physical and mental well-being, environmental quality, and the overall quality of life regarding contemporary urban conditions. It documents the state of the science

linking design to the human condition and highlights methods for architects, planners and citizens to improve the living environment.

This paper for the first time implements an holistic framework by driving operations toward the new kind of Pocket Park, i.e. the Pocket Park for Kids. While respecting all the urban design strategies of such urban layout, the PPK is specifically tailored over children needs to foster creativity, learning permeability, social interaction, cultural exchange and growth. At the same time, it is conceived to mitigate urban over-heating, over-noising and air pollution, with specific attention to those related morbidities which increased children population vulnerability during the COVID-19 pandemic and potentially in other challenging times, e.g. during hurricanes and earthquake-related hazards. This serves to remind us that even the smallest actions in the city can be charged with ideology, social and environmental meaning.

The proposal solution for kids-oriented urban design wants to propose Pocket Parks for Kids as an effective urban design strategy for societal and local renovation rethinking in urban areas with great potential as microclimate mitigation technique, benefitting environmental conditions in terms of thermal, acoustic, and air quality domains.

The operative design and implementation platform, populated by the proposed roadmap, was started from direct and indirect observations and ethnographic research already carried out on some urban parks. Canvas models and specially designed tools have made it possible to outline the needs and habits of children and parents concerning the use of different types of urban areas and green spaces. Data collected will be enriched through best practices in order to better define the design procedures and tailor the strategies consistently to each urban design need, from a microclimate, societal, and economic perspective.

As future development of this study, the design and implementation of exhaustive guidelines will be elaborated. Subsequently, field analysis will be conducted and the first implementations will be promoted through the realization of the interoperable feasibility study, multidisciplinary design and evaluation analysis applying it to the city of Perugia, in its variety of urban context by means of co-design activities to contribute children's voices in local planning for city growth management.

Abstract | The tourism is the globalization's weakest link because travelling has become one of the most risky activity due to the COVID-19. Therefore we must prepare well in advance to make travel safer in the post-pandemic step. The paper addresses the definition of furnished space model for traveler-tourist, designed of within the user-centered design philosophy. This allows the individual to fully experience the journey, monitoring with respect for privacy his state of health, thanks to the lab-on-a-chip, the microfluidic device that is revolutionizing the field of clinical diagnostics. The LOC technology could have an extremely interesting field of application in tourism and contribute to improve many services provided to passengers, as in air travel as in Hyperloop. The LOC thanks to its intrinsic advantages in terms of portability, accessibility, and technology, will allow the realization of intelligent mobility systems that combine the future expected perspectives of personalized preventive medicine during "journey".

KEYWORDS | NANOMEDICINE, TOURISM, HEALTH, WEARABLE DESIGN, LAB-ON-A-CHIP

> Sir, there is not much I can tell you. I don't know how we got into this tunnel, I have no explanation for it. But I ask you to consider that we are moving on tracks. The tunnel therefore must lead somewhere. There is no evidence of there being anything wrong with the tunnel, except of course that it doesn't end.
>
> *Friedrich Dürrenmatt*

1. Introduction

The tourism was one of the world's most thriving industry until the COVID-19, but it is in a state of collapse now and its future is uncertain. Travelling has become one of the riskiest activities in the pandemic era and it is also much more expensive than the cheaper and more comfortamble smart working way. Therefore, we should prepare well in advance to make travelling safer during this period and, well in advance, also in the post-pandemic step, if we do not want to lock ourselves in our homes for ever and become a sedentary society.
When we enter in the theme of travel, our most remote memories come to light. Even the stresses and emotions that come from the Cinema emerge - the "Seventh Art", the most generous -, that black and white Cinema that has filled our eyes with greetings from the train's windows, with handkerchiefs that melancholically sway in the air on the docks of the stations, of the bodies that swing in the corridors of a carriage to find a handold to search a new center of gravity, or even crimes full of mysteries aboard the International Wagon Company's train. The legendary Orient Express. Melting nostalgia and lacerating separations are the emotional feelings that often accompany the experience of films that talks about travel, even when you go out into space, as in the film by Andrej Tarkovskij in 1972. Before facing an important mission on Solaris's Planet, the protagonist, Kris Kelvin, spends days in his father's dacha, immersed in memories in the company of the elderly parent; here the camera lingers on that landscape which he will soon have to leave. And it is precisely the time of these shots on earth to increase the sense of detachment. To the trip's theme we also associate the pregnant images that descend from the visual arts. Unforgettable, for example, Compartment C, Car 293, one Edward Hopper's work (1938), one of his hymns to solitude, where there is an empty place, perhaps left by someone, between the window of a train that overlooks a landscape immersed in twilight and a woman caught in the act of reading, without great participation, almost casually, a booklet. The suggestions also come from the theater and fiction. In a short story by Pirandello, *The wheelbarrow*, the journey is transformed for the protagonist on an occasion to rethink his lifethe act of looking out of the train's window is his true journey, the inner one, which leads him to get to know himself. The multiple psychological variations, which are captured in the artistic and literary works of all times, express the richness and complexity of travel's theme and experience, and of the very meaning of the word "travel" in its various senses. Think about one of the most famous

journeys, those of Ulysses, Christopher Columbus or Neil Armstrong and Buzz Aldrin, all, for various reasons, mythical, generated by a vision, and which include commitment and risks; travels that always underlie the experience of the encounter, even dramatic or violent, with the other by itself. And to the traveler of the past, who is no even longer the men of art and culture of the Grand Tour, liberalism has replaced the touristconsumer, by conceptual subtraction from the experience of travel by the marketing’s dimension of risk, of daring, gambling, physical effort[1]. Today the traveler of the past is the emigrant who has a very specific purpose, to run away from the living hell of his country with the desire to reach a wellness state for him and his family. Considering travel as an internal experience, as self-knowledge, which has value beyond the aim to reach, and therefore beyond the purpose of the trip, obviously it sounds like a luxury reserved for those who can afford it, that is, to us. In the era of Liquid Modernity and the "software era", the space endures a decisive devaluation, to put it as Bauman (2006), to the point that the only dangers of a "navigator" are web viruses. It is worth mentioning here an illuminating passage from the chapter Time / space of Bauman's essay

> “In the software’s universe of travel at the speed of light, space can be crossed literally "instantly": the difference between "far" and "near" is erased. Space no longer limits action and its consequences, and counts for little or nothing; it has lost its "strategic value", as military experts would say. [...] Once it is possible to cover the distances (and therefore the materially distant parts of space on which we act) with the speed of the electronic signals, any reference to time appears, as Jacques Derrida would say, "sous rature". The concept of "instantaneity" apparently refers to a very fast movement and a very short time, but really it denotes the absence of time as a factor of the event [...]. Time is no longer "the way to go to achieve certain things" and therefore no longer gives value to space. The almost instantaneousness of the software era inaugurates the devaluation of space. [...] since all section of the space can be reached in the same time frame (or rather "instantly"), no part of space is privileged, none has a "special value." (Bauman, 2006, pp.132-133).

The traveler, however "[...] is not someone who loves traveling by remaining attached to his land, the traveler is a man who resolves himself in continuous movement, in the uninterrupted effort to free himself from all internal and external bonds, finding his own stability in continuous transformation "(Galimberti, 1992). What before the pandemic could have turned out to be a free choice, or a tendency, to remain nailed to one's home smart digital workplaced, preferring cyberspace navigation to the multisensory experience of physical travel, for almost all individuals today travel

[1] With the exception for 'adventure holidays', often combined with survival courses, which are in any case among the products of the tourism industry, where the inconvenience or accident is the result of a calculated planning. In addition, the metaphorical 'journey' of the drug addict deserves to be consumed exclusively within his body.

undergoes to a drastic and forced contraction. We are consoled by the benefits produced, thanks to this situation of planetary paralysis, by the reduction of atmospheric pollution, anyway the nostalgia for the journey is unbearable! Packing your bags, buying tickets, going to the airport, getting around in a foreign city, meeting strangers, working, chatting and dining with foreign colleagues, staying overnight in ever-changing hotels, are activities that belong to our personal memory. And when we see such situation in the movies, these actions that for us, before the pandemic, were ordinary, if not routine, today they seem to us carried out by inhabitants of other planets.

2. Nanomedicine and lab-on-a-chip

The traveler-tourist equation, beyond an understandable criticism that can also be moved against a second equation, much more problematic than the first one, tourist-consumer, now obliges to consider travel as an experience to be lived in compliance with security rules (with the attempts of the last few years, flight passengers had to be subjected to a gradual increase of checks in airport, with an increase of the time's boarding procedures and even of the simple access to some airports) moreover a limitation of things to be able to carry in the luggage. Passenger health is also a factor now regulated by international standards. Therefore we want to highlight how the "health" issue of the tourist - and of the passenger in general - can increasingly become a relevant aspect to offer quality services in international transport, not only by making travel accessible and safer to those who belong to risk categories, but always raising quality standards of travel, in relation to wellness, for all passengers. In this sense, nanotechnologies, due to the wide possibilities of application, low cost included, can represent a significant support. Nanosciences and nanotechnologies concern researches in various multidisciplinary fields that benefit from the collaboration of physicists, chemists, biologists and engineers. The growing applications of nanotechnology in the medical field have led to the creation of what is called nanomedicine. There are numerous opportunities in medical-surgical treatments, such as nano-encapsulation for the release of improved and focuses medication and reconstructive (regenerative) nanotechnology. However, nanomedicine seems to be able to develop more widely in the diagnostic field whether for the earliness of early diagnosis or for permanent health's monitoring. The growing use of nano-scale sensors integrated into micro-scale devices is leading to the production of low-cost healthcare devices that can be used outside the laboratory or hospital, by medical personnel or directly by patients in home care and telemedicine.

> "Nanotechnology and its applications in biomedical sciences principally in molecular nanodiagnostics are known as nanomolecular diagnostics, which provides new options for clinical nanodiagnostic techniques. Molecular nanodiagnostics are a critical role in the development of personalized medicine, which features point-of care performance of diagnostic procedure. This can to check patients at point-ofcare

facilities or in remote or resource-poor locations, therefore reducing checking time from days to minutes. […].” (Gorjikhah, Davaran, Salehi, Bakhtiari, Hasanzadeh, Panahi, Emamverdy & Akbarzadeh, 2015).

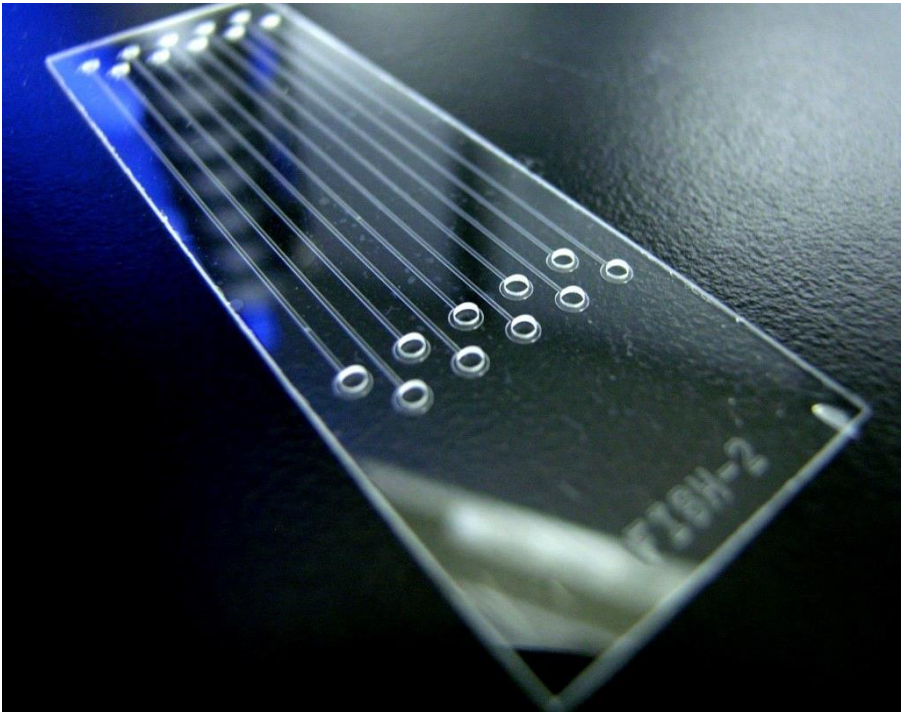

Figure 1. Schematic view of a Lab-on-a- Chip device for blood testing (see Red Blood Cells are flowing and analyzed)” by a compact microscope

The rapid evolution of scientific research is developing microfluidic small devices that integrate multiple functions on a single chip, the lab-on-a-chip (LOC), revolutionizing the field of clinical diagnostics. The chemical and biological analyzes, which today take place in specialized laboratories, can thus be carried out with striking advantages due to extremely reduced times and costs. Moreover, thanks to these miniature laboratories, usually only millimeters or centimeters in size, it will be possible to implement the so-called point-of-care analysis (POCT), or the possibility that the patient will avoid going to the laboratory. The prospects offered by this type of LOC technology, applied not only in the biomedical field, but also in the agro-food and environmental field, will enable rapid diagnosis and in any situation thanks to its portability and personalization. With the biosensors contained in the lab-on-chips it will be possible to recognize, for example, a specific molecule of clinical and diagnostic interest related to a pathological state or a functional alteration of the organism. “[…] By manipulating reagents on the microscale effects such as rapid heating and mixing can be exploited. It also allows waste and exposure to dangerous chemicals to be minimized”.

3. The project

According to the Constitution of the World Health Organization - OMS, the United Nations specialized agency for health issues established in 1948, the aim of the Organization is "the achievement, by all populations, of the highest possible level of health ", defined as" a state of total physical, mental and social wellness"and not simply" absence of disease or infirmity. The international system in charge and the railway, shipping and air companies must therefore commit to raise their quality standards. Therefore, it does not appear as an exaggeration to think of introducing the possibility of monitoring their health among the services provided to customers, before boarding, during and after the journey, to also guarantee an effective protection of the other passengers's health and of all those who will subsequently come into contact with them, in case of the spread of highly contagious diseases, as is happening with the coronavirus. What is illustrated here is the concept of a research project developed to participate in national and international calls, with the establishment of a transdisciplinary group of researchers and aimed to an obtaining funding for the experimentation and subsequent prototyping phase. In particular, we think about the preparation of special environments equipped with a lab-on-a-chip system integrated in a smart on-board furniture. Hyperloop, considered as the fifth alternative transport system to the four existing for long journeys, car, train, plane and ship. The sustainability of the system is added to the innovation of the system. Each capsule can leave 28 passengers every 2 minutes, for a total of 840 per hour. You could go from Milan to Bologna in 9 minutes, and in 30 minutes from Rome to Milan . The first commercial section to be operational will be the one now under construction in Abu Dhabi, but it is working also in Brazil, the United States, France, China, India, Korea, Indonesia, Slovakia, the Czech Republic, Ukraine and Germany.

Figure 2. The material used for the Oversee bracelets is the TPU, a thermoplastic polyurethane.

The application of lab-on-chips in the tourism’s industry, for travelling by plane, ship, train and future ones in Hyperloop capsules can be articulated into three different stages: 1) before boarding; 2) during the trip; 3) on arrival. The rapid monitoring of the passenger's state of health concerns not only the individual person, but also those he will meet in the cabin of an airplane or, for example, in the Hyperloop capsule. It is known to all that small-sized environments in which you have to stay for a long time, sometimes even beyond 12 hours, can be places that are strongly responsible for the spread of bacterial and / or viral diseases. The recent epidemic of the new coronavirus, which the real seriousness is not yet fully assessable, is showing that checks before departure and arrivals would seem to be the only weapon, at the moment, to control the spread of contagion. Rapid and targeted clinical analyzes can certainly be a more correct and advanced tool than the simply observation of passengers’s temperature, with a thermoscanner or with gun thermometers. The rise in body temperature is not necessarily a symptom of an ongoing infection; actually, the infection, as it now known, can be spread by people who have no symptoms and no fever. The rapid and low-cost clinical analyzes in steps 1) and 3), therefore, before and after the trip, they fulfill a social character, when they are made necessary for extremely serious events such as the spread of epidemics, or instead responsible self-diagnosis’s operations are the ones passengers voluntarily submit in all the other cases.

Figure 3. Oversee Bracelet technological system.

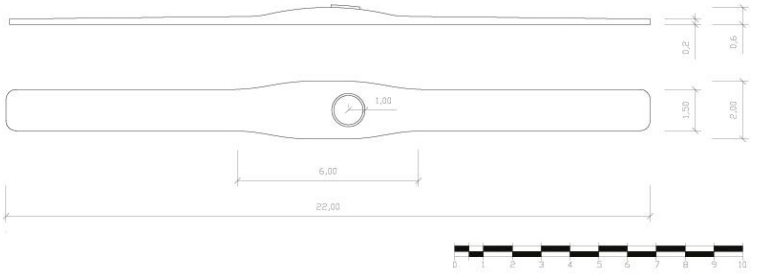

Figure 4. Technical drawings of Oversee Bracelet.

The project therefore consists in a realization of a chip lab-on contained in a bracelet - conceived as any fashion unisex accessory, but equipped with a second function aimed to a quick and effective test that identifies subjects positive for Coronavirus before boarding domestic flights. Without causing further slowdowns, the passenger who undergoes security checks before entering the gate or, even before passing through passport control, must activate the operation of the lab-on a chip. When passing through the metal detector or body scanner gate, with bluetooth technology through the radio waves of the ISM bands - Industrial, Scientific and Medical (electromagnetic radio frequency of 2.4 GHz), it signals the quick test result to a light and sound light. The negative subject passes smoothly, while the positive one is invited to enter a secure room. Any malfunctions of the device involve the repetition of the test.

Figure 5. Packaging of 0versee bracelet.

Diagnosis operations are those that passengers voluntarily submit in all other cases. During the journey, in step 2), they have a more "private" value. The idea is therefore aimed at ensuring maximum safety, in particular for the elderly or those suffering from certain pathologies, who do not intend to give up the travel experience without being separated and isolated in outpatient environments. In fact, in the future, the spatio-temporal dimension of the "journey" could be an opportunity to contextualize the journey with the possibility of undergoing diagnostic checks. The development of rapid and personalized diagnostics could have an extremely interesting field of application in the tourism sector, in particular where the conditions of travel are not guaranteed first aid, such as in air transport or in future trips in Hyperloop.

4. Conclusions

Therefore, Lab on chip, thanks to its intrinsic advantages in terms of portability, accessibility and technology, consensus will be the creation of intelligent mobility systems that combine the expected future prospects of personalized preventive medicine during the "journey".
It will also be possible to foresee, in the future, a subsequent phase of guided autotherapy, thanks to the Lab-on-a-chip, by sending the results of the analyzes to your doctor remotely and by administering specific drugs and in the indicated doses. The purpose of this work is to try to imagine a future world in which "the journey" will become an opportunity to carry out health checks. In fact, non-invasive or very invasive and portable devices could be imagined as integrated systems incorporated for example in passenger seats. By taking advantage of travel time, intelligent seat systems, equipped with electronic and lab-on-chip devices, will be able to provide a complete medical diagnosis.

Figure 6. Hyperloop is a futuristic magnetic levitation transport system that allows you to travel at 1126km / h.

As described above, these sensors will be able to monitor many physiological parameters and biomarkers during the journey. LOCs will require liquid samples from body fluids. In essence, we can consider that LOCs are made from different blocks or modules, regardless of the specific biomarkers and related deriseas. A) sampling systems for miniature system (i.e. microneedles); B) a microfluidic unit capable of manipulating the analyte; C) detection unit in which the measurement is performed; D) a signal processing system to provide data for a diagnosis; E) a storage and communication unit for communicating data to doctors in order to validate the diagnosis; F) the person's smartphone should also be connected to the system to allow communication with the sensors integrated in the smart seats. A seat design is required for hosting such devices and performing this analysis. The only modules that should be in contact with the body is the first module on the liquid sample. The rest of the modules can be incorporated and therefore not accessible to people. Lab on a chip device can be used for detecting and/or measuring different biomarkers in body fluids. Many diagnostic tools are nowadays based on Lab on Chip technology and have been proofed for detection of various types of biomarkers. Actually, significant R&D activity is pursued worldwide in many research groups both in industry and academia. For sure the technology of Lab on a chip will be the elective diagnostic paradigm in the near future. In this context we, at best of our knowledge, are the first to investigate and discuss a scenario in which such diagnostic tools can where the rapid and /or continuous diagnosis of human health can be integrated and embedded in the ordinary life of the "journey".We intentionally did not address the specific biomarkers or pathology that can be detected and evaluated by Lab on a chip as we are more interested in understand and explore in our research to build up a completely scenario that never has been addresses before based on user-centered design philosophy and fully integrated in a normal day-life and outside of the classical "clinic" and "hospital" situation.

Post-pandemic medicines: towards a new normality

*carloemilio.standoli@polimi.it

Abstract | The Covid-19 Pandemic has caused two types of phenomena: on one hand, it has profoundly changed people's lives, calling into question even the most normal behaviours, such as being able to walk out of the house; on the other, it has accelerated the consolidation of new habits, not necessarily appropriate. This is the case of behaviours linked to the dimension of care, of self-diagnosis and the consequent self-care are approaches amplified by the ongoing pandemic, bringing to light the lack of an overall vision of the Italian care system and in particular of the medicine management.
This paper explores this issue, firstly offering an overview of the problems and the changes taking place, and then offering some potential openings on project ideas. These openings would rethink the future processes of homecare and the entire drug supply chain, from production to distribution, up to post-sale tracking and consumption, to the disposal.

1. Pandemic distances: new behaviours in care

Indeed, the ongoing Covid-19 pandemic is radically changing many of the behaviours that take place in our daily lives. Old practices that have always characterized our ordinary life, are giving way to new experiences that are likely to normalize early, even if offspring of discomfort and behavioural restrictions (Van Bavel et al., 2020).

Distance, fear of relationships, isolation are the main drivers of new behaviours, affecting the relationship between doctor and patient, patient and hospital facilities, patient and disease, patient and care (European Union, 2020).

In an attempt to reduce the risk of contagion, many health services have drastically reduced outpatient visits and hospital admissions, revealing the weakness of the health system that, in recent years, especially in Italy, has followed models of strong centralization at the expense of a territorial medicine (Armocida, 2020; Dell'Acqua, 2020).

Like all disruptive events, the pandemic is proving to be a powerful catalyst for system innovations. An accelerator of innovations already in place, such as e-health and all forms of digitization of therapy that could, shortly, make available new modes of remote prevention, treatment, and care (Fagherazzi, 2020; Cobelli, 2020). The new ergonomics and proxemics of distance (Bolzan et al., 2020) generate new behaviours and processes and, at the healthcare level, affect the care system at different scales, from the places designated for this purpose to the individual drug packages. It is on this last aspect that this contribution dwells, probing the different aspects of pharmacological care put on the test bench by the current pandemic.

2. “Living” and “Orphan” medicines

The Covid-19 Pandemic shed light on the lack of a strategic vision of healthcare as a system. We can view the pandemic state as an amplifier of many issues related to the healthcare system as a whole and traditional care practices (Armocida, 2020). Epidemiologists and immunologists are predicting upcoming pandemics as a normal condition of our future. Viruses and bacteria will occupy a decisive place in spurring the opening of new diagnostic and therapeutic avenues. It is projected that by 2050, 50 million people will die from bacterial multi-resistance (Turin, 2018). The most traditional antibiotics and antivirals have drastically reduced their effectiveness in treatment (Li, 2014), partly due to their overuse in therapies (Alhomoud et al., 2017) and indiscriminate release into the environment, through crops and farms.

New therapies are appearing on the pharmacological research front. In Europe, the first clinical trials are starting to evaluate new forms of treatment against infections. These are trials already in use in the countries of the former Soviet Union (Altamirano & Barr, 2019) based on substances of a biological nature. They are called “phage cures” because they are

based on selective viruses whose peculiarity is to feed on bacteria: those that traditional antibiotics are no longer able to attack due to the resistance acquired by these microorganisms. These phage substances are “alive” and precisely for this status, their use poses new questions to science (on the risks implicit in therapeutic uses), to jurisprudence (on the rules of use of biological material very different from drugs whose peculiarity is to have a stable active ingredient) (Verbeken et al., 2017; Huys et al., 2013). But also design, as a translator of matter into objects, into production systems, into sales systems, into packaging, storage, and transport processes may play an important role in "shaping" this new system of care, through solutions designed starting from the needs gathered from the observation of user behaviour (Stegemann et al., 2016).

The transition from the experimental and laboratory level to the large-scale production of such peculiar products challenges the project in all the relations - widely explored - that link the term design to the industrial one, as well as challenging it in relations not yet fully addressed, such as those that connect the project to the transformations of the biological world and living matter (Weiner et al., 2000). It also activates systemic reflections on the role that the design approach could have in the field of pharmaceutical products in general. The pharmaceutical sector is a context which, despite huge investments in R&D that have historically led to innovation among the most advanced, has not paid systematic attention to the evolution of pharmaceutical shapes in order to improve the assumption and facilitate the processes of interaction with the patient. Furthermore, in the pharmaceutical sector, industrialization processes are based on rigorous criteria in terms of quality control, safety, efficacy, and economics. These plans are often in contradiction with each other and push, as in the case of some types of medicines for limited use, such as the "orphan drugs" - so named because they are intended for rare diseases, often "orphan" of the drug - to go to small production lots, almost artisanal in nature or, to quote Maldonado, super-industrial (Maldonado, 1976). Orphans, even more so, in the pandemic era when all industrial efforts have been diverted - sometimes with reconversion processes - towards the production of medicines and sanitizers of wider use.

“Living" and "orphan" drugs are two examples of the compelling relationships between the form of medicine, the form of the industrial process, the logic, and economies of production. To these tight logics are added the standards that define formats and sales packages according to standards aimed at responding to product safety and quality criteria (Van Baelen et al., 2017). These standards (which impose, for example, the minimum number of doses per package) are binding in Italy as well as in many European countries and, if on the one hand, they are effective in guaranteeing the safety and integrity of the product, on the other hand, they do not allow to meet the needs of personalized therapies for patients (Minghetti et al., 2014). There is also a lack of a design approach aimed at simplifying the experience of using the medicine, starting from the way in which the information for use is presented to the form of the packaging; the design process is very often unbalanced in favor of the reasons of production.

There are some virtuous examples, both currently on the market, such as some blister packs of contraceptive pills, and in the development phase, as in the case of the FebriSol project (www.febrisol.com); in both examples, elements and affordances have been designed that encourage the processes of interaction and consumption of the drug. Actually, in both these cases, information is presented on the primary and secondary packaging, guiding the user to the consumption of the drug and - thanks to physical interaction, such as crushing the blister or scratching the label surface - communicating and reminding the daily intake of the pill.

In the United States, drugs are sold according to the duration of therapy, and contained in prescription bottles; these containers are indistinguishable from each other and might cause poor adherence to therapy or errors in the use and consumption of drugs. If on the one hand, the process of care and therapy is personalized, on the other hand, the experience of care and management of the drug presents significant critical issues and risks, due to an object not properly designed for interaction with the user. An example of how design can address this challenge is Deborah Adler's project for CVS Pharmacy, to redesign the package and label (Adler, 2017). Concerning the package, different ones have been designed according to the type of drug to be contained; then colored rings have been realized, to be added to the packaging as customization and to make it visually more recognizable. Regarding the label, the hierarchy of the information has been reorganized, making more visible the name of the patient, the type of drug, and the useful indications for taking the medicine.

Personalization of the drug and its wrappers, containers and blisters, and attention to the design of the interaction and user experience with the drug represent perhaps one of the most important challenges that pharma should be looking towards. Especially at a time when pandemic behaviours are proving to be powerful accelerators toward autonomous and increasingly domestic management of care.

3. 3D Printed drugs: towards personalised care and distributed production

The applications of additive manufacturing related to Health and Care are growing and, according to data from the International Data Corporation (IDC), in the Western European 3D printing market, what is driving the growth are precisely the applications in the medical field, which in 2019 accounted for about 33% of the total spending of 7.2 billion in the additive sector (Naghshineh et al., 2020). In this regard, the path paved by experiments with 3D printing of the "custom" drug (Chavda, 2015), can prove revolutionary by introducing new logics of product, production and distribution process, prescription and dispensing of the drug.

In the health sector, there is an area of convergence between the official healthcare system, the making culture - as a new way of manufacturing - and patients as bearers of innovation

through the experimentation of devices for healthcare, according to a "Do It Yourself" logic (Maffei et al. 2019); these emerging socio-technical transformations seem to go together with those medical-pharmaceutical research trends that go towards *ad personam* treatments and that now constitute a consolidated research direction. However, these scenarios cannot be transferred tout court within the context of pharmaceuticals.

Indeed, the pandemic has fostered behaviours that distort the concept of personalisation, which was already widespread, and which are now encouraged by the imposed doctor-patient distance. This distance has led many patients to self-prescribe therapies, to borrow therapies from the network or from the experience of other patients (Bessell et al., 2003; Malik et al., 2020). On the other hand, what can be transferred by the new technological practices is the centrality of the patient, who is no longer just a "human factor" but a "human actor" in innovation processes (Maffei et al. 2019). As a patient personally involved in the dynamics of pathology and its treatment, he becomes a superuser, enabled by communities of designers and systems of digital experimentation (such as Fab Labs and makerspaces) to the role of the lead user (Von Hippel, 1989). A role that makes the patient an activator and an active participant in innovation processes. In fostering the emergence of the patient-innovator, these evolved forms of user participation simultaneously activate new forms of user-oriented health care (Oliveira et al. 2015; Sienkiewicz et al. 2017).

Technology, in other words, has triggered changes in mentality and cultural attitudes that go well beyond merely its technical-productive potential. Not that they should be put in the background. Far from it. The lines of experimentation for the creation of 3D printed pills, balanced on the personal needs of each patient, follow the logic of the small-batch, useful as we have seen in the case of “living” or “orphan” drugs that struggle to find space in traditional production lines. They also go in the direction of the unitary drug that replaces, in a personalized way, the multi-drug therapy, thus obviating the frequent errors of incorrect dosages or improper dosages (Norman et al., 2017).

Such examples are: the Galeno trial, initiated by BIOlogic, in which the digitization of capsule production allowed the subdivision of the capsule into modules, making it effective for the integration of active ingredients with scheduled release schedules; a 2014-dated study, in collaboration between the University of Milan and Massachusetts Institute of Technology, on the feasibility of Fused Deposition Modeling (FDM) 3D printing in the production of capsular devices for oral pulsatile release, based on a polymeric (hydroxypropylcellulose, HPC) swelling/erodibulum (Melocchi et al., 2015); the start-up Multiply Labs (multiplylabs.com) focused on creating multidrug therapies for cardiovascular disease, diabetes, HIV, and mental illness through capsules that contain each patient's daily prescription in a single capsule, with the goal of correctly dosing the patient's medication and improving adherence to treatment; the production of FabRx (fabrx.co.uk), a British company founded at University College London, which is focused on creating personalized treatment medicines - in terms of dosage, shape, size and dose combinations - specifically designed for on-site production at pharmacies or clinical trial units.

Although these cases are still a niche and are not destined to become the "new normal" with immediacy, we would like to underline here how, personalized production, modifies the industrial logics, also in terms of their territorial distribution, favoring new proximity to the hospital, to the doctor, to the pharmacist and ultimately to the patient and his needs.

Through the development of strategies such as those mentioned, moreover, it will be more guaranteed the safe and controlled accessibility to the drug and easier to manage the tracking of the entire supply chain of the pharmaceutical product.

In this field, a customization culture has not yet reached a sufficient maturity level, similar to the one that design has brought to other goods, interpreting it in a strategic way to make it become a competitive advantage factor. In the pharmaceutical sector, the systemic customization can offer different design chances, such as: the design of shapes conceived to meet the users' challenges (e.g., prehension, swallowing, recognizability, etc.); the customization of dosages; the research of potential ways of "joining" the active ingredient with the excipients, in order to enhance its bioavailability according to defined timing; finally, the hybridization of active ingredients in a single pharmaceutical shape.

Design can and should also intervene in the communication sphere in order to prevent the spread of a misconception of the concept of personalisation, which misinterprets the potential of available technologies and which could be exacerbated by pandemic isolation.

4. The Pandemic and the counterfeit medicines

During the pandemic, the strong limitation or even abolition of traditional diagnostic practices due to the high risk of infection has encouraged forms of DIY diagnosis and treatment. The Web reveals itself as a channel not without dangers, both in the diffusion of knowledge coming often from individual experiences that assume the strength of a generalizable knowledge, and above all in the concrete dispatch of care.

It has long been shown that the online sales channel is dangerous in the purchase of drugs dispensed by circumventing the necessary prescriptive path that makes the therapy unique and individual. Phenomenon amplified by the pandemic situation with a surge in the sale of drugs for the treatment of symptoms from Covid-19 and counterfeit vaccines (Ministero della Salute, 2021; Interpol, 2021; CNBC, 2021). These have been defined, not surprisingly, the new "liquid gold" (Fregatti, 2020). The phenomenon of counterfeiting and the increase in illegal trafficking of drugs (in particular antidepressants, disinfectants, antibiotics, antivirals, as well as medical devices such as gloves, masks, gowns, diagnostic tests, etc.) has had a high point from March-April 2020 (AIFA, 2020; Gruppo di lavoro ISS Farmaci COVID-19, 2020).

In April 2020, the Istituto Superiore di Sanità published a Report on the risks of online drug purchasing, warning about DIY coronavirus treatments. (ISS, 2020; Cazzaniga & Di Giorgio, 2020). Besides, on December the 3rd, 2020, the Italian Medicines Agency (AIFA) issued a Recommendation already christened as "Enhanced Traceability Drug" to increase the power

of the European traceability standard 2011/62/EU (European Union, 2011). With this recommendation, AIFA envisages the use of a digital platform, on which pharmaceutical companies are required to upload the serial numbers of the individual packages of each pharmaceutical product, before their shipment. AIFA, in this way can follow the path of the drug both towards the hospital channel and towards pharmacies.

5. From the pandemic, the design of new opportunities

The reinforcement of serialization, aimed at combating the illicit purchase of drugs, already widely in use but widespread during the COVID pandemic, lends itself to be an opportunity to stimulate new project scenarios, precisely because it allows to follow the path of the drug up to the end user. Their introduction has produced cascading effects, some of which are necessary to optimize investments in the readjustment of production facilities, others related to a more careful observation of the drug throughout its life cycle, from production, distribution, prescription, dispensing, purchase, use and consumption, until disposal. Even after the pandemic, this observation leads to a systemic increase in design activities related to good practices in the use of pharmaceutical products aimed at sustainability, which could become the standard in medicines life cycle management.

Serialization and antitampering have been, for example, an opportunity to redesign the secondary packaging of the drug, to ensure greater clarity and ease of access to information; understanding and simplicity in use; enlargement of the user base even to the weakest groups (Baule & Bucchetti, 2015). For example, the antitampering has for the first time forced the sale of the sealed drug. In this instance, the rule, born for safety purposes, has yielded the side effect of producing an increase in unused drug waste. The seal placed on the pack does not allow the package to be inspected to verify the shape and size of the prescribed drug. It is well known that, particularly in elderly patients, the difficulty in swallowing - especially tablets - is amplified by the size, thickness and roughness of the drug's surface. During the Metadesign Course within the Product Design Bachelor’s Degree at Politecnico di Milano, several exercises carried out on drug packaging, to improve its communicative potential, have brought out the need for pharmaceutical companies to represent in 1:1 scale the shape and size of the drug contained, to support patients with swallowing problems in the right choice of purchase. Confirming the need for this information integration, on December the 10th, 2020, Teva Pharmaceutical Industries (www.tevapharm.com) announced the new company policy that includes the obligation to report on each package the representation of the content in real size at the Smart Packaging Conference. Another virtuous example of how the anti-tampering regulations are guiding companies to more comprehensive interventions on packaging, to increase the level of security, is provided by the folding boxes, tamper evident, designed and produced by IGB Bressan whose R&D Centre has worked to respond to the regulations by integrating child resistant packs.

This is the context in which new design strategies can be included to extend the medicines' tracking to cover their entire life cycle, in order to move towards a fully smart medicine.

6. The attributes of post-pandemic medicines: smart and traceable

The serialization operations, aimed at making traceability possible, are useful tools to provide patients, health services and public administrations with greater forms of protection and guarantee on the originality of products (Piutti, 2020). They are made possible by the new opportunities that digitization makes available and are a first step in a series of broader interventions aimed at the “tecnologization” of the drug and the objects that surround it, to improve its use in the different phases of its life cycle.

We tend to christen all consumer products, including pharmaceuticals, as “smart” whenever a single technological application intervenes to modify or expand the possibilities of interaction between user and product; in the case of pharmaceuticals, this is often to mitigate the many problems in the proper management of therapy. Sensors to capture data useful for patient monitoring; ultra-broadband connectivity to allow data to travel and devices and people to communicate; internet of things, biotechnology and nanotechnology for targeted treatments; use of smartphones, apps, wearable devices to monitor vital parameters; ingestible digital pills that cure only diseased cells; QR codes that expand the package insert with how to take the drug and make the information available in different languages; smart carts that can detect the correct distribution of drugs in the departments; smart bracelets that allow the health worker to automatically select the patient and his correct therapy, etc (Pozzi, 2019).

But, once again, the breadth of the aspects of drug therapy touched by the pandemic, and their process relationships, have precisely demonstrated the need for a system approach to the issue of medication and treatment.

At this stage, each pharma is moving in an autonomous mode. This modality produces a puzzle of non-organic interventions, lacking a framework within which the various innovations can unfold their potential. Just as an example, we note that serialization for traceability purposes allows for the monitoring of particular aspects of the product's life (e.g., where the drug is located along the sales channel), but leaves uncovered and at the same time suggests that the forms of drug monitoring could be extended to the disposal phase (Chaves & Decker, 2010).

Moreover, it suggests that the many forms of quality control of products, used for example in food (Chen, 2020), could be introduced with positive implications on the fairness of use (adherence) of the medicine both in home therapy and in the hospital environment. We refer for example to "smart labels". We refer for example to the "smart labels": so far, there are two types of smart labels, mainly used in mass retailers and - marginally - in the

pharmaceutical industry, namely thermo-chromic labels and the ones with integrated RFID sensors.

The first can undergo a change of color (temporary or permanent) as a result of a thermal shock or temperature change. The latter, thanks to the presence of RFID sensors and the information they contain, can be used to ensure the integrity and traceability of products, from the production cycle to the sale, providing useful information to the consumer during use and consumption (Pozzi, 2019).

In pharmaceuticals, the massive diffusion of these types of labels could certainly benefit both the production, management and quality control processes and the user's experience of care. The design and integration of smart labels and products capable of reading and displaying the information contained therein, represents a challenge for new home care and telemedicine systems and processes.

And it is also the task of design to translate and even make plausible solutions that risk remaining only chimeras in the world of medicine. Consider, for example, the possibility of remotely communicating that the drug has been taken, an issue that is anything but trivial without a complex feedback system. The actual assumption, to be detected remotely, requires sophisticated technologies, very useful even and especially in a hospital environment, especially in high-intensity infectious wards, such as departments Covid-19, where there is the impossibility of staying inside the room during the assumption of therapy by the patient.

Some technologies under development, such as sensors and electronic circuits integrated into ingestible drugs, may be more appropriate for this purpose. Thanks to their small size, they can be ingested by the patient, to have accurate images in real time of some tracts of the digestive system, or to monitor the health status of people, or to control the correct adherence in drug treatment (e.g., PillCam, Proteus Digital Health, Abilify Mycite).

And extended or enhanced traceability could complete the life cycle of the drug also in the hospital environment where all steps, from the prescription, to the supply at the hospital pharmacy, to the storage of drugs in the ward cupboard, to the preparation of the therapy trolley, up to the patient's bed, are steps of a complex process with a high possibility of error because highly dependent on the operator. The introduction of drug and patient identification codes, already widely used in several European countries, has proved very useful to reduce errors in administration (European Directorate for the Quality of Medicines and Healthcare, 2018).

Finally, the management of the drug when it becomes waste, for different reasons such as its expiration, discontinuation or change of therapy, is not yet so structured and controlled, in the same way as the disposal of other types of waste (Žiauberytė, 2011). Indeed, to date, many drugs are thrown in the common waste, becoming a risk to public health and the environment (Li, 2014; Vatovec et al., 2017). Thus, the drug could be tracked not only in the production, transportation, purchase and intake phases, but also in the disposal phase, both

in terms of product design (e.g., baskets) and service design (e.g., the role of the pharmacy in collection procedures). While from a cultural point of view it would be necessary to further sensitize and educate citizens on the proper disposal of medicines, on the other hand, thanks to the possibilities offered by technology that is becoming increasingly widespread, the medicine could be tracked even at the moment it is thrown away. Based on existing experiences of smart baskets, which give information about their filling and optimize the collection processes, or that allow the collection of certain types of waste (for example, diapers and sanitary napkins, which if differentiated, can be recycled), during the Metadesign Course within the Product Design Bachelor's Degree at Politecnico di Milano, the students have developed a basket for the collection of drugs. With this example, we propose a design reflection on the traceability of the drug in its entire life cycle, acting both on the awareness and education of the user and on the management of the drug as waste.

7. Design culture within future care processes

There is one positive effect we can attribute to the pandemic state: that of having highlighted how little normality there is in the processes of care. Perhaps this is because the disease itself does not belong to the sphere of 'normality': all the complex practices that inhabit it and the behaviours it triggers are out of the ordinary, changing or distorting a person's everyday life. The accessibility of medicine, which is currently the main treatment practice, is a human right. To be considered as such, it is necessary to design new ways and new shapes of quality, safety, trust, friendliness for the patient, to make him/her feel in control and at ease when dealing with the healthcare system as a whole, compared to when he/she tries to manage his/her health status autonomously. Characteristics capable of promoting a new normality of care that is truly post-pandemic. In this sense, we have seen that the prerequisites are already in place in technology and policies to be able to intervene on certain customs and habits relating to the management of one's health, which were consolidated but which the pandemic crisis has eradicated.

The Design Culture can bring together the different knowledge and disciplines that affect the pharmaceutical sector and the processes of care. Indeed, as illustrated in the previous paragraphs, the design contribution can affect the different dimensions of care. It may involve the production, material and formal aspects of the medicine itself: thanks to the use of tools such as 3D printing, it is possible to create a truly personalized cure and design a custom treatment. It may concern the formal, graphic and material aspects of the packaging, and thus guide patients towards a better and more conscious interaction and experience of medicine use. It may address the management of home treatment and the relationships among the various actors of the process, investigating the communication potential through digital channels.

As a consequence of the pandemic situation, the often digital and virtual interactions among the patient, the medical staff and the pharmacist have become much more difficult; thus, all

the figures involved have had to adapt to communication tools and relationships not specifically designed for the management of care processes. The entire experience of care, from the purchase to the assumption of the medicine, has lost the degree of familiarity, control and security given by the direct and real interaction among the actors of the care process, amplifying the possibility of errors and related risks.

The potential offered by technology for the pharmaceutical sector, and the critical aspects that have emerged in the home care processes represent an opportunity: the Design Culture can indeed be an interpretative and project filter through which we can respond to the challenges of home care processes and interaction with drugs, keeping the human component at the centre.

sharon.hooper@leeds-art.ac.uk

Abstract | This paper explores novel approaches to teaching, learning, making and exhibition of student work amidst lockdown restrictions in autumn/winter 2020 during the Coronavirus pandemic. At a small, specialist arts university, in the North of England, Level 5 undergraduate students on BA (Hons.) Visual Communication embarked on a blended approach to teaching and learning, following strict social distancing measures for sessions in studio/workshops and with many sessions online. The module asked students to improve technical skills and principles, form small peer groups and choose exhibition theme, create final outcomes in response to themes and to present their work to an audience. Typically, all teaching happens face-to-face, and exhibitions are held in local public venues. This year, however, we had to embrace digital technology and social media, adapting to the 'New Normal' to reach both learners and audiences. This paper is a case study and reflection on efficacy and what we can learn and embrace in the future.

KEYWORDS: BLENDED-LEARNING, EXHIBITIONS, AUDIENCES, LOCKDOWN, DIGITAL MEDIA

1. Introduction

Visual Literacy is a module running for Level 5 (second year) undergraduate students on BA (Hons.) Visual Communication (Viscom) at a small, specialist arts university in Leeds, North of England. The Viscom course is very broad and multimedia in scope, encompassing a variety of skillsets: Graphic Design, Photography, Moving Image, 3D & Illustration. The course has a small cohort of students, with 45 students at Level 5. In the Visual Literacy module which takes place in autumn/winter Semester 1, our Level 5 students are asked to select a skillset in which to improve technical skills and principles, to form small peer groups, to decide on an exhibition theme, to create final outcomes in response to this and to present their work to an audience. Typically, all teaching and learning sessions happen in studio, and exhibitions happen in local public venues selected and secured by the students, such as a gallery or bar. Students are normally responsible for theming, booking, marketing, curating and installing their events with careful tuition and guidance throughout this process. They are also asked to respond to their group theme creatively in a way which demonstrates progression in their chosen skillset, and to produce final outcomes for their group exhibition or event. We have previously had student groups present work, for example, in an upstairs room in a popular bar in city centre, or in the city art gallery over a long weekend. The focus of these events is not just to showcase student work, but to also involve and engage the audience as much as possible. Often groups hold workshops or participatory activities associated with their outcomes, such as public colouring of illustrations reels, or interactive walk-through installations. The visceral experience or producing tangible work, installing it into a physical space, often prepping walls, using ladders, hammers, spirit level etc. and seeing an audience attend and view their efforts is both inspirational and rewarding for students. It shows them what they can achieve collaboratively and validates their practice.

However, against the backdrop of a worldwide coronavirus pandemic in 2020 the module had to be reconfigured for this year with social distancing measures in mind. During the majority of the time, our city was under UK government Tier 3 restrictions which prohibits all social or cultural experiences at which an audience might gather (UK Gov. 2020). It also meant a significant amount of teaching and learning had to take place online, but with a preference to enable all face-to face teaching wherever possible. Initially we considered whether this module could run at all in any meaningful way. However, after carefully reviewing some of the responses to the pandemic from around the world, we decided we could still facilitate a valuable learning experience as well as high-quality outcomes and public events. In order to do so, we had to embrace digital technology and social media, using all the tools commonly available to the general public to their full capabilities.

Not only did this change our means of engagement, but it also affected some of central critical concerns. Embedded into sessions this year were some of the following questions:

1. Social distancing and proximity: working together in groups

2. Creating conversations online: How can we engage audience across different digital platforms?
3. Measuring Impact: How can engagement translate into action/change in the real world?

Whilst not all of the work made was about coronavirus directly, it all dealt with contemporary cultural and social issues, often made more pertinent by prohibited social interaction.

Aims

The module is founded on the underlying ethos of the Viscom course, to foster a multimedia practice underpinned by design methods, which allows students room for nuances and differences to determined their practice. Primarily, students need to improve skills and knowledge in a chosen skillset. It also emphasizes the need to communicate to audiences, be they predetermined and specific, or more general as in the public at large.
The module also values real-world application of design and social skills. This year, against the background of the pandemic, these were not just driven by a need to communicate a particular theme or message in the best way possible and with the greatest aesthetic concern, but by a need to *connect*. This need to connect was much stronger than in previous years. Driven by periods of enforced isolation and more remote learning, students needed to connect with staff and with each other. We had to establish a network of mutual support and encouragement using digital technology, and then turn this outwards to connect with audiences. Therefore, this year the module retained the same drivers to improve particular technical skills, but with an overriding emphasis on the potential of digital communication and online technologies to connect meaningfully with real people.

Methodologies

Instigated by the university's decision to adopt a blended learning approach, we employed digital and analogue methods of delivery. Whilst a majority of the Viscom tutors have significant teaching, making, exhibition and participatory experience, we had little experience of doing this remotely prior to the first UK lockdown in March 2020. Therefore, the strategies for the module were:

1. To create communities of practice; with other practitioners, within the student body in small event/exhibition groups, and within tutor-led skillset groups.

2. To explore online and digital technologies; as tools for learning, as tools to create and communicate art practice, as tools to engage in conversation (with each other and audiences).

Before the pandemic, the Viscom team had no experience of employing online platforms as learning tools nor as the means by which to present work. However, with early training and by connecting to other practitioners globally through online meeting platforms, we created a network of support. This was achieved through listening, observing, testing and interacting, and was influenced by Wenger's ideas of communities of practice being groups of people who share a concern and participate in a practice together (Wenger-Traynor, 2015). We carefully curated our course Visiting Professional (VP) programme to include a variety or practitioners responding to the new scenarios created by the pandemic, particularly in the field of audience engagement. For example, we had Tandazani Dhlakama, a curator at MOCAA, Cape Town, South Africa, talk to us about curating and reaching a new demographic of audiences (Dhlakama 2020). Artist Lena Dobrowoska talked to us too, sharing her use of immersive digital technologies to communicate real world climate issues powerfully and globally (Dobrowoska 2020).

Our Visiting Professionals (VPs) also helped re-enforce critical and contextual sessions delivered by the Viscom team. We covered topics such as ethics, sustainability, representation and diversity, interactive arts etc., and our VPs Talks demonstrated these ideas in practice. This was one better than just showing students examples on google. Instead, they benefitted from being able to ask VPS questions, albeit through the medium of a screen, and to interrogate ideas at a more applied level. The immediacy of dialogue allowed students to become part of a specific community with our VPs. Not only did students ask module relevant questions, but also wider questions relating to their own practice and contextual interests. This generally resulted in open invitations to students to continue conversations beyond our allotted VP sessions.

In previous years, students were guided through a structured series of specialist workshops, skillsets and individual tutorials, upon which they were expected incrementally acquire technical skills and knowledge. However, access to new means of learning in the form of online resources (such as Adobe tutorials, Linked-in Learning or bespoke workshop videos recorded by the institution and uploaded to estudio pages, the university's virtual learning spaces), meant students could piece together their learning at a non-linear and self-determined pace. For example, a student did not need to do a screen-printing workshop before trying etching in a structure pre-arranged by module and workshop leaders. Instead, they could watch the etching induction videos first and then physically access the workshop through an online booking system. This new approach meant learning was more open, taking a constructivist approach to skills and knowledge acquisition rather than adhering to Piaget's developmental model (Piaget,

1936). That is, the student could engage with resources as and when they wish, rather than when a tutor believes they are ready in a linear model of development.

Within the module, each students' engagement was located around two peer groups: A skillset group with a specialist tutor (which came together as a result of students' choice to work in a particular media), and an event group (which came together as a result of students choosing particular themes of interest). These groups overlapped a little, but not much. Through them, students formed their own communities of practice. They also aspired to transform their audiences into a communities of practice through the activities and call outs on social media and digital platforms. To maximise inclusion and engagement, this had to be done online and using consumer-ready platforms. Students' creative outcomes also had to be digital for them to be seen. During the module, we looked at Claire Bishop's argument about digital arts. In *Digital Divide*, she asks:

> *"While many artists use digital technology, how many really confront the question of what it means to think, see, and filter approach the contemporary through the digital? How many thematize this, or reflect deeply on how we experience, and are altered by, the digitization of our existence?" (Bishop, 2012, p. 436)*

We attempted to really consider the potential of digital technologies at the ideas stage of development, rather than to convert outcomes merely for display. Rather than to disavow the digital means of production, we attempted to embrace this head on, even within analogue processes, with the prior knowledge of the imperative of digital encounters with between the work and audiences. Bishop quotes Lev Manovich, who asks if communication itself can be a subject of an aesthetic (Manovich, 2001), and due to our necessity to do this via screen-based engagement, it was a main point of consideration throughout.

Process

Whilst the first UK lockdown in Semester 2020 forced teaching online, much content had already been delivered. Therefore, most teaching at that point was feedback to individuals or small groups, meaning staff and students had a limited experience of digital teaching tools at the beginning of this academic year. These had not been applied, to the new context in which tutors and students were engaging. We were both unfamiliar with each other, due to new cohorts, and had not yet established relationships. Additionally, some skillset areas could be better facilitated than others. For example, 3D workshops in metal, wood, ceramics etc., as well areas such as screen printing, letterpress etc. could happen pretty much as normal with some scaling down of group sizes because they had prepared resource spaces to enable social distancing and hygiene in advance. Yet some areas, particularly Moving Image and Photography, were still struggling to recover equipment (most of which had been loaned out by last year's

outgoing Level 6 students prior to Easter holidays and lockdown). Therefore, not only were technical inductions difficult due to group sizes, social distancing and equipment handling issues, but the resource areas did not even have the equipment they normally have available.

The Module leader and Level 5 team centrally co-ordinated all generic module teaching, critical and contextual sessions, and overarching schedule (including the VP schedule). However, we decided to devolve all content of skillset learning to the relevant specialist tutors to research and deliver according to potential provision within the restrictions. We used teaching hours to build in tutor-led workshops in small skillset groups, enabling lecturers to develop and deliver specific skills and underlying principles, which differed significantly between skillsets, but which all covered a consistent high standard.

Table 1: Skillset tutorials and Tutor-Led Workshops

Graphics	The Brief & the Brand Logo & typeface design Layout & composition Resourcefulness Sustainability Resourcefulness; Sustainability (3Es) ADOBE CC History of Graphic Design Rights Print/Digital Self Confidence
Illustration	Working With What You've Got: Experimentation using everyday objects, testing techniques, tools and materials Icon: Self portraits for use as promotion, profile and branding Headlines: Information and story through illustration

3D	Make Do: Paperclip workshop, Potential, Taking things further, Materials, 3D Online, Visual Identity, Brand Building Material Culture: Object Anthropology, Your Work Culture, Ethics & Sustainability, Impact & Legacy, Community & Inclusivity Christmas Market: Selling Platforms, Customer/Audience, Trash into Cash, Zero Waste, Commerce
Photography	Exposure Compensation Composition Silhouettes Controlling Lighting Image post-production

Flexibility and freedom were key. For example, in Moving Image, we explored technology and extended our community of practice beyond the university. We looked at a mobile phone app, *Filmic Pro*, which enables a smart phone to shoot high quality footage, stored on the cloud, without codec issues when imported for editing. We also explored gimbals for mobile phone cameras and accessed some of the free archives available, in particular through the UK based *Archive for Education* programme. The tutor set tasks which were achievable regardless of equipment or isolation, do-able on any camera, in one's own room or out of doors. Yet these still explored key principles such as camera movement and shot angles, whilst focusing on creative ideas and creating high quality films. Being within a learning group with shared aims, students formed a community of practice, a peer support network which enabled Vygotsky's **'**Zone of Proximal Development' (Vygotsky, 1978), thus furthering each other's attainment and standards. Google Drive was also used to share work and upload it for tutor and peer review. Finally, these small skillset groups enabled us to hold some

classes in the studio (given the university had stipulated no large group or individual teaching could happen in person). This ability to be present (if it was appropriate to the session) meant staff and students could bond better. "*Genuineness, trust* and *understanding*" are identified as key attributes in any learning relationship by Carl Rogers (Rogers, 1967 304-311 in Smith, 2004). Evidence of this bond became apparent in student take-up of optional online tutorials when they became available later on in the module.

We engaged with the online learning resources to which the university had subscribed, such as Adobe and Linked-in Learning. Our workshop technicians and academics set recommended pathways for students, but the latter could also explore these resources for themselves. Our university workshops provided their own instructional videos too across a range of media, from After Effects to screen printing, and other online learning platforms such as Adobe Max conference and FilmBuddy gave students access to professional speakers, masterclasses and 'how to' guides. Overall, students were offered a much wider range of materials and methods of engagement. This supplemented focussed skillset learning with tutors and each other, and gave students the freedom to explore and engage as appropriate to their practice, learning style and speed. With the further feedback from tutors through online tutorials and in-person small group critiques, students were really able to develop an independent constructivist knowledge base.

By the time our Visual Literacy module started in September of this academic year, the world had experienced lockdowns in many countries and yet the creative industries had responded innovatively in order to share work with audiences. It was important that we, staff and students, were aware of what was already out there that might be useful. Therefore, the Level 5 team spent a significant amount of time preparing, researching and attending different online openings, events, seminars etc, and gathering them into a Padlet resource. One of the significant advantages of digital exhibitions or performances, for example, is the ability to access culture from your own home for free. For example, Tracy Emin's show, *I Thrive on Solitude,* at Whitecube Gallery, London, or The V & A's *Kimono: Kyoto to Catwalk*, were real treats. Similarly, participating in *Slung-Low* (a Leeds-based online choir) and attending *Stay-at-Home-Rave* by North England's original Indy Club, *The Hacienda* offered expanded cultural involvement, but all from within the home. Likewise film festivals, such as the independent festival, *Scalarama*, or *Leeds International Film Festival*, could be attended through a smart phone with good wifi, thus maximising opportunity to view films, but limited to the confines of an individual's domestic private space . However, the ability to go global and explore international phenomena such as *Global Hack*, was unique and unprecedented. Within this, we were conscious that the Viscom team's cultural choices might not resonate with students, and so we invited students to contribute to the Padlet and construct their own collective resource.

Students' thinking around events, exhibitions and their responsibility as creatives exhibiting work in public was supported by the critical and contextual studies programme embedded into the module.

Table 2: Visual Literacy Critical and Contextual Studies

How do you measure and evidence impact?

These took place via large group Google Meets. At first it was a very different experience for all. As lecturers we would be communicating with students who mostly had their mics and cameras turned off. When presenting we could not even see the chat function (which was used by a just few of the braver students at first). To mitigate, we team-taught wherever possible when facilitating large groups in order to maximise student interaction Besides chat functions, examples of this are using Break-out rooms in Meet, as well as the whiteboard function (called a 'Jam') to enable students to respond to questions visually and in smaller groups where they felt more comfortable. Lecturers could support the groups virtually whilst using Google Hangouts to quickly exchange information between themselves. All of this was backed-up by Meet recordings and slides uploaded to our estudio pages. Despite our worries that this might affect attendance, we found this not to be the case.

We used Google Meets tools to facilitate students forming event groups according to their choice of shared themes. This year students formed six groups, with approximately eight students per group. In order to communicate with each other and plan beyond group tutorials with tutors, students generally used social media such as What's App chat groups, Facebook or Google Meets amongst themselves. This allowed them to plan, discuss, delegate and share elements, such as further refinement of group theme and aims, publicity design, marketing & distribution, colour schemes, website design etc.

Table 3: Student Event Groups, Themes and Platforms 2020

Group Name	Theme	Platform
LIV	Narrative, life cycle	Website and Instagram https://viscomliv.wixsite.com/home
Imbalance	Wellbeing	Website and Instagram https://imogenjoycedesigns.wixsite.com/imbalancedhouse
You	Popular British Culture	Zine collections hosted on a Website, and Instagram https://foryouaboutyouzine.wixsite.com/launch
Art Exchange	Lockdown boredom and isolation	Instagram https://www.instagram.com/artxchange_ig/
Renew	Environmental Issues	Instagram and Website with Youtube Live Stream event https://renewlau.wixsite.com/renew
Identity	Identity Formation	Artsteps, Google Meet (opening), Instagram https://www.artsteps.com/view/5fb677168e680c30237e3e6d

Most students used Instagram personally, so were already familiar with it to promote and build audiences for their online group events and exhibitions, and even to host the happenings in some cases. We looked at creative uses of Instagram, such as puzzles, give-aways and drip-feed releases. All final creative outcomes had to be launched and released online with no physical public interaction during the final week of teaching in December 2020. By connecting all six event groups to the Viscom course Instagram, other students and alumni could follow and join the different groups' events. After these successful online launches, the module submission was also digital. This was the second time since March 2020 that students had done so. We prepared students by asking them in advance to consider how best to submit their work digitally. We were able to show strong examples, from the previous year, of blogs or Indesign documents as digital PDFs in the place of physical sketchbooks(for submission). The advanced awareness of the online context necessitated by the enduring pandemic this time round, meant staff and students were better technically equipped and familiar with digital submission.

Evaluation

Student participation and engagement was facilitated by a blended approach of some in-person skillset workshops and a majority of learning online. Anonymous student responses to end-of-module evaluation report:

- Students liked recorded talks and resource inductions.
- Students liked group work and events for the social contact.
- Students felt they had lots of opportunity to seek feedback from tutors and that they were very supportive.
- Students enjoyed lecture content and industry talks.
- Students really enjoyed practical workshops (both online and in-person).

(various anon. 2021)

These responses were fairly positive but only a few students bothered to complete the evaluation survey. Potentially this is due to having nothing bad to say about the module, but it could also be due to online/screen fatigue coinciding with the start of another national lockdown in UK.

Staff and module leader observations following review and assessment of student work broadly align with student evaluation comments, with some additional thoughts:

- Familiarity with technology and better institutional sign-up to packages over time improved online learning experiences for staff and students as module progressed.
- Small groups/Break-out rooms facilitated more nuanced learning.
- Team-teaching allowed invaluable ability to assist students when experiencing difficulties.
- Students would not turn on cameras, and they rarely used mic. However, the chat function was frequently employed.
- Uploading presentations and lecture recordings enabled expanded learning, not limited by space and time, and allowed students to review sessions at their leisure.
- Budget did not need to cover travel costs and therefore was able to pay for more VPs from around the globe.
- Final outcomes were of a high quality consistent with other years.

(Hooper, S. 2021)

Of course, in a major UK city (Leeds), with most learners either in student accommodation or living at familial homes, access to internet and devices was not a problem in the main. Occasionally however, technological access was an obstacle and we attempted to provide laptops, hard drives, access to campus etc., where needed and

where possible. Most visual work was of a high quality and often technology-specific outcomes. Some students demonstrated strong engagement with online learning resources, developing independence that accelerated skills learning. However, some work was repetitive in its topic and approach, if not in outcome, probably due to reduced diversity of experiences and concerns during the pandemic. Of particular note, students have anecdotally repeated that they really valued the group work and the social interaction that this afforded (albeit online). Students believed it helped their mental health by providing a shared sense of purpose and connectedness that helped stave off some of the negative effects of social distancing and isolation (various anon., 2021 b).

Conclusion

New technologies have always brought new engagements and potential social change. Benjamin reminded us of this in his reflections on mechanical reproduction and the simultaneous capacity for both revolution and fascist appropriation (Benjamin 1935). The printing press and cinema allowed more egalitarian access to culture, in his opinion. In the current climate, we have seen further expansion of this as digital streaming has replaced cinema, often making it more affordable and accessible. Similarly, there are online teaching methods resulting from the pandemic that have proved positive, largely because of their capacity to enable expanded access and opportunities for review.

In proposing the emancipated spectator, one who can accumulate a knowledge bank based on their own subjective and collective experiences beyond a simple dichotomy of right and wrong, of passive and active, Ranciére has faith in the thought capacity of learners/spectators/participants to extract and build their own understanding (2007). Whilst online participation and learning could be dismissed as passive, it does present a gap, or space for active agency as well as for the imaginary and difference. Whilst there is a danger every student will unquestioningly draw information from the same internet sources and trending material, this can be differentiated by skillset groups and tutor influence to suggest more nuanced sources. Another advantage is a wider scope for Schon's Reflective practice, both during and after the practice (1991). The module results show students who used online technology and time alone well developed more reflexive praxis.

Many galleries and museums responded creatively to the possibilities of extended audiences as offered by remote access due to the forced move online. Tandazani Dhlakama of Zeitz MOCAA, South Africa discussed not only new ways of engaging with audiences, but the need to reconsider who the new audience is first and foremost (Dhlakama, 2020). Geographic location and time and budget constraints around travel and entry tickets are not such a barrier online, therefore potentially engaging a wider

demographic beyond the typical cultural elite and familiar middle classes. Whilst audiences to student online events were not wildly distinct from themselves, students did embrace the possibility, if not always carrying it through successfully. Such willingness is, in itself, hopeful for a more egalitarian future. Next year, we hope to embrace technology further and exchange with students in another country and culture.

If, as Wenger believes, learning is a process of actively becoming, both as an active learner and as a member of a community of practice, familiarity and comfort within this new digital space is a prerequisite. Initially, students weren't necessarily as familiar as anticipated with creating an online presence. For, despite being digital natives and used to constructing identities on and offline, the sense of permanence around the *academic* and *professional* output (in this context anything intended to be seen by a wider public), was less familiar to students, akin to Bourdieu's distinct social spaces (1998). However, due to the current, all-pervasive necessity to embrace the digital, and working within small groups for mutual support, students became more comfortable with this new normal over time.

There are many skills and benefits afforded by online events and exhibitions. Social media and digital technology provide us with a wealth of user-ready tools to communicate adequately with audiences. They increase our reach and make work more accessible. However, they do not offer all the benefits that in-person teaching and exhibition afford. The digital experience was positive overall, but could better co-exist with in-person participation. Like many institutions, we are intending to move forward with a blended approach, taking the best from what each has to offer, circumstances permitting.

(Re)envisioning the contribution of design to the sustainable transition of healthcare systems

Amina Pereno [a]*

Abstract | The health emergency has challenged our health systems, stressing the weakest points but also revealing the strengths to be harnessed. Among these, the concern for the environmental, social and economic aspects of health systems – gathered under the heading of sustainable healthcare – has suffered a temporary setback but will certainly experience strong growth in the post-pandemic era. During 2018 and 2019, a collaborative foresight process on the future of sustainable healthcare was conducted with over 150 healthcare stakeholders. This paper starts from the strategies that emerged from the collaborative foresight to re-read them in light of the impacts of COVID-19 on health systems. A systematic literature review mapped the effects of the pandemic on the sustainable development of health systems and, therefore, on the defined strategies. Hence, the paper defines the connections with design disciplines and the possible contribution of designers in the development of sustainable healthcare in the post-pandemic era.

KEYWORDS | SYSTEMIC DESIGN, SUSTAINABLE DESIGN, HEALTHCARE, SYSTEM TRANSITION, SUSTAINABLE DEVELOPMENT

1. Introduction

1.1 Origins and effects of the sustainability debate in healthcare

In 1996, the U.S. Environmental Protection Agency identified the incineration of medical waste as the main source of dioxin, one of the most powerful carcinogenic gases. For the first time, healthcare organisations realised that environmental protection had a direct link to patient care, and international associations and campaign groups gathered under the banner of the Hippocratic principle *primum non nocere* (first, do not harm). Main organisation, such as Healthcare Without Harm, addressed the substitution of impactful chemicals and pharmaceuticals, endorsed energy efficiency initiatives in health care facilities and, above all, promoted awareness raising programmes on the environmental impact of hospital routines. The results have undoubtedly been positive, but the main limit of 'do not harm' is that of a fragmentary vision of the health systems.

During the 2000s, the economic crisis exacerbated the problem of the environmental, social and economic sustainability of the health sector, which has always been a heavy burden on the public budgets of Western societies. New health associations and hospital organisations started addressing the issue, and medical research engaged in the debate on sustainability. Important medical journals published the reflections of health professionals questioning the socio-environmental impact of their medical specialties, as evidenced by the contribution of Sherman and Ryan (2010), among the first to tackling the challenge:

> "Only through understanding the connectivity and contribution of modern health care practice to ecological issues can physicians work toward aligning commitment to individual care with public and planetary health" (Sherman & Ryan, 2010, p. 139)

As also recognised by the European Commission (2016), making health systems sustainable means to find new approaches to make them more effective, accessible and resilient. The Hippocratic principle deserves credit for having pushed medical research to question its role towards society and the planet, broadening the concept of health towards a holistic vision of well-being. However, it lacks of systematic methods to investigate sustainable healthcare, and the complexity of the issue requires a step forward to find points of convergence between different disciplines.

1.2 Design and medicine towards a co-disciplinary vision

The relationship between Design and Medicine consolidates in the same years of the sustainability debate in healthcare, but it focuses on topics other than the environmental ones.

The literature highlights multiple points of contact between the two disciplines: the attention to a new design of healthcare spaces was one of the first contributions of the design disciplines in the medical field (Golembiewski, 2016). A more recent field is the design

of biomedical devices (Vincent & Blandford, 2017), which involves design in the creation of home and hospital items for rehabilitating patients in their daily routines, or in the design of safer and more usable medical-surgical instruments to support professionals. The ability to understand people and manage complex systems has also found wide application in the emerging eHealth sector (Ekelanda, Bowes, & Flottorp, 2010), which adopts ICTs in the healthcare field to improve the treatment dynamics and foster the prevention and management of diseases at home, especially the chronic ones.

The combination of Medicine and Design has therefore produced interesting results, but the recent addition of the sustainability dimension significantly changes the state of the art. The economic, social and environmental sustainability of health systems goes beyond the product and service dimension and requires a strategic and all-encompassing vision. Design can offer a multi-level perspective to the complex problems of health care and, in particular, Jones (2013) identifies Systemic Design as a design discipline able to focus on the needs of multiple users, while addressing the indeterminate complexity of the system in which they are embedded.

Despite the peculiarity and challenges of the healthcare sector, it is inappropriate to think of "Design for healthcare" as a sub-discipline of Design, this is even more true for "Design for sustainable healthcare", where the inclusion of environmental sustainability leads to a further level of complexity. A single branch of design cannot address the issue of sustainable healthcare. Especially when it comes to environmental sustainability, the risk is to relegate competence and responsibility to a single discipline, as it has happened in the past for eco-design (Toso, Barbero & Tamborrini, 2012). Design has a clear disciplinary identity and well-established methodologies to dialogue on equal terms with Medicine. Sustainability comes into play as a transversal topic to both disciplines, and it must be tackled jointly, combining the skills and tools peculiar to Design and Medicine. Only an open and equal collaboration can enable to tackling the challenge of sustainable healthcare, avoiding the risk of making simple improvements to the status quo rather than pursuing real sustainable innovation.

1.3 Post-pandemic visions on sustainable healthcare

Today, the COVID-19 pandemic has further highlighted the need for adopting more sustainable approaches to health systems. Indeed, although environmental concerns on healthcare may seem secondary to the health emergency, the protection of our planet plays a crucial role both upstream and downstream in the value chain. First of all, mitigating climate change and reducing the consumption of resources will contribute to improve the economic sustainability of health systems – hence the financial resources for acute illnesses – and to prevent diseases of environmental nature or due to the destruction of natural ecosystems (Marco et al., 2020). Secondly, the linear system on which current supply chains are based has shown its fragility during the pandemic, leading to failures that more dynamic, resilient and local systems could prevent (Jafarnejad et al., 2019).

However, it is undeniable how the pandemic has changed and will change the approach to sustainability in healthcare, questioning the contribution of all disciplines involved. In the two years prior to the COVID-19 outbreak, the author collaborated in a foresight process, coordinated by the Nordic Center for Sustainable Healthcare, which involved several stakeholders in the health sector, particularly in the Nordic region. The process resulted in the definition of macro-strategies aimed at fostering sustainable healthcare. Although the strategies remain valid as an expression of the complexity of a consolidated system, it is clear that the pandemic emergency impacts on them, demanding a review in the light of the COVID-19 experience. It is also important to stress that the strategies were devised from a foresight process mainly involving the Nordic countries, whereas the pandemic phenomenon, as well as the research investigating its sustainability impacts, has a global reach. While, in some respects, this may be a limitation of the analysis of post-COVID strategies, in others the health emergency has exposed common flaws in health systems worldwide and their supply chains, thus highlighting the need to actualise the strategies at a global level. Moreover, the strategies involve different sectors and disciplines, and also strongly involve design. This paper starts from an analysis of design's contribution to sustainable healthcare strategies to envision the new evolution of the strategies themselves, as well as the role of design disciplines in the light of the pandemic experience, proposing possible approaches for a new normal.

2. Methodology

2.1 Research background

The growing interest in Sustainable healthcare highlights the common perception of the need for change in the sector. To date, different approaches and visions to the topic have not yet agreed on a shared definition but, as Fischer (2015) points out, "*all approaches seem to have in common that a comprehensive approach with a long-term focus and a need to balance economic, social, and ecological interests needs to be used in the discussion of sustainable healthcare systems.*" (p. 298).

This need for a systemic transition towards environmental, social and economic sustainability was the starting point for a foresight process on sustainable healthcare, which engaged – through 5 workshops – 165 selected stakeholders representing the health system: regional and national authorities, universities and research centres, NGOs and healthcare networks, clusters, health industries, health providers, professional consortia. This foresight process has jointly adopted anticipation and systemic design methodologies (Pereno & Eriksson, 2020). The results of the workshops have been elaborated with a double purpose: first, to identify possible future scenarios for sustainable healthcare, building a triple vision of the system in the medium-long term. Second, to define the strategies to concretely foster

a transition towards a desirable future, identifying three main areas of intervention (Table 1).

Table 1. Strategies for sustainable healthcare (SH). Adapted from Pereno & Eriksson, 2020.

Strategy	Strategic actions	Time horizon	Scale of action
COLLABORATION: Increasing national collaboration on SH	Establishing a national collective impact initiative for SH	Short	National
	Creating a Green Deal for SH	Medium	National
	Strengthening the cooperation around a shared vision of SH	Short	Local
INNOVATION: Increasing sustainable innovation in healthcare	Developing sustainability assessment models for industries	Medium	National Global
	Providing industry specific guidance	Short-medium	National
	Creating virtual accelerator for SH companies	Medium-long	National Global
	Creating 'publics' as interdisciplinary arenas on SH	Short	Global
	Increasing support for test beds in SH	Medium	Global
INFORMATION: Increasing collective knowledge about SH	Introducing SH into university curricula	Medium	National
	Promoting information campaigns targeted at decision-makers	Short	National Global
	Developing an international communication package on SH	Short	Global

The paper starts from the results of previous research to deepen the specific contribution of design in the strategies developed, to explore the implications that the pandemic has on sustainable healthcare strategies and, especially, on design disciplines in this area.

2.2 Research methodology

As pointed out in par. 2.1, the adopted methodology aims to answer the following research question: How does design support the implementation of sustainable healthcare strategies, given the changes triggered by the COVID-19 pandemic?

For this purpose, the research starts from the strategies that emerged within the foresight process completed before the pandemic (Pereno & Eriksson, 2020), and implements a methodology based on three analytical steps.

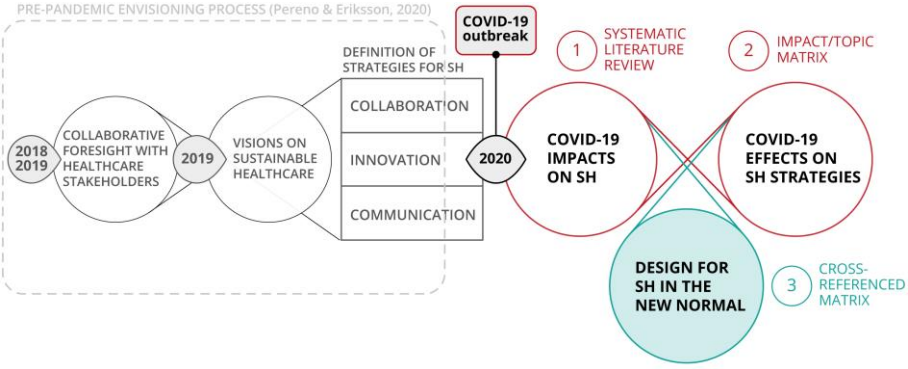

Figure 1. Graphical representation of the methodological process.

Figure 1 visualises the previous research phase in connection to the three research steps followed in the past year:

1. *Systematic literature review of the pandemic impacts on sustainable healthcare*. The first step has carried out a review on the main databases (Scopus, Web of Science, and PubMed) which allowed an overall analysis of the main articles through a categorisation of the authors' keywords and an in-depth analysis of the most relevant publications. This systematically highlighted the main impacts of the pandemic on sustainability in the healthcare sector.
2. *The effects of the pandemic on the strategies for sustainable healthcare*. The strategies presented in par. 2.1 (collaboration, innovation, and communication) have roots in the pre-pandemic era. While in principle they are still valid, it is beyond doubt that the global health emergency calls for re-reading them in the light of the new emerging landscape. Therefore, it has been used a matrix to cross-reference the topics and impacts of the pandemic on the sustainable development of health systems, in order to put them in connection with the sustainable healthcare strategies.
3. *The contribution of design to post-pandemic strategies for sustainable healthcare.* The last step combines the results of the two previous ones to define how strategies have changed due to the pandemic and how the contribution of design disciplines to sustainable healthcare should evolve into the new normal. The previous work (see par. 2.1) adopted a design approach for the analysis of foresight process results; however, the specific contribution of the design disciplines in the implementation of the strategies that emerged was not further investigated. Thus, the final step focuses on highlighting the synergies that design brings into play to contribute to these strategies.

The three-step methodology has enabled the pandemic phenomenon to be analysed by means of qualitative-quantitative databases in order to investigate, from a qualitative perspective, the design synergies in the emerging area of sustainable healthcare, in the post-pandemic era.

3. The contribution of design to new healthcare scenarios

3.1 The impact of COVID-19 pandemic on the sustainable development of health systems

A systematic literature review was carried out through the main databases (Scopus, Web of Science, PubMed) to define the impact of the pandemic on the healthcare sector as regards sustainability. Table 2 shows the results obtained through a query that was purposely wide-ranging to include all the topics and disciplines that have dealt, to some extent, with the effects of the pandemic on the sustainable development of health systems. The records obtained from the different databases have been cross-referenced to eliminate any duplicates.

Table 2. The main impacts of COVID-19 pandemic on sustainable healthcare.

Query	Database	Records	Final records
("covid-19" OR coronavirus) AND (health OR healthcare OR "health care") AND (sustainability OR "sustainable development") AND (LIMIT-TO (PUBYEAR, 2021) OR LIMIT-TO (PUBYEAR, 2020)	Scopus	370	429
	Web of Science	190	
	PubMed	169	

The next step was the analysis of the results collected and their categorisation according to the topics addressed. This has been done in two phases: first, a schematisation of the keywords of the total records that allowed a general analysis of all contributions. Figure 2 visualises authors' keywords in hierarchical order: some macro-topics emerge, both of a general nature (public health, system resilience, policy and strategic management, etc.) and of a more specialised interest (mental health, Personal Protective Equipment, ecosystems protection, etc.). Hence, the keywords analysis enabled to identify nine main topics resulting from the relationship between the pandemic and the sustainable development of the health sector: Health systems, Policy and governance, Environmental aspects, Social aspects, Economical aspects, Technological aspects, Industry, Food production and consumption, Education.

Figure 2. Hierarchical visualisation of authors' keywords related to the impact of the COVID-19 pandemic on sustainability in the health sector.

Starting from the general topic analysis, an in-depth reading of the most relevant publications (based on relevance and number of citations) has been conducted for each of the categories analysed. Table 3 shows the direct and indirect impacts that the COVID-19 pandemic has on sustainable healthcare, as revealed by the papers analysed.

Table 3. The main impacts of COVID-19 pandemic on sustainable healthcare.

Topic	Impacts	Main publications
Health systems	Origin of the pandemic; resilience of health systems; global health security; well-being during pandemic; impacts on specific people categories (elderly, young, people with disabilities); impacts on different categories of health workers; impacts on specific diseases (mental health; non-communicable diseases).	Coccia, 2020; Djalante, Fraher et al., 2020; Osingada and Porta, 2020; Shaw and DeWit, 2020.
Policy and governance	Public health policies; strategies for public governance; cross-sectoral government strategies; policies to enhance collaborative innovation actions; public-private partnership (PPP) and the role of private stakeholders.	Baxter and Casady, 2020; DeWit, Shaw and Djalante, 2020; La et al., 2020; Sarkodie and Owusu, 2020;
Environmental aspects	Health effects of environmental protection; Sustainable Development Goals targets; sustainable models of health system; waste management in healthcare facilities; medical single-use products and plastics; wastewater; sustainability of specific activities related to healthcare (tourism, production, energy).	Cheval et al., 2020; Marco et al., 2020; Naidoo and Fisher, 2020; Patricio Silva et al., 2020; Seshaiyer and McNeely, 2020; The Lancet Public Health, 2020.

Social aspects	Equity of access to healthcare; pandemic effects in developing countries; models of international collaboration for health emergencies; causes of inequality within the pandemic (migration, low-income, informal economy); causes of social exclusion within the pandemic; information suppression.	Bahn, Cohen, and van der Meulen Rodger, 2020; Wang and Tang, 2020; Armitage and Nellums, 2020; Shadmi et al., 2020.
Economical aspects	Economic risk management strategies; financial sustainability during the pandemic; labour market impacts of the pandemic; innovative welfare strategies; corruption problems.	Kruse and Jeurissen, 2020; van Barneveld et al., 2020; Visconti and Morea, 2020.
Technological aspects	Telehealth/telemedicine; social media and pandemic communication; Healthcare 4.0 and digital innovation in health systems; machine learning; Internet of Medical Things (IoMT) and medical devices.	Fryer et al, 2020; Helou et al., 2020; Smith et al., 2020; Thomas et al., 2020.
Industry	Supply chain management and supply chain disruptions; Personal Protective Equipment (PPE); sustainable manufacturing in the healthcare industry; sustainable transportation.	Ibn-Mohammed et al., 2021; Leite, Lindsay, and Kumar, 2020; Rowan and Laffey, 2020; Tirachini and Cats, 2020.
Food production and consumption	Food security; food safety; production and management of food waste; sustainable and healthy nutrition; sustainable agriculture models.	Galanakis, 2020; Attwood and Haja, 2020; Savary et al. 2020.
Education	Role of higher education in the pandemic; health education; technology and ICTs in education; Learning Management Systems (LMS).	Code, Ralph, and Forde, 2020; Hays, Ramani, and Hassell, 2020; Wahab, Shuib, and Shaik, 2020.

3.2 The implications of COVID-19 pandemic on sustainable healthcare strategies

While the sustainable healthcare strategies highlighted by the foresight process (see par. 2.1) show the potentials for action towards new pre-pandemic sustainable scenarios, the categories analysed in the literature (see par. 3.1) revealed the issues most affected by COVID-19, and which will undergo a significant change in the post-pandemic era.

In order to identify the role of design in this transformative scenario, a cross-analysis of these outcomes was carried out. Figure 3 presents the different sub-topics that have been analysed through a matrix that combines the topic specialisation level with its impact scale on individual and collective activities. The three categories of sustainable healthcare strategies are then included in the matrix to identify the scope for future interventions and impacts:

1. *Post-pandemic collaboration*. Collaborative strategies will mainly address general issues that may have specific impacts on individual activities as well as on collective life. Among the issues demanding greater attention in the future are the sector's governance strategies aimed at creating more resilient systems that can collectively address health emergencies and complex challenges, such as those posed by the UN Sustainable Development Goals. The economic and financial crisis has also highlighted socio-economic weaknesses, as in the welfare, that have a far-reaching impact on people's lives and require urgent collaborative strategies.
2. *Post-pandemic innovation*. Innovation strategies will mainly deal with specialised topics impacting on individual but also collective tasks. During the pandemic, manufacturing and agri-food industries have shown the need for greater flexibility, safety and sustainability, particularly some supply chains such as PPEs. Health technologies also need to innovate from a social perspective, addressing a global audience with different needs, especially in developing countries. The efficacy and sustainability of digital health is another social and technological issue that the pandemic has dramatically accelerated, while also highlighting shortcomings in usability and acceptability.
3. *Post-pandemic information*. The prevention and awareness-raising role of the media was already evident before the pandemic, but COVID-19 stressed the need for attention to environmental issues that may cause or accelerate disasters of environmental origin. Waste and supply chain management in emergency situations also require more careful and coherent information strategies. The role of education in such a context is even more striking, as there is a need to train students, professionals and citizens on sustainable healthcare issues that are cross-cutting to care, environment and wellbeing. The results of the literature review (see Table 1) showed that the topic of misinformation or suppressed information is marginal with respect to COVID-19. Although the link between sustainable development of the health sector and information transparency is not one of the core topics of current research, it is undeniable that seeking out reliable channels and modes to communicate with citizens is crucial, especially in relation to sustainable healthcare.

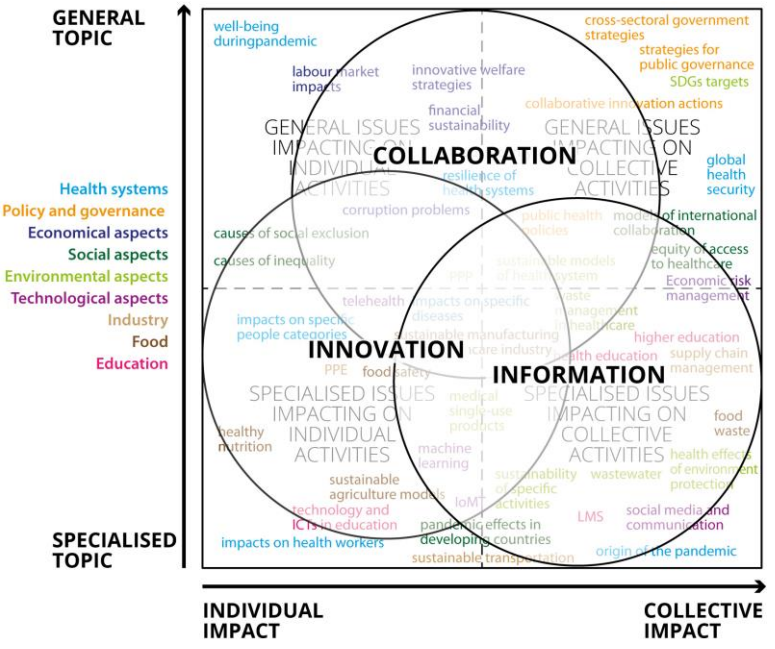

Figure 3. Relationship between the topics and impacts of the pandemic on the sustainable development of health systems, in connection with sustainable healthcare strategies.

3.3 The contribution of design to sustainable healthcare strategies in the post-pandemic era

Starting from the matrix shown in Figure 3, the research finally focused on the contribution of design disciplines to sustainable healthcare strategies, considering the new challenges that have emerged.

Figure 4 depicts the design disciplines within the matrix and in connection with sustainable healthcare strategies. The choice of design sub-disciplines is based on the categorisations proposed by Ceschin and Gaziulusoy (2019) and Irwin et al. (2015), as both address the issue of design for sustainability through different levels of action, from product to socio-technical systems. In some cases, the proposed disciplines have points of overlap or inclusion in each other (e.g. Design for sustainability transition includes policy design methods and tools), but the focus was placed on the disciplines themselves rather than on their interdependencies.

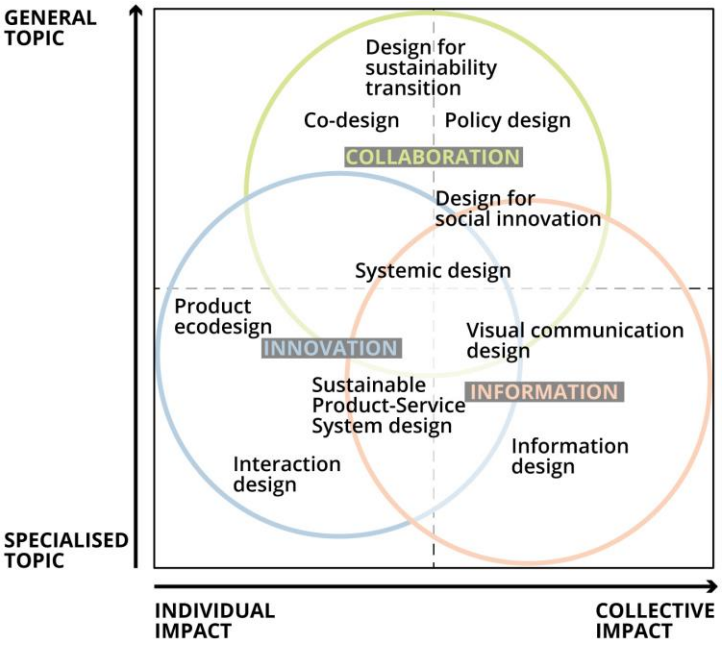

Figure 4. Relationship between main design disciplines and sustainable healthcare strategies.

Overall, the matrix provides support in defining the contribution of design to the three action areas identified as strategic for the development of sustainable healthcare:

1. *Design for collaboration in sustainable healthcare*. As previously highlighted, the governance strategies of the healthcare sector should aim at boosting the resilience of health systems, addressing the socio-economic issues and the need for collaborative actions. The pre-pandemic foresight identified collective impact initiatives and green deals as desirable instruments to enhance collaboration. The COVID-19 has been strengthening this urgency and design disciplines can support the process acceleration. To that end, co-design strategies are crucial: Manzini (2015) defines co-design as a problem-based and solution-oriented design process resulting from the interaction of a variety of disciplines and stakeholders. In this process, design experts have acquired the skills to foster collaboration and guide the process towards achieving solutions that meet actual needs. This ability is applied to the policy field, working on the design of policies for socio-economic systems, as well as to the definition of transition strategies for social and socio-technical systems in the medium and long term. Overall, design for collaboration towards sustainability acts at the level of complex systems, fostering trans-disciplinary and cross-sectoral processes. They support both the engagement of

key stakeholders and the pursuit of clear objectives over multiple time horizons, based on a clear understanding of the underlying system.

2. *Design for innovation in sustainable healthcare*. Whether collaborative actions can foster social innovation, industries from different value chain are called upon to address the demand for sustainable innovation, especially in services and products. The pandemic stressed the need of manufacturing and agri-food industries for greater flexibility, safety and sustainability from a cross-country perspective. Service design methods, and Sustainable Product-Service System design in particular, allow a lateral approach to product design, focusing on a strongly social dimension that enables complex innovations to be pursued. The tools for user engagement in the design and validation phases can also be valuable in the healthcare field, where sustainable healthcare strategies aim to accelerate the testing and introduction of new solutions. As healthcare, compared to other sectors, has a lower environmental concern regarding products, ecodesign skills can act to support recycling and reuse strategies, providing specific guidance to industries. Lastly, digitalisation and information technologies have been accelerated by the pandemic and the shift towards digital services will be confirmed and consolidated in the future. From that perspective, interaction design methods and tools have already been active in the area of eHealth, but they can still play an important role in driving new sustainable behaviours, from resource saving to distributed home care management.

3. *Design for information on sustainable healthcare*. The pandemic has highlighted the urgency of informing and training people and professionals on environmental issues. The environmental origin of COVID-19 strengthens communication strategies, providing new topics to be addressed. At the same time, some aspects of resource and waste management require effective communication even in stressful and emergency situations. In this context, two important design disciplines come into play: information design supports effective and efficient understanding of complex situations and information provided to users. In stressful conditions, this is even more important to enforce environmental guidelines without overburdening healthcare staff. Visual communication design, on the other hand, deals with communication to the general public, helping to define the channels, methods and messages to be conveyed towards creating a fertile ground for sustainable healthcare.

4. Discussion and conclusions

The paper addressed the impacts of the COVID-19 pandemic on sustainable healthcare, a trend that was rapidly developing in the pre-pandemic era. This contributed to understand how the phenomenon may be stalled or, conversely, strengthened in the post-pandemic era.

The literature shows very little research in the field of design for sustainable healthcare, and a greater gap exists in investigating how design will contribute to the sustainability of health systems in the future. The paper lays the groundwork to address this research gap, basing its contribution on solid research conducted within co-disciplinary and cross-sectoral arenas.

However, the research presents limitations that should be better addressed in the future. Firstly, the contribution of design is theorised through a deductive path which, although following a consistent methodology, remains in the realm of anticipation. Therefore, further validations are needed in the short- and medium-term to validate the actual contribution of design in a real environment.

The second limit, is related to the problem of assessing the design contribution through real case studies, which are not common in sustainable healthcare. As discussed in the introduction, collaboration between Design and Medicine has historically focused on other research fields – from medical devices to eHealth – other than the environmental issue. The radical change in the post-COVID era will further evolve existing disciplinary relationships and research topics, making it even more challenging to identify or create practical inter-disciplinary projects.

The third limitation relates to the high stress condition in which healthcare professionals are working. Although the pandemic seems to be coming to an end thanks to the new vaccines available, doctors, nurses and health workers will still face stressful working conditions in the coming months. In 2020, this forced the postponement of many projects outside the health emergency, and in the short term, the restarting of cross-sectoral and inter-disciplinary collaborations will take time before finding new spaces in a calmer and normalised situation.

Although not easy to address, these research limits pose important challenges for design disciplines, raising the bar towards broader sustainability goals – such as the link between the well-being of the planet and our societies – and towards new collaborations able to work on a system level rather than on specific products or services.

Reinforcing Networks of Place-Based Care and Resilience

*jvanoyen@ecuad.ca

Abstract | Since early 2020, communities across the globe have been challenged by the ongoing COVID-19 pandemic. This project formed in parallel with the trajectory of the pandemic and in response to compounding ecological and social justice crises. Fragmentation of resilient care and kinship networks as an emerging consequence of COVID-19 prompted us to ask: how do we, as designers, researchers and educators, build up these networks in the absence of face-to-face contact? The project has resulted in an open digital publication and participatory workshop framework centring themes of collaboration, care, and resilience. As the pandemic rages on, the emergent methodology of this project has in itself become a typology of care, a creative refuge for collaborators which bolsters us in our collective efforts to observe, document, and prop-up small acts of care and resilience in the hope of living within the carrying capacity of our planet.

KEYWORDS | CARE, RESILIENCE, EMERGENCE, PLACE-BASED DESIGN, COVID-19

1. Introduction

it is the end of a day, a season, a way, an era
the change is tumult, terrifying and beautiful
we will never be convinced to be expendable.
alchemize every death system, liberate
our divine lives.
- Excerpt from adrienne maree brown's poem *for George Floyd: fire*

This project began in pursuit of optimism and agency as survival tactics in the face of massive, systemic crises. Uncovering moments of care and resilience in our daily lives and domestic spaces, now put front-and-centre as we sheltered in place, felt necessary as 2020 unfolded. We hoped that stitched together, these small things could become a wide and joyous network; a salve of tangible, positive and regenerative ways to approach living within the earth's carrying capacity together during a global pandemic. 2020 and 2021 have been years of ongoing and stacking global crises, which amount to challenging times in which to live, let alone work. Yet, as design researchers, we are positioned to work through, respond, and adapt to challenges alongside our communities. This project emerged within the context of three ongoing and interconnected global crises: (1) the novel coronavirus pandemic; (2) the diminishing capacity of our planet to support our current ways of life; and (3) ongoing racialized violence and systemic oppression.

In early 2020, we experienced the onslaught of a global pandemic: the rapid spread of the novel coronavirus disease (COVID-19) and its devastating effects on communities worldwide (Pitlik, 2020). News of overseas lockdowns quickly became news of local lockdowns in March, with health orders urging people to immediately decrease their social exposure and avoid all non-essential travel (Holliday, 2020). Businesses closed their doors, public transit halted, and universities closed, shifting classes and research activities online ("B.C. universities", 2020).

In April of 2020, with the pandemic in full-force across the globe, we (virtually) assembled as a small group of design researchers in response to a joint open call from the Canadian Association of Graduate Studies (CAGS) and the Social Sciences and Humanities Research Council (SSHRC). The call was an invitation to respond to a Policy Horizons Canada report titled *The Next Generation of Emerging Global Challenges: Living within the Earth's Carrying Capacity* (2018). The report reminds us of the many critical ecological tipping points we are hurtling towards, approaching the inability of the planet to fully support life and with that massive social upheaval, war, and widespread death. It is apparent that the pandemic is inseparable from these ecological crises. The efficiency at which the virus has swept through the bodies of animals, our human bodies, and our communities is a reminder of the fallacy of human exceptionalism; we are not and cannot be separated from the living systems around us (Kolinjivadi, 2020).

On May 25, 2020, George Floyd was murdered through an incident of police brutality in Minneapolis, USA (Hill et al., 2020). This event, as well as other Black deaths by police violence, sparked massive global protests under the banner of Black Lives Matter and other anti-racism movements. These movements demand justice for Floyd, defunding of the police, an end to mass incarceration, and other changes necessary for Black liberation (ACLU, 2020). Questions swirl in the already-ignited socio-political landscape: how can a just and sustainable recovery from COVID-19 ever be achieved without Black safety? Speaking up to the other systemic forces we are dealing with (COVID-19, ecological crises) is inextricable from speaking up to systemic racialized oppression.

As design researchers, we feel compelled to respond to crises with collaborative and creative work, to ensure cross-disciplinary dialogues are happening with communities at the centre. This paper describes an emergent process for responding to massive and systemic challenges from within community, while co-existing in pluralistic lived realities. First, it explores the core theoretical frameworks through which we approached this work. Second, it recounts our methodology as it unfolded from a decentralized and collaborative process, in an attempt to speak up to the great challenges we are living within; from our own perspectives, with observations of care and resilience that are small yet unmistakable. Third, we describe the designed outcomes of this methodology: an open digital publication and participatory workshop framework, which encourage readers and participants to notice, observe, share and document small acts of care and resilience within their own lives. Finally, this paper will reflect on the implications and significance of this emergent methodology and resulting outcomes.

2. Theoretical Framework

2.1 Networks of Place-Based Care

Within this project, we have envisioned our *networks* to include the people and other beings we live and work with, beginning in the immediate vicinity of our bodies — our gut microbes, pets, families, neighbours and houseplants. Here, *more-than-human* includes "things, objects, other animals, living beings, organisms, physical forces, spiritual entities, and humans" (Puig de la Bellacasa, 2017, p. 1). They also include our colleagues and students, with whom we collaborate and learn from, and whose creativity and pluralistic experiences richly inform the work. Each of us are nodes, or knots, in these complex meshed networks; the threads that connect us twist, overlap, and reinforce each other. However, the onset of COVID-19 produced isolating conditions under which these threads seemed at risk of loosening, going slack, or dissolving altogether.

Sheltering in place, we asked the question: how can we shore up networks of care and resilience, and remain accountable to the more-than-human systems we live within, while experiencing isolation and precarity? Our response is guided by a definition that care “includes everything that we do to maintain, continue and repair our world so that we can live in it as

well as possible" (Tronto, 1993, p. 103). This world includes "our bodies, our selves, and our environment, all of which we seek to interweave in a complex, life-sustaining web" (Tronto, 1993, p. 103). Care can be *place-based* when it derives meaning via relationships built through localized, contextualized, and shared experiences, informed by a rooted understanding of local cultural and natural systems (Irwin et al., 2015). This highlights care's always-situated implications; to care means to enter into a relationship of mutual obligation and reciprocity (Puig de la Bellacasa , 2017). This extends to our work as designers; to care- and design-with implicates us in relationship with our communities, for which we care and from which we receive care. Additionally, the temporality of care often disrupts the tight, linear schedule of our capitalist and productionist society (Puig de la Bellacasa , 2017). In taking the time to care, we are given permission to slow down, witness, and attune to our immediate environments.

2.2 Resilience and Emergence

The Resilient Design Institute (n.d.) defines resilience as "the capacity to adapt to changing conditions and to maintain or regain functionality and vitality in the face of stress or disturbance". Committing to a methodology that would allow us and our communities to recover and transform while developing work became a priority (brown, 2017). In *Emergent Strategy: Shaping Change, Changing Worlds*, adrienne maree brown outlines a concept of emergent strategy which includes "plans of action, personal practices and collective organizing tools that account for constant change and rely on the strength of relationship for adaptation" (2017, p. 23). It is rooted in a definition of emergence as the way in which multitudinous simple interactions and activities may give form to complex patterns and systems (Oblensky, 2014). As described by brown, the lineage of emergent strategy can be found in nature, as well as through the development of her own personal and familial relationships and histories, racial and economic justice movements, Indigenous knowledge and resilience, and the relational leadership models exhibited in the work of Black science fiction writer Octavia Butler (brown, 2017; Butler, 1993). In this project, it inspired a methodology which puts relationships at the centre, and allows processes, outcomes, and insights to emerge from those.

3. Methodology

This project developed first within a group of four design researchers (Jean Chisholm, Avi Farber, Laura Kozak, Julie Van Oyen); then expanded by four additional collaborators (Jacquie Shaw, Monique S. Carr, Oluwasola Olowo-Ake, and Jess Sung) and a workshop of ten.

3.1 Beads on String: A Collection of Small Things

A design response to *Living Within the Earth's Carrying Capacity* felt impossible without also addressing the immediate and interconnected conditions of the pandemic. We felt their weight each day through the isolation of lockdown and concern for the health of our loved ones and planet, and were at a loss for how to respond: how could we, from the makeshift workspaces of our kitchens and bedrooms, generate something in response? How could we recreate the generative nature of a shared studio without being in the same place? We checked our expectations as to what we would produce, and instead centred the wellbeing of our group and its members. Over several weeks, we met via short video calls to discuss everything from the massive reports and crises we were dealing with, to how small our individual lives had gotten. We shared stories of epic journeys across borders and mundane trips to the grocery store; struggled our way through lost opportunities and lack of childcare; and showed up for each other to reflect on the world as we saw it from each of our own windows and doorsteps.

The nature of these shifting scales of impact intrigued us: we became more attentive to place-based consequences of systemic challenges. The notion of fractals became a way we could understand how to respond to overwhelming systemic forces and injustices, given that "how we are at the small scale is how we are at the large" (brown, 2017, p.45). What was happening in our bodies, our homes, our neighbourhoods? From this vantage point, what small acts of care were we implicating ourselves in, and how might these small-scale actions impact the whole system (brown, 2017)?

We began with simple photo documentation of small acts of care and resilience in our own lives. Leaning into a slow and attentive approach, we gathered images in a shared Instagram feed (Figure 1), which gradually affirmed what we had sensed: when held together, these small things add up to something that feels significant even in the face of global crises. Our discussions and image archive evolved into descriptive personal texts, shared with each other via online multi-collaborator writing platforms. Through this collection of writing, we widened our scope to investigate how our individual experiences were connecting to broader systems and ecologies.

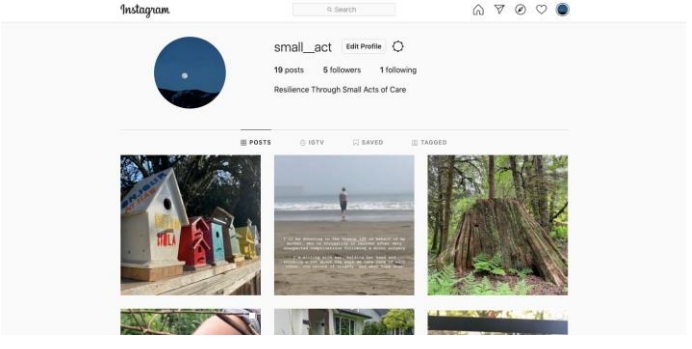

Figure 1. Shared Instagram feed holding our first observations of care from our own lives.

We also shared a reading list: it included Ursula Le Guin's *Carrier Bag Theory of Fiction* (1989), which offers an alternative way of being human in contrast to the story of prehistoric hunters and weapon-wielders. It is inspired by anthropologist Elizabeth Fisher's (1979) assertion that before the luxury of sharp tools and weapons, humans had been using containers for storing food, valuables, children and even themselves (via shelters) for a long time. This emphasis on humans as collectors, carriers, and sharers is important, as we seem to be reaching the tipping point of multiple crises caused by the weapon-wielders' dominating, extractive, and oppressive systems. Our group considered the ways containers might act as typologies of care: cupped hands holding water; beads on string connecting our stories; meshed networks emerging from connected nodes; bags and bundles, to help hold and carry weight. Our working group, image archive, and shared text documents all became containers of sorts to hold ideas, observations, questions, feelings, and reflections.

3.2 Mesh: A Weaving of Voices

During the summer of 2020, we each invited one person from within our own circles to contribute a text and take part in a discussion. The group now included a total of eight collaborators, creatives from both academia and community working together, connected virtually yet spanning North America. It was essential to expand and decentralize our group to encompass a greater plurality of responses to the contexts we found ourselves within. This gentle opening-up of our working group felt nourishing during continued pandemic-induced physical isolation. Once the additional contributions were written, we held a virtual event (Figure 2) involving a reading of each contribution and a discussion. Each collaborator was invited to reflect on how we engage and attune ourselves to small acts of care and resilience within our respective communities. Again, shifting frames of reference from macro to micro scales, and localized and virtual spaces, helped our respective but overlapping observations feel more connected and place-based.

Figure 2. Screenshots from collaborators' virtual gathering.

3.3 Bundle: An Offering

The workshop *Micro-Care: A Workshop on Small Acts of Resilience* held at Emily Carr University's *In Touch: Graduate Research Symposium 2020* allowed us to iterate on our first gathering, and to share our methods and extend the meshed network of care and creative kinship initiated in this project. The workshop was 90 minutes long, and began with some short contextual readings from the publication. Next participants were invited to observe their current physical surroundings or to reflect on the things they know and witness in their lives, and put some interpretation of care on a piece of paper – a drawing, a map, a written text, something else. This was done together in order to support any initial questions or confusion participants may have regarding the prompt. We then disbursed into breakout rooms to share and discuss, and returned together after half an hour. The session encouraged participants to be attentive to place-based consequences of systemic changes, as well as acts of optimism, care and resilience happening in place, and to establish trust dynamics and create conditions for collaborative work.

4. Outcomes

4.1 Publication

Micro-Care: Small Acts of Resilience for Living Within the Earth's Carrying Capacity (Figures 3-6) is an open digital publication which documents a process of attuning our attention to care and expands our understanding of what resilience might mean (Chisholm et al., 2020). It contains first-person texts recounting lived realities of the pandemic, ecological crises, and social justice landscape of 2020. It includes personal stories of neighbourhood networks of

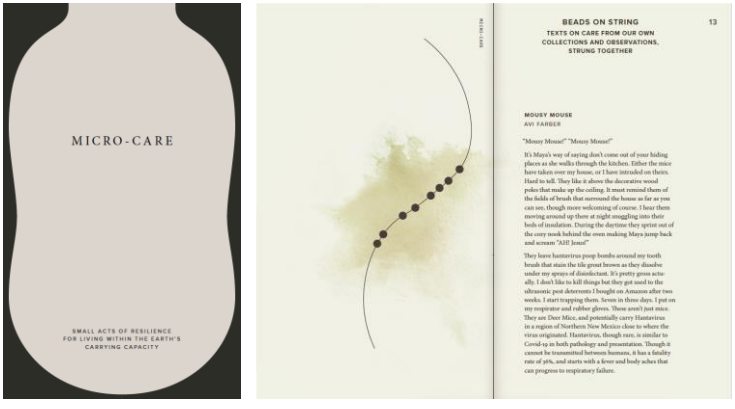

Figure 3. Cover and sample spread of the Micro-Care open digital publication.

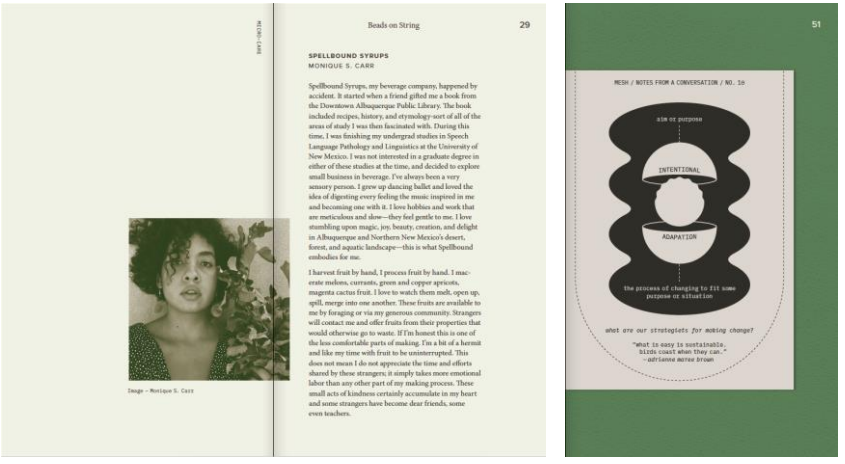

Figure 4. Sample spreads of the Micro-Care open digital publication.

resilience emerging with the onslaught of the pandemic, sharing and distributing essential goods such as food and children's toys; concerns about pathogens carried into the home by deer mice; methods of foraging and harvesting food which support biodiversity; as well as an original poem speaking to the importance of artistic expression and supportive personal relationships in the face of systemic racism.

The publication also includes a smaller booklet containing fragments of the virtual conversation transcribed as annotated visual formulas (Figures 5 and 6), titled *MESH: A Network of Emergent Fragments, Moments of Respite, and Points of Navigation to New Places*, nested within the collection of written texts. A multimedia approach followed the spirit of gathering, collecting, sketching, and placing ideas in relation to one another. The visual design process mirrored the writing process: humble ideas in small bits of work, stitched together: just making and seeing what emerged.

The work creates dialogue between the social and the scientific, in looking at the direct ways that policy reports and politicized social dynamics were playing out in our bodies, our friendships and our work. Held together in the container of the publication, the texts and images provide a snapshot of our small group's efforts to pursue optimism and agency in the chaotic face of larger systemic forces.

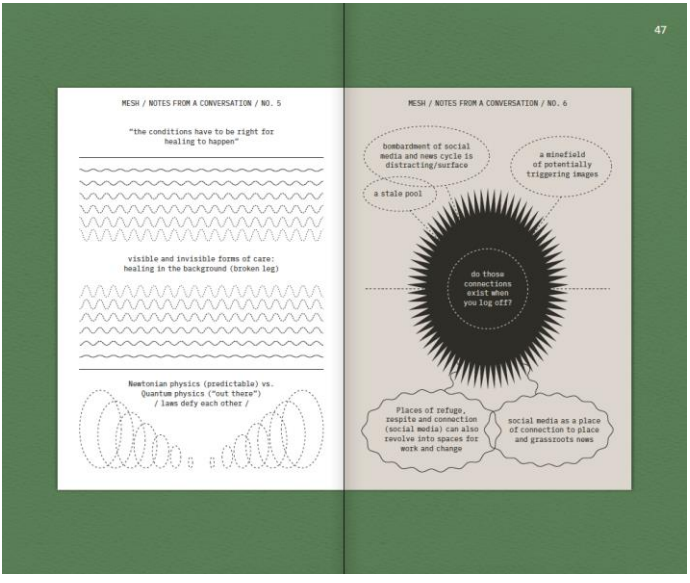

Figure 5. Spread from the Micro-Care document, depicting the MESH cover page next to an illustrative watercolour depicting a mesh texture.

Figure 6. Transcribed and diagrammed fragments of the virtual discussion.

4.1 Participatory Research Framework

Participants in multiple sessions have contributed texts and diagrams (Figure 7) describing acts of optimism, care and resilience happening in their lives. These offer an expanded model of how these small actions are taking place everywhere, even in the midst of great challenges. The outcomes of these and successive workshops stand as artefacts of their time, and are to be archived as the continued work of this project.

In keeping with the methodology of our publication, the workshop framework attempts to remain open-ended, thereby dismantling tokenistic methods of consultation in the field of participatory design, whereby 'design experts' consult with community stakeholders in ways that are instrumentalizing or over-simplified (Bratteteig and Wagner, 2014; Iversen and Dindler, 2014).

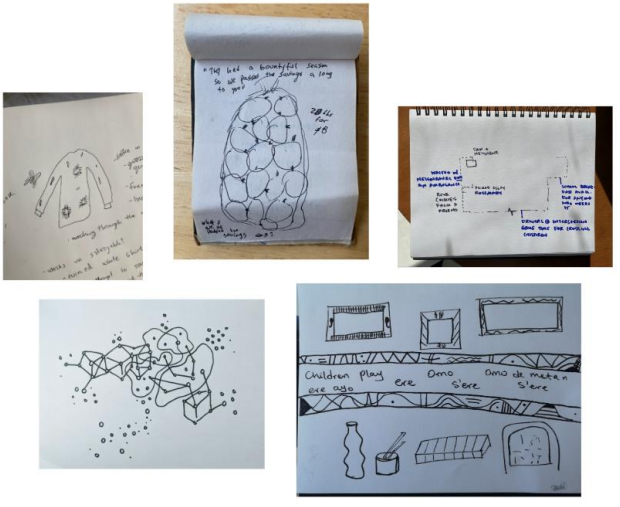

Figure 7. Sampling of workshop participant contributions: drawings and diagrams depicting observations of care and resilience in their own lives.

5. Reflection

By attuning ourselves to and sharing small moments of hope and optimism in our individual and communal lives, collaborators on this project cultivated a network of care and kinship with each other in the face of pandemic isolation. This work supports resilience in its multi-

scale approach: actions at the individual and community scales in turn respond to systemic challenges at ecosystem and global scales (Resilient Design Institute, n.d.). However, limitations exist with this framework as human to human linkages become more decontextualized. Simple and nuanced gestures such as asking participants to observe and identify what is happening around them can come across as privileged or oversimplified when offered to someone in an acutely challenging situation. As stated by Puig de la Bellacasa (2017), care has an ambivalent quality and is not to be engaged with innocently.

Another iteration of our workshop, at a second virtual academic symposium, revealed that without the ties created through sustained relationships and shared understanding of context, the approach held less meaning and had diminished potential to extend care amongst participants. Nuances surrounding what kinds of tenuous threads connect us to create safe spaces to participate in this work are emerging, and it would seem that greater attention to relationship building and protocol may be necessary in contexts that are farther-reaching and only digital. As a deeply relational practice, the methodology is not easily scaled or accelerated: at its core, it resists capitalist prioritization of these modalities. Despite this, we hope the emergent and adaptive methodology may be useful to others working and learning virtually during these times of evolving precarity.

5.1 Fractals: A Conversation in Spring 2021

As this paper is being prepared for circulation, further reflection has come to light from our collaborators. Specifically, it has become clear that the paper has failed to represent how truly intersectional the perspectives have been, and how much richness continues to come from BIPOC and queer collaborators in the emergent work. The following has been adapted from a conversation between authors during spring 2021.

Julie Van Oyen (JVO): Jacquie, how did it feel to work on the Micro-Care document together last summer?

Jacquie Shaw (JS): It felt like a casual, easy ask…and it felt great to be asked and have something to do during COVID. I was coming out of my own academic burnout, and it felt nice to feel like my thoughts and contributions were valued and safe in this space we built.

Jean Chisholm (JC): The way we'd started working, as described in this paper, felt like a great antidote to the way we're usually being asked to work. Jacquie, I remember I had just read your writing on water and care (cite Micro-Care) and it seemed like it touched on many of the ideas we were trying to explore. But there were also so many other reasons I was excited to invite you into this project, emerging out of our 10 year friendship.

JVO: Fast forward to now: how did it feel to review this paper we'd written about the project?

JS: When I skimmed it as both a contributor and a designer/futurist/researcher critically exploring design/er's roles in equitable and decolonized futures — looking at the citations,

who is actually involved, where is it coming from — I just didn't see the presence of the BIPOC and queer people involved. I, myself, am a queer person of colour, and that's really important to me. It's part of what community means to me, and what it means to serve a community. I know that other people of colour were involved and that wasn't placed anywhere. It was written in the context of the global reckoning of white supremacy that happened last summer, and mentions George Floyd, but not Breonna Taylor or Regis Korchinski-Paquet. I am used to feeling these ways about academia. I'm used to feeling overlooked, and used to feeling prickly about the use and inclusion of marginalized folk as props or as extractive knowledge areas. It really feels like "inclusion", but for the benefit of continually centring and moving forward whiteness in the academy. So when I reviewed the paper I had this strong critique, especially knowing that it had been written by a smaller, all-white part of the full collective. But if it weren't for my relationship and trust with Jean, and my involvement in early stages of the project, I may have just let it go.

JVO: Instead of back-editing the paper to include these things that are missing, we've decided to present the critique as an additional sub-section. To open it up and show what happened, the harms that were done. Why does it matter to present it this way?

JS: I'm interested in breaking the format of, "this a finished project, and this is what we did." I'm interested in how we can build and share skills around intersectional analysis and intentional intersectional approaches. How do we make those more explicit? Instead of just talking about designing-with, and designing for transformation, we can practice that today. The decolonizing of design keeps coming up; how can we actually practice that while responding to these kind of calls within institutional settings, which may be at the same time upholding systemic barriers rather than dismantling them? I care about design as a discipline, a culture. I care about the future of design. That internal institutional critique comes from a place of deep love, care and investment. It's the stubbornness of me: I'm like, "no, it can do better". Sometimes that critique happens and you go on to have great conversations, and build great work and cool spaces. And sometimes that critique doesn't take, and then you pack your bags and move on to the next space. There's no real scarcity of places to share your ideas. When you've invested a decade of your life in design, you want to stick it out.

6. Conclusion

Applying our theoretical framework of care and resilience, this project responds to three ongoing and interconnected global crises. We applied an emergent, evolving methodology to produce an open digital publication and participatory workshop framework which cultivate and strengthen community. Our expanding network of collaborators has built up a rich archive of caring and resilient acts and relationships, which when held together may stand up to even the most daunting systemic forces. Though we cannot know for certain how truly sustainable and just our ways of caring are, we attempt to stay with the trouble by remaining situated in relationships with those we work with, rather than considering ourselves as

design researchers remote or removed (Haraway, 2016). As can be seen in the collected and cobbled-together artefacts and conversations, this work is ongoing.

About the Authors:

Julie Van Oyen (she/her) is a designer, researcher, educator, and settler of Western European descent whose work explores embodied design research, more-than-human interactions, and digital service design with local communities in so-called British Columbia, Canada.

Jacquie Shaw (they/them) is a queer Filipinx-Bermudian immigrant settler in what is currently Canada. As a designer/futurist/researcher their practice combines design anthropology, education, and strategic foresight to critically explore design/er's roles in equitable and decolonized futures.

Laura Kozak (she/her) is a designer researcher, organizer and mother. A core interest in place-based design, including systems of reciprocity and exchange, informs her research and teaching practice at Emily Carr University of Art + Design in Vancouver, Canada.

Jean Chisholm (she/her) explores place-based design practices and community collaborations that work towards relational, ecological and equitable ways of living. She teaches design at Emily Carr University of Art + Design in Vancouver, Canada.

Land & Community Acknowledgements: The project described in this paper took place on the unceded territories of the xwməθkwəy̓əm (Musqueam), Skwxwú7mesh (Squamish) and Səlílwətaʔ/Selilwitulh (Tsleil-Waututh) Nations and the territory of the Jicarilla (hickoria) Apache, Pueblos, and Núu-agha-tʉvʉ-pʏ (Ute). As uninvited guests, the authors gratefully acknowledge not only where we are, but the ways in which responsibility to place have informed this work. We attempt to practice these land acknowledgements not only as acts of recognition, but to let them serve as a constant reminder to attune ourselves to the real, lived, and material impacts of colonial ideologies and their related systemic forces, and to consider the ways in which our actions can contribute to just and sustainable ways of living.

Practices of care, kinship and mutual aid – central to resilience and ways of living among BIPOC communities – have been long held and passed along through formal and informal networks. This includes the enormous importance and influence of the work of Black and Indigenous scholars, storytellers and theorists cited here, and also the original writing contributions of Monique S. Carr, Oluwasola Olowo-Ake, Jacquie Shaw, and Jess Sung.

Acknowledgements: A very special thank you goes to Avi Farber, design researcher and fourth member of our first Micro-Care working group. Avi's thoughtful and creative working style and contributions have been a core part of this project from the beginning. Thank you Oluwasola Olowo-Ake, Jessica Sung, and Monique Carr, for trusting us and adding your perspectives, wonderful writing, and thoughtful discussion to the project. Many thanks also extended to Steven Lam, for getting us started, and Hélène Day Fraser for joining and thinking with us during our MESH discussion. Finally, we have so much gratitude for all of our ECU symposium workshop participant-collaborators, for their insights and generosity surrounding the session — from the bottom of our hearts, thank you.

Research on rapid mass production of emergency products based on FDM 3D printing

Xueyan Wang[a],Dongmei Peng[b]

[a]Shandong University of Art and Design
[b]Shandong Univsersity of Art and Design
747679480@qq.com

Abstract |This article uses a designed non-contact switch remote control product during the Covid-19 epidemic to solve public health safety issues, to explore the rapid development methods of emergency products, to study the design ideas of products based on 3D printing manufacturing technology, which can enhance the 3D printing speed, success rate of the product structure design.

KEYWORDS | 3D PRINTING, COVID-19 OUTBREAK, EMERGENCY PRODUCT DEVELOPMENT, RAPID PRODUCTION

1. Introduction

Since the outbreak of the Covid-19 epidemic, medical supplies have been consumed rapidly, and the production of medical supplies has also been restricted, resulting in a shortage of some medical products. In this emergency period, all parties have responded to the production of necessary protective products.Among them, the 3D printing industry has made great contributions to this, and 3D printing centers across the country(even the world) have joined together to produce mask breathing valves, goggles, and thermometer gun shells with various 3D printing equipment to solve the urgent need for medical products in short supply(As shown in Figure 1). With the maturity of 3D printing technology, the price of related equipment has been reduced, home 3D printing equipment has been popularized, and the e-model files of various medical products can be shared through the Internet. Therefore, distributed production of scarce medical products, even household production, is realized, long-distance transportation of materials is avoided, and the timeliness of material supply is greatly shortened.

Time is very precious during the epidemic. If the emergency product design for the epidemic follows the conventional production process, it is easy to miss key opportunities. 3D printing is an emerging production technology. It does not need to make molds, production lines, etc., Only with e-model files, through network resource sharing, mass production can be carried out immediately, thereby realizing rapid production of corresponding products during emergency periods.

Through an experimental case of product design for public health safety during the epidemic period, this article summarizes the design ideas, structural design, and circuit module design points of emergency products suitable for 3D printing technology.

Figure 1. 3D printed medical products

2. Reasons for choosing FDM3d printing

There are many kinds of 3D printing technology. Commonly used 3D printing processes are FDM3d printing and SLA3d printing(As shown in Figure 2). Hereinafter referred to as FDM, SLA. FDM is a thermoplastic polymer melted and extruded into filaments, layer by layer stacked on a hot bed molding, SLA uses a material that is photosensitive resin, through the laser irradiation at the top of the machine to make the resin layer by layer curing molding. Although SLA has better surface molding quality than FDM, FDM is more suitable than SLA for emergency production during an epidemic. The main reasons are as follows, first, the price of FDM printer is very low, the price of ordinary type machine is less than one percent of SLA printer, therefore, the use of FDM production costs are lower.At the same time, FDM printers are also the most widely used. Not only are 3D printing factories equipped, but general homes and studios will also be equipped with small FDM printers. According to the "2018-2023 Global 3D Industry Market Outlook and Investment Strategic Planning Analysis Report" of the Prospective Industry Research Institute, the development of 3D printing is heavily dependent on technological progress and breakthroughs. At present, the most popular technology for global 3D printing applications is FDM Technology, accounting for

63.9% of total platform revenue(Zhi Xin Wang,2019).Second, the materials that FDM can use are generally PLA, ABS, and nylon. The strength and toughness of these materials are much stronger than SLA resin materials. Third, in terms of post-processing of parts, SLA printed parts need to be soaked in alcohol to wash the surface resin, remove support, UV curing, sanding, painting and other steps, while FDM printed parts only need to remove the support to apply assembly, through the use of different color consumables can produce parts of corresponding colors without painting.

Figure 2. FDM and SLA 3D printing equipment

In a comprehensive comparison, FDM has huge advantages in cost, material, and model post-processing. It is an ideal way for emergency product design and rapid production during the epidemic.

3.Design test case introduction

This is a product design test for public health safety during the epidemic (As shown in Figure 3). The purpose of the test is twofold. First, through such a design, non-contact remote control of switches in public spaces is realized. Second, explore the optimal design direction for the characteristics of FDM. The name of the test product is called the wireless remote control switch. It is pasted on the side of the light control switch panel through nano rubber pads. The product simulates the effect of pressing the switch by the motor to drive the lever to move forward and backward to realize the remote control of the switch without changing the line. Convenient upgrade to traditional light-controlled switch panels, suitable for various indoor and outdoor environments,such as homes, companies, and schools.The product has a wide range of applications and can be installed on various key switch devices such as switch panels and elevator buttons. The product can be used not only in public places during the epidemic period, but also in daily life, providing convenient and safe remote control operation for the elderly who have inconvenient legs and do not want to move to press the switch, and children with short height who can not touch the switch.

According to the production characteristics of FDM, the product has been optimized for many times in the product structure to increase the printing speed and reduce the printing error rate. The configuration of internal electronic components has also been adjusted many times to shorten the development cycle of product circuits, thereby achieving the purpose of rapid development of emergency products and rapid mass production.

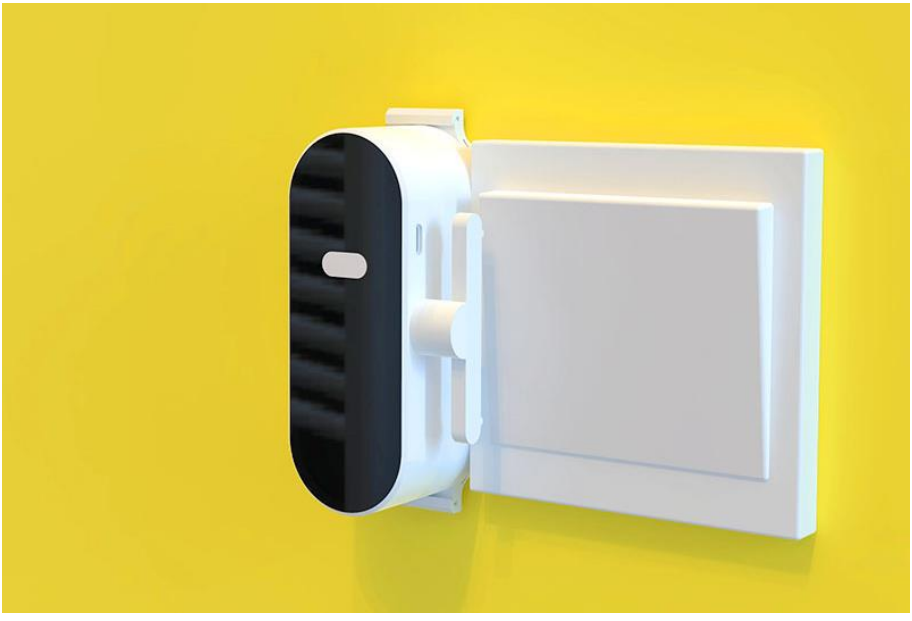

Figure 3. Test case-Remote control switch

4.Design ideas

The core idea of emergency product development and design based on FDM3d printing technology is to design according to the characteristics of FDM printing technology. 3D printing technology has always been used for personalized custom production, or for proofing before mold production. The products are produced in small quantities. If mass production is carried out, the structure of the design plan that affects the printing speed and success rate must be considered factor.

It is necessary to make full use of existing resources to design functional products that can respond to urgent needs. Product design is based on the basic principle of "making the best use of everything", making full use of existing resources and rationally deploying them according to the attributes of each item to maximize its value. "Make best use of everything" includes not only the use of various materials and standard parts, but also various processing technologies that can be quickly mass-produced. In product design, a brand-new part often

has to go through many tests from conceptual design to mature function, there will be a long development process, and accompanied by many unknown factors, the test cases in this article make full use of standard parts and try to avoid design of custom parts.

5. Structural Design

5.1 Removal of the mold pulling angle

The mold pulling angle is the angle between the tangential direction of the side where the workpiece and the parting surface of the mold intersect and the normal direction of the parting surface of the mold that is artificially set in order to make the workpiece more convenient to leave the mold. The draft angle will increase the thickness of the bottom of the part and thus increase the printing time. Since the FDM parts are formed layer by layer, the surface with inclination will produce more obvious layer lines. Therefore, when designing a 3D printed product structure, there is no need to consider the design of the mold pulling angle separately.

5.2 Structural design from the inside out

This kind of structural design process must first determine all standard parts used on the product, determine the spatial position of these parts on the product according to functional requirements, and then design the product shape according to the internal part structure. This can make the product more "tighter" and reduce the product volume (as shown in Figure 4).

In the test case of this article, we will first determine the parts to be used, create models in the software according to their actual dimensions, arrange them compactly, and finally design the product shape according to the internal part structure, which not only reduces the product volume, but also The important thing is to reduce the height of the product, reducing the height can significantly save printing time, usually the print layer height of FDM is 0.2mm per layer, if you reduce the height of 5mm, you can save 25 layers of printing time.

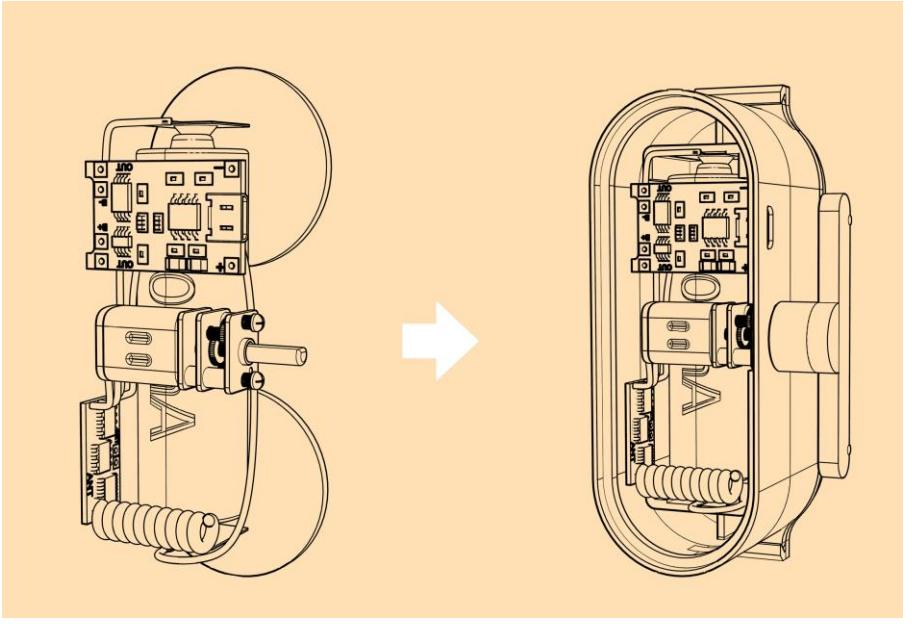

Figure 4. Emission of internal components first before designing the external shape

5.3 Optimize the support structure

There will inevitably be suspended parts in the product structure, which has no effect on mold production, but it will increase the difficulty of 3D printing. 3D printing is stacked layer by layer. The suspended structure cannot be printed directly, so In order to prevent the material of the suspended structure from falling, it is necessary to add a supporting structure in the suspended position (Mendonsa C,2015), but the supporting structure will increase the printing time and failure rate. Therefore, the suspended protruding part of the product needs to be optimized during the design. The usual practice is to design a slope below the suspended part.5

In the experimental case of this article, the convex eave structure in the initial plan of the product will generate a large amount of support during printing. In the print preview, you can see that a large number of blue supports are generated under the convex eave. After adding the inclined plane, the wire extruded by the printer nozzle will advance along the inclined plane layer by layer to avoid supporting (As shown in Figure 5).

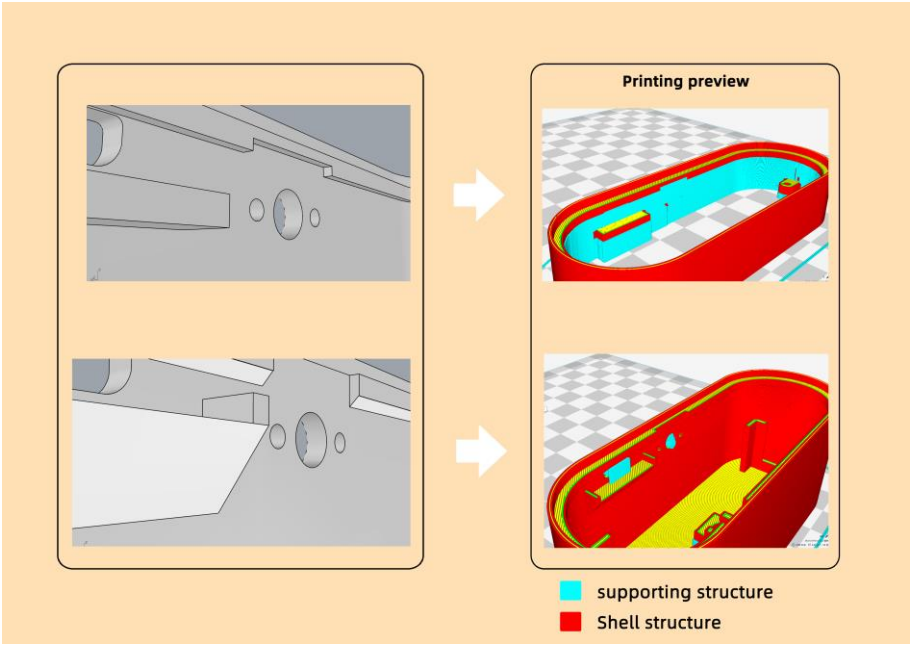

Figure 5. Optimising the effect of structure on print results

5.4 One-piece shell

In mold production, in order to facilitate the manufacture of the inverted structure, the product shell is usually divided into two. For 3D printing, this will increase unnecessary processing procedures. The XYZ movement of the 3D printer nozzle can produce various complexities. Therefore, the product shell can be designed as an integrated design (as shown in the figure 6).

In the test case, the segmented housing of the remote control switch was combined into one, the screw hole for screw connection was eliminated, the model structure was simplified, and the printing time was reduced.

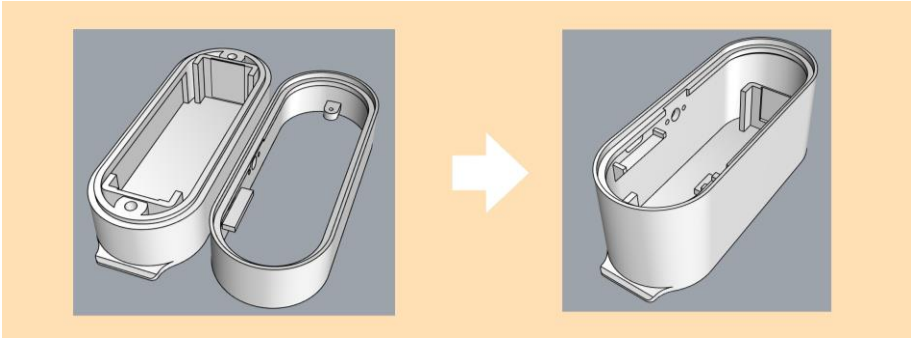

Figure6. *One-piece housing*

5.5 Assembly methods

There are four general product assembly methods: *Snap-fit*, mechanical fastening, hot melting, and welding. One of the most convenient is the snap and mechanical fastening. The *Snap-fit* structure (as shown in the picture7) is assembled and fixed by elastic deformation, so the material needs to have good toughness. The flexural modulus of PLA is greater than that of photosensitive resin (as shown in the figure8), indicating that PLA is not easy to deform. Due to the poor elasticity of PLA material, the buckle structure is not suitable for parts produced by FDM. For FDM, mechanical fastening is the best choice. Mechanical fastening includes self-tapping screws, rivets, nut screws. In order to improve the compatibility of the printing model, design thread structure should be avoided, because the accuracy of FDM3d printers of different types and brands is different. The thread structure requires very high precision, and a little error may lead to the failure of part assembly.

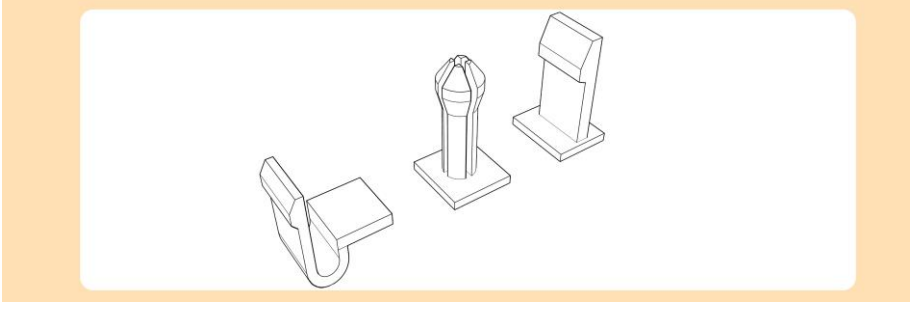

Figure7. Snap-fit

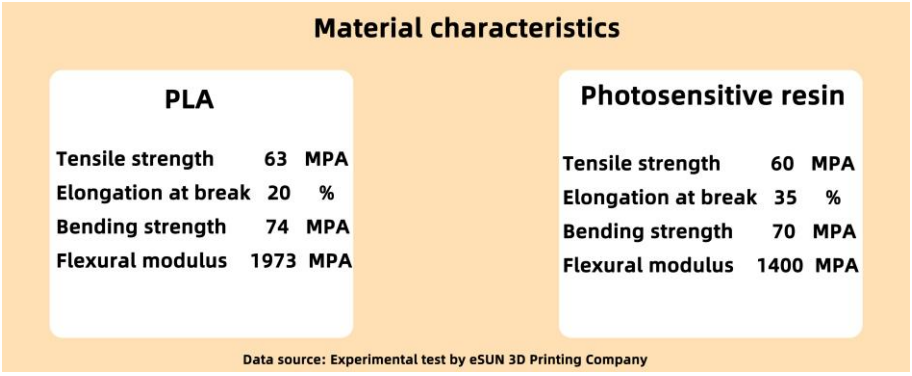

Figure8. Material characteristics of FDM and SLA

Self-tapping screws, including thread cutting self-tapping screws and thread forming self-tapping screws(As shown in Figure 9). The latter has greater circumferential stress than the former, so it is suitable for larger-sized stud structures, and for smaller diameter studs, it is more suitable for thread cutting self-tapping screws(Yuan Zhong,2016). Self-tapping screws are often used in brittle or harder plastics, so they are suitable for FDM hard PLA materials. In addition, the pressure riveting nut is also suitable for FDM parts. The nut is pressed into it, and the elasticity of the nut hole is used to realize the fastening of the nut. The advantage of this method is that it does not require equipment costs. The disadvantage is that internal stress will be generated. Thin wall thickness and smaller diameter pillars will affect the performance of the nut.

Figure9. Mechanical fastening

5.6 Assembly clearance

The precision of mold production is very high, and the assembly gap between parts is very small, usually between 0.1-0.15mm. This value cannot be widely used in various FDM machines. Parts manufactured using the above parameters will have over-assembly and running jams, death or even assembly failure. The assembly clearance of FDM should be designed between 0.2-0.3mm.

In this test case, the gap between the remote control switch and the base card slot is 0.20mm(As shown in Figure 10). In the later test, the parts manufactured and tested using a variety of different brands of 3D printers can slide smoothly.

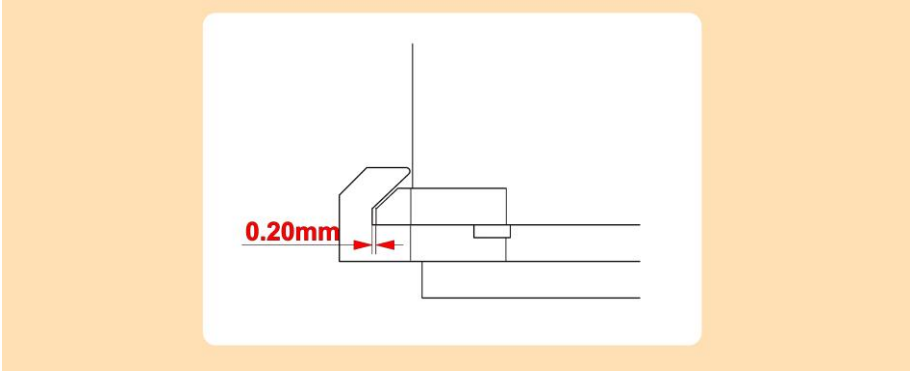

Figure 10. Assembly clearance

5.7 Hollow structure

Hollow design is very important to FDM, which can significantly reduce printing time. Only the parts on the part parallel to the horizontal plane can be hollowed out. The hollowed out treatment on the vertical plane will result in a suspended structure, which in turn will generate printing support and increase the printing error rate.

In the test case of this article, the base of the remote control switch is hollowed out and optimized. The function of the base is mainly to be glued and fixed. Therefore, the position outside the glue paste range is hollowed out (as shown in the figure 11).

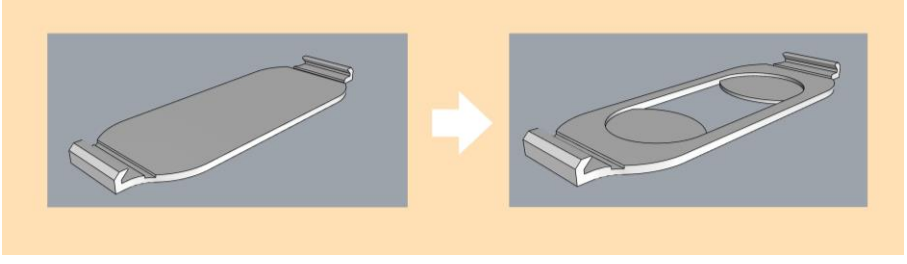

Figure 11. Hollow base plate

6. Modular circuit design

The purpose of modular circuit design is to shorten the development cycle and design process, and to split complex circuits into reusable modules. (ChunXia Yang,ZhengYan Feng,2012)

In the test case of this article, the initial circuit plan uses a highly integrated circuit board, which is a circuit board developed based on specific functions. The number of this circuit board is small in the market, and it takes a long time to develop an integrated circuit board. Therefore, special integrated circuits cannot meet the requirements of rapid development and rapid production.

Through modular design, the integrated circuit is split into "standardized" circuit modules. "Standardized" circuit modules refer to electronic modules widely used in the market, similar to standard parts in mechanical parts. These electronic modules are sold in many places across the country and have a large inventory. In the test process, the integrated motor remote control circuit board is split and designed, and a circuit board with the same function as a special integrated circuit can be combined. (As shown in Figure 12).

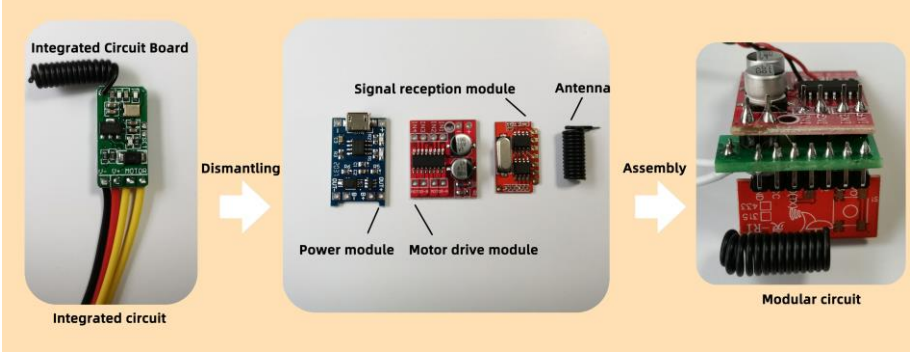

Figure 12. Modular circuits

7. Combination of other processes

The advantage of 3d printing is that it can manufacture complex spatial structures, and can be manufactured immediately on the machine with design drawings. Optimizing the parts through the above design principles can increase the printing speed. However, the overall manufacturing time is still relatively long, so it needs to be combined with other production processes, which need to have the characteristics of high precision and rapid production.

In the test case of this article, the black cover of the remote-control switch is processed by laser cutting technology, and the processing material is acrylic. The manufactured product cover is not only beautiful but also can be mass produced in a short time. This design method cuts product manufacturing time in half.

8. Network sharing platform

In order to realize distributed production across the country in a short period of time, product design digital files need to be shared through a network platform. The 3D printing community website is the most ideal platform. Most platform viewers have 3D printing equipment or are proficient in 3D printing technology. After downloading technical documents, they can quickly produce and produce efficiently. In addition, the platform should also add other production technology sections. In an emergency, all parties can unite and cooperate to quickly realize the production of products in various regions.

9. The expected effect of the project

Relying on the huge number of FDM3d printers in the country, the rapid distributed production of emergency products can be realized, and long-distance transportation of materials can be avoided. The extremely short development time ensures that the products can be applied in a critical period. In addition, the above-mentioned design methods also continuously lower the processing threshold of products, and get rid of the constraints of production lines on product manufacturing. For example, in the test case tested in this article, individuals can also complete the production and assembly of the product with detailed design information.

Due to the lowering of the production and processing threshold, small and medium-sized enterprises, studios, and student teams can also achieve independent product development and production, so that product design solutions can be implemented at very low investment costs, without the need to purchase expensive production equipment. In addition, this design method can quickly produce a batch of products to market, test whether the product features can meet the market demand, and quickly complete the improvement of the product according to user feedback.

10.Epilogue

Emergency product development and design based on FDM3d printing technology can solve the problem of rapid production of emergency products, provide new options for mass production, and make it possible for individuals to develop products, so it has a good application prospect. This article only summarizes the key points in the test case. There are more subject knowledge worth exploring behind each area. Industrial design itself is a comprehensive subject.I hope that experts and scholars in different fields can provide valuable opinions.

Semi-immersive Virtual Habitat to Enhance Relaxation in People with Dementia during COVID-19 Emergency

Silvia Maria Gramegna*[a]
[a]Politecnico di Milano
*silviamaria.gramegna@polimi.it

Abstract | The effects of lockdown-induced isolation, with changes in daily routines and reduction of emotional, social and physical stimuli, have been a detonator for the rapid increase of neuropsychiatric disorders among fragile elderly, such as people with dementia (PWD). The temporary closure of day care centres for dementia represented a serious shortcoming in the day-to-day care, with a related increase in stress levels for both PWD and their carers and a reduced quality of life. Within this framework, new non-pharmacological care methods are needed to help reduce agitation-related behaviours in PWD, in order not to increase the pharmacological load and its related healthrisks. This paper presents a pilot study focused on the development of a prototype of a semi-immersive virtual environment, called Semi-immersive Virtual Habitat, aimed at decreasing agitation and enhancing relaxation in PWD, especially after experiencing stressful experiences such as lockdown measures during COVID-19 pandemic.

KEYWORDS | DEMENTIA, SEMI-IMMERSIVE VIRTUAL ENVIRONMENTS, NON-PHARMACOLOGICAL THERAPIES, HABITAT

1. Introduction

1.1 Dementia and COVID-19 Emergency

At the end of February 2019, COVID-19 emergency has raised in Italy. Soon, the whole nation was put into a strict lockdown, and all the population, from young to elderly, had to stop and adapt to the novel measures restricting daily life and social contacts. The effects of lockdown-induced isolation, with changes in daily routines and reduction of emotional, social and physical stimuli, have been a detonator for the rapid increase of neuropsychiatric disorders among those most at risk, such as the cognitively impaired elderly. Among them, people with dementia (PWD), represent one of the most fragile group of people, due to the impairments caused by the disease, and its related symptoms: confusion, agitation, stress-related behaviours, depression and apathy. Dementia is not a specific disease, but a general term describing a wide range of symptoms associated with a decline in memory or other thinking skills severe enough to reduce a person's ability to carry out daily activities. Alzheimer's disease (AD) accounts for 60-80% of dementia cases. Therefore, at the peak of the pandemic, the lockdown triggered another emergency: the increase in neuropsychiatric symptoms, such as agitation-related and stress-related behaviours, in PWD and their families. Agitation-related behaviors include verbal, vocal, or repetitive motor activity (Cohen-Mansfield,2008). Stress-related behaviors include purposeless wander, screaming, repetitive calling out and accelerated breathing (Reynolds et al., 2018). During the lockdown, more than 60% of PWD showed an increase in behavioural disturbances, while more than 65% of family members were found to be more vulnerable and affected by overt symptoms of stress (Cagnin et al., 2020).

1.2 Day-care during COVID-19 Emergency

Strict lockdown measures led to the suspension of all the activities of all semi-residential, socio-assistential, socio-educational, multifunctional, socio-occupational, health and socio-sanitary centres for people with disabilities (comprising physical and mental disabilities, but also people with cognitive impairments such as PWD) given the difficulty of enforcing social distancing rules. The temporary closure of day care centres for dementia represented a serious shortcoming in the day-to-day care of people with dementia, with a related increase in stress levels for both patients and their carers. In general, the most frequently reported symptoms were irritability (40%), agitation (31%), apathy (35%), anxiety (29%) and depression (25%) (Cagnin et al., 2020). Gradually, daily care centers were reopened, once the initial emergency seemed under control. Hence, healthcare professionals had to face the increase of these symptoms affecting the quality of life of PWD, delineating mostly new non-pharmacological methods and therapies, in order not to increase the pharmacological load and its related healthrisks.

1.3 Virtual Reality (VR) Environments as tools in dementia care

Virtual reality (VR) is scientifically understood as a complex environment, determined by a differently immersive, interactive and three-dimensional graphic interface that allows simulation operations and specific forms of communication and learning, offering the user the possibility of perceiving himself as physically present in a virtual world, so that he can interact with it, through sensations, emotions, evaluations and behaviours typical of everyday reality. Among the different types of VR available, this study focuses on the Semi-immersive category, i.e. those VR devices that come in the form of an environmental device, with the size of a small room, equipped with projection or rear projection devices and screens (3 to 6 surfaces) that reproduce the stereoscopic images of the computer and project them on the walls, with different shapes and degrees of convexity, adequate depth indices of the image, giving a three-dimensional effect. To date, there is evidence of the effectiveness of using this tool in various neurorehabilitation fields (Garcia et al., 2012). Moreover, the use of virtual reality environments for PWD is an emerging field, which has shown encouraging positive results in previous research (Flynn et al., 2012; Van Schayk, 2008; Garcia et al, 2012; Reynolds et al., 2018; Kim et al., 2019). In this framework, semi-immersive virtual environments for PWD aim to improve the person's quality of life, decrease the incidence of certain symptoms such as stress, agitation and anxiety and monitor the person's residual capacities. After XXX was put in lockdown due to COVID-19 pandemic, health professionals encountered an increase in those symptoms in PWD. Forced isolation and lack of social interaction had a negative impact on those fragile individuals. Cognitive impairments made difficult for them to understand the occurring situation, increasing their anxiety and behavioural symptoms caused by the lack of assistance due to the closure of socio-assistential services during the lockdown. Thus, semi-immersive VR environment represent a promising tool for dementia care, effective in the decreasing of such symptoms, without increasing the pharmacological load (Kim et al., 2019).

This paper illustrates a pilot study conducted on the effects of using virtual environments on PWD. In particular, the study conducted explores stress-release virtual settings to enhance relaxation in PWD. The research developed the prototype of a Semi-Immersive Virtual Habitat, in the form of an environmental device of 16 sqm (4 meters edge length), aimed at decreasing agitation and stress-related behaviours in PWD.

This study presents an attempt to apply VR technologies in the field of dementia care, especially in the framework of non-pharmacological therapies, aimed at increasing the quality of life of people with dementia. Moreover, COVID-19 pandemic, and the related lockdown measures undertaken in Italy, offer a relevant occasion to experiment this prototype and its therapeutic outcomes, as forced isolation and lack of socio-assistential services led to a heightened need to develop tools and care methods able to lessen stress levels and agitation, and increase wellbeing and quality of life for PWD.

2. VR Environments

According to Ellis (1994), a virtual environment consists of three essential components which, in a transverse manner, integrate with each other:

1) Content: this concerns the quality of reproduction of the virtual objects, which must be as similar as possible to the real ones, having characteristics of staticity and movement, regardless of the user's will or not. In this way, the user has the possibility of integrating with the content, as an agent subject but also as a simple explorer.
2) Geometry: refers to the physical extension that the computer programmer intends to give to the environment, for example closed (a building) or open (a park).
3) Dynamics: this concerns the rules of interaction between all the contents that a designer must bear in mind when creating a simulation. For a virtual environment to be credible, in fact, all the objects contained within it must conform their behaviour to the normal laws of physics of the real world.

Currently, there is evidence of the effectiveness of the use of VR in neurorehabilitation with cognitive impaired people: i.e., in the rehabilitative treatment of memory disorders, both prospective (related to remembering to carry out intentions and actions that cannot be carried out at the very moment they are formulated, but must be postponed to a later time and in a different retrieval context); and recovery, by using the restoring function (repetitive exercises to improve performance in a memory task), for reorganising functions (using the intact function to make up for the damaged one) and to calm states of anxiety or agitation due to neurodegenerative pathologies that impact the person's cognitive abilities.

People with cognitive impairments report decreased stress when using VR for both stimulation and relaxation (Garcia-Betances, 2015). Moreover, individuals with cognitive impairments may positively benefit from the implementation of VR technology care tools which encompass quasi-naturalistic and/or realistic stimuli (Manera et al., 2016).

Thanks to its ability to allow the creation and control of dynamic three-dimensional environments, in which behavioural response can be recorded, measured and improved, virtual environments offer options that are not available with traditional methods (e.g. assessment of cognitive abilities over time, training, sensory stimulation, etc.).

Nowadays, we can discern 2 main categories of VR simulations employed in VR environments: semi-immersive, and fully-immersive ones.

As Persky & McBride (2009) state “Fully-immersive virtual environments allow researchers to create very realistic environments while maintaining a high level of experimental control”. This specific VR technology has been successfully implemented in VR environments aimed at curing phobias, anxiety, stress and memory problems (Garcia, 2012).

Semi-immersive virtual environments are computer-generated environment mainly composed of interactive computer graphics, designed to physically and/or psychologically

immerse one or more users in an alternative reality. This kind of VR Environments can be applied in CAVE-like systems, which generates a room-sized semi-immersive virtual environments with the number of rear-projected bounding surfaces ranging from 3 to 6 (eventually including floor and ceiling).

2.1 Semi-Immersive VR Environments in Dementia Care

Thus, the use of virtual reality environments for people with dementia represents an emerging field, particularly in residential facilities for the elderly, where opportunities to engage residents in a meaningful way may be limited (Siriaraya & Ang, 2014).

VR environments are an emerging technology with a variety of potential benefits for many aspects of rehabilitation assessment, treatment and research in the field of dementia. An interactive and generically immersive virtual environment encourages the creation of virtual but realistic environments for people with dementia, designed with the aim of improving the quality of life of the person living with dementia and monitoring the person's residual capacities (Kim et al., 2019).

Prior studies have explored design requirements when developing VR Environments experiences for PWD in both semi-immersive and fully immersive modalities (Siriaraya & Ang, 2014; Hodge et al., 2018). These studies demonstrated the key role played by VR Environments tailored on PWD preferences and personal interests, as it could enhance a more meaningful engagement (Tabbaa et al., 2019).

In particular, the pilot study presented in this paper, focuses on the development of a prototype of a semi-immersive VR Environment, called Semi-immersive Virtual Habitat, aimed at decreasing agitation and enhancing relaxation in PWD, especially after experiencing stressful experiences such as lockdown measures during COVID-19 pandemic. The semi-immersive Virtual Habitat replicates most of the features of a real-sized CAVE™-like system, allowing health professional to introduce non-pharmacological care methods using virtual reality environments. Moreover, extensive research has examined the important role quality of life plays in the wellbeing of PWD. The environment plays an important role, as it can sustain PWD stimulating correctly their residual capabilities, supporting their loss, and enhancing their independence (Gramegna, 2017). Thus, therapeutic tools aimed at relieving stress and agitation-related behaviours could positively contribute to the enhancement of quality of life for PWD.

3. Semi-immersive Virtual Habitat for dementia care

3.1 Definition of the Habitat

The pilot study presented in this paper is part of a wider research on therapeutic environments for PWD carried out within GRACE_Lab, an experimental laboratory of research involving designers and researchers from Politecnico di Milano and therapists and medical professionals from Genera Onlus, an organization active in the care of PWD in Milan.

The Semi-immersive Virtual Habitat represents the first digital prototype of a virtual therapeutic habitat for PWD developed within GRACE_Lab research.

The Semi-immersive Virtual Habitat physical structure is mainly based on CAVE™ system features and technologies. The first CAVE™ system was designed and built in 1992 by Carolina Cruz-Neira, Daniel J. Sandin, and Thomas A. DeFanti at the University of Illinois, Chicago Electronic Visualization Laboratory (Cruz-Neira et al., 1992). CAVE™ system is a room-sized semi-immersive virtual environment equipped with three to six projected surfaces (eventually including floor and ceiling).

The Semi-immersive Virtual Habitat is a front projected semi-immersive virtual environment which embodies three surfaces for projection and interaction.

The Semi-immersive Virtual Habitat is an interconnected system aimed at stimulating/facilitating cognitive activities involving mainly PWD with Mild and Moderate dementia, and only few with Severe Dementia. Through the use of semi-immersive virtual reality, the Semi-immersive Virtual Habitat creates an interactive environment where PWD can perform cognitive and/or physical activities. In addition, the Semi-immersive Virtual Habitat could represent in the future a dynamic monitoring system of cognitive abilities and a virtual space for rehabilitation activities. At the moment, these possible functions have not yet been tested. Further test and experimentations will be conducted in order to inquiry those aspects and develop a defined protocol of use and evaluation.

The virtual environment is intended to offer different digital configurations in order to create multiple scenarios according to the specific activities (i.e. relaxation, contemplation, cognitive stimulation, etc.) and needs of PWD using the environmental device.

3.2 Habitat Features, Purpose and Interactions

The Semi-immersive Virtual Habitat consists of a physical room enriched with interactive digital projections and tools where PWD, accompanied by therapists can perform therapeutic, contemplative or playful-educational stimulating activities. Inside this virtual environment, researchers adopted a habilitative approach designed to support PWD remaining skills instead of stimulating lost or impaired ones, promoting meaningful and engaging (Brawley,2007; Zeisel,2013; Zeisel & Raia,2000; Zeisel et al.,2003; Reynolds et al., 2018).

These activities are based on the orchestration, in time and space, of appropriate visual, sound, tactile and olfactory stimuli through multimedia projections, lights, sounds, aromas, physical objects (i.e. fabrics). In particular, in the pilot study presented in this paper, designers and researchers developed a collection of digital contents focused on the interactive projection of natural environments, natural elements, animals and outdoor natural environments (i.e. reproduction of woods with hidden interactive animals, woodlands and seascapes), as promising, but still hardly explored, therapeutic elements to foster relaxation in PWD. According to Reynolds et al. (2018) "Research has found that viewing nature reduces stress and improves mood, but few studies have focused on the potential of viewing nature to reduce negative emotions associated with dementia". Previous studies underline how direct contact with nature has a positive outcome on PWD mood and wellbeing (Zeisel,2013; Zeisel & Raia,2000; Zeisel et al.,2003). Nature and in particular, gardens and woodlands represent an effective and evidence-based approach to reduce agitation-related and stress-related behaviours in PWD (Zeisel, 2013; Reynolds et al. 2018). Several studies described the benefits of viewing natural scenes and natural landscapes on PWD. This supports the hypothesis that also experience a virtual natural landscape may reduce stress-related and agitation-related behaviours among PWD. The specific purpose of this study was to understand whether a virtual natural experience could reduce stress and agitation, enhancing relaxation, in PWD attending a daily care center, after a stressful experience such as the lockdown occurred in Italy in 2020 due to COVID-19 pandemic.

3.3 Habitat Experience

Specifically, the pilot study conducted, involved a group of 30 PWD attending a day care center in Milan. Participants ranged in age from 70 to 83 years, involving both women and men. Moreover, participants were experiencing stress-related and/or agitation-related behaviours. Two alternate 30-minutes sessions were conducted with each group. Previously, all the persons involved undertook a mini-mental state exam (MMSE). The MMSE was used to provide an overall picture of cognitive status and dementia severity and produced a range from 9 to 25 where lower scores correspond to greater dementia severity (Folstein et al., 1975). Participants were divided into two groups, both of them covering Mild, Moderate and Severe dementia. Each group experienced alternatively the virtual environment during a 30-minutes session, in which therapists alternated contemplative views and short interactive activities. Initially, an introductory phase was conducted by the therapists: they asked to the participants to describe the view they were seeing, which kind of elements they could discern, if they liked it or if they were scared. Afterwards, therapists conducted short question-based activities, supported by interactive projections taking place in the Semi-immersive Virtual Habitat. Some of them encompass the contemplation of natural sceneries, associated with sounds and odours. In the end, therapists proposed to the participants to directly and freely interact with the projections.

Fig.1: Pilot study participants spontaneous interaction with Semi-Immersive Virtual Habitat

4. Outcomes

Design researchers participated in the sessions as observers. Comments and gestures (in the form of body positions, non-verbal gestures and communications, movements) made by participants were analyzed to understand the overall reactions. In particular, the sessions were audio recorded, in order to be further analysed by the research team, giving special emphasis to the comments made by the participants during the different interactions. Comments made during the sessions were associated with discomfort, agitation, pleasure, relaxation, with supplementary observations regarding reminiscing factors and past life events. Comments made by the participants associated with discomfort and agitation were “I don’t like this place”, “What’s wrong here”, “I don’t like it”, in a single case accompanied by gestures such as searching for an exit wandering purposelessly around the room. Comments associated with pleasure encompassed “how beautiful is here”, “wonderful”, “I like these trees”, “I feel good”. Often these comments were associated with facial expressions indicating enjoyment and astonishment, hand gestures and non-verbal expressions indicating positive amazement. Relaxation was detected from body positions and gestures: some participants assumed a more relaxed position while seated on the chairs, one participant fell asleep during a natural scenery contemplation activity. During the sessions, some participants reminisced about past experiences sharing comments like “I

have been there", "when I was young I went there with my family", "With my wife we liked walking in the mountains". To resume the comments made by participants during the sessions, there were 6 comments related to discomfort, 3 comments related to agitation, 22 to pleasure, 4 related to reminiscence. Regarding the participants, during the sessions, one person expressed agitation-related behaviours, wandering around purposelessly. Another person expressed discomfort. None of the participants expressed apathic behaviours. 28 participants out of 30 expressed interest and/or positive mood. Among them 24 undertook body positions expressing relaxation and comfort. 1 participant fell asleep during the session. We could discern 2 kinds of behaviours among the participants: on one hand, active participation accompanied by curiosity for the interactions taking place, on the other hand, contemplation and amusement for the virtual sceneries. The last part of each session was dedicated to free interactions with the digital environment: 28 participants out of 30 spontaneously interacted with the digital environment through gestures associated with verbal comments. Those comments include "That's wonderful, you can draw without getting dirty", "look at the flowers I'm drawing", "I like it".

After the sessions, therapists asked to participants to describe their mood. 28 participants made positive comments like "I feel good", "I enjoyed it", "I'm fine and I liked it". Therapists noticed that the majority of the participants were calm, without expressing agitation-related behaviours. Moreover, 11 participants fell asleep after the sessions.

5. Discussion and Limitations

The pilot study was conducted with a small sample of participants due to the limited number of PWD attending the day care center involved in this research. Recruiting more participants for the study was not possible, given the maximum attendance of 35 patients in the day care center. Taking into account this limitation, the results are promising, and a sample size of 30 represents a statistical significance in this pilot study. Accordingly, future studies with larger sample sizes have the potential to show results even more significant.

Previous research supports the benefits of direct contact with nature on hospitalization (Ulrich et al., 1991; Rodiek, 2006), and moreover on PWD (Brawley, 2007; Calkins, 2011). Virtual environments have been extensively used in the treatment of agitation in people with cognitive impairments (Garcia-Betances, 2015), while little research has been conducted on the positive effects of virtual environments on PWD (Siriaraya & Ang, 2014), making this specific topic a promising field of research. This pilot study, gives support to the hypothesis that a virtual experience of natural scenes may enhance relaxation and positive mood, reducing agitation-related behaviours in PWD exposed to a stress period.

From the pilot study conducted it is possible to deduce that a VR semi-immersive experience, focused on the projection of natural environments, significantly improved relaxation and pleasure in PWD involved. Pleasure comments and the lack of agitation-

related and stress-related behaviours underline the positive outcomes of such virtual experience on PWD.

Key findings of this pilot study are that semi-immersive virtual environments positively affect the majority of the participants, with only 2 of them expressing increased agitation or discomfort. Pleasure and positive mood were clearly identified among the majority of the participants. The analysis undertaken during and after the sessions represented an initial attempt to evaluate qualitatively the mood and the state of relaxation among participants. All the participants involved were showing agitation-related and stress-related behaviours before being involved in the semi-immersive virtual sessions. Their spontaneous interactions with the virtual environment may represent that semi-immersive virtual environments could be considered effective tools in the care of PWD. Moreover, the participants who fell asleep after the sessions, may represent a significant sign of the effectiveness of such experiences in enhancing the relaxation of stressed PWD without using pharmacological interventions.

Recommendations for future research regard the involvement of a larger sample of participants, in order to strengthen the efficacy of the study. The collection of data in the form of comments through the use of a video camera may reduce the influence of the presence of a researcher in the room, which could have influenced the emotions and behaviours of some of the participants, and so could have represented a limitation to the study. Further analysis may be conducted on the potential correlations between the severity of dementia (Mild, Moderate or Severe dementia), the type of comments and interactions performed with the virtual environment.

Actually, the ongoing sanitary emergency prevented the researchers to perform further studies, as social distancing measures were recently reintroduced in Italy. The introduction of heart rate monitoring before and after joining the session in the Semi-Immersive Virtual Habitat would represent a significant measure to effectively quantify stress in the participants, associated with agitation-related behaviours. Another future significant implementation could be the use of eyes tracking technologies in the Semi-immersive Virtual Habitat architecture, in order to detect clear signs of agitation among the participants.

6. Conclusions

The pilot study presented in this paper has a dual purpose: on one hand, to examine the effectiveness of a semi-immersive virtual experience on PWD experiencing agitation-related behaviours. On the other hand, this pilot study inquiries the effectiveness of a natural virtual experience on PWD, and its capability to reduce stress-related behaviours. Literature underlines that direct contact with nature should be preferred, but some studies started to explore the effectiveness of virtual natural experiences. The Semi-immersive Virtual Habitat presented in this pilot study could be considered a promising tool for enhancing relaxation in PWD experiencing agitation, stress and anxiety. The semi-immersive virtual experience provided showed positive results in reducing agitation. A virtual space could offer a cost-

effective solution in the hands of therapists to reduce stress in PWD, without recurring to pharmacologic treatments. As Alzheimer's Association (2015) reports, new treatment strategies are needed to help reduce pharmacologic interventions and their associated healthrisks.

New therapeutic tools such as the Semi-Immersive Virtual Habitat presented in this pilot study, represent promising tools for the enhancement of the quality of life of PWD, especially after experiencing stressful life events such as lockdown and social distancing mesures, as happened in 2020. Effective non-pharmacological tools and therapies may promote positive mood and relations among PWD, staff and family members involved, and may improve PWD involvement in meaningful and pleasurable activities (Livingston et al., 2014).

The Semi-Immersive Virtual Habitat presented in this pilot study is not meant to be a stand-alone intervention, but rather needs to be integrated into a complete care management program, tailored on the individual's needs.

Shifting paradigms in Sustainable Fashion Design education: Studying implications & effectiveness of pedagogical methods adopted in a pandemic setting

Pragya Sharma
Assistant Professor, Indian Institute of Art & Design (IIAD), New Delhi, India
*pragya.sharma57@gmail.com

Abstract | The onset of COVID-19 pandemic in early 2020 led to an abrupt shift of design studios online worldwide. Overnight, design environments fully transitioned from a traditional face-to-face setting to a virtual studio. Fashion design educators began deliberating on how to teach various projects online as part of the design curricula. In order to deliver certain components of the Fashion Design curriculum, faculty and staff resorted to live recorded videos in studio or at home to demonstrate pattern making and garment construction to the students. On the contrary, it was found that sustainable design module, when delivered as part of the curriculum, there are advantages of delivering the project online (or in a blended mode once the crisis is over), instead of a complete traditional studio environment. Following a practice-based approach, the paper explores the effectiveness and advantages of teaching the module in context online by discussing pedagogical techniques through a classroom project undertaken during the pandemic. Conducting project and faculty feedback through surveys, personal interviews as well as studying students' work as evidence, a design framework has been proposed detailing the flow of learning activities and methods to approach sustainability in design curriculum in a holistic manner using an online or blended mode of delivery.

KEYWORDS | EDUCATION FOR SUSTAINABLE DEVELOPMENT (ESD), SUSTAINABLE FASHION DESIGN, DESIGN FRAMEWORK, ONLINE LEARNING, BLENDED LEARNING.

1. Introduction

The disruption caused by the pandemic-induced nationwide shutdown of schools and colleges in early 2020 had alarming ramifications on the education sector worldwide. Novel terms like Emergency Remote Teaching (ERT) (Hodges et al., 2020) and Crisis Distance Education (CDE) (Al Lily et al., 2020) came into frequent use by researchers to explain the forced education scenario the teachers and students collectively found themselves in. Aa was found, this type of learning is fundamentally different from online education, e-learning, or distance education, in the sense that ERT is an ad-hoc alternative rather than a preferred choice (Al Lily et al., 2020; Hodges et al., 2020). In response to the crisis, the digital transformation of education (Iivari et al., 2020; Korkmaz & Toraman, 2020) brought about meaningful learnings in virtual teaching specifically pertaining to fashion design education, wherein a significant part of the curriculum is built around the human body, fabrics, garment construction, and most importantly fit and quality of the outcomes—tangible aspects that are difficult to replicate in a virtual environment. Teaching sustainable design module as part of fashion design curriculum, which is the area of focus in this study, in addition to the above aspects also entails problem-based design thinking, working on collaborative assignments, field research, and strong industry interface. To summarise, the student is not just producing a design outcome such as a garment but developing long-term values and ethics as well.

To make graduate students become more responsible designers, Education for Sustainable Development (ESD) or Education for Sustainability (EfS) has gained increased relevance in the last few years, constituting an important part of curricula across design disciplines (Thomas, 2009). While ESD focuses on the learning process essential to support sustainable development, EfS emphasizes building the capacity to live more sustainably (Lang, 2004). The fashion industry generates large quantities of waste at every stage of the supply chain, causing harm to the environment (Gam & Banning, 2011), thereby increasing the relevance of ESD/EfS in the context of fashion design education. Owing to its long-term nature, sustainability as part of the curriculum is a value-driven module (De Kraker & Lansu, 2007; Grose, 2013; Huckle, 2006; Wolff, 2020), a way of thinking (Leal Filho, 2010); it is not just about equipping students with required knowledge, skills & tools, values & ethics but building empathy and resilience as well. The ideas and ethos integrated as part of the learning process are internalized for lifelong learning (Yasin & Rahman, 2011), attuned to the student's philosophy and aesthetics, with the knowledge developed guiding them in complex decision-making situations they may encounter in real-life. Students often take time to imbibe these values over the academic years, and so the way the class delivery is approached becomes crucial and plays an important role in long-term learning.

A practice-based research, this study acknowledges that online delivery is not merely a digital translation of what is being taught in a face-to-face learning environment but about rethinking and realignment of pedagogical practices and classroom delivery. This study explores the effectiveness and advantages of teaching sustainable fashion design module online by discussing pedagogical techniques through a six-week online classroom project

titled 'Design for Sustainability' taught to undergraduate second-year fashion design students in India, during the pandemic. The project has previously been delivered in a traditional face-to-face setting, in a pre-pandemic scenario, with 15 contact hours and 15 self-study hours allocated per week. For this study, qualitative methods like surveys, semi-structured personal interviews, and written student feedback were employed. Furthermore, students' work—design outcomes, reflections, digital blogs—provided useful insights into their thinking and learning processes while they were working on the project.

The study discusses the delivery formats incorporated during the project, largely focusing on Masterclass & Panel Discussion with Global Experts, Thinking Thursday, Independent Study (of the Local), and Collaborative Working for Knowledge Sharing; approaches that were previously not explored in a traditional learning environment. These techniques can be perceived as symptomatic of the present reality but supported with a review and synthesis of the literature on sustainable design education in a pandemic setting as well as discussing blended models in design education, it can be ascertained that the approaches will stay relevant once the crisis is over and face-to-face teaching can resume. For sake of clarity, the term 'blended' in this paper refers to a mix of physical space (face-to-face) and virtual space (online) to facilitate teaching and learning activities. The findings implied that there are advantages of teaching sustainability module in a blended mode as compared to a complete face-to-face learning environment. As a result of the study, a learning design framework has been proposed, detailing out how the module can be delivered in a blended mode. Acting as a roadmap for researchers and design faculty teaching on sustainable design module as well as to enhance the existing curricula across design disciplines, the framework can be altered to suit contextual needs depending on the objectives, timelines, etc. of the project to arrive at holistic learning for the student.

2. Discussing approaches incorporated for online classroom delivery

A six-week-long project taught to a cohort of 32 students, 'Design for Sustainability' introduced students to sustainable design in the fashion domain underpinned by its core notions and ethos. As a concept, sustainability is often interpreted as too broad and abstract (Landgren & Pasricha, 2011; Leal Filho, 2010; Thomas, 2009) and at times delivering this project in a short duration incorporating the important aspects of sustainability within the module can be a challenging task (Yasin & Rahman, 2011). In order to simplify and break down the wider concept of sustainability while retaining its significance, a strong emphasis was laid on how the project was planned and delivered as well as designed in a way for the students to understand the concept from a wider perspective—primarily defined by their local context, slowly examining it from the lens of fashion, and eventually moving towards a global context.

The primary learning outcomes of the project dealt with the student's demonstration of strategic use of research methodologies and analytical tools, formulation of an individual point of view as well as the ability to critically comment on the interface of context & design. To fulfil these outcomes, different delivery formats were planned incorporating the 6 types of teaching and learning activities as formulated by Laurillard (2013) in the Conversational Framework – Acquisition, Collaboration, Discussion, Investigation, Practice, and Production. While planning the learning activities, special focus was given on how to drive student engagement and participation since in a virtual learning environment, as is often found, students do not turn on their cameras because of various reasons and find it difficult to build a sense of community. Integration of theory and practice (Moore, 2005), as well as a combination of synchronous and asynchronous activities including lecture presentations, interactive sessions with industry experts, watching documentaries, and holding discussions, collaborative learning & assessment, and knowledge checking strategies like quizzes, were incorporated. Bloom et al.'s (1984) six levels of cognitive learning – Knowledge, Comprehension, Application, Analysis, Synthesis and Evaluation, were referred to in deciding the progression of these activities over the course of six weeks.

Table 1 summarises this alignment along with appropriate technology used in the virtual environment for maximizing student engagement. Alongside, the table also suggests the possible application of the delivery format in a post-pandemic learning environment. It should be noted that each session in any of the formats was held for a maximum of 150-180 minutes every day, including 10 minutes comfort break. Canvas (Instructure, n.d.) was used as a Learning Management System (LMS) to host project content, organize assignments, tasks, and activities, share learning outcomes & rubrics, and manage assessments. As first-time users of Canvas, both the students and the faculty took time to familiarise themselves with the platform but eventually found it extremely useful. Additionally, Microsoft Teams (Microsoft, n.d.) was used as a video-conferencing platform to conduct online sessions as well as for quick sharing of important resources and links or notifying students about any changes in the class schedule. Also, various online tools and technologies were used to assist student learning, as will be discussed in the next few sections. Working in close collaboration with the institute's librarian, Learning & Resource Centre's services were extensively used with E-books and scanned copies of rare books organized on Google Drive for easy access.

Feedback during the project was delivered through a combination of mediums – annotated corrections on the submission document (using SpeedGrader on Canvas), detailed critique in comments, analytic rubrics, peer feedback, and verbal feedback provided by the faculty synchronously in groups during online sessions. Since both students and faculty were working in a forced online learning environment and there was a lack of resources and equipment at home, it was fair to provide more oral or written constructive feedback and assessing the student on fewer outcomes—graduating from quantitative to qualitative assessment methods (Farrington, 2020). Expectations were explicitly set through the rubric with the intended learning outcomes mentioned to assist students in self-paced learning—an important aspect with the students working in isolation, and for them to align the pace of

the classroom, with their health and well-being as the country approached an upward increase in the pandemic curve. Being considerate of the situation, all online synchronous sessions on Microsoft Teams, barring one-on-one mentoring sessions and sessions conducted in breakout rooms, were recorded for students' reference and hosted on Microsoft Steam (Source). During the project, the students maintained a design journal as a daily log of reflection on activities as well as made a conscious effort to regularly post their reflections on the blogs. Wix, a free website builder (Wix, n.d.) was used as a simple, easy-to-use technology platform that simultaneously aided in the creation of a digital repository of the student's design journey during the project and concurrently building 'communities of practice' (Dewitt et al., 2015).

Table 1: Alignment of teaching & learning activities in accordance with Laurillard's (2013) Conversational Framework

S.No.	Delivery format	Technology / Mode	Learning activity type	Frequency across activities	Synchronicity	Post-pandemic learning environment
1	Lecture Presentation	Microsoft Teams virtual meeting	Acquisition	6	Synchronous	Virtual classroom
2	Masterclass + Panel Discussion with Global Experts	Microsoft Teams virtual meeting	Acquisition + Discussion	7+2	Synchronous	Virtual classroom
3	Thinking Thursday	Breakout rooms in Microsoft Teams	Investigation	4	Synchronous	Virtual classroom
4	Independent study (of the Local)	Home/ Local area	Investigation + Production	2	Asynchronous	Home and On-field
5	Problem-based Learning Task	Teams meeting + Self	Practice + Production	2	Synchronous & Asynchronous	Face-to-face classroom

6	Collaborative Working for Knowledge Sharing	Padlet, Mural, and Mentimeter	Collaboration	2	Synchronous	Virtual classroom
7	Discussion Board	Canvas	Discussion	5	Asynchronous	Virtual classroom

2.1 Lecture Presentation

A frequently-used delivery approach, the lecture presentations were largely PowerPoint presentations used to introduce concepts around sustainability and fashion, supported by the use of collaborative platforms like Padlet (n.d.) or Mentimeter (n.d.) for knowledge sharing amongst the students. Aimed at instigating the learner's curiosity and foster student engagement (Latchman et al., 1999), the presentations were not descriptive—had more images and less content, with every slide following up with probing questions in order to scaffold student's learning, during the project as well as learning from previous terms. This is consistent with Dovros & Makrakis' (2012) view that scaffolding questions help trigger students' critical skills and allow them to stay focused. For example, while introducing sustainable fibres and fabrics, the conversation was initiated from their previous knowledge of natural fabrics in the first year. The use of Padlet as a tool with anonymous responses was helpful in co-creating this knowledge, the outcome of which was used to discuss the topic further (See Figure 1).

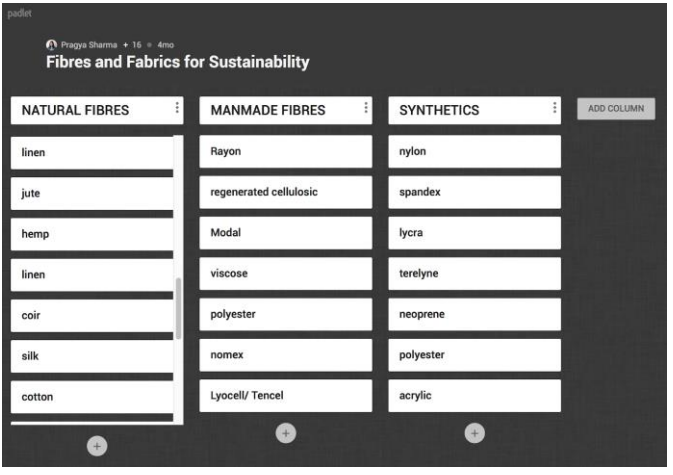

Figure 1: Interface of Padlet showcasing students co-creating knowledge during 'Fibres and Fabrics for Sustainability' discussion.

A face-to-face learning environment provides fewer opportunities for this form of knowledge sharing amongst the learners. Unlike a physical classroom session where some students do not get the chance to contribute to the co-creation of knowledge, in the case of the above-mentioned activity, every student was able to share and do so anonymously without inhibitions or fear of judgment. In other small in-class activities, for example, while discussing longevity, the students were asked to pull out their favourite piece of clothing from their wardrobe and study labels in order to understand fabric composition, wash care as well as the origins of the garment. This resulted in real-life learning about the significance of wash care labels and understand the meaning of various symbols. To supplement the learning from lecture presentations, e-books and scanned library resources were shared on Canvas LMS.

2.2 Masterclass & Panel Discussion with Global Experts

A 90-120 minutes long intense interaction, discussion, or lightning talk lead by an industry expert, the online Masterclass format provided students the opportunity to reduce distances and interact with global experts from different domains of sustainability irrespective of location or traveling constraints. To provide a multifaceted learning experience to the students, the project incorporated 7 masterclasses, with experts ranging from representatives from waste segregation organizations, sustainable fashion designers, journalists, and textile artists to writers, speculative designers, and young graduates. The instant project commenced with one such Masterclass titled 'Trash Talk' that provided a good entry point to the larger domain of sustainability, exposing students to the most basic aspects of sustainable living.

Partly owing to the circumstances where one vied for connecting more with people (albeit virtually) and build meaningful connections, the experts were quite enthusiastic to share their knowledge & experiences and interact gratis with the students. This format essentially reinforced learning from lectures, giving learners an insight into the speaker's ideas & practice in addition to fostering cross-cultural exchanges. In one such masterclass with Texas-based textile artist Maday Lange, the students were provided a virtual tour of her working studio. The session concluded with the students sharing the quilted textiles they had worked on in their summer break and getting a quick review by Maday (See Figure 2). In a regular face-to-face format, such an activity would have taken up a lot of time with individual students.

Figure 2: Screen capture of masterclass with Texas-based artist Maday Lange

The Panel Discussion format brought together four global experts from various sustainable domains to discuss topical issues in the fashion context like supply chain, circular design, co-existence of luxury and sustainability, the impact of COVID-19 pandemic on fashion systems, to name a few. This format was incorporated twice during the project, giving students a practical insight into the workings of the industry. Such formats helped them engage in discussions with the panellists as well as with their peers, thereby strengthening their individual skills like speaking and impersonal communication that did not receive an outlet during longer isolation periods (Al Lily et al., 2020).

2.3 Thinking Thursday

To lighten up the classroom sessions, with the motive of stimulating students' curiosity, a discussion-only day was planned every Thursday that brought on board artists and curators across varied disciplines to collaboratively indulge in a range of activities—from studying and critiquing a piece of artwork, discussing and deliberating ways of working and building aesthetics, to analysing a research paper. The format acted as a medium for the students to contest dilemmatic topics that piqued their interest such as planned obsolescence and conspicuous consumption, to name a few. In alignment with the multifaceted nature of ESD, the objective of this format was to probe students to activate their analytical and critical thinking skills, and encourage open-ended discussions while engaging them in a learner-centred dialogue. Research by McCarthy & Boyd (2005), indicated that students become more critical in their thinking when they try to defend their ideas in a discussion. This form of classroom talk, as articulated by Barnes (2010) has the power to shape knowledge through learner engagement with processes ranging from hypothesizing, exploration, debate, and analysing. Additionally, during the sessions, non-recorded breakout rooms

(Poston et al., 2020) with limited faculty intervention allowed students to share their thoughts and opinions freely with their peers.

2.4 Independent Study (of the Local)

As part of the project, two inquiry-based assignments centred around independent learning, assisting students in taking ownership and deciding the pace of their learning. Post the 'Trash Talk' Masterclass at the beginning of the project, they were assigned a home-based research task wherein they had to look into different sections in their house – kitchen, washroom, dining area, living area, etc. and closely observe the unsustainable products & practices and suggest healthy alternatives. The core aim of this peer-reviewed assignment was to identify and rationalize the concept of sustainable practices, within the context closest to them, their home in this case, and develop an appreciation and critical eye towards the impact their lifestyles create on the environment. With analytic rubrics providing an objective way for peers to offer feedback, such formative assessment activities have a significant impact on improving student learning and are appropriately facilitated through online technologies (Carter, 2009; Yam & Rossini, 2011), for example, Canvas LMS in the current case.

With the local aspect forming an important role in understanding sustainability (Fletcher, 2008), a follow-up of the above assignment required students to study in-depth any one of the local industries in their respective region. Titled 'Finding my Local', the assignment aimed at making students more conversant with their surroundings, articulate their findings, and offer critical commentary in the form of a 500-word reflective essay, reinforcing their critical and reflective thinking skills, one of the key skills for ESD (Dovros & Makrakis, 2012; Howlett et al., 2016; Pavlova, 2013). Furthermore, this kind of student engagement with local communities reflects the principles of sustainability (Leal Filho et al., 2018) as well as helps them understand different points of view (Too & Bajracharya, 2015). In both the activities, the student's context became important and so this particular assignment was designed in a way to reinforce the relevance and importance of local especially during a time when there were mobility restrictions. The goal was to make the student more self-aware about their surroundings and explore local creative industries via primary research, thereby leading to the creation of a customized real-world learning experience for each student.

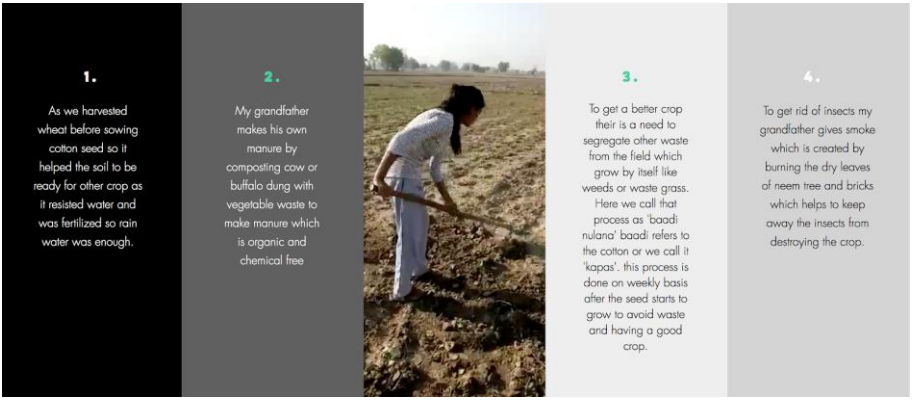

Figure 3: A student's blog entry on 'Finding my Local' assignment.

2.5 Problem-based Learning Task

Incorporating the 'Learning by doing' philosophy as advocated by De Kraker & Lansu (2007), this format involved activities that provided a hands-on learning experience. One particular assignment aimed at understanding and finding a solution to the immense amount of cut-and-sew waste generated in the garment construction process—an important discussion in the sustainable fashion context. The students were supposed to select an unused or discarded garment from their wardrobe, deconstruct and rip it apart, separating all its components, and subsequently place them on a piece of fabric to calculate wastage generated in the making of the garment. Further, they investigated how the original garment could be re-designed with minimum waste as well as explored different ways of incorporating the waste pieces in the new garment, ensuring maximum fabric use. Due to material and equipment constraints at home—a dress form and a sewing machine—the students were advised ways to put the panels together, other than machine sewing, using hand stitches, pleats, tucks, insertions, folding techniques, etc. to assemble and construct the garment. Figure 4 shows one such visually documented design process.

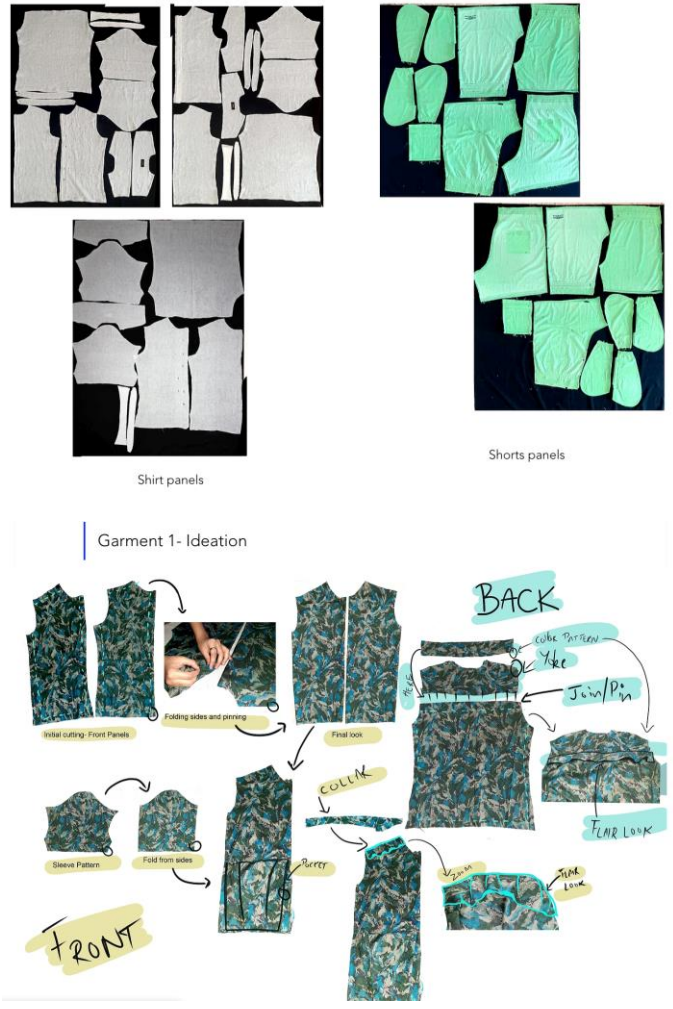

Figure 4: A student's work showcasing de-construction and garment waste calculation for her garment, and subsequent re-arrangement of the panels to create new design.

Addressing and understanding the dilemmas and challenges of sustainable development requires skills in critical thinking and problem-solving (Huckle, 2006; Thomas, 2009). Such assignments prepare students for the industry and aid them in any complex decision-making process they may encounter in their day-to-day lives. In another assignment aimed at hands-on learning, the students approached sustainable garment making through the zero waste design method, a popular sustainable design strategy. Initially instructor-led with step-by-

step demonstration, the assignment involved creating zero-waste patterns through folding techniques. In the synchronous online session, all the students had their laptop cameras tilted towards their working tables in order to imitate the studio environment, enabling students to see each other's explorations as well as for the faculty to appropriately guide them. The small miniature folds—after initial explorations on a 12" small mannequin for determining openings, were translated into self-size muslin pieces, asynchronously. In this kind of practice-based problem-solving learning environment, the teacher's role moved from an instructor, a primary source of knowledge—to a facilitator (Hoic-Bozic et al., 2008). One-on-one mentoring sessions, discussion with peers, and self-reflection enabled feedback in this format.

2.6 Collaborative Working for Knowledge Sharing

To aid participatory decision-making with the peers as well as drive student engagement, small activities were planned within the online sessions. In one such classroom activity, Mural (n.d.) was used as a collaborative platform. The activity was aimed at understanding the origins of the Fashion Revolution movement #whomademyclothes (Fashion Revolution, n.d.) and involved critically listening to the narratives of garments' workers that explained their working conditions and treatment by employers in a sweatshop in Bangladesh. While studying sustainability in the fashion industry, developing an understanding and building empathy becomes vital. Following a Flipped Classroom approach (Bergmann & Sams, 2012), the students were assigned the pre-work to listen to a 25-minute podcast episode by Fashion Revolution (Fashion Revolution Podcast, 2017) prior to the online session. During the class, an important dialogue emerged among other discussions points, about Turkish factory workers, who made clothes for fast-fashion brand Zara and had placed tags in garments that read, "I made this item you are going to buy, but I didn't get paid for it" (Park, 2017). After listening to the podcast, as a roleplay, they were asked to imagine themselves as the garment worker and write a 50-word note to be attached to the garment, answering the cue '*What would you want to say to the customer, if you get a voice?*'. They wrote and pinned their letters as sticky notes on Mural, a snippet of which is shown in Figure 5. The Flipped Classroom approach helped foster a deeper understanding of the concept since saving the classroom time to listen to the podcast episode, provided the learners enough time to engage in critical discussions in the session.

Figure 5: Notes to garment workers on sticky notes on Mural as an outcome of #whomademyclothes activity

2.7 Discussion Board

The Discussion tool on Canvas LMS was actively used to hold asynchronous discussions on micro or out-of-the-classroom activities like documentary & movie reviews, sharing of reading resources, opinions on articles, etc. It also acted as a Q&A forum for the students to pose question or clarify any doubts on the project. Usually, a thought-provoking statement was often posed on the board by the faculty or the student to collectively reflect on. Since sustainability as a topic is subjective and is largely defined by one's socio-cultural context, a lot of its aspects require crucial discussions. Hence, topics were chosen in a way that brought forward one's individualised context, thereby fostering intercultural learning. Storytelling was used as a powerful way to evoke responses, for example, while discussing upcycling in class, the students were asked to share a repurposed story of a garment from their family on the discussion board. A comment by one of the students read,

> "When I entered first grade, we had strict restrictions on wearing school uniforms with accessories of the proper colour, either grey or the colour of your uniform and no other colour was acceptable. My mother knitted a woollen grey scarf for me and I never liked it. I always thought it looked so ugly on me. I used to wear it till I got on my school bus and then removed it. My mother knew it and she knew I played this mischief so she unravelled it and made a cap out of it, mixing a little of black yarn as well. I loved it but when it stopped fitting my head, my mother unravelled it again and used it to make a crochet cover for the offering plate she took with her to the temple."

Belonging to different parts of the country, sharing of similar stories & perspectives from students' contexts resulted in building of ideas and experiences amongst the student

community. Features like threaded discussions, like, reply to a peer's comment were enabled, thereby helping in building meaningful conversations amongst the student community.

3. Survey Results

To measure the implications of the delivery approaches, a survey was conducted on Google Forms in the first week of conclusion of the project. Questions were answered on a 4-point Likert scale form Strongly Agree to Strongly Disagree. Additionally, four face-to-face semi-structured interviews were conducted, 8 weeks later, with the students from the cohort. Table 2 highlights the feedback criteria along with the results.

Table 2: Student Feedback Survey Results

S.No.	Questions	Strongly Agree	Agree	Disagree	Strongly Disagree	Total
1.	Introduction to the project enabled me to understand what is expected of me	15	12	1	0	28
2.	The concepts covered in the project were explained well (made it easy for me to understand and apply)	14	14	0	0	28
3.	The delivery of the project was interactive and engaging	13	15	0	0	28
4.	I was challenged and motivated to stretch and push my abilities	15	13	0	0	28
5.	The criteria for feedback has been made clear to me	14	13	1	0	28
6.	Detailed feedback has been given on my work in a timely manner	15	12	1	0	28
7.	Feedback given has helped in improving the quality of work	14	14	0	0	28
8.	Overall I am satisfied with the quality of teaching	12	15	1	0	28

Summarising the results, 96% of the class, 27 out of 28 students were overall satisfied with the delivery of the project. Table 3 further elaborates on some of the students' comments sharing aspects of the teaching that they believe had a positive impact on their learning.

Table 3: Student feedback sharing comments

S.No.	Respondent	Comment
1.	R4	The constant positivity during the class
2.	R8	Masterclasses and one to one discussions.
3.	R10	Everything was taught in a simple, practical manner, making it easier to learn
4.	R12	The masterclasses were very enriching and faculty supportive and encouraging throughout the project
5.	R14	I think all the aspects helped- masterclasses/ discussions, assignments. Challenging yet interesting.

4. Analysis of Approaches

Based on evaluation of responses generated student feedback through survey and interviews, classroom observations, as well as literature review, Table 4 gives a detailed analysis of the approached.

Table 4: Inferences and detailed analysis of delivery approaches

S.No.	Delivery Format	Analysis
1.	Lecture Presentation	As observed from the active participation of the majority of the students, good attention curve combined with the critical questions posed by many of them, it was found that the classroom discussion facilitated students' high-order thinking skills, an important aspect of ESD. This format stimulated student participation; oral contributions from the students were elaborate, and the responses were quick, illustrating that the students found the sessions to be engaging. Anonymous responses on Padlet fostered student engagement as researchers have found that anonymity in activities makes learners more participative since they do not need to reveal their identity (Brady et al., 2013).
2.	Masterclass & Panel Discussion with Global Experts	As per the survey results, the masterclass format was the 'most-liked' aspect of the project and students found them to be 'enriching'. As one of the interviewees spoke, the sessions gave them a "global viewpoint on how artists, designers & organizations are incorporating sustainability in their practices." This format allowed students to get an

		insight into different aspects and avenues they can explore within the larger context of sustainability. Listening to varied perspectives as well as building their own, the environment that was consequently built through this format, helped students experience they were a part of the larger design community.
3.	Thinking Thursday	As was observed in online sessions, this format provided the students with a day in the week where they were not concerned about absorbing knowledge or producing an output. Through their active participation, it can be deduced that the students enjoyed these design thinking sessions wherein they were actively observing, analysing ,and synthesizing the visual elements they were being exposed to.
4.	Independent Study (of The Local)	As gathered from personal interviews, practical learning was seamlessly integrated into the student's day-to-day personal and professional contexts. This format activated the students' self-initiative skills, making them more reflective and self-aware, with most of them looking at their home-based industries or the ones in their closest proximity. In an interview, a student mentioned that working independently provided her ample time to apply her learnings, and critically reflect on them. While working on the home-based research assignment, students discussed how the assignment led them to initiate conversations with their parents and grandparents around sustainability, getting insights on how it was being practiced traditionally and applying their findings towards the deliverable.
5.	Problem-based Learning task	The assignments were designed to be self-paced and exploratory in nature. Although a challenging yet important aspect of the project, 'designing around limitations' further reinforced by the constraints the pandemic brought about, strengthened the student's problem-solving skills, compelling them to make conscious decisions at every stage, and finding the best possible way to tackle a problematic situation. One of the students commented in the survey, "Understanding deconstruction has led to ample wastage of fabric in the form of ripped garments." This implies that the student was actively conscious of fabric waste while working on the assignment, thereby signifying that the student's higher-order thinking skills were activated.
6.	Collaborative Working for Knowledge Sharing	Collaborative activities were good forms of engagement amongst peers. As became apparent from the notes written on Mural, the #whomademyclothes activity invited an empathetic response from the learners, followed by a discussion where the students commented on and appreciated one another's notes.
7.	Discussion Board	Even though students were not evaluated on their participation, they were found to be engaged and reflective in the discussion forum with their comments supported by sound knowledge. Important arguments were being raised in threaded comments that prompted others to join

the conversation, fostering peer-based learning. Echoing Dovros & Makrakis' (2012) view and as was observed, introverted students were better at expressing their opinions asynchronously as compared to a traditional face-to-face classroom, thereby building a supportive and inclusive learning environment.

Additionally, annotations on SpeedGrader on Canvas (n.d.) helped in sharing individualized feedback which is a powerful learning engine as espoused by Rapanta et al. (2020) in their research. For every assignment, rubrics were shared on Canvas to set expectations. One of the students interviewed shared that the rubrics helped her direct her learning on the project, a sentiment echoed by Mirriahi et al. (2015) as well. An emergent asynchronous communications approach, blogging acted as a strong learning tool (Rhode, 2009) with the student documenting their daily or weekly reflections (based on the learner's pace) on classroom discussions. Arena (2008, p.3) identifies that blogging also promotes higher-order thinking skills since, in order to establish a conversation and to construct knowledge collectively, learners and instructors will have to "… go beyond superficialities, posting entries that increase reflection, analysis, discussion, and synthesis."

As has been discussed by many researchers, the main challenges faced by the students in a remote teaching environment primarily included – impact on emotional well-being, absence of dedicated working space, lack of family support, socio-cultural barriers, technical glitches, internet connectivity issues, etc. (Iivari et al., 2020; Kini-Singh, 2020; Paudel, 2020; Rapanta et al., 2020). In addition to these challenges, the author observed the following shortcomings as well:

- In the absence of necessary equipment, primarily a dress form and a sewing machine at home, the fit, and quality of garments impacted design outcomes. While some students had provision of these at their homes, some did not and so it was fair to not assess them on the construction aspect of the assignment, but on the conceptual strength of the design as well as their risk-taking abilities; the alignment of Learning Outcomes (LOs) in the rubric was done accordingly. It was also ensured that the students were well-appreciated when they mitigated problems while working from their home environment.
- As one of the interviewees pointed out, the students were not getting enough chances to see each other's work unlike in a face-to-face setting. The student spoke about how seeing each other's work motivates and encourages them to perform better. To resolve this dilemma in future projects, free cloud storage platforms like Shared Drives on Google (Google Drives for Developers, n.d.) or OneDrive on Microsoft (n.d.) can be incorporated.
- In the shutdown scenario, students were unable to undertake a campus-based learning project, unlike last year when the project was delivered in a face-to-face setting. As emphasized by many researchers, the campus—as a learning location and students' first contact to practical experience—forms an important element in understanding sustainability concepts through problem-solving (Gudz, 2004;

Moore, 2005; Too & Bajracharya, 2015). Due to remote teaching, the students missed out on this learning aspect.

- Collaborative learning through teamwork can be explored as one of the delivery formats. As emphasised by Remington et al. (2017), teamwork encourages every team member to be actively involved and accountable for their learning goal. Additionally, working as part of the team, learners develop skills like leadership, communication, considering different perspectives and opinions as well as conflict resolution. Since this was the first instance a project was delivered completely online and due to lack of experience in planning and designing activities incorporating teamwork, the format could not be explored but now with much experience, this can be further worked upon.

4. Opportunities in a post-pandemic scenario

There is no doubt that a virtual environment that educators were inadvertently forced into, played a huge role in the planning and restructuring of the design of various projects. The efforts put into remodelling projects from a face-to-face to an online mode leads to the pertinent question of whether or not these practices will be relevant in a post-pandemic scenario. Design institutes worldwide are already considering a blended approach that involves a combination of traditional and online delivery methods, keeping in mind the advantages and opportunities that online learning environments offer – flexibility, accessibility, allowance of self-paced learning, affordability, to name a few (Bleed, 2001; Carman, 2005; Iivari et al., 2020; Kini-Singh, 2020; Paudel, 2020; Rapanta et al., 2020; Singh & Phirriyalatha, 2020).

As per the student survey results, 5 out of 6 students feel that they would have performed better in a part studio, part virtual environment, as opposed to a complete face-to-face or a complete virtual learning environment. This brings into light a blended mode of delivery, and hence, the following approaches can be suggested for if and when the project is delivered in a blended mode:

- In order to space out the level of learning in the context of sustainable fashion design, it is advisable that this component should start early in the first year of fashion design itself, to create a significant experience at each level. This results in a scaffolded learning experience for the students, sharing Bruner's (2009) view in his Spiral Curriculum theory.
- The number of masterclasses can be minimized to accommodate other virtual events aimed at participatory learning amongst peers such as Virtual Hackathons. Hackathons are collaborative and intense activities with the focus on producing a definite outcome by the end of the event (Aguado et al., 2014).
- More interdisciplinary approaches can be explored such as working on collaborative assignments with students from other disciplines—communication

design or product design. Not only does it form an important element of ESD (Yasin & Rahman, 2011), it has been routinely highlighted by many researchers that the transformation in higher education towards sustainability should encourage inter and transdisciplinary approaches (Ferrer-Balas et al., 2009; Moore, 2005; Remington-Doucette et al., 2013; Sterling, 2013).

5. Learning Design Framework for blended delivery

As Kini-Singh (2020), Pektas & Gurel (2014), and other researchers have reiterated, blended learning in design education is not a new phenomenon, with appropriate use of technology becoming important for facilitating and enhancing the learning experience (Rapanta et al., 2020). Informed by qualitative data collected from respondents as well as supported with literature, a blended learning framework has been designed based on a layered thinking approach that can be used to deliver the module holistically (See Fig 6). Following the essential ingredients for blended learning, as formulated by Carman (2005), the cells with white background suggest that the format works best in a virtual learning environment while the cells with grey background require physical studio space. As has been routinely observed, incorporating varied platforms for learning is less monotonous for the students, and makes them more inquisitive learners. Thought-provoking activities as part of the framework will help intensify the learning process. Design Council's (n.d.) double diamond model was referenced to plan how students' learning during the project can be reinforced through different delivery formats (as highlighted in different coloured boxes).

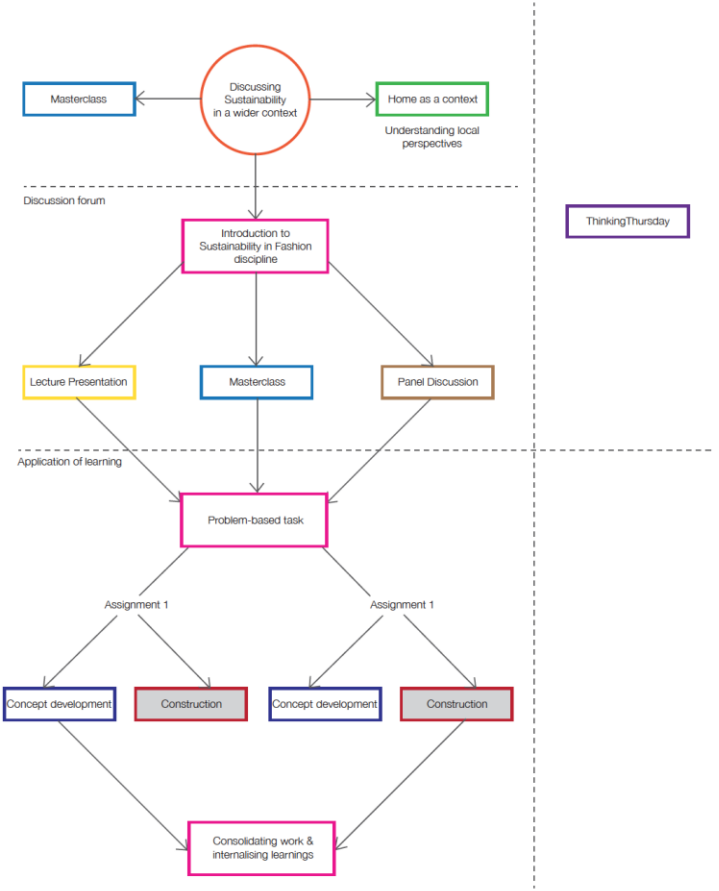

Figure 6: Proposed design framework for a blended mode of delivery of sustainability module taught to third year undergraduate Fashion Design students

5.1 Discussion & Limitations

As was observed and has been pointed out by Dovros & Makrakis (2012) in their research, at times, design faculty find it challenging to orient their curriculum owing to the multidimensional complexity of the sustainability module. The proposed framework aims to assist educators in ad-hoc circumstances like the ones encountered in the past year. As advocated by Carman (2005), “People perform better when they have a mix of modalities and methods of learning.” The framework, in this case, helps cater to different students’

learning styles and pace (Rapanta et al., 2020). Some of the challenges that one can encounter while using the framework are:

- Considering student diversity while working in a virtual environment and as aptly articulated by Pedró (2012) in their research, one should be mindful of the fact that various kinds of polarizations exist between those who have access to and ability to develop digital literacy skills and those who do not.
- Although multiple online technologies and tools were discussed in the instant research, one cannot assume that all platforms are safe to work on. As Rapanta et al. (2020) warned, available 'free' tools may share user data with third parties and this may not align well with an institute's privacy & protection policies. In addition to this, not all online tools are free or there are certain limitations on the number of users or the number of files that can be created. The use of such platforms, as mentioned in the paper, was done as an experimentation phase, before deciding on whether or not the institute should invest in them.

Another limitation of the framework is that it does not accommodate faculty's digital literacy skills and other competencies while adapting to new technology or platform and ease of working. In this context, the framework can start a larger conversation worthy of a separate paper. Also, as Leal Filho et al. (2018) pointed out "…the capabilities of academic staff to support learning transformation processes are too often assumed, and more attention should be devoted to faculty professional training." Hence, the development of appropriate pedagogical content knowledge (Shulman, 1987) will be required for designing and delivering the project in a blended mode.

6. Conclusions

The research conducted in this paper gives an overview of the approaches incorporated in the delivery of a Sustainable Design module virtually during the pandemic, as well as suggests ways of rethinking teaching Sustainable Fashion Design in a blended mode. Design educators worldwide have always believed that studios are best functional in a physical setting unless there is not a provision for one, but the findings of this paper imply that it is advantageous to take some or most of the aspects of a sustainable design module in the fashion domain online for better student learning and engagement with the project. Incorporating activities and tasks as part of different formats, as discussed in the paper, and aligning these with varied learning activity types leads to holistic learning for the student that has a lasting impact. As was identified, an online learning environment leads to more independent and self-driven learning for the student.

Blended approaches in delivering modules in fashion design curriculum may become the norm in the future irrespective of any calamitous situation that may occur. The pedagogical approaches and methods discussed in the study will continue to remain relevant in a post-pandemic learning environment. More in-depth comparisons could have been drawn when the project was taught last year in a complete traditional face-to-face learning environment

versus an online delivery, however, that study would have been out of the limits of this paper. In order to further enhance the design of the framework, another aspect that can be studied further is exploring the approaches and implications as well as the proposed learning design framework from a faculty's perspective and accommodate their challenges. As an important participant in the student's learning process, the faculty needs to be conversant as well as comfortable with the technologies incorporated in the classroom delivery.

Strengthening city resilience through the re-orientation of a social innovation incubation programme in Covid-19 time. The case of 'The School of the Neighbourhoods'

Marta Corubolo*, Anna Meroni, Daniela Selloni

Politecnico di Milano - Department of Design
*marta.corubolo@polimi.it

Abstract | This paper describes the impacts of Covid-19 on the social innovation incubation programme, 'The School of the Neighbourhoods', promoted by the Municipality of Milan, as a policy that aims to enable and empower prospective social innovators to transform ideas into prototypes and actions. The nature of the programme, intrinsically disruptive because focussed on up skilling people, on learning from the most interesting experiences, on providing solutions and generating social impact, has been regarded as an already potentially excellent answer to the pandemic in a 'new normal' perspective. The programme has now been adjusted to increase its capacity to activate a strategic conversation with and within local communities and to train the sense-making ability of the prospective innovators to design a 'new normal'. It may be regarded as a living experiment to enhance the resilience of a city, part of a wider policy for the *cultural and technical empowerment* of communities before and beyond the pandemic circumstances.

KEYWORDS | SOCIAL INNOVATION, INCUBATION, CO-DESIGN, SERVICE DESIGN, STRATEGIC DESIGN, PROTOTYPE

1. Background knowledge

1.1 Design for social innovation incubation.

The dramatic effects of the CoVid19 pandemic had an impact on people's lives in every country in the world. The state of emergency has affected all levels of society, highlighting how much a choral and cohesive action among different sectors is necessary in facing issues arisen from this situation and in devising a change on a systemic level.
At the local level, communities have shown an unprecedented capacity of action, often collected in repositories or platforms (to mentions but a few: in the city of Milano, the initiative by the municipality 'Milano Aiuta'[1]; in the city of New York the initiative 'Mutual Aid NYC'[2]; in the USA the 'Mutual Aid Hub'[3], and many more), by fast prototyping innovative solutions as creative reactions to the emergency state. Considering the main traits of such extemporaneous initiatives (e.g.: the origination in the local community, the creation of collaborative relationships often based on mutuality, the innovative use of resources to create commons, the care for social inclusion and public value, beside the massive and creative adoption of digital solutions), these can be considered as practices of social innovation (Murray et al, 2010; Howaldt, J. et al 2018). As such, they might benefit from specific support policies to scale and to increase both their efficiency and impact, so to create the basis for a more proactive and participatory post-emergency society. This paper discusses the contribution of design to shape a strategy that an existing social innovation local policy may explore to capture the momentum associated to the pandemic and to envision a 'new normal'. More in particular it describes some of the initiatives undertaken within 'The School of the Neighbourhoods', a programme promoted by the Polimi DESIS Lab - Design Department of Politecnico di Milano with the aim to enable and empower prospective social innovators in areas of the city in need for an economic and social boost.
As discussed in several arenas (Meroni, 2019; Lou, 2018; AAVV, 2015) social innovation is a key element to create more resilient societies, that is able to achieve and sustain health and well-being through recovery (how well people bounce back and fully recover from challenge) and sustainability (how well people sustain health and psychological well-being in a dynamic and changing environment). In fact, from a design perspective in particular, social innovation is a process that, at the same time, implies and results from empowering people to overcome difficulties by using creative thinking and problem solving, looking at problems as opportunities and becoming open to change. As such, designing for social innovation is a way to strengthen the resilience of a community.

The scholarly debate around how social innovation can be empowered and enabled is wide and articulated (Dees et al, 2004; Westley & Antadze, 2010; de Bruin & Stangl, 2013; Gabriel,

[1] 'Milano Aiuta', https://milanoaiuta-servizi.comune.milano.it
[2] 'Mutual Aid NYC' https://mutualaid.nyc
[3] 'Mutual Aid Hub', https://www.mutualaidhub.org

2014): it is particularly focused on the trajectories of scaling and on the programmes to accelerate and sustain such progresses. A common agreement emerged on the necessity of moving beyond the idea of scaling as an organizational growth (Bradach, 2010; Addarii & Lipparini, 2017) narrowed on the capacity of the single innovator to acquire technical skills to improve the performances. Instead, the dichotomy between 'scaling out' – disseminating social innovation to benefit more communities – and 'scaling up' – connecting the social innovation to opportunities in the broader economic, political, legal or cultural context (Westley & Antadze, 2013) – is useful to frame the subject of this paper. In fact, it helps to understand that effective processes enabling social innovation need to nurture an innovation culture in society at large (Moulaert & Van den Broeck, 2018; Meroni, 2019) besides to train specific skills and provide technical measures. Indeed, incubation experiences (Davies & Simon, 2013b; Miller and Stacey, 2014) have demonstrated that supporting social innovations requires to consider, as part of the process, disseminative, open and inspirational initiatives with a twofold aim: on the one side, to empower communities, by generating awareness, critical and creative thinking, entrepreneurial skills to develop ideas that can generate public value (Murray et al, 2010; Pauwels et al, 2016; Selloni, 2017) and, on the other side, to stimulate in people openness, interest and then behavioural change toward different ways of living (Manzini & Jégou, 2008).

In this line, we can see that in the last few years the public sector, specifically at the local government level, has been acquiring awareness and knowledge on the importance of setting the stage for design conversations about the future of the cities as ordinary practices of participation. These initiatives are 'infrastructuring' processes according to the definition of the Scandinavian scholars of participatory design (Karasti and Syrjänen, 2004; Hillgren et al, 2011): policies aiming to connect the players of the civil society, by building relations and organising purposeful encounters to stimulate social innovation from citizen-based initiatives. These policies are not straightforward directed to produce solutions for societal challenges, but are rather strategies to stimulate conversations, collaborations, mutual trust and awareness among the players as preconditions to accelerate social innovation and important as the more operative measures.
By acknowledging the diffused creativity of local communities and "empowering people to conceive, develop and produce solutions together" (European Commission, 2013; Davies & Simon, 2013a), such policies configure themselves as a "designerly way" (Cross, 1982) of incubating social innovation, for two distinct reasons:

1. On the one side, they aim to form the capabilities of understanding and tackling ill-defined problems, of synthesising, inventing, making and doing. They do so by stimulating awareness on the on-going challenges, by making people, familiar with the surrounding ecosystem and not afraid to experiment and by facilitating participation. In other words, these policies are thought to create a culture of innovation, so to stimulate sense-making, behavioural change and the readiness

to adopt new ways of living. We can call them 'actions of *cultural-empowerment'*.

2. On the other side, they operatively support people in framing intuitions, modelling interactions, using ingenuity, empathy and developing a concern for 'appropriateness' (Cross, 1982), adopting a 'design thinking' approach and largely using service design methods and tools. Through these actions, incubation programmes aim at developing in the innovators the more technical skills of design and entrepreneurship, so to accelerate the conception and prototyping of solutions. We can call them 'actions of *technical-empowerment'*.

According to Manzini (2015), a designer may act within these social innovation policies as 'expert', able to trigger, facilitate and participate in different 'design conversations'.

Thus, in this paper, when speaking about design for social innovation incubation, we refer to both these different kinds of actions of *cultural* and *technical empowerment*, implemented within policies that can be described as participatory processes involving social innovators and stakeholders, where designers contribute by bringing and transmitting different competences mainly from the service design domain, among which, co-design has a relevant role as a way to achieve citizen empowerment (Selloni, 2017). In fact, being social innovations relational, collaborative and multi-stakeholder forms of service, service design acquires relevance to social innovators for 1) outlining complex form of interactions, while keeping a focus on maximizing their social impact, 2) addressing a defined target audience of beneficiaries and their needs, 3) designing the experience of the users and of all people engaged, 4) considering the adoption and adaptation of technologies, 5) conceiving innovative form of purpose-driven partnerships with a wider potential network of stakeholders, and 6) establishing meaningful relationships with the community and co-designing the solution with it.

1.2 Design for public-interest services and place development.

Public-interest services are solutions able to create a value that can be shared among the community: they do not benefit only few individuals, yet respond to individual interests and needs. They serve the well-being of a social collective, while transforming the culture of a community by means of participation, deliberation and social learning (Selloni, 2017). They are the outcome of a "configuration of citizens construed as a 'public' around a crucial issue in a local context" (Selloni, 2017, page 41) and they are placed within a hybrid area between the state and the market.

The convergence of the notions of public-interest services and social innovation is evident and recognised, being the latter focussed on changing social practices in order to overcome societal challenges, meeting social demands and exploring different ways of doing things, while creating social relations and public value (Howaldt, J. et al, 2018). It unfolds from the natural and conscious desire of citizens to be pro-active and from their need of having things done in a more satisfactory way.

As a result, it is increasingly becoming an integral part of public policies the strategy of enabling social innovation to flourish in places, cities or neighbourhoods where the social fabric is weak, the commons are inexistent or disappearing, and the public value is few recognised. This is precisely where social innovators can bring substantial benefits for people, de-facto partnering with the public administration for the purpose of regenerating places and communities.

1.3 An experiment of resilience

When it comes to the circumstances of Covid-19 pandemic, both the described design approaches might be called up as instrumental to envision and experiment with a tremendous transformation. A transformation intended to be necessary not only to manage the transition to the so-called 'new normal', but also to shape this new normal in itself. In fact, we are now in the unique position, as a society, of orienting the needs, values and priorities that will inform the future. The design community must have a voice in this by bringing its expertise to the several policies across the world aimed at the cultural and technical empowerment of citizens for the generation of public-interest initiatives.

The programme 'The School of the Neighbourhoods' started at the end of 2018, time before the pandemic: yet, in its premises the foundations of this approach are well established, since it has the ambition to make emerge and empower the innovators, to facilitate collaborations at the neighbourhood level, to align the visions towards a shared and collective value of social innovation, to improve the quality of life at the local scale. As a whole, it intrinsically puts into action the above-mentioned strategies for resilience, namely empowering people make a new sense of their life, using creative thinking and problem solving, looking at problems as opportunities and becoming open to change.
With the outbreak of Coronavirus, the fundamentals of this programme did not change, but the way in which it is being implemented and the relationship with the innovators and the context actually did, not only as a reaction to the temporary circumstances. The whole programme, thus, is undergoing a resilience test in itself against the uncertainty provoked by the pandemic.

2. The case study of 'The School of the Neighbourhoods'

2.1 Context: Milan, 'a social innovation city' reacting to Covid-19

Over the last years the city of Milan, according to different observers, has witnessed a period of 'renaissance' (Guerrini, 2017; Magni, 2018), energised by Expo 2015 and supported by a changed city government (Tajani, 2016), as well as a series of public/private projects contributing to shape its identity of vibrant, restless, city and to expand its capacity for innovation (Clark et al, 2018). From February 2020, the pandemic of Covid-19 dramatically

hit Milan (and the whole Lombardy region) as the very first area in Europe: it was, since the beginning to date, the most impacted area in Italy and a great shock for the whole city. One of the first actions of the municipality was to publish a document open to the city's contribution, entitled 'Milano 2020 - city adaptation strategies' (Comune di Milano, 2020a). It is a strategic document to explore some possible scenarios for the restarting of Milan, together with actions for the management of a 'new normal', focusing on the dimension of the neighbourhood as the unit through which to reconceive the services and sociality of a city and explicitly connected to the '15-minute city' model developed by Carlos Moreno and welcomed by many other cities in the world (C40 Mayor's Agenda for a Green and Just Recovery, 2020). The purpose of 'Milano 2020' was precisely to collect suggestions focusing on reconceiving services and sociality of a city (Comune di Milano, 2020a): the success of the initiative (335 extended proposals among 2967 received ideas) testifies the willingness of the Milanese to promptly respond to the pandemic. Looking at the silver lining, this momentum has materialised, for instance, into a fast and fearless digital experimentation, a test of flexible working solutions, a series of solidarity initiatives, an emotional and collaborative use of the public space, a rethought of life priorities. It has also generated new dramatic needs, often basic and primary, connected to the social and economic crisis.

2.2. 'The School of the Neighbourhoods': structure and phases

'The School of the Neighbourhoods' (La Scuola dei Quartieri, 2018-22) is a programme initiated by the municipality of Milan to stimulate and enable social innovation in some disadvantaged areas of the city. The research group of the authors is core part of the consortium of partners implementing the project.
The programme is organised into 3 main cycles of scouting and incubation, impacting different areas of the city in the outskirts. Each cycle lasts about one year and is composed of 3 phases. While the first phase of scouting takes more a form of *cultural-empowerment*, the third phase of prototyping and accelerating solutions is more a form of *technical-empowerment*. The second phase, which consists in the School's 'Advanced training' is something in between: on the one side, it is about supporting people to tackle challenges and invent innovative responses, on the other it deals with modelling solutions and developing entrepreneurial skills.
Here below we provide a brief description of the process.

1. Scouting and participation to the municipal call: citizens are called to participation through a series of initiatives 'on site'. The first step of 'The School of the Neighbourhoods' is indeed a free and open programme of encounters that aims to let needs and opportunities expressed by the neighbourhoods to meet prospective social innovators and to guide them in submitting their ideas to the call. Conceived as an incremental path of support, it consists of 5 different formats that move from an initial 1:1 interview with the participant to a series of meetings investigating the impact of the project and its relevance for the communities, and finally a more technical workshop that supports participants in the preliminary design of

the solution and the drafting of the application. Besides this, the first phase encompasses open lectures from the neighbourhoods, a series of 'The Good Stories' (Figure 1) from the communities and established events such as 'The Ideas' Festival", during which we developed a series of design tools such as 'The Fortune-Teller of Ideas' (Figure 2), a set of cards to stimulate ideas, and 'The Compass of the Ideas', a tool to navigate the design of an idea (Figure 3).

Figure 1. 'The Good Stories' exhibition aims at inspiring new ideas by presenting innovative service models based on existing social innovation practices.

Figure 2. 'The Fortune-Teller of Ideas' designed to stimulate new ideas.

Figure 3. The desk of 'The Compass of the Ideas' to support the initial design phase of a project.

2. Advanced training: selected participants attend an intensive training programme lasting 10 weeks in which they learn how to transform their idea from an initial concept into an actual solution. The ideas are deepened in all dimensions from the value proposition to the user journey, identifying possible business models and legal forms, until a phase of prototyping and of defining an action plan for the first year of development. As stated, our contribution is focused on diverse areas of the design discipline: mainly service design, as the majority of the ideas are service solutions that need to be framed by using service design tools, but also co-designing and prototyping are key-expertise, because engaging multi-stakeholder communities is part of the process as well as the ability to transform a solution into a prototype easily actionable and adjustable.

3. Prototyping and personalised support: selected participants receive personalized support and a project grant up to a maximum of 25000 euros to co-finance the first year of activity. Aim of this stage is to prototype the solution designed during 'The School of the Neighbourhoods', adapting it to the changing conditions and involving the neighbourhood in a process of experimentation and often co-production of the activities

2.3 'The School of the Neighbourhoods' for the 'new normal'

Within the pandemic situation, 'The School of the Neighbourhoods' has being regarded as an ideal initiative to support projects that could match the needs related with the post-emergency conditions of the city, such as new models of aggregation, food-related services, alternative forms of care and much more. The reflection made within the whole consortium and with the municipality brought to decision of strengthening the capacity of 'The School of

the Neighbourhoods' to attract or make emerge ideas consistent with the strategy of the Municipality for future and desirable for their potential of creating public value. The wide principle at the basis of the redesign of the programme, besides the contingency of organising scouting and training activities in an effective way, is to plan and act for the future. For the 'new normal' indeed, moving from the stimulus of what we would like to see realized in the long term that this emergency could somehow promote, so to capture the momentum generated by Covid-19. This reflection regards the whole programme, yet, for the purpose of this article we focus the discussion on the redesign of the second cycle of scouting and incubation (started in January 2020), which has been heavily impacted by the isolation measures that locked down Italy.

Being the second cycle interrupted in its scouting phase, the first action promoted by the municipality, in a constant dialogue with the consortium, was to reformulate a new communication and scouting plan to better tackle the new condition of the city and specifically of the targeted neighbourhoods. Conceived as a set of initiatives of *cultural-empowerment*, it resulted, for example, in a new online format of open lessons named 'Live from the Neighbourhoods' to give voice to adaptation strategies and initiatives (Figure 4). Their goal was to showcase different living experiences in order to feed the civic imagination, spread awareness and inspire new projects to face the uncertainty of the time. Such initiative was reinforced and integrated to the third cycle (currently on-going), together with new online tools to support participant in getting into contact with local communities during the pandemic restrictions (e.g. 'Explore the Neighbourhood', designed as an online pocket guide and a series of 'Virtual Walks' of the neighbourhood).

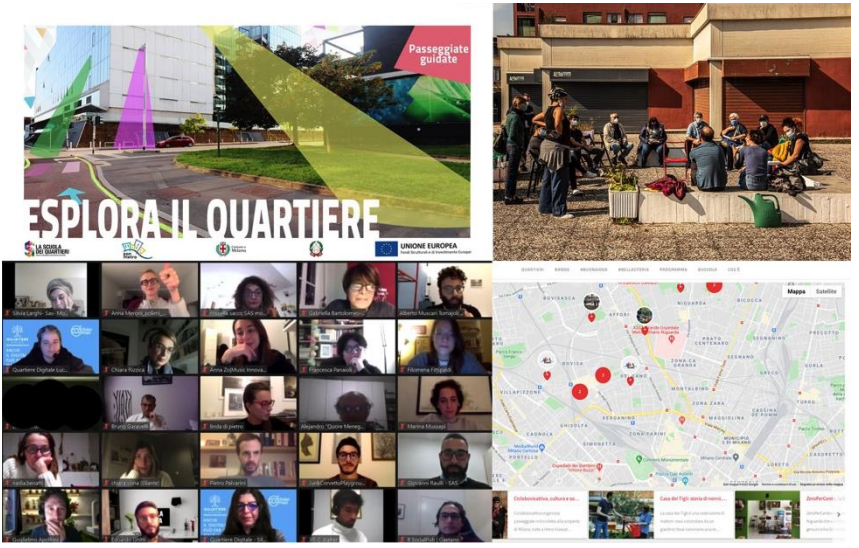

Figure 4. The scouting activities of the School experimented with online, offline and blended ways of connecting participants and the neighbourhoods.

Furthermore, the call for ideas and the scouting phase of the second cycle were re-oriented for attracting social innovators with a more robust background in terms of networks, and resources. The assumption at the base of this orientation was that citizens more prepared, motivated to adjust their ideas and with a more established network of relationships in the neighbourhoods were likely to be more capable to face the present situation and, to drive other subjects toward action, eventually uplifting the overall quality of life. To make this in practice, we designed a way of conducting the interviews with the prospective innovators explicitly aimed at bringing about a form of *technical-empowerment*. A tool for the logical review of the idea was created, so to be used during short on-line interviews. Designed as a progressive journey, it allowed both the team of the School and the innovators to become aware of the concreteness and potential of the idea and its promoters.

As a result of these initiatives, in June 2020, 57 applications were submitted by 157 citizens and among these, 25 ideas have been selected to participate to the advanced training. Looking at the numbers, 19 out of these 25 proposals participated to the scouting phase, thus being involved in the dissemination and light training activities. As a matter of fact, the call received more applications than in the first cycle (+20% of applications) of an increased quality attested by a higher average evaluation score. This seems to reach the objective of having more concrete and promising ideas. Some proposals, such as a platform to display and connect local shops, a neighbourhood hub, a service to support collaborative actions in condominiums, can be defined as actual ‘neighbourhood services’ and can be viewed as an

evolution of the small daily tasks exchange that some communities of neighbours carried out during the lockdown. Moreover, the submissions revealed a renewed attention to a more participative use of the public space and to the topics of ecology and sustainability, seen as collective and collaborative actions (thus installing smart machineries in condominiums, reinterpreting the urban gardens in terms of a new proximity and activating agroforestry processes in periurban areas).
In our view, this orientation of the proposals towards the creation of a more connected and dense social fabric is linked to the several mentioned local initiatives in which the principle of proximity is crucial: people give back meaning to district, to neighbourhood practices, to the creation of a network of relationships with a high level of connectivity, even more important in Covid-19 time.
In addition, we have seen some changes in the profiles of the people submitting ideas to the call. Indeed, compared to the first cycle, the participants are on average younger, most of them are inhabitants of the target neighbourhoods, and with a stronger motivation of contributing to the improvement of their own district. They also demonstrate a wider capacity of relying on existing networks, testified by the increased number of letters of support.

The advanced training that started in September 2020 was completely redesigned into dynamic and modular digital formats, which includes video-pills, online lectures, 1:1 coaching support and an open platform, but also a 'blended' modality that combines digital and physical encounters with local communities (when allowed). As regard to the contents of the lectures, the redesign focused on paying more attention to critical aspects and good practices emerged during the Covid-19 outbreak, but also on supporting participants in the design of more adaptive solutions. Moreover, managing ambiguity has become one of the most important subjects of the training so to deal with aspects (such as flexible offering, integration of different digital touch points, integration of new assets and stakeholders), that emerged as crucial during the pandemic, while keeping the focus on maximizing the social impact of the solutions.

3. Incubating social innovation as a policy for resilient cities

As in many other cities, we can assume that in Milan the pandemic has exacerbated context related critical issues, being these connected to inequalities, fragilities, unemployment, access to resources, quality of the urban commons, insulation, bad narratives and perceptions, personal safety and security (Sokol and Pataccini, 2020). While doing this, it has also brought out unprecedented forms of solidarity and mutuality, concretised by creative communities into original solutions to new 'old' needs, often primary, such as making a living, receiving care and socialising. This can be synthesised in the observation that the creativity spread in society is a powerful bottom-up resource for the resilience of cities. Yet, this creativity and what it is able to produce needs to be supported and empowered, so to

scale up (influencing institutions and rules) and scale out (getting more robust, diffused and therefore impactful). The occasion offered by the on-going programme 'The School of the Neighbourhoods' to make this happen and shape a post-coronavirus society could not be neglected. In fact, the readdress of its actions as a response to the situation was both a need and an opportunity for strengthening a programme already very much in tune with the strategies toward the 'new normal'.

Adopting a design for social innovation perspective, we can comment and cluster the actions according to their ambition to produce a cultural or technical empowerment.
With regard to the the first kind, the *cultural-empowerment*, the scouting, communication and dissemination initiatives conducted in the neighbourhoods, such as the online format 'Live from the Neighbourhoods', the open lectures, the 'Good Stories' and the digital open workshops to explore the neighbourhood, together with the new strategies and actions designed for the third cycle are thought to spread awareness of the creativity of some communities in giving response to everyday needs, to generate a snowball effect of positive emulation and self-confidence in other people, and to progressively instil the sense that different ways of living are possible. The impact of the pandemic highlighted the importance of the proximity and collaborative dimension not only between neighbours, but also the organizations already operating in the places and between these and impromptu initiatives. This emerged from the number of partnerships and letters of support included in the submissions to the second cycle of 'The School of the Neighbourhoods', and on a more general perspective from the on-going initiatives in the Milanese area. Connecting such initiatives and reinforcing a new storytelling of the neighbourhoods can be considered as part of the impact of the *cultural-empowerment* activities of the School, going beyond the single social innovator and embracing the city scale as beneficiary.
Last but not least, the activities of the School during the Covid-19 outbreak and in the following months had the ambition to generate 'comfort with ambiguity': a mind-set ready to change and aware that ideas continuously evolve and therefore are in permanent prototyping.

With regard to the *technical-empowerment* actions, the tools and methods adopted in the interviews with the prospective innovators to prepare them to the candidacy were thought to guide the conversation toward understanding the needs of the target beneficiaries, the value of their experience and the capacity of the idea to answer them, not forgetting how technologies might have helped. Therefore, they were built around service design principles. Whilst developing these features, the innovators were stimulated to consider their personal capabilities, the connection with other stakeholders and the actual capacity of the solution to produce value for the neighbourhood. The links with the context emerged to be crucial not only in future scaling the ideas but also in networking the social innovators with the neighbourhood and in grounding the solutions to the actual needs and assets of its community, i.e. to provide a sense of reality to the intuitions. Such approach has been further implemented both in the scouting phase and in the advanced training, by increasing

the focus on co-design and prototyping expertise. Altogether, this highlighted the distinctiveness of social innovation of being responsive to social needs, of generating public value and fostering sustainable behaviours and outcomes.
The noticeable emphasis on local identity and local scope of the proposals submitted to the second cycle's call for ideas can be seen as a mere reaction to the Covid-19, but also, and together, as a renewed sensitivity and awareness for the quality of the places we live. Indeed, 9 out of the 25 selected ideas are connected to the Covid-19 in different ways:
_the pandemic worked as a background in which their intuition took shape, such as the urban garden born during the lock-down in the shared spaces of a condominium, the activities dedicated to support foreign people blocked in Italy due to the Covid-19 restrictions that evolve into a community hub and the services to connect and give support to the local shops in order to design shared facilities;
_the pandemic worked as a stimulus to rethinking their initial solution, for example, reshaping a cultural centre into an itinerant truck that, to quote the participants, "preserves cultural survival" in situations of emergency and fragility; the renewal of abandoned green areas as platforms for new educational paths dedicated to young generations and professionals supports the creation of intergenerational relationships of mutual help.
Beyond the specific themes, these examples show the purpose to (re)activate the social fabric through collaborative actions, that work as a way to create a more resilient society in normal time, able to face emergency situations and more in general a conflicting and fragile environment. Using the words of a prospective social innovator, there is a need of creating "moments of collective productivity" as seeds of sociality. Only by making things happening together, he writes, it is possible to start creating those social ties that emerged to be truly qualifying, vital and distinctive resources during the most difficult phase of the pandemic.

Finally, we can discuss the re-orientation of 'The School of the Neighbourhoods' as a way for top-down social innovation policies to intercept and empower a bottom-up creativity sensitised and boosted by the outbreak of an unprecedented situation. In this framework the design discipline acted as a cultural agent capable of stimulating a strategic conversation with the whole consortium of partners, in order to reorient a complex and interlaced system of initiatives, actions and training formats towards a rapidly changing environment and to align the scope of 'The School of the Neighbourhoods' to the new needs and sensitivity of society. Even if not directly involved in each action of the programme, the design discipline made use of its sense-making capacity to interpret the emergency situation and bridge it with the possible horizon of a post-pandemic society. It contributed to give the start to a wider and more participative strategic conversation with and within local communities, through the scouting and disseminative actions redesigned in the lockdown which are likely to become integral part of the 'new normal' of 'The School of the Neighbourhoods'. As such, in the mid-long run, it can prove to be a strategy to strengthen the resilience of a city, by implementing incubation actions that empower both the cultural and technical capabilities of individuals and communities.

Abstract | In times of COVID-19, where keeping distances is essential to safeguard people's health and life, remotely monitoring infected patients both in hospitals and homes becomes vital. Telemedicine is the key to ensure healthcare assistance by minimizing human-to-human exposure and the spread of the virus. Evidence suggests that during the first pandemic wave in 2020, COVID-19 spreading took place to a great extent in hospitals, nurse houses, senior living communities, and more generally among healthcare workers and patients. Today more than ever, technological solutions that provide remote healthcare are needed to mitigate the infections among health system personnel and patients. In this paper, we propose a multidisciplinary design solution: ABBRACCI, an AI-based smart wearable device for COVID-19 patient monitoring and care, that is meant to be a tool to monitor the health and wellbeing of people diagnosed with COVID-19 – both critical hospitalized patients and non-severe ones that have been confined at home – but also people at high risk of infection who suffer from chronic diseases and multimorbidity.

KEYWORDS | TELEMEDICINE, COVID-19 MONITORING, WEARABLE DEVICE, MEDICAL DESIGN, ARTIFICIAL INTELLIGENCE

1. Introduction

The Coronavirus epidemic has created an unprecedented situation due to the great number of people infected, the virulence and morbidity of the virus and its geographical extension. It has also brought new attention to healthcare workers (doctors, nurses, paramedics, family doctors, pharmacists, and even cleaning attendants) who must manage a complex and critical relationship with patients. Data reported by the Italian National Institute of Health (ISS, 2021) shows that COVID-19 virus has spread to a great extent in the health system: from the crisis' start until March 24, in Italy about 127.581 healthcare operators had been infected, in a total of 3.402.290 cases of COVID-19. Medical action cannot be separated from direct contact with patients, therefore the interaction between medical staff and patients represents a risk of infection for both of them. First of all, in hospitals or nurse houses where patients and health personnel interact on a daily basis. Second, in patients' homes where infected people are quarantined and visited regularly by family doctors or healthcare workers. And third, in older people's homes or senior living communities where patients are not infected but are at high risk of contracting the virus due to their compromised health status (chronic diseases and multimorbidity). Thus, it appears evident that the pandemic represents an enormous risk to both sides (patients and healthcare workers), and technological solutions to give response to this current issue are essential.

The question then arose: how could *design* contribute to enabling healthcare workers to operate minimizing contacts with COVID-19 patients while ensuring safety and effective assistance? And, on the other side, allowing both hospitalised and non-hospitalised patients to feel monitored and assisted? To answer this present question, European institutions and research centers (Unimore; RE:Lab; Università Iuav di Venezia; Fondazione Democenter - SIPE; Pannon Business Network Nonprofit KFT; August Pi i Sunyer Biomedical Research Institute IDIBAPS; Humatects GmbH) have pooled their ideas and know-how to come up with a design concept: *ABBRACCI, AI-based smart wearable device for COVID-19 patient monitoring and care*. That, in a future perspective, it could respond to new potential dangers and emergency situations.

2. The ABBRACCI concept: a possible multidisciplinary response

2.1 Design and use cases

The vision of ABBRACCI begins with the acknowledgment of two primary needs of healthcare during a pandemic: the first is the need to keep healthcare workers safe to avoid the disruption of the healthcare systems, and the second is the need of a continued, effective, and prolonged monitoring of the patients in a safe environment.
ABBRACCI concept combines a wearable device, which integrates a set of measurement

sensors of physiological data, to an AI-based platform specifically developed for patients' parameters analysis and for predicting potential disease deterioration. It consists of a smart wristband (a silicon band and a removable integrated sensor as shown in Figure 1) that detects heartbeat, arterial oxygen saturation, body temperature and dehydration − as suggested by the evidence, these parameters are relevant to detect COVID-19 physiological changes (Seshadri et al., 2020; Islam et al., 2020; Ates et al., 2021) − and a multiple-device monitoring application (both smartphone and desktop) for real-time viewing and storage of data collected, in order to maintain prompt caring attention continuously.
Since healthcare has spread across different areas, ABBRACCI would adapt to three use cases (hospitals, assisted living facilities, and home) related to two user groups (healthcare workers and patients) – Table 1:

Table 1. The ABBRACCI use cases.

Place	**Healthcare workers**	**Patients**
Hospitals	Doctors, nurses, hospital staff	Hospitalised patients
Home	Family doctors, healthcare workers	Non-hospitalised patients
Home, senior living communities	Family doctors, healthcare workers, caregivers	People at high-risk of infection (elderly, chronic disease sufferers)

As shown in Table 1, ABBRACCI concept is intended to those hospitalised patients with severe COVID-19 complaints; to non-hospitalised patients who are recovering at home from mild symptoms; and also, to high-risk of infection people such as elderly, chronic disease suffers who need to be monitored in their domestic environment or in senior living communities.

Hospital healthcare providers are the most at risk, having to deal with extremely symptomatic patients and highly contaminated places of work. Due to the difficulty in replacing personal protection equipment (PPE) and the general shortage of them, even a simple operation such as consulting the health condition of each patient can be difficult and potentially dangerous for nurses and doctors. ABBRACCI would allow healthcare operators to look at the parameters of their patients both at a safety distance and constantly. Possibly they would be able to consult vital signals even more than in the usual situation, where they are usually collected two or three times a day. Moreover, this operation can be conducted by fewer people than before, leaving the others available to work on emergency cases.
In this way, patients can stay in the infection department and in the meantime, doctors and medical staff would receive and visualize the updating of the parameters from distance.

Figure 1. The ABBRACCI kit and the doctor version smartphone App

The role of family doctors has gained a renovated attention as well. Since their duties have much increased, they had to deal with new forms of stress caused also from the lack of protection. Although some academics point out that

> "physical distancing in family practice is operationalised by a variety of measures, such as triage, phone or teleconsultation, removing chairs from waiting rooms and putting up Plexiglas screens at the reception, making it possible to keep the practice open and to welcome the patients who need seeing us" (de Sutter et al, 2020, p.59),

in the case of a home visit, distance is almost impossible to maintain, and family doctors are exposed to great risks. Even so, they play a crucial role in COVID-19 research thanks to their careful registration of all their patients, especially those with typical COVID-like symptoms who were not hospitalised but recovering at home. Therefore, ABBRACCI can allow them to consult the health parameters of their isolated patients without physically going near them and without exposing themselves to unnecessary risks.

Quarantined patients receive from the hospital the ABBRACCI kit (which integrates two sensors to guarantee constant monitoring and the patient version smartphone application) and family doctors visualize the updating of the parameters on their App version – Figure 1. They can consult the parameters in every moment and, thanks to the AI-system, potentially prevent the rise of emergencies. Involving family doctors, the same procedure will be run

also with no-COVID patients during their cure at home, to have more data and compare different parameters, progresses and outcomes. This is also important for the category of 'fragile' patients, such as elderly, with chronic conditions and multimorbidity, which also include the ones in nurse houses and other kinds of healthcare facilities or senior living communities. Since the practices and gestures of care have changed so much to avoid the risk of infection, patients have also suffered from isolation and loneliness. ABBRACCI has the potential of reassuring patients thanks to wearing the remote-control system and making them feel close to their family doctor. The simple and intuitive app interface provides a practical utility as well as brings psychological benefits to all kinds of patients.

2.2 The Artificial Intelligence's role and technological integration

The integration of Artificial Intelligence and wearable biometric monitoring devices can ease the medical and care operations. Indeed, AI-based devices enable the monitoring and measuring patients' data in real time, supporting the diagnosis, and predicting patient's status while helping health operators to provide the appropriate treatment or prompt intervention. Decision-making algorithms incorporating telemedicine, designed through the utilization of Artificial Intelligence tools, could be used to assist with definitive disposition of the evaluated patients by remote analysis (Chauhan et al., 2020).

The AI and machine learning solution can enhance every stage of patient care, from research and discovery, to diagnosis, to selection of therapy.

> "As a result, clinical practice will become more efficient, more convenient, more personalized, and more effective. [...] Physicians have long needed to identify, quantify, and interpret relationships among variables to improve patient care. AI and machine learning comprise a variety of methods that allow computers to do just this, by algorithmically learning efficient representations of data" (Johnson et al., 2018, p. 2668-69).

The integration of AI applications with wearable sensors can help detect the disease and predict the potential evolution in the patient based on the analysis of the personal history and the comparative analysis with vast amounts of unstructured medical data.

On these premises, the project ABBRACCI supports the product innovation of a smart, AI-based wearable device for the monitoring, recording and analysis of significant physiological data for the screening, diagnosis, and prognosis of COVID patients, elderly and 'fragile' users, to be accessible by medical staff through a monitoring application (smartphone and department computers). The continuous recording of real-time data would allow health workers to compare information extracted from historical datasets − considering that Health Systems are digitising their patients medical histories and collecting them into Electronic Health Records (EHRs) (Caceres, 2013). Moreover, integration among all the tools characterizing the proposed solution would identify individual personalized treatment based on recorded parameters and the clinical history of the patient. The AI platform built on the Dynamic Bayesian Networks would help evaluate and optimise strategies for controlling the

spread of the epidemic and it would detect the presence of the pathogen related parameters especially in an early stage of infection, helping medical staff for diagnostics, prevention, treatment, or rehabilitation. It is important to note that, to obtain an AI component with high performance level, many data are required, which could only be collected by using the monitoring application over time. Therefore, in this project the initial model for the AI component would be trained from clinical data, which would be collected from hospital partners of the project (AOU Policlinico di Modena and August Pi i Sunyer Biomedical Research Institute). While testing and validating the monitoring system, the AI component would collect patients' symptoms data and, once enough data are collected, the level of services provided by the monitoring application will be increased.

Going into details, the technology instruments to be integrated are sensors for the detection of physiological parameters, the AI-based software, the monitoring application used by medical staff and, in some cases, by non-hospitalised patients, and the geographical network for sharing and transmission of notifications. Sensors and software have already designed, developed, and validated in laboratory during the project AGEDESIGN Interreg V-A Italia-Austria - Call 2016 in which it has been developed a kit of devices (wearable and portable) for the daily monitoring of physiological parameters (heartbeat, cardiac frequency, arterial oxygen saturation and body dehydration) of the older population. The validated results of AGEDESIGN feed into this ABBRACCI design concept that would embrace emerging technologies as Artificial Intelligence tools. Therefore, ABBRACCI integrates a set of sensors into a wristband to measure vital parameters of the patient, such as heartbeat (BPM), arterial oxygen saturation (SpO2), body temperature and dehydration. The choice of these parameters provides required information for the remote medical staff and can be used as an effective framework for detecting alarm situations in patients with related diseases, both at home and in residences for the elderly.

As shown in Figure 2, the sensors embedded in ABBRACCI concept would be:

- an optical sensor (photoplethysmography) for the detection of the heartbeat (BPM) and SpO2;
- a thermistor for the temperature;
- and a bioelectrical impedance sensor for body hydration.

As for the AI component, the processing unit would be realized as a probabilistic model, specifically as Dynamic Bayesian Networks (DBN). The DBNs capture temporal evolutions and statistical relationships between the model variables, including the sensor data, and the patients' symptoms and disease histories. The probabilistic model would be trained as a data-driven and expert-driven model, meaning that it would be used both data and expert knowledge to build the structure of the model. The probability distribution of parameters and the statistical relationship between variables would be learned from available data.

The training of the model is repeated when a new set of data samples is collected to increase the accuracy of the model prediction over time – Figure 3.

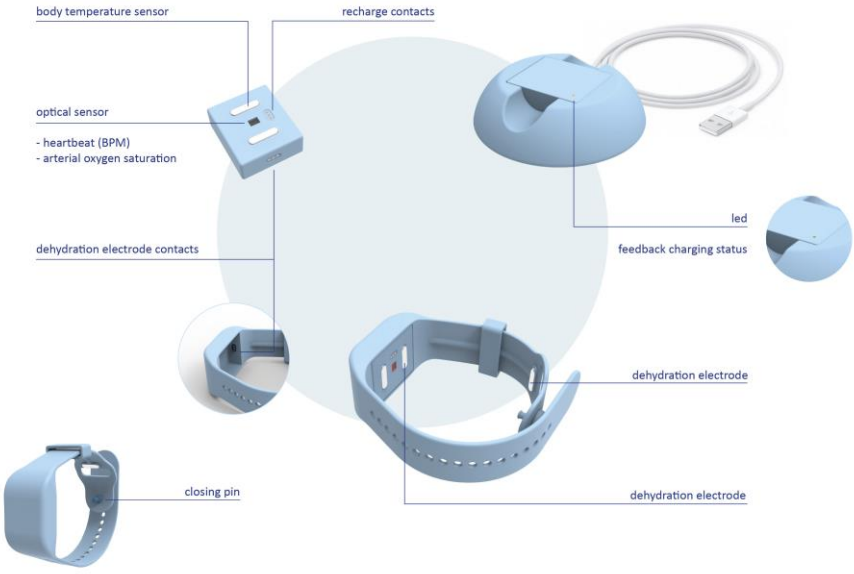

Figure 2. The ABBRACCI technological components

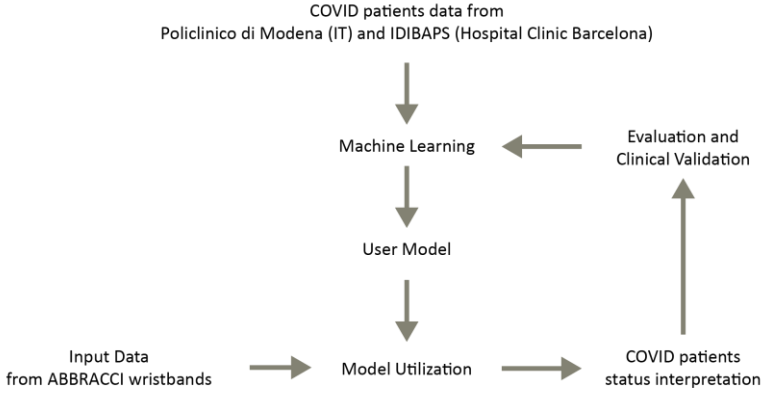

Figure 3. The ABBRACCI overall concept

2.3 Toward validation and medical certification

Since ABBRACCI is intended to be a wearable medical device, it is fundamental to go through a medical certification process.

User pilots represent the possibility to demonstrate the efficacy of the kit, the measured parameters, its usability (user experience, perceived usefulness and acceptability), the technological and innovation potential of the project, and the benefits for users. The device would be compared with similar solutions already in use and certified. In order to provide evidence of the sustainability and maturity of the solution, the pilot phase would be run in the project partner hospitals:

- AOU Policlinico di Modena (Hospital connected to UNIMORE), Italy;
- August Pi i Sunyer Biomedical Research Institute IDIBAPS (connected to Hospital Clinic Barcelona), Spain.

The validation of the device would be first carried out through the involvement of healthy users. This is also due to the uncertainty about the evolution of the COVID-19 disease in the next months and the difficulty to predict whether there will be COVID-19 patients to be involved in the test. In addition, to test the accuracy and the feasibility of the system the project does not necessarily need ill users (for example, it may involve patients with heart failure or COPD, where SpO2 monitoring is important). Another phase of the validation would involve COVID-19 patients, both inpatient and non-hospitalised ones. Starting from the COVID databases from Italian and Spanish Hospitals, the aim is to verify accuracy of ABBRACCI in detecting symptoms and related alarm signals by obtaining a specific algorithm. The table below shows the alarm levels considered for each parameter – Table 2:

Table 2. The ABBRACCI alarm levels

Parameters	**Mild**	**High**
Rest heart rate	> 95/min	> 110/min
SpO2	< 95% in ambient air	< 90%
SpO2 in COPD	< 90% in ambient air	< 87%
Hematocrit (HTC)		People at high risk of infection (elderly, chronic disease sufferers)
Male	> 53%	
Female	> 50%	
Body temperature	> 37,5 °C	
High alert level		
Rhr	> 100/min	
SpO2	> 90%	
HTC	> 55%	
Temperature	> 38 °C	

The parameters shown in the table have been chosen for the following reasons:

- High heart rate at rest is an indicator of disease and indirectly also of febrile state and dehydration. It becomes a high alarm in resting tachycardia (>110 / min);
- Low SpO2 (partial oxygen saturation) is the most accurate sign of COVID pneumonia; the alarm level is inferior in COPD (Chronic Obstructive Pulmonary Disease) patients;
- Haematocrit (HCT) is an indirect sign of dehydration and therefore of fever and disease status (it is usually lower in females);
- Body temperature greater than 37.5°C is suggestive of possible infection.

It may be assumed that the combination of the four parameters with alarm level at maximum values configures a state of high probability of COVID infection. It is possible that the combination of two or three of them with high levels could also constitute a high suspicion of disease.
These parameters will be tested in hospitals as well as in nurse houses and patient homes. In hospital the validation would be done with the parameters derived from hospital instruments, the results would be compared to ABBRACCI's data to validate the level of accuracy and the ability of the algorithm and AI model to predict the evolution or deterioration of the disease.

Regarding the medical certification, the kit could be classified as Class I of medical devices with measuring function. It is intended to pursue a certification process based on the requirements of the MDR 2017/745, European regulation on medical devices. From the architectural point of view, the project foresees a connection between mobile phone and sensor-based wristband via Bluetooth protocol. There is no interaction between the wristband and the mobile phone that interacts on the hospital's monitoring systems and IT infrastructures. Obviously, the mobile phone can provide some form of interaction with the hospital network, but this would not concern any critical IT systems. In other words, complete independence of the networks would be ensured according to the directives of the MDR itself and with reference to IEC 80001. The MDR 2017/745 specifies that devices that are intended to be operated together with other devices or products should be designed and manufactured in such a way that the interoperability and compatibility are reliable and safe. Compatibility refers to the ability of a device, including software, when used together with one or more other devices, to perform without losing or compromising the ability to perform as intended. Interoperability refers to the fact that the two or more devices, including software, should exchange information and use the information that has been exchanged for the correct execution of a specified function. Other fundamental aspects for Class I of medical devices are compliance with the metrological requirements. This activity would be carried out by comparison with reference certified instrumentation adopted as "gold standard" for the different types of measurements performed by ABBRACCI kit.
In addition, the guidelines EN 60601-1 and EN ISO 14971:2020 should also be considered.

2.4 Market analysis

To understand the ABBACCI level of innovation and its positioning compared to competitors[1], a market analysis was carried out. Compared to the current devices available in the market and in use to detect vital parameters, the project grants the contactless real-time detection and remote transmission of patient physiological data to the doctor.
The analysis of the state-of-the-art places ABBRACCI to be the only wearable device that continuously detects heart rate (BPM), saturation of arterial oxygen (SpO2), body temperature and hydration status through a single and integrated device. Another distinctive element of the project ABBRACCI could be the accuracy of the data, that would be certified and allow the project ABBRACCI to be classified as a medical device. In fact, no wearable devices exist for the detection of certified data regarding the vital parameters considered. Moreover, the feature of the device is the way the data are read: they cannot be viewed on the display (i.e., directly on the wristband) but only on the smartphone monitoring application supplied to medical and nursing staff, to control their patients without direct contact, and non-hospitalised patients.

Based on the results of the market analysis, as shown in the positioning maps below (Figure 4), ABBRACCI could be the only device with continuous monitoring with certified data, which continuously stores it and makes it viewable on the monitoring application used by medical staff and patients at home. It could be the only one, in the category of wearable devices, able to combine heart rate detection (BPM), arterial oxygen saturation (SpO2), temperature and body dehydration.

[1] Referred competitors: TENSORTIP MTX (Cnoga Medical); iHEALTH AIR (iHealth Labs); FOX-300 (I-Tech Medical Division); HONOR BAND 5 (Huawei); CHECKME O2 (Viatom); CHECKME PRO (Viatom); GARMIN VENU (Garmin), O2RING (Wellue Health); HEALBE GOBE2 (Healbe); COSINUSS TWO (Cosinuss).

Figure 4. ABBRACCI vs Competitors

3. Conclusion

Dealing with the emergency caused by the pandemic required enormous efforts from all citizens. It certainly was not the first global threat, but, for the first time, we saw a global response. The technological tools have helped us be truly cohesive in understanding how we could defend ourselves, how and what to design and build to protect us, those who cared for us and generally all vulnerable people. Designers were called to prompt action to suggest a wide variety of solutions to the problems that covid-19 continually introduced; in this context, the ABBRACCI concept was born.

Given the essentiality of maintaining distance from one another in the COVID-19 era, the ABBRACCI project is meant to be a telemedical tool for safer monitoring by the health workers of the infected patients, both hospitalised and those confined at home. The design concept integrates Artificial Intelligence as a way to better prevent, diagnose, treat and predict the course of the disease. The global spread of COVID-19 provides a large amount of data regarding citizens health, supplying a way to the enhancement of the Artificial Intelligence system and employing it in healthcare. Artificial intelligence thrives on data, and in healthcare, there has never been a more fruitful opportunity to feed clinical research and fulfil the AI in the medical field itself. ABBRACCI might also contribute to the digital transformation of the health system and medical practice by providing tested and demonstrated tools, practices, skills, and services hoping to extend this approach also to the treatment of other diseases (the detected parameters might also point out other pathologies and, in the worst scenario, might be useful in the next pandemic).

Over the past year, the pandemic has accelerated the technological development of remote monitoring devices for Covid-19 patients or potentially at risk of infection (Best, 2021). However, current solutions (like ABBRACCI) are still under research and need further experimentation to reach the marketplace. Several companies in the biomedical industry and some clinicians have adapted existing solutions to the new requirements and challenges dictated by the coronavirus pandemic, but, to date, there is no specially designed solution.

The effect of this project in the market would consist in responding to a specific user's need in a more integrated, faster, and evidence-based way creating new perspectives for multidisciplinary collaboration. In fact, the conception of ABBRACCI has involved many professionals, such as doctors, engineers, designers; and it highlights the potential of the design discipline: it is not just the design of an intelligent wearable product; it is the design of it into an extended design service.

Nevertheless, given the urgency of designing new solutions and the promptness with which the idea was conceived, this project needs further insights and analysis of strengthens and weaknesses.

Abstract | Traditional university education is poised for radical change. As we move into the 4th industrial revolution, the experience of the consumer will become critical in every sector, including education. We will also soon see colleges compete with IT firms that have the capabilities to deliver this mode of digital learning. This is evidenced by Google's plan that is set to disrupt traditional four-year degree programs. Educational institutions will need to have robust systems in place that differentiate them from the IT companies offering e-learning courses. It would be up to the universities to ensure that higher education is more than vocational and skill-based training and to foster a culture of independent research and investigation.

KEYWORDS | ONLINE EDUCATION, E-LEARNING, DATA , TECHNOLOGY, IT COMPANIES

Traditional university education is poised for radical change. This was already underway via an increasing number of online courses and vocational training options, and in many parts of the world, the complaints and dissatisfaction expressed by students about rising fees and an education that doesn't justify the cost. With the coronavirus pandemic, this gap has exacerbated at a much faster rate than previously anticipated. There are both benefits and drawbacks to this impending change. In the short term, this is causing disruption in delivery methods, in the quality of interaction being offered, and access to education for those without digital resources. In the long term, this could be beneficial for education systems as a whole, though many challenges lie ahead.
Progress in this sphere has been limited due to a lack of incentive for commercial institutions and the possible threat to the job security of academicians (Klain, 2015). With the COVID 19 pandemic, this is changing but it needs to be steered in a direction where the quality of education is not compromised and more people have access to this new mode of learning.
Right now the world has 4.57 billion internet users. This figure is increasing by more than 8% every year (Datareportal, n.d.). This growth is especially noticeable in developing nations like India where there are nearly 700 million internet users and by 2025 this is projected to grow to over 974 million users (Keelery, 2020). Asia makes up for 55.1% of the world's population and has 52.2% of the world's internet users (Internetworldstats, n.d.). A study conducted by IBM showed that for every $1 spent on e-learning, a company can stand to gain $30 while the Research Institute of America found that retention rates can increase by 60% via online education (Thorton, n.d.).

This provides us with the unique opportunity to bring a standardised quality of education to every individual with access to the internet, irrespective of their socio-economic class, and to some extent, independent of the quality of instructors. We can exponentially increase and improve access to education. In India apps like Baiju's and Toppr are already greatly assisting school students. Online learning can also bring these benefits to tertiary education, especially in Asia where this number stands well below developed nations. Content creation has already been democratised by the internet and online learning presents us with the opportunity to invite multiple teachers and practitioners from different regions to collaborate on content and we can tailor the content for different levels of learning and for students from very diverse backgrounds.

We can in the near future expect Facebook/social media like interactive models of learning which will be extensively personalised, powered by Artificial Intelligence and Machine Learning that curate content for individual students. As we move into the 4th industrial revolution, the experience of the consumer will become critical in every sector, including education. We will have opportunities to optimise the use of audio, video, animation, simulation, and other online technologies to promote engagement with the students for deeper understanding and retention.
We will soon see colleges compete with IT firms that have the capabilities to deliver this mode of digital learning. This is evidenced by Google's plan that is set to disrupt traditional four-year degree programs. Google's Career Certificates will allow students to gain job spe-

cific skills for in demand profiles at a fraction of the time and cost required for traditional higher education (Nott, 2020, Google Digital Unlocked, n.d.). Educational institutions will need to have robust systems in place that differentiate them from the IT companies offering e-learning courses. It would be up to the universities to ensure that higher education is more than vocational and skill-based training and to foster a culture of independent research and investigation. This paper will summarise the benefits and challenges of online education before delving into the role of IT companies in facilitating this mode of learning.

Benefits of Online Learning

1. Standardised quality and mode of delivery.
    - Online education provides us with the opportunity, through standardised training and material, to bring quality education to every individual with internet access. Time is carefully utilised for material to be delivered and the preparation happens beforehand.
    - In India apps like Baiju's and Toppr are already greatly assisting school students. Although it should be noted that these companies are not ed-tech (at least not yet) but content companies marketing aggressively. Baiju's has over 40m downloads, 2.8m paid users, and average engagement of 71 min (Banerjee and Sharma, 2019 , "Is BYJU's Really EdTech", 2018).
2. Record keeping
    - Assignments, presentations, reference material and submissions are more readily available to students, administration and faculty via the mode of communication and through learning management systems.
3. Flexibility
    - Besides administrative benefits the flexibility and autonomy for students and instructors can greatly benefit both parties especially when they have other commitments. This works especially well for students with families or employment that can benefit from the flexibility and self directed nature of online education (Makernko and Andrews, 2017).
4. Skill Development
    - Online learning can greatly broaden professional and skill development for employed students. As mentioned earlier in this paper, online vocational training and credit courses can be of immense aid to expand skill sets and further career goals.
5. Reduced Cost
    - The Infrastructure cost of buildings, power, tools etc is absent. However, this has a flip side of technological infrastructural costs which will be discussed later in this paper.

6. Online Resources

   - An array of tools for assisting and facilitating better instruction such as bulletin boards, electronic texts, hyper-linked sources, and immersive multimedia.

7. Accessibility

   - For students from less privileged backgrounds and for those with families or employment (Makernko and Andrews, 2017). Online instruction also overcomes geographical boundaries and can be delivered at lesser costs to students of lower socio-economic class.
   - There's also greater accessibility when learners have a certain degree of anonymity. Factors such as age, appearance, and gender are largely untraceable and so the focus can remain on the content of the subject and the individual's response to the material at hand.

Despite all these benefits and the potential of equality offered by online education, there are sadly many practical, administrative and political challenges plaguing beneficial development of this domain.
This paper will discuss these challenges and then discuss in detail, the role of IT companies in this sphere and why this needs to be regulated and monitored very strictly.

Pitfalls

1. Stress of learning new tools and a new learning environment

   - For instructors and students, particularly with how suddenly faculty and students have had to adapt to the COVID 19 situation. Facilitators not properly trained in online delivery or familiar with online tools may not adequately be prepared to deliver in the Virtual Classroom, despite being very adept in on-ground instruction.
   - For many instructors, the new delivery method also means that they're at work 24/7 with students reaching out via texts, calls, not giving the faculty enough time to unplug and rest (Anderson& Rainie, 2018).
   - Many teachers have had to recreate entire syllabi and curriculums to adapt to this new method of delivery while often facing similar connectivity and emotional challenges as the students.

2. New technological infrastructure expenses

   - High speed internet, laptops/ computers, webcams and software have placed burdens of sudden expenditure of students, faculty and administration. Broadband access in third world countries exacerbates these issues, affecting certain students and faculty

more than others. Lower income households are also less likely to have multiple devices at their disposal for use by all family members (Perrin, 2019).

3. Less immersive than in campus instruction

- Video chats make it harder to process “non-verbal cues like facial expressions, the tone and pitch of the voice, and body language” (Jiang, 2020). Delays in the video communication also make it harder to have natural conversation while being on camera makes people self conscious and can quickly get exhausting. All these factors make it difficult to gauge students’ attention, understanding and retention while also undermining the teacher’s role as a facilitator for learning since it’s difficult to create the right environment
- Additionally, living off campus may have added responsibilities at home such as caring for their families or completing chores while being disconnected from their colleagues and fellow students.

4. Devaluation of university degrees

- This is a possibility due to downsizing of higher education by reducing the number of full-time faculty and using less involved part-time instructors and technical support. Standards of accreditation for "cybercourses" may need to be relaxed, thereby ultimately devaluing university degrees as online learning threatens to commercialise academic discourse (Gallick, 1998).
- With less immersive roles off campus, faculty may not time to research and as more part timers join, there is danger of tenure at risk, thus weakening faculty loyalty and declining academic careers (Gallick, 1998)

5. Copyright and Intellectual Property

- As campuses go online, faculty are increasingly required to share their course descriptors, catalogues and content. Gallick (1998) cites a number of cases of plagiarism of course content in similar situations with no protection for the intellectual property of the course instructors.

6. Politics

- Gallick, 1998 suggests a political agenda for edutech investments wherein governments are hoping to save funds in the future. He remarks that constrained education budgets are the one the major reasons to support online education. In India for example, in 2020, there has been a 3% increase in the amount allocated towards higher education from 2019-20. This is unlikely to meet the requirements of entrants for higher education (over 800,000 in 2018-19) and employability of graduates in India is a serious concern (Roy, 2020). This is likely to encourage the move to online learning but also rings alarm bells. In India, UGC frames rules and regulations and is responsible for

monitoring quality but has no authority to implement regulations or penalise defaulters so if standards of education quality are not met, there may not be any repercussions for it and higher education will suffer.

- Take as an example, a 10-year contract in 1998, between Microsoft, GTE, Fujitsu and Hughes Electronics with CSU administrators to create a for-profit, joint-venture company, called the California Educational Technology Initiative, or CETI (Klien, 1998). This move was criticised by faculty, students and citizens as "vague and a possible threat to competition and academic independence, and for passing on hidden costs to students" and CETI was eventually voted out. Then in 2003, CSU entered a $662 million Common Management System contract with software giant PeopleSoft, which was once again viewed with suspicion by faculty and staff who claimed to have been underrepresented in CMS and CETI negotiations (Banres, 2003)
- Both deals were criticised for "controversial corporate participation, legislative investigation, a lack of competitive bidding, union concerns about job security, and charges from faculty and student opposition of conflicts of interest and bad business sense" (Banres, 2003)
- CMS was defended by the university while staff was critical and unhappy (Angel, 2003). Initially planned to be voluntary, CSU forced all campuses to adopt CMS. CMS appeared to save neither effort nor time and it was hard to gauge if it was saving money.
- It should be noted that CSU's assistant vice chancellor of Information Technology Services, David Ernst was paid $11,000 a month by PeopleSoft to "facilitate meetings" for the company (Angel, 2003).

7. Mental and Emotional wellbeing

- Online teaching has been observed to increase rates of burnout (Hogan & McKnight, 2007), loneliness (Dolan, 2011), stress and isolation (Smith, 2015) in online instructors as compared to on campus teachers (Makernko and Andrews, 2017). Makarenko & Andrews (2017) suggest that instructors with longer careers who've taught substantial numbers of courses per year may acclimatize to demands of online teaching over time and therefore, do not report higher levels of stress.
  Dolan (2011) identified some broad categories of concern for adjunct online instructors, based on qualitative analysis of interview data -
  - Poor compensation
  - Lack of materials
  - Lack of communication and connection
  - Large class sizes
  - Lack of support from administration
  - Ill prepared students

- Dolan found lack of connection as the most relevant ie, feelings of isolation from students and other faculty members and disconnectedness from the larger univer-

sity. Makarenko & Andrews (2017) concluded from their study that findings suggest the flexibility of time and location offered by online instruction may have negative socio-emotional effects. While online instruction has risen in acceptance and popularity, research on and solutions for the well being and mental health of online instructors is limited (Makarenko & Andrews. 2017). If these issues continue without being addressed, we may have online courses but not instructors and a learning management system alone may not be able to address this (Makarenko & Andrews. 2017). While Online learning does have the advantage of using pre recorded material and resources from the web, Wilson, Ludwid-Hardman, Thornam, and Dunlap (2004) assert that instructors remain crucial in the learning process, even in higher education. Instructors provide and maintain infrastructure for learning (syllabus, calendar, communication tools, and instruction resources). They facilitate participation, collaboration and community building for learners while assessing learning and giving feedback. They resolve instructional, interpersonal, and technical problems while also creating interest in the subject matter. (Roddy et al., 2017)

8. Entry of Tech giants into education

"Corporations already control much of our lives. Do we want to hand over public education as well?' David Kien, 1998

- This is the primary concern of this paper. We will try to understand the threats to the future of education and individual development and society, if IT companies facilitate learning without rules, restrictions and proper frameworks for how much data they can gather and where it can be applied.
- Restrictions on physical contact, lack of opportunity to meet top academicians, and learn from fellow students threaten the rationale for university education during the pandemic. IT firms may offer a better deal for online learning in comparison and there are time, geographical, and monetary advantages to this. However, IT companies can not offer holistic development of an individual, only high quality vocational training. Most concerningly, however, is their habit of data collection and using this data for commercial purposes as well as influencing behaviour. If IT companies are now given the opportunity to observe and govern educational development, the possibilities of them harnessing this data on how students learn, grow, interact, is potentially dangerous. As many schools and universities turn to platforms like Google Classroom, the question to ask is, what does Google gain from this?

Take for example Google Book Search project. Initially presenting the project as altruistic, Google uses the vast library at its disposal to train AI to better optimise its search engine and thereby, make its profits. It was particularly useful to have var-

ied and rich language in fiction books, based on which the system is able to mimic almost fluent sentences. While the Author's guild has claimed copyright infringement, Google claims that this is fair use of data (Lea, 2016). Google has contended that its book search project will not harm the market for books due to the limited amount of text available for viewing and may benefit the market by identifying and summarising books for users, which may be particularly beneficial for books that may not be well publicised. Google will therefore encourage users to buy the book by providing links to where the book may be borrowed or purchased (Band, 2006). Legality of this aside, Google did not initially reveal its intentions and this was not how the authors intended for their work to be used (Lea, 2016). Google started this project, as startups today seem to, with a "better ask forgiveness than permission" attitude, Authors Guild's Gleick pointed out (Rosenberg, 2017).

- Let's look at another IT company handling large amounts of data - Facebook. Popular social networking sites where we share information, videos, music and images or create new connections like on Facebook, Instagram and whatsapp, are owned by Facebook. There are dedicated channels to cater to music, like Spotify, or videos, like Youtube or shopping, like Amazon. Today a handful of companies control how we see and share information. Surveillance has emerged as the new business model for internet companies. This information is used in a number of ways, many of which compromise privacy -

  i) Targeted Advertising
  Predictive Analysis of gathered data and behavioural research can be used to target users for relevant advertisement for shopping and to improve products and services (Chen, Pavlo, Canny, 2009)

  ii) Social Score
  Studying an individual's internet usage, social media activity, purchases, financial information, hobbies all allow the system to predict, with accuracy, the individual's age, income, beliefs, friends etc and some systems, and countries are using this information to assign people a "Social Score". China for example is putting a Social Credit system in place which is intended to assess citizens' and businesses' social and economic reputation ("China's facial recognition," 2017) , Xu and Xiao, 2017) This data will directly determine individual aspirations, job accessibility, prospects of finding a spouse and will thereby be used to nudge citizens into complying with desirable behaviour. (Creemers, 2016)
  These measures can potentially start being applied from an early age to model the growth and learning of children and young adults, not only by governments but also by IT companies that will seek to profit off this kind of data and apply it to improve the growth and algorithms of these companies.

  iii) Invasion of privacy

While an extensive, organised and public surveillance system like the one in China may not exist in the west, data is being used for surveillance almost universally. Surveillance in the form of "Facebook likes" can be used to predict "sexual orientation, ethnicity, religious and political views, personality traits, intelligence, happiness, use of addictive substances, parental separation, age, and gender." (Kosinski, Stillwell, Graepel, 2013). The effects of such surveillance will be more pronounced as algorithms seek to predict how individuals will grow and possibly steer their development in directions suited to commercial and political agendas.

iv) Social Cooling

People vary their behaviour when they know they are being observed. This behaviour modification becomes pronounced when we realise that our digital information and search history is available and can be used to assign a score. Data gathering can be used to infer and predict personal information (such as ethnicity, age, habits, political views etc). This affects our "digital reputation" and could affect opportunities or bring us under scrutiny. Social Cooling is a long term phenomenon that occurs in a reputation based economy which results in a culture of conformity characterised by self censorship, an aversion to risk taking, and rigid social structures (Schep, n.d).

Online meetings can already be fatiguing as discussed earlier in the paper due to the stress of being under observation and without the non-verbal behavioural cues like expressions and body language. This with the added stress of being observed and recorded can make it difficult to create an apt learning and teaching environment.

Conclusion

We can be sure that in the case of Google Classroom and other online learning platforms as well, all the assignments, submissions, course details, interactions etc being shared are being or will in the near future, be observed closely. This data can be used to measure progress and set learning goals for students based on their ability, comfort and requirement but in the hands of IT companies, it will be used to possibly compete with the very universities and schools that are using these platforms and to, more dangerously, maybe use this knowledge to influence user behaviour for corporate gain. Based on data gathering and lack of accountability from large IT companies in the past, we must come to the realisation that the data on the developmental psychology and learning of students will be used to monitor and shape not only them but may also be used to censor and steer education in ways beneficial to those monitoring it.

The design culture and the challenges of the new normal

Nicola Morelli*[a],

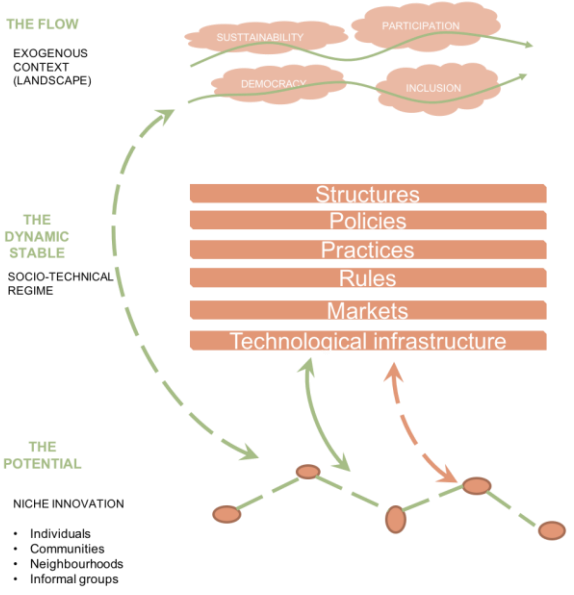
[a]Department of Architecture, Design and Media Technology, Aalborg University, Copenhagen

Abstract | The challenge of the *new normal* would be nothing particularly new for those designers that for years have advocated radical challenges to address major socio-technical crises in our society. Yet the urgency of the new normal would need society to take action very quickly, and this in turn, imply a well-structured design approach. The challenge for designers is therefore to operationalise principles that have been in the air for quite a long time, transforming them into practices, accelerating the exploration of mechanisms of transition and finding conceptual terms and operative strategies for working at different scales. This paper is exploring the implications of the idea of a *new normal*, in the view of taking a further step for the definition of a working site for the *new normal.*

KEYWORDS | NEW NORMAL, MISSION ORIENTED INNOVATION, EVOLUTIONARY INNOVATION PROCESSES, TRANSITIONS

1. Introduction: the new normal and the dynamic of innovation

The pandemic crisis and what is coming soon after it is monopolizing the debate in all the disciplines working on innovation, from the most technical ones to social and humanistic disciplines. Since the beginning of this crisis it has been clear that the challenge it poses is not limited to the medical science, which are frantically working to find vaccines and treatments, but it is a systemic crises that involves the way capitalist societies are organized (Latour, 2020; Mazzucato, 2020) and it is therefore extended to all the aspects of society, and it does not exclude any geographical region in the globe. No technical device or knowledge will solve this problem if its use will not be complemented by a radically different way to organize our everyday social interaction. Moreover, the challenge is not limited in time, we will not come to the *normal,* as the socio-technical configuration of the post-pandemic will never be the same as the old one.



Talking about the *new normal* means imagining a way of living, interacting, working, learning, and taking care of people that is unfamiliar to the most, and the permanent condition of this change requires that such change be widely accepted, possibly co-designed by large part of society, and organized at multiple levels.

The concept of normality refers to routinely way of doing things, it is about everyday doing and it is based on a multitude of practices, each related to specific niches, activity, social-cultural contexts and technical knowledge. Routines generate the structure of social practices and social order (Reckwitz, 2002). A transition in social order implies the crises of the routines and of the knowledge such routines are based on. The crisis of the normal and the shift to a new normal has to be explored as a change in different logical structures, at different levels. It is not just a new way of living the everyday life, but it has to be understood as a change in the context, in the structures, in the institutional forms and in the general socio-cultural landscape that frames our society.

Changing such practices and the infrastructure that support them is usually very hard, because of the inertia they oppose to every major transformation. History of society and technology do recognize a progress in such social structures, but the nature and speed of change process seems inexorable. *We use to think that the "train of progress" was unstoppable or could not even been stopped, and yet, in few weeks this train has been stopped. It could not be slowed down or redirected* (Latour, 2020).

A restart on a new track implies a process of innovation at both the micro scale and the large scale. It requires the acceleration of processes that are normally slow and evolutionary and, for a design perspective, it requires the extension of the design approach to a scale of change that designers have never faced.

Several recent studies are emphasizing how the structure of innovation can be described as an evolutionary process that amplifies some cases of innovation in niches, to create changes in the way institutional structures are organized (see figure below). Clusters of niche innovation can converge into changes that have an impact in regimes. Those regimes in turn impact on new niches, but in some cases the change at the regime level can impact on the system of values, culture, believe and organizational frames on which institutions are funded. This new level has been described as a landscape, which change slowly and according to evolutionary processes, while they set the frame for changes in niches and regimes. (Geels, 2005; Geels & Schot, 2007).

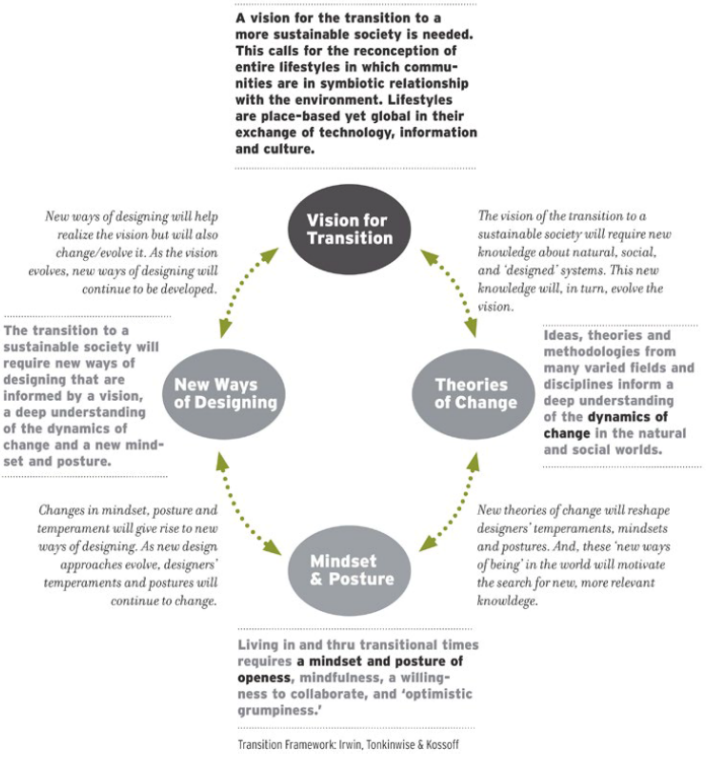
The evolutionary innovation process, inspired to (Geels, 2005), elaborated by the author.

Design and transitions to the new normal

The dynamic of change described above and the relation between changes at different levels is also part of the discussion on the possibility and opportunity of those changes to be *designed* or in any way *directed* by designers, planners or policy makers. This discussion challenges the design community to a deeper understanding of the structure and the dynamic of change and an exploration of the strategies for this change to become real.
In fact this discussion is not new to the design community. The call for a radical view towards change has been advocated for many years, especially in respect to crucial questions, such as the question of sustainability. Soon after the Club of Rome urgent call for action

(Meadows & Club of, 1972) design research started to systematize the early experience of the pioneers of environmentally responsible design, such as Buckminster Fuller and Victor Papanek (Papanek, 1973), towards strategies to support radical changes in the way human beings organize their artificial environment (Manzini, 1997) and it was quite clear that such change would have started from the everyday life (Manzini & Jegou, 2005), but would have implied broad framework changes (Thackara, 2007). The question of sustainability was possibly the first working ground for designers to face challenges that overcome their traditional range of action, which until that point was focused on products (industrial design), interaction and participation (interaction design). Other challenges came, which implied a design-oriented vision towards broader changes, from the question of migration and integration to the call for social innovation and even to democracy (Margolin, 2012) While this approach was maturing on a theoretical level, the explorative activity was very prolific, but limited to local experiments and it was hardly scaled up to broader changes, as it was facing the resistance of social, technical and economic systems to any large transition. Design conferences offer many examples of local projects focusing on social innovation, personalized healthcare, environmental initiatives, but few contributions - such as Manzini and Rizzo (2011) - and few projects – such as *DoTT07* (Thackara, 2007) - are focusing on how those initiatives should be scaled up.

The pandemics has changed the context conditions, because it introduced an element of radical change that cannot be avoided any longer. Everybody understand that we cannot come back to the previous situation, everybody understands that the accumulation of points of crisis and the massive investment of funds to face the upcoming crisis will need to be addressed somehow, towards a *new normal*, i.e. new practices, new institutional frames, new cultures.



The problem can be seen from two perspectives: from one perspective the massive crisis is imposing large visions of change, which need to address major challenges highlighted by the present crisis. On the other hand it becomes very clear that the *new normal* society is looking for cannot be sufficiently described through large visions, or through a panoramic view, but they need to be projected on the everyday observation and in the way the life of everybody is changing. The problem that the crisis is proposing is not only to figure out the missions for the upcoming future, but also to make sure that the change in everyday life, or, to come back to Geels' transition patterns, the innovation in niches, is going in the right direction, that clusters are created and amplified, that converge towards the desired missions, and that every single initiative and every minimal change can be used - if consistent with the broader missions - to reach the results that society is looking for, especially in this moment. Such results are addressing certain objectives, concerning healthcare, environmental conditions, social equality, democracy or different configurations for capitalism, that are shared by large part of the public opinion. Some of those objectives are explicitly specified by the Sustainable Development Goals, which probably represent the most widely accepted set of missions for the future of the planet. Others, like democracy or the reformation of the capitalist system are less explicitly implied by the sustainable development goals, but are at the centre of the debate about economic development and

society. (Mazzucato, 2014; Piketty, 2014)
Looking at those changes from a design perspective means focusing on how those mechanisms of change can be analysed and possibly supported.
We can look at change in two complementary perspectives: the landscape-to-niche perspective and the niche-to-landscape perspective. The first may start from the large challenges and try to address the niche changes, the second should start from specific projects and look at how the direction of change suggested by those projects can be selected, empowered, when they are heading to the desired direction, or avoided, when directed in undesired directions.

The landscape-to-niche perspective: translating missions to action

In the last few years, the most frequently mentioned approach to large-scale change has been articulated around the definition of specific *missions (Georghiou, Tataj et al., 2018; Mazzucato, 2017; Mazzucato, Kattel et al., 2020)*. This term is used for defining well-defined goals, that address major societal challenges and help policy-makers setting directions for growth and making strategic investments. It is important to mention that missions do not refer to top-down policy intervention, but rather into the operationalization of visions based on a large consensus around problems that are considered as crucial in every specific moment and social context. This concept has been integrated in the forthcoming programs of the EU (Mazzucato, 2019) and develops the implications of the definition of *grand challenges* in the previous strategic programs (Georghiou et al., 2018). Missions are therefore a way to define direction of changes, or preferred trajectories of evolution of the whole socio-technical landscape in a geo-political context, such as Europe in this historical moment. The challenge is obviously to translate such missions into actions and strategies that also concerns the minimal changes in everyday life, or in specific local contexts. This translation from broad societal goals to people's life is in fact bridging the question of innovation from the political and strategic level close to the area of interest for design, at far as we consider design as an attitude to translate values and social aspirations into concrete actions or infrastructures.
This strategic level however, has hardly been considered by the design discipline, which has more often worked at the level of interaction, participation, personal and social engagement in specific cases. Only in the last few years the interest in increased, for design actions that could trigger a dialogue between different perspectives, from the perspective of policy makers to initiatives of co-design, that could operationalize the activity of policy making (Bason, 2014, 2017; Irwin, 2015; Kimbell, 2015). In parallel, the awareness of a possible role for design in broader societal transformation has been considered in EU-funded projects, such as *Design for Europe* (designforeurope.eu) or within broader innovation support projects, such as *Designscapes* (designscapes.eu) or *Urbact* (urbact.eu).
From a design perspective the question is to understand the role of design, or a design

approach, in processes of transition, but also the operational definition of a design approach and the impact that could result.
The most articulated theoretical frame to propose a design approach in the perspective of long term transition has been proposed by the studies on transition design (Irwin, 2015). Transition design analyses the role and contribution of design to large socio-technical changes, in the perspective of addressing major challenges, such as sustainable futures or social equality. This approach is based upon the understanding of the interconnectedness between social, economic, political and natural systems and explicitly refers to the connection between place-based solutions and lifestyle changes and broader social, economic and environmental changes. Transition design is the explicit attempt to challenge existing paradigms and envisioning new ones, using design as a methodological approach. Rather than proposing a methodology, transition design proposes a process that starts from a vision, elaborates and proposes a dynamic of change, proposes a new mindset and posture of openness and proposes a new way of designing. The process is circular and assumes a progressive and co-evolving development of visions for transitions.

The transition design co-evolution process (Irwin 2015)

The process suggests a design attitude, rather than a specific methodological toolkit, however one of the stages, the theory of change, is now a consolidated methodological tool for describing a dynamic of change and assessing its impact (Simeone, Drabble et al., 2019). The other stages of the process are instead looking at the design attitude towards change and are useful to frame individual design interventions, so that they are consistent with broader visions for transition. They are therefore useful to link landscape changes to individual instances of change, or to point out niche innovations that present promising opportunities to impact to larger scale. This highlights the interconnectedness of a landscape-to-niches and the niche-to-landscape perspectives.

The niche-to-landscape perspective: the contribution of design for service and design for social innovation

Working for niche change means generating concrete transformations of everyday life by interacting with it, provoking, triggering new behaviors and proposing new solutions. Service designers do not need particular exemplifications to understand the nature of this work, because this is their bread and butter. It implies the interaction with people, their engagement, understanding their needs and possibly organizing solutions according to existing social, cultural or economic conditions and according to technological knowledge available at the local level. In the last decades, the contribution of design for social innovation has redirected design attitudes towards participatory approaches (Saad-Sulonen, de Götzen et al., 2020), thus changing what Irwin defined as the mindset and posture of design in respect to innovation.
Working at the niche level, that means working in specific contexts and on specific design solutions, with the aim of generating larger scale change implies an attempt to scale-up, or institutionalise change, thus generating mechanisms of codification and scalability that trigger regime changes, i.e. changes in public institutions and in the regulatory framework. Change at this level creates the institutional basis for changing what is perceived as *the normal* in a *new normal*.
Working for such change also implies that certain assumptions in the existing practice of professional design are changed, such as:

- *Assumption 1. Change needs a designer, that means only expert designers have the knowledge and the methodological tools to generate change and innovation.* Although this assumption is based on the fact that designers are officially trained to manage innovation and are educated to methods and tools to support such capabilities, in fact the change resulting from a design action is the result of the negotiation of several actors, including citizens, experts from other disciplines, service providers or public administrators (Concilio, De Götzen et al., 2018; Manzini, 2015). A designer can only orchestrate or facilitate the action of such actors, the designer's action can trigger creative processes or support the

development of new solutions by infrastructuring the creative process (Hillgren, Seravalli et al., 2011; Morelli, De Götzen et al., 2020), but the result is not in the brain of a single person, it is rather the result of a community.

- *Assumption 2.Supporting a group of people and lead them towards the definition of new solutions is enough to imagine large change.* In fact small participatory processes are very interesting and very encouraging, but in se they do not imply that those innovation processes can be scaled up or replicated. Several cases can be found in literature, that propose very interesting and stimulating examples of co-design of new solutions, interaction among specific groups, brilliant cases that inspire the work of other designers. However the replication of such cases is not always possible, because it depends on the context, on the availability of the same human and knowledge resources and on the quality of interaction among communities (Morelli, 2015). A different strategy to support large scale changes based on the replication of small niche interventions would be to set up framework programs, thus defining relevant thematic areas and ecosystems, on the basis of which the niche interventions should be organized (Manzini & Rizzo, 2011)
- *Assumption 3. Replication and scale up can be seen with the same lens as the analogous industrial processes*. In fact we cannot imagine to replicate a niche project, what we can replicate is the structure of change, but not the result of such change. The replication should be based on a process of codification of knowledge and skills and on an analysis of the process of value creation within the niche, in order to understand which of those processes can be replicated, which actors (and therefore which knowledge and skills) would be needed for the replication and what kind of scalability is possible to achieve. While industrial processes may generate wild fire scaling out mechanisms, small interventions of social innovation may replicate by clusters or by nodes (Morelli, 2015).
- *Assumption 4. The rules of replication are similar in all places*. in reality a change in UK has mechanisms of interaction that may not work in Greece, change is context dependent and so is replication, as well. It is not a case that certain design practices, such as participatory design, were very productive in Scandinavian countries, where the co-operative movement had shaped relevant social and productive infrastructures, including food production, housing and wind-energy production. The attempt to export successful models, such as the Scandinavian model or the industrial districts developed in the northern part of Italy in the 60s-70s have often failed because of the different landscape conditions, i.e. different institutional structure, different cultures and different way to live together or to share knowledge, experience, resources and risks.

The challenges of designing for the new normal?

The challenge posed by this crisis calls for a change in practices and minimal details in everyday life, but this change is only possible if institutional structure can support the change and if the broad cultural, political and societal landscape is reconfigured. This paper outlined two approaches to those changes, which are not alternative, but rather complementary. The dynamic of socio-technical transition proposed by Geels and Schot (2007) highlights that this process is a continuous reshaping of niches, regimes and landscapes, with quick and small changes in niches shaping slower regime changes and evolutionary landscape changes. Understanding this dynamic and exploring the way it operationally works in real contexts is the challenge for everybody, but this challenge becomes even bigger when considering two further instances:

- A design approach to those dynamics implies a research on how their operationalization can be in fact *designed*. While designers are comfortably managing or facilitating change at the niche level, and they are more and more often called to contribute to regime change, i.e. policy design, government intervention, public advocacy and consultancies, they are quite unfamiliar with changes at the level of landscape, and in fact the evolutionary nature of transitions at this level poses the question of the *designability* of such transitions.
- While the changes described by Geels and Schot (2007) are slow and evolutionary, the present condition, and the same idea of *the new normal* implies that the speed of the transition being much faster. In few periods in history such transitions have been so fast, more recently the post-war reconstruction in Europe, or, earlier in the last century the Chinese revolution or the Turkish cultural revolution promoted by Ataturk. Most of those transitions were simply acceleration of the evolutionary process, given a radical change in the status and the condition of a social context. In none of those cases the idea of *designing* the change was suggested, yet, in all of them we could find people that actually worked as *designers*. The question is whether this time we can propose a design approach – and of course if this approach can preserve fundamental values such as democracy, social equity and freedom, that were not always present in the previous cases.

The challenge of designing the new normal is therefore in the novelty of the situation and in the lack of a design culture embracing such broad changes. Designers, or a diffuse design approach, will need to redefine their way of working, tools and methods, mindset and posture. This is what makes the design of the new normal an opportunity the design community cannot afford to miss.

Conclusions

The scale of the present challenge demands a design approach. National and international institutions seem to understand this, when they organize the economic support to the coming change not simply on the health crisis, but looking to broader and largely shared missions. However the involvement of professional designers in this process is not given for granted. Several contributions to the debate of the ethical values of design, from Papanek (Papanek, 1973) to Margolin (Margolin, 2002, 2012) suggest that design cannot just be seen as a *technological fix* to the demand for such a radical change, because its implication are implicitly or explicitly political, that means that design implies political decisions and critically develops their consequences at the societal level. This paper suggest that the role of design in this epochal change could be to link broad visions for societal transformation and changes in specific contexts. It is important however, to take into account and to debate the relevance of this role in orchestrating and coordinating the actions that would lead to changes in different levels. Because of its political nature, design is not a *neutral* tool in this change. Design is biased, because it implies a choice of what change directions design and designers will infrastructure. The risk is to *colonize* the change and to oversimplify the manifold structure of the context in which design works (the urban context, local communities), or to propose a "social ventriloquism" in which a self-entitled innovative organization develops its own finding and proposals as "the voice of a target audience"(Vassão, 2017)

This paper is not proposing solutions or recipes to address the action of designers, but rather a ground for discussion, which implicitly suggests a number of questions: is the design community equipped to contribute to qualify missions in operative terms? What methodology do we need to operationalize missions into concrete and specific actions? On the other hand, do we have the conceptual tools to raise the impact of design action in specific initiatives to a level that contributes to larger transitions? How can the process of scaling up and institutionalizing those initiatives be infrastructured without losing their manyfold structure?

These are possibly questions to discuss in the design community, in education institutions and in common forums, even though the urgency of the search for a new normal will push the same community to participate to this transformation before the definite answers are mature.

The effects of eye expression on emotion perception

Yi-Hsun, Liu[a] , His-Jen, Chen*[a]

[a]National Cheng Kung University, Tainan, Taiwan
*hsijen_chen@mail.ncku.edu.tw

Abstract | In 2020, worldwide are affected by the covid-19 epidemic, and people need to wear masks to maintain their everyday lives. In this situation, people could only recognize the upper half of the facial expression to judge the emotions from others. Therefore, to improve the public's emotional judgment in a harsh environment, this research uses the method of Kansei engineering to classify and evaluate 200 male and female eye images collected on the Internet. After the expert focus group method, the visual type factors table of Eye gaze (including six characteristics and five levels) is established. Then, through regression analysis, four characteristics that can effectively judge emotions are found, such as pupil's position, squinted eyes, brow wrinkles, and lying silkworm. Finally, the experiment aims to find out three regression equations to predict the positive and negative feelings of different pictures to the participants.

KEYWORDS | EYE GAZE, SIGHT, EMOTION PERCEPTION, FACIAL EXPRESSION, KANSEI ENGINEERING

1. Introduction

In 2020, every place in the world was suffered from the covid-19 epidemic, and people must wear masks in their daily life. However, the mask covers one-half of the face area, leaving only the upper half of the facial expression features (eyebrows, eyes), allowing people to evaluate emotions from the limited facial features. However, the information provided by the eye area has been proved in the research of Smith, Cottrell, Gosselin, and Schyns (2005). They found that the information from the eyes and eyebrows is the key to assessing facial expressions' most accurate recognition. Under the influence of the epidemic, people had no choice to improve their ability to interpret facial expressions based on eye contact clues.

Facial expression

Facial expressions are combined with various contractions and relaxation of facial muscles and bring people 250,000 attractive faces (Altıntaş & Çamur, 2005). When it demonstrates human expressions, there is much implicit emotion that could convey the message with behavioral intentions, social communication, and other information(Tian, Kanade, & Cohn, 2011). Mehrabian (1968) found that in face-to-face interactions, 7% are transmitted through text, 38% are conveyed through intonation, and the most significant proportion is transmitted through body language – which is 55%. Although the human brain can predict other's facial expression recognition effortlessly in typical daily situations; however, the influence of epidemic makes the situation more difficult to recognize the facial clue while wearing masks. For instance, in some language exam, candidates are required to wear masks for speaking examinations, which affect the examiner's judgment results strongly. Therefore, if there is a visual reference for the upper half of the facial expression cues, it might help people recognize emotion under challenging situations.

Most facial expression recognition research extracts expression features from the entire face(Ekman, 1993; Friesen & Ekman, 1978), and there are not many studies based on the eye and eyebrows. In Wells, Gillespie, and Rotshtein (2016) study of facial expressions, such as fear, anger, and sadness, these emotions can be recognized from the eyes; eyebrows can further support and enhance these expressions. In Oztel, Yolcu, Öz, Kazan, and Bunyak (2018) research, a set of iFER expression recognition system is proposed. In their system, emotional judgment based on facial features only on the upper face can be as effective as 92%, but it still cannot reach 99.38% of full-face recognition (such as dlib facial recognition). Therefore, this research intends to find a table of visual features through experiments, which can help people effectively recognize others' emotions while wearing masks during the epidemic and show research results to developers who conduct research on facial expressions A.I. researchers.

Kansei Engineering

The word " Kansei " is derived from Japanese vocabulary, and its original meaning is the psychological feelings and images that users think about one object. In the field of cognition, it is expressed as the starting point of people and objects and exploring the relationship between people's perception of objects, sensory feelings, and their behavioral

intentions(Nagamachi & Lokman, 2016). Kansei imagery has a wide range of applications, including ergonomics, cognitive science, psychology, design, and information science. It can be used to help understand the feelings of using products and design psychology, so that it can be used to fulfill the user's expectation and enhance user experience. (Schütte, 2005)

Mostly Kansei Engineering is built to research people and products' relationships. The primary purpose is to help the designer create a new product based on user's feeling. It contains four main points: (1) How to understand user's attitude toward objects by estimating their psychological feelings (2) Through understanding the feelings, researchers can find out the design features of products, (3) Establishing Kansei engineering in with human-oriented design considered, (4) Adapting changes in society and user preferences to pivot the direction of design features (Matsubara & Nagamachi, 1997).

Although there is much previous research on product or object, there is rare research discussing facial expression with Kansei engineering methods. This method could help the researcher transfer qualitative data to quantitative formula. For instance, the researcher can collect people's feelings when they receive visual information through *focus groups and interviews.* According to these qualitative data collected, researchers can use questioner to validate the result and find out the equations that which features are able to affect user's feelings. Therefore, this research aims to gather the participants' perceptual information from this method and explore what kind of eye expression elements will affect people's positive and negative feelings after viewing the eye pictures. According to the above discussion, the three research purposes are below:

(1) Through experiments design, find the eyes features that could identify positive and negative emotions.

(2) Provide an "eye gaze of the visual feature" for people to recognize emotion when they do not have sufficient cues for emotional recognition.

(3) Explore whether there are differences in expression features and feelings in the eyes gaze of different gender

2. Method

The experiment in this research will be divided into three stages: (1) Collect the experiment images, (2) Classify the pictures in positive and negative directions, and (3) Establish a visual type factors table. After that, the experiments' results were used to find out those visual elements through questionnaires, which have an impact on the positive and negative perception of the picture.

2.1 Experiment

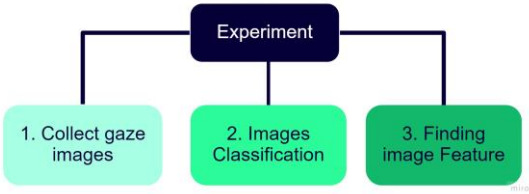

Figure 1. Experiment process

The first stage: Collect Gaze images

At this stage, we asked 6 participants, three males and three females, about 20~26 years old, who have received 4~6 years of visual education and training and selected the experiment's pictures according to the criteria provided by the researcher: (1) Age / about 12-50 years old (2) Race / regardless of skin colour. Previous research indicated no difference between Black and White skin people's eyes or between Asian and White eyes in the level of cooperation elicited. (Berki, 2014) (3) Gender / each participant must collect 20 images for each male and female (40 sheets in total) (4) Look straight ahead. (5) The images colour and resolution should be clear enough (more than 150dpi) (6) Images show eyebrows, eyes, forehead (7) People inside the images are not allowed to wear glasses, and without any movements or gestures (ex. hand posture) (8) People inside the pictures can have various expressions (happy, angry...).

The pictures in the existing facial expression databases are not used because the eyes we see every day are all-natural eye expressions. Furthermore, the pictures in the databases are manipulated by other researchers, which is different from what we see in a typical environment, so we choose the eyes photos collected on the Internet. Among them, 20 images of males and females (a total of 40 photos were collected by one person), and the researchers deleted duplicate and substandard pictures and cut them to a uniform size of 148*105mm. Finally, 100 male and 100 female photos were collected (200 photos in total) (Fig.2).

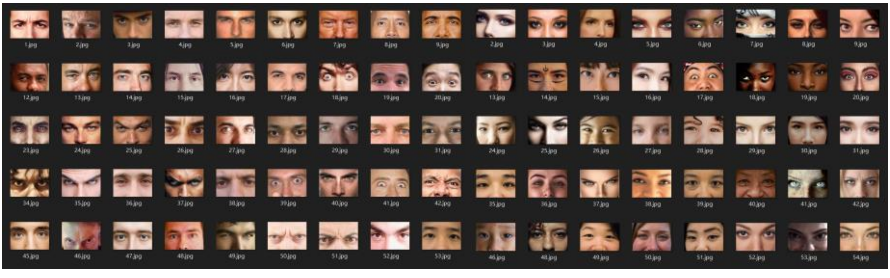

Figure 2. Images of eye gaze collecting (male and female)

The second stage: positive and negative image classification

There are 20 students from National Cheng Kung University, ten males and ten females. Their ages ranged from 20 to 25 years. They are asked to watch these 100 picture cards selected in the previous stage and evaluate the positive and negative emotions. According to the positive and negative perception, the pictures are divided into two categories, the weak and robust sightline, and finally divided into positive strong, positive weak, negative strong, negative weak. After that, each picture was counted into different points: positive strong 4, positive weak 3; negative weak 2, negative strong 1. Finally, the researcher got the average score of each picture and selected three pictures with the most substantial positive and negative directions; 3 pictures with the median positive and negative directions, as Figure 3 (below).

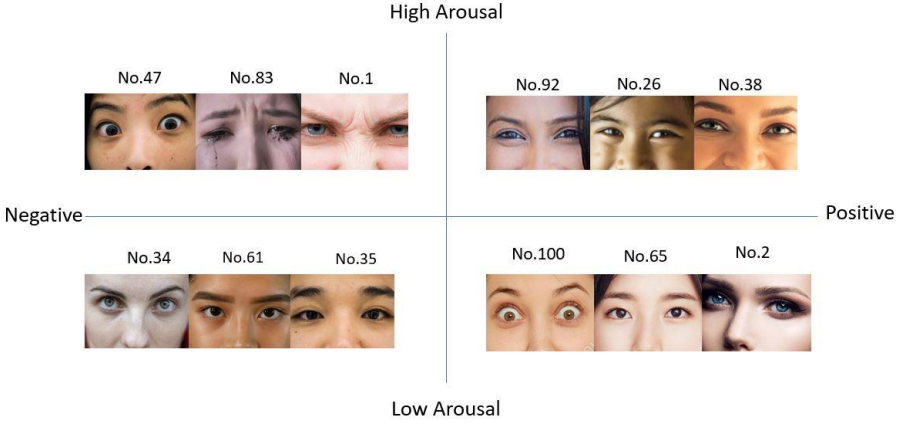

Figure 3. Final selected pictures (female)

The third stage: Analyse the feature of pictures

At this stage, three designers with more than four years of visual design work experience are selected as the Focus group members. After a complete discussion and analysis by the focus group, the visual elements and influencing factors that make up the eye gaze expression are summarised, and the visual factors table of eye gaze is established, as shown in Table 1 and Table2. These tables of the eyes can be aggregated into six items, namely *eyebrow angle, pupils' location, the distance between eyes and eyebrows, squint degree, frowning degree and lying silkworm*. Here are six categories and 5 degrees, which are subdivided into 30 items.

During the second stage of the experiment, the researcher has received 3-4 participants referring that" lying silkworm makes me feel more positive and charming". This result also rephrases in the third stage when designers were analysing these 100 pictures. According to doctors' definition in cosmetic surgery (medpartner, 2016), what constitutes a lying silkworm is a part of the eyelid obliterator muscle (orbicularis oculi muscle). This part is close to people's eyelashes, and there will be a line about 0.2 cm to 0.7 cm wide (could see in *Figure 4)*. Different from squinting eyes, the lying silkworm is no need to squeeze the muscle.

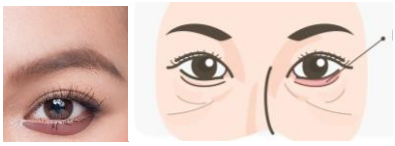

Figure 4. The position of silkworm

Table 1. The visual factors table of Eye gaze

Category		Level 1	Level 2	Level 3	Level 4	Level 5
Category	Eyebrow Angle					
	Pupils' Locations					
	Distence between Eyes & Eyebrows					
	Squint Degree					
	Frowning Degree					
	Lying Silkworm					

Category		Level 1	Level 2	Level 3	Level 4	Level 5
Category	Eyebrow Angle					
	Pupils' Locations					
	Distence between Eyes & Eyebrows					
	Squint Degree					
	Frowning Degree					
	Lying Silkworm					

2.2 Questionnaire

The 24 pictures (12 males and 12 females) selected in the second stage were used in a questionnaire to correspond to the visual type factors table in the third stage to collect the visual elements in each picture. Secondly, the researcher asks about the positive and negative emotional value of each picture. At this stage, 20 questionnaires were collected, ten males and ten females, aged about 20-25 years old. This research uses an internet questionnaire to collect data and ask the following questions with 24 pictures:

According to the question below, select the degree of the feature that you think fits the pictures:

- Eyebrow angle (1 drooping / 5 raising)
- Pupil position (1 lower / 5 upper)
- The distance between eyebrows and eyes (1 very close / 5 very far)
- Squinting degree (1 none / 5 intense)
- Eyebrow wrinkles (1 none / 5 strong)
- Whether there are lying silkworms (1 no / 5 strong).
- This picture gives you the positive and negative feelings (1 negative / 5 positive)

All data were recorded and analysed anonymously.

3. Result

In this research, the six features of the visual type of feature table (eyebrow angle, pupil's location) were used as independent variables, and positive and negative emotional feelings were used as dependent variables to perform *Multiple Regression Analysis* with SPSS. The questionnaires were performed with P-values, <0.05 are considered as statistically significant and p-values. = 0.05 but ,0.1 are reported as non-significant trends. The 24 selected pictures (12 for each male and female) are analysed first, then the male pictures (12 males) and final for the female pictures (12 females), so there were three regression equations found.

All pictures (male + female pictures)

For all 24 pictures, a multiple linear regression was calculated to predict participants positive and negative feelings based on 6 visual features. A significant regression equation was found ($F(6,473)=36.546$, $p<.01$), with an R^2 of 0.317. In all features, only pupil position($p<.01$),

squinted eyes(p<.01), brow wrinkles(p<.01) and lying silkworm(p<.01) were significant predictors of positive feelings of eye gaze pictures, and the relationship is as follows:

*Positive feelings of **All pictures** (Y) = 2.479 - 0.163*__pupil position__ + 0.278*__squinted eyes__ - 0.407*__brow wrinkles__ + 0.202*__lying silkworm__*

Male pictures

Second multiple linear regression was calculated to predict participants positive and negative feelings in all male eye gaze pictures. A significant regression equation was found (F(6,233)= 26.878, p<.01), with an R^2 of 0.409. Only pupil position(p<.01), the distance between eyebrows and eyes (p<.01), brow wrinkles(p<.01) and squinting (p<.01) significant predictors of positive feelings of eye gaze pictures, and the relationship is as follows:

*Positive feelings of **male pictures**(Y) = 2.4 - 0.238*__pupil position__ + 0.226*__distance between eyebrows and eyes__ + 0.255*__squinting__ - 0.272*__brow wrinkles__*

Female pictures

The last multiple linear regression was calculated to predict participants positive and negative feelings in all female eye gaze pictures. A significant regression equation was found (F(6,233)= 14.255, p<.01), with an R^2 of 0.269. Only squinting (p<.01), brow wrinkles(p<.01) and lying silkworm(p<.01) significant predictors of positive feelings of eye gaze pictures, and the relationship is as follows:

*Positive perception of **female eyes**(Y) = 2.462 + 0.291* __squinting__ - 0.482* __brow wrinkles__ + 0.229* __lying silkworm__*

4. Discussion

With Kansei engineering, this research had transferred participants' feeling into quantitative data. According to all pictures' equations, we can find that these four visual features, pupil position, degree of squinting, brow wrinkle, and silkworm, can effectively predict the positive feelings of the eye gaze. When the eye gaze picture with pupil position is lower (-0.163), the degree of squinting is intense (+0.278), the eyebrow wrinkles are almost no (-0.407), and with a bit of lying silkworm +0.202 are more likely to cause the participants to have positive feelings.

Interestingly, the eyebrow angle that the researchers thought could accurately predict the positive and negative emotions of the eye gaze, which Oztel et al. (2018) uses the eyebrow angle as one of the considerations for judging emotions in their iFER system. These results in our experiment are not significant. The possible reason might because when people showing a smiling face, the eyebrows are not always raised; some people appear to be dropping (see Fig.5). These two pictures get the highest positive pictures, but they show entirely different eyebrow angles. As a result, this feature cannot efficiently predict the positive and negative feelings alone.

Figure 5. Corresponding pictures with the visual features derived from the equation

Figure 6. Corresponding pictures with the visual features derived from the equation

In the male picture's equation, it can be found that the eye gaze will be predicted positive when the pupil position is lower (-0.238), the distance between the eyebrows is moderate (+0.226), the degree of squinting is substantial (+0.255), and there are almost no brow wrinkles (-0.272) (see Fig5.). When scoring the positive and negative images, the researchers recorded that among 20 participants, four of them mentioned that "male pictures have largely strong negative emotions, and even neutral eyes are easy to let me feel negative." Previous studies have shown that the gaze on the male face is significantly more threatening than the female face (Ohlsen, Van Zoest, & Van Vugt, 2013)

In the female picture's equation, there are only three features that can provide optimistic emotion predictions, followed by intense squinting (+0.291), flat eyebrows (-0.482), and a little lying silkworm (+0.229). Compared with pictures of male, women have fewer distinguishable features. During the experiment, some participants also mentioned that it is not easy to distinguish women eye gaze between a positive or an aggressive look in the neutral eyes. Women's nonverbal cues are more accurately judged (Hall, Carter, & Horgan, 2000) and women generally have richer facial expressions than men(Brody & Hall, 2008), but in this research, there are quite different. Although the participants thought that neutral eyes were less recognizable, there were still five participants who mentioned that women's eyes were cheerful, friendly and attractive (Korthase & Trenholme, 1982). In our statistics, the results are also in line with the feedback from the participants (see Table.2). The number of female pictures rated as negative feelings is less than that of male pictures.

Table 2. Table of subjects' evaluation of male and female pictures (1 negative / 4 positive)

Male Picture No.	*Mean*	Participants gender & scores of pic.				Female Picture No.	*Mean*	Participants gender & scores of pic.

91	1.70	44	1.8	98	1.5	57	1.95	32	1.9	9	1.9

5. Conclusion

The contributions of this research are as follows:
(1) This research uses a focus group to find the six features and five levels of eye gaze
(2) Make a visual factors table of eye gaze, and summarize the four major characteristics that affect people's positive feelings of gaze
(3) Collect positive and negative feeling evaluations of each picture during the experiment, found that the male's eye gaze pictures are more likely to make people feel threatened and negative feelings. In contrast, female eye gaze pictures are more attractive and accessible to give people a positive evaluation(Korthase & Trenholme, 1982).
(4) With Kansei engineering, the equations of eyes gaze pictures had been founded out. By using these, people can predict positive and negative feelings with different features.

These results could be applied to the judgment of emotional faces, adding criteria for identifying positive and negative emotions to improve its identification. Moreover, when designers are working on character design, they can use the results in this research to carry out character design and animate design. With the tables, it could help designers to enhance the detail features between the eyebrows and the eyes and make it more vividly. With the contribution of this research, the result can be used at strict environment which need to wear mask or helmet. Furth more, it can also help people effectively recognize others' emotions while wearing masks during the epidemic

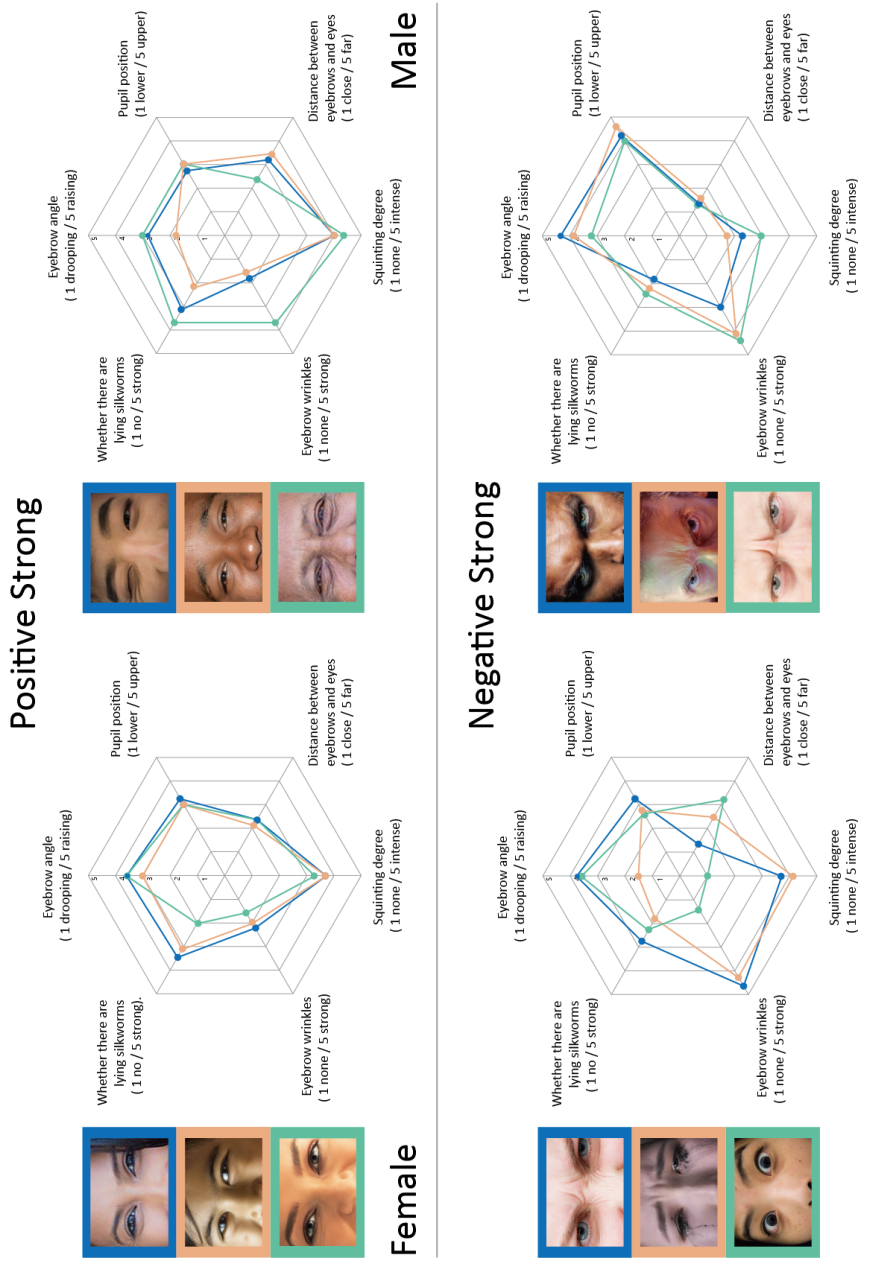

Figure 6. Radar chart of the strongest positive and negative emotions

The value of design in the emergency-driven scenarios. Crafting Ecosystems with data

Francesco Dell'Aglio[a], Enza Migliore[b], Chiara Scarpitti[c]

[a] Apple Developer Academy, Naples
[b] Xi'an Jiaotong-Liverpool University in Shanghai
[c] Università della Campania "Luigi Vanvitelli" - Dipartimento di Architettura e Disegno Industriale, Aversa

Abstract | During the Covid-19 emergency of 2020, the Information system, governed by data-flows, generations, and representations, proved to be one of the most overwhelming and uncontrolled phenomena. In this scenario, the essay presents a critical analysis, highlighting urgencies and opportunities for the design discipline to define its substantial and meaningful role in the Information Age. The research encourages the design culture to go beyond the dichotomy between materiality and virtuality by depicting reference's paths and practices, trying "to craft" new hybrid ecosystems. To inspire new design challenges, the experimental project Crafting Ecosystems is a proposal of a new design-led scenario for the Information. The goal is to offer a different kind of public Information based on empathy and awareness, focused on the restoration of a balance between natural and artificial, translated into tangible actions, replies to emergency circumstances. The final designed project is an interactive invitation to observe reality in an integrated way and realize how data and emergencies inevitably depend on the interconnected balance between all living beings.

COVID-19, DATA VISUALIZATION, MATERIAL-FOCUSED DESIGN, ALGORITHMS, NATURAL ECOSYSTEMS

_DCs 1. The impacts of emergencies on the design culture:

rebuilding ecosystems.

The transversal of design is crucial for understanding the present and future scenarios, the interdependence between knowledge, and the discipline's evolution. Through the hybridization between heterogeneous sectors such for instance, electronic and materials engineering, natural, social, and economic sciences, philosophy, and human studies, the design culture can enlighten the deeper purpose of its project: the indissoluble interconnection between human beings, nature, technology.
Adopting both the operational protocols of scientific knowledge and the complex readings peculiar of the humanities, design can reinterpret reality, going beyond the traditional disciplinary categories, for the construction of an interconnected system between society and environment. The hybridization between different fields also derives from a complexity of instances, in line with the most urgent global issues that affect society today. Among these, a central role is assumed by environmental sustainability, the relationship with technologies, digital communication, and big data, the geopolitical debate. These are multi-faceted issues that can only be approached through a partnership between multiple players and know-how. This is evident when we consider what the Covid-19 pandemic has made clear: the unstoppable alteration of ecosystems due to the impact of human life. "In these days, there is a recurrent use of the expression "back to the normal world" as if what we lived before Covid-19 was normal: social disintegration, widespread poverty, animal exploitation, destruction of the environment, increasing damage to the planet and natural things [...]. (Caffo, 2020, p. 30).
The Covid-19 emergency has radically changed our lives' structure, destabilizing them through a forced acceleration of the digitization processes adopted in this Social Distance phase. Never as in this period, smart working, use, and abuse of social networks, overproduction of data, can be considered tangible and widespread phenomena of a new way of living culture and professional relationships. Planetary emergencies such as those we are still experiencing today - on which Covid-19 is only the iceberg peak - put in crisis the whole system of values previously based on the so-called "progress." The center of gravity of the issue shifts from humankind to the entire planet, a necessary approach for constructing a real, sustainable society in an anti-hierarchical perspective. In this ecosystemic vision, the approaches, strategies, and objectives must be reviewed. It is a question of rethinking the world as a fluid and interacting ensemble (Coccia, 2018) through a neo-humanist approach that no longer constitutes anthropocentric and promotes coexistence between heterogeneous organisms, races, and cultures. (Latouche, 2004, p. 95). Design sustainability is not only aimed at restoring a primordial nature but rather intervenes by raising consciousness in the desire to rethink the world of production and consumption in a completely different perspective, integrated with all other living beings. (Haraway, 2016). Thanks to its ability to illustrate complex problems through a rich narration, the project can be a strategic tool for a collective awareness of the most current and complex phenomena. In this scenario, communication design plays a crucial role and becomes a "common space to facilitate processes of understanding, approach, and management of our time's fragilities.

[...] The designer has an enormous responsibility because in his being a seismograph of the existing, he records and keeps track, reads and interprets, making an idea of the future emerge [...] and impacting on reality". (Piscitelli, 2019, p. 122).
By envisioning desired scenarios, design becomes a vector for dialogic processes where its narrative is as meaningful as the final result: the goal is to open questions and understand what role it can play, acting first of all in the perspective of change. Therefore, through its ability to raise a collective awareness, identifying both consolidated issues and embryonic emergencies, design takes on an educational value. Add to this; it is considered that the concept of emergency must be re-examined as permanent and implicit in contemporary society. "Nature compromised, broken, interrupted, is, in fact, not only that of the plant world but also that balance between all living species, that coexistence between vital worlds that our anthropocentric culture has progressively ignored. In this imbalance - provoked by arrogant anthropocentrism [...] - we find ourselves today in its totality, with our responsibilities as dominant species and our culture as colonizers of ourselves". (Boeri, 2018, p.9).
In light of these instances' complexity, the positivistic view that sees the designer as a problem solver, thanks to absolute and crystallized solutions, vanishes. His role is now closer to the one who - permanently in an investigative state - identifies the controversial points, creating virtuous and hybrid solutions that firstly trigger a change.
With the dematerialization of objects, even design is transformed, incorporating digital data and inputs from the web. Considering its transdisciplinary nature, the impact of design culture can become life-saving through an ethical integration of different aspects of reality. Design projects, understood as devices of divergent thinking, assume the ability, through their narrative existence, to act by raising awareness aimed at new behaviors and human being-world interactions. In this perspective, the future discipline directions are characterized by infographic installations, interactive systems, material and processual experiments, high technological devices. In this hybrid landscape, projects no longer belong to closed product categories.
In a context of a design culture that reinstates equal importance to the human being as well as to nature, the most stimulating works concerns themes such as the survival of man on earth, the preservation of living species, the care of territories and biodiversity, the integration between technology and nature. Between them, an extraordinary opportunity for investigation emerges from the digital flows of data, from the information that crosses the network and its possible translation in objects and processes. The idea is that even the product designer has to learn to manage these flows, shaping them most ethically until their incorporation into the project, to create new knowledge and an unimagined empathy. Whit these premises, in the followed chapters, the essay will investigate two crucial aspects of the current infodemia condition - the handling of data and the design with data - arriving until to a speculative design proposal that projects data towards a physical and sensitive impact.

_DCs 2. A new scenario for the design: handling data.

Is there any connection between the fact that "we are altering our infosphere fundamentally [...] adding a whole new stratum of communication to the social system" (Toffler, 1980, p. 172) and the culture of product design? It could probably be envisioned in the attempt to

try, within design methods, to reinterpret human beings as "informational organisms interconnected with bio-logical organisms and engineered artifacts" (Floridi, 2015, p. 161). We are living in a new era where communication technologies are shaping the environment into a new reality. However, how much does the design discipline have a real idea of the rules by which the data flow constantly shapes our routines? Answering such a question is becoming essential for the discipline's evolution due to the impact those entities have on our environment. Now, more than ever, knowledge, in the contemporary form of information flows and data, "is and will be produced in order to be sold, it is and will be consumed in order to be valorized in a new production." (Lyotard, 1984, p. 4). Covid-19 has stressed an extreme global fragility affected mainly by the information system. The design discipline should look at the potential of such an unprecedented mutation proposing future-proof scenarios made of products that coherently live in their contemporaneity. Because lacking comprehension about the qualities and the effect of the information system - of which data are a brand-new raw material - means not being able to shape our environment profitably. That is why it is urgent to fully understand this new material's characteristics and start deepening specific studies to play an active role as critical observers. During Covid-19, some topics emerged that asked for reflections, like those related to the Information reliability and the relevance of the sources and their contents, but primarily those connected to people's capability to critically filter the information.

The "imperative to abandon blind trust in technology and to deepen our critical spirit" (Perez Tornero, Varis, 2010, p. 24) is now at a crucial crossroad where the declared intent of the global network to make everyone equal is missing its promises in front of two main issues, non-equal accessibility to the network, and consequently to its contents, and the capability to interpret the information itself. Looking at numbers, we see that internet users increased globally from only 413 million in 2000 to over 3.4 billion in 2016 (Roser et al., 2015). Nevertheless, how many people are online? The map of this distribution overlaps that of world poverty and countries lacking in democracy. Such asymmetry of information's distribution generates inequalities. That is why the United Nations demanded global cooperation through a data revolution to eradicate poverty while underlining that even considering the massive changes carried through technologies from the year 2000, "inequality remains and opportunity is not open to all" (UN, 2013). On the other side, the fact that we have left most of the information processing to the machines has affected our computational thinking abilities over those years, making us lazy for deep understandings. That is why the UN has asked international experts to propose ways to improve sustainable development data. The report summary states that "Data are the lifeblood of decision-making and the raw material for accountability" (UN, 2014), underlining how the current state of data is stressing the gaps between what we know and when we know it, as well as the gap between who know and who do not.

The amount of data unconsciously produced daily is massively used to profit and model our compelling needs. The economic and political impact is enormous, impacting negatively on a social justice level. It is exactly that supposed global access to the privileges of knowledge that was in the “dreams of the digital insurrection” (Baricco, 2018), but that, along these

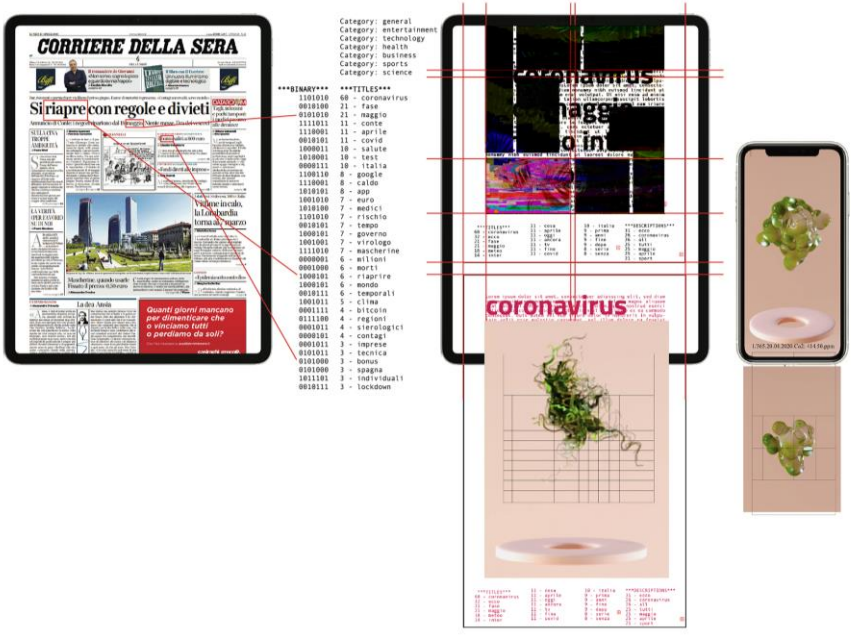
years, has shaped a habitat in which the disproportion between rich and poor is upgrading in the disproportion between included and excluded. This asymmetry embraces large groups from the developed countries, particularly those who cannot access, analyze, evaluate, create, and act in the digital ecosystem; in other words, those who lack Media Literacy and consequently suffer the negative impact of media manipulation and misinformation unconsciously. Being illiterate in such a topic transcends the boundaries of poverty and transversally impacts the capability to read contemporaneity and fully handle our new reality.
In the last 100 years, communication accelerated human evolution and all its related phenomena more than ever in history. Product Design has interpreted this acceleration and shape the human environment by wholly accompanying the upcoming needs and behaviors. Nevertheless, communication also created a brand-new era of the economy in which data is a whole new entity that we should shape and model with the same intent as before. That is why we think that data should be considered as a new contemporary physical material. Data's increasing variety of forms, velocity, and quality has allowed their success, wide-spreading, and profound diffuse impact. According to a white paper by the IDC, the global data sphere could grow from 33 to 175 zettabytes by 2025. Industries will mainly define such massive data growth as Financial Services, Manufacturing, Healthcare, Media, and Entertainment. The critical point of this process is that we are nearly entering the age of data readiness, and for this reason, we are still in need of understanding the issue that this will bring, which, as we described till now, is essentially affecting our lives and our environment at all levels. This condition is crucial considering that data technologies are becoming central for productivity expansion, data monetization, and value creation. Designers, as well as Architects, have, in this sense, a unique and crucial responsibility in shaping future synchronic societies in which "every object worthy of human or machine consideration generates a little history. These histories are not dusty archives locked away on ink and paper. They are informational resources, manipulable in real-time." (Sterling, 2005, p. 45).

_DCs 3. An overview of contemporary practices: designing with data.

In the Information Age, the design discipline has to face the dichotomy between virtuality and materiality to solve its hesitancy to define and affirm its clear role. In fact, "although scholars in information-centric disciplines are keenly aware of the connection of data to materials, their counterparts in fields relating to the built environment are less cognizant of this relationship" (Brownell, 2016, p. 1238).
The connections between Information and materiality have been studied rigorously within the fields of Informatics, Communication Theory, Organization studies, and Interaction Design. This latter, together with Data Visualization and Digital Fabrication, is the only design

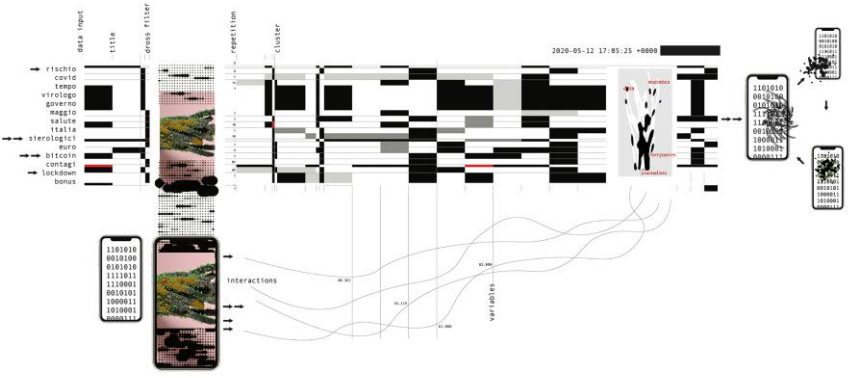
field to have developed a confident approach to the dynamics of data flow, establishing their tools and methods. On the other hand, Material-focused Design, such as Product and Industrial Design, shows a lack of consistency when dealing with the translation between Information and materials. Should we consider these disciplines unaffected by Data flow and continue exploring and implementing only specific practices such as Data Visualization and Digital Fabrication? Should we continue handling data only as inputs for visual outputs or as a tool for technical solutions? In this case, the whole Design System would miss the opportunity to evolve its culture by enhancing its awareness of new resources.
Focusing on the union of information technology and materials, Duncan (1994, p. 203) stated that "the single most important material used by manufacturers in the future will be data." In this paper, data are interpreted as a new kind of raw materials that the designers can exploit and the responsibility to handle. We specifically address them as "raw" materials instead of any other type of entity to lay out a more confident and more precise design discipline attitude towards their analysis and exploitation. This analogy provides us with a comparative path to define meaningful and sustainable approaches and challenges of the discipline in this field. The endless research and technological process related to raw materials took centuries to achieve a relevant classification and systematization of resources. We claim that, in order to face and handle the complex scenario of data and Information, we should inquire about our solid experience with raw materials, and all the related issues, such as their shortage, to have a reference of theories and agencies. It is emblematic that we also use analogies in terms of both vocabulary and technology, such as mining and extraction.
Considering data as raw materials would help the design:

1. to define a meaningful translation and application of digital contents into physical products and actions,
2. to reach a deep knowledge about typologies of data for their classification and systematization,
3. to update the design culture with new resources, generating unusual sustainability concerns on the environmental, social, economic, and cultural levels.



During this research, we have been studying contemporary approaches that use data as materials for design to highlight the strength and weaknesses points in this field. Observing mainly two directions, Data Visualization and Data Physicalization, we selected three case studies as relevant for our goal.
One of the most considerable design achievements is the approach of Data Humanism by Giorgia Lupi. It is built on a deep speculative attitude towards the evolution of Data Visualization. Data Humanism generated a substantial shift from Data Visualization to Data Drawing. The "first wave of data visualization [...] was successful in making others more familiar with new terms and visual languages" (Lupi, 2017, par.1). After this accomplishment, there has been a trivialization, and "visual design is often applied to data simply as a cosmetic retouch of important and complicated issues in an attempt to make them look simpler than they are" (Lupi, 2017, par.1). Lupi seeks to humanize data visualization to make it speak our language, questioning the impersonality of a merely technical approach and starting to design ways to connect numbers to knowledge, behaviors, people. Another consistent contribution is about techniques and skills. Her practice is based on "drawing" data rather than let the machine automatically process them. *Drawing* is a human capability that supports and drives thinking and comprehension of things. Drawing is also part of the

design process, so it is a way how designers can exploit their specific methods to generate innovation.
Another Design accomplishment is the manifestation of data as a physical embodiment, which is often collected under the term data physicalization or physical visualization. A remarkable contribution is the activity of The Mediated Matter Group of MIT. They created a multi-material voxel-printing method enabling the physical visualization of data sets commonly associated with scientific imaging. This technology consists of multi-material 3D printing with polymeric photo materials, which enable the simultaneous use of several different materials, and by utilizing cyan, magenta, yellow, black, white, and transparent resins, full-color models with variable transparency can be created. This process allows the physical visualization of unconnected points, cloud data, lines and curves, open surfaces, and volumetric data (Bader et al., 2018). Physical information displays offer tangible interaction, enabling a more comprehensive understanding of information intuitively, going beyond the possibilities offered by virtual and augmented reality. Moreover, voxel printing enables direct digital manufacturing of data sets without creating intermediate representations for 3D printing. It proves to be a more accurate and effective visualization, avoiding the loss or alteration of information. Consequently, data representation in a physical form through digital fabrication has emerged as a research area and practice.
The other example is Forensic Architecture's work, which provides us with one of the most interesting references in terms of new applications and opportunities for the Design discipline to have an active role in the Information Age. Forensic architecture is the name of an emergent academic field developed at Goldsmiths University. It refers to architectural evidence's production and presentation—relating to buildings, urban environments— within legal and political processes. This research group uses data as a source of investigations to help international courtrooms, parliamentary inquiries, United Nations (UN) assemblies, as well as in citizens' tribunals and truth commissions. They make use of digital and physical models, 3D animations, and cartographic platforms to recreate crimes' dynamics and scenes to support the justice system. This approach creates a fluid translation between digital and material, moved by a very clear and practical mission, and represents a model case going beyond the visualization and the technological improvement, to focus on applications, roles, and untapped forms of interdisciplinarity. It is also inspiring in terms of method; in fact, it treats data through traditional design competencies and tools, such as spatial, mechanical, physical, and behavioral studies. From this analysis, the research outlines, as strategical strength points for an evolution of the Design discipline, the concept of humanizing data, the materials-led practices of physicalization and crafting, and the experimentation of unexplored interdisciplinary collaborations. In terms of weakness, it comes upon the need to overcome visualization's main goal and the exclusive focus on very techno-scientific applications.



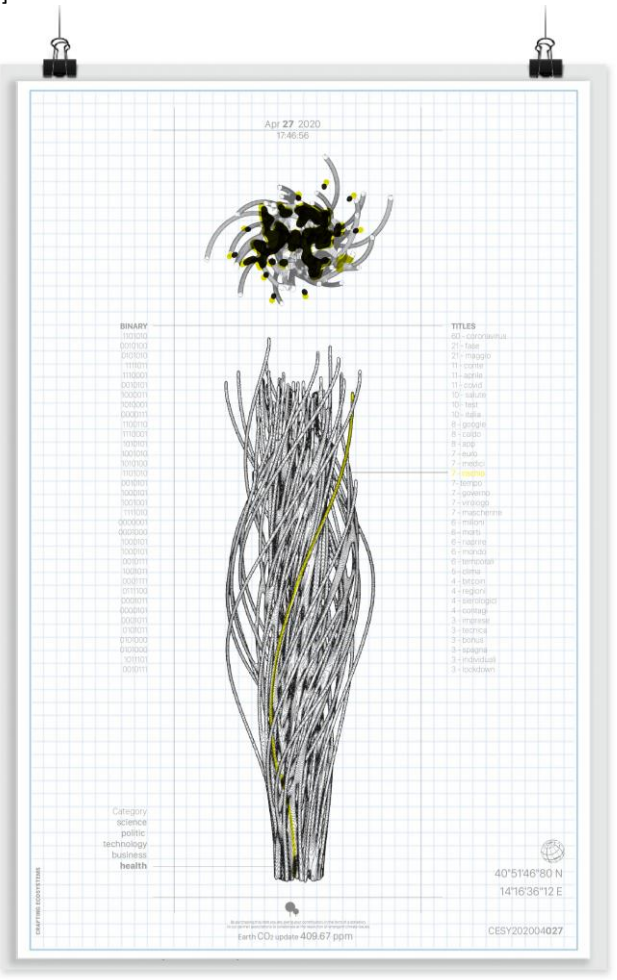
_DCs 4. *Crafting Ecosystems.*

The experimental project Crafting Ecosystems, activated by the emergency of the global pandemic, is an attempt to exploit the traditional approach of the designer toward data to produce a new awareness about extraordinary dynamics and bold design-led scenario. In

this proposal, raw data are seen as physical materials expressing information capable of modeling a tangible change process.
The project is based on a double-time perspective, made evident during the lockdown: the speed of the media information coming from the continuous digital flows; and the slowness of the natural ecosystems with its calm and inexorable evolutionary times. With the aim to relate man and nature through digital technologies, combining these two-time levels, it is an invitation to observe reality in an integrated way and realize how emergencies inevitably depend on the interconnected balance between all living beings, humans, animals, plants.
Firstly, to activate this design process, it has been selected a source, as the designer usually does when looking for specific raw materials. In this case, view the focus on the pandemic's related information, they have been chosen the Italian journalistic daily news from an API in open-access. In collaboration with a network engineer, we designed different algorithms to use as crafting tools for these "data flows." The first algorithm has been created to filter data and keep only the ones relevant to represent the current scenario of Covid-19. Secondly, we obtained a collection of words, such as the most used by National newspapers in pandemics, concerning health, science, technology, and politics sections. [Figure 1] We have considered their frequency and the exact words used to enable filters of comparison, statistics, priorities and determine their presence variability and relevance. In a very synthetic way, this data collection has depicted the dominant info-sphere during the climax of the virus spread in Italy.

After this phase, a second algorithm has been structured to extract a cluster of sub-data, such as recurring words associated with the main ones, to start portraying a more exhaustive scenario made of quantitative and qualitative information, whose intersection composes a narrative of both numbers and perceptions. [Figure 2]

The result has been a daily collection of selected data which we processed with a final 3D modeling algorithm. This passage envisions an organic and virtual plant generated by the selected data's interaction, critically filtered to respond to our goal to connect technology, design, and ecosystems perception. In this sense, we aimed to clarify the relation between emergencies, as the current pandemic, and human responsibilities translated into the ecosystem's alterations. For this purpose, we have imagined an interactive app that visualized the monthly growth of the plant. [Figure 3]



The plant grows organically, day by day, interconnecting at different levels the words selected by the two previous data algorithms, the geo-fencing coordinates of the user, and the local daily CO2 levels generated in real-time. By selecting a specific day, the user can purchase the corresponding physical graphic artwork in order to rebalance, by their planting, the number of trees needed to restore that ecosystem.
From a conceptual perspective, the visual combination of algorithmic design and the progressive inclusion of data from nature reveals a philosophical choice of a non-passive acceptance of our interconnected condition between natural ecosystem and infosphere. Through the app project, the data algorithm governs the virtual plant's growing logic, while the critical thinking project coincides with the decision phases that establish the operations at multiple levels of complexity (numerical, geographic, climatic data, xyz variants).
The plant's variations proceed according to rules that can only be partially controlled because they are linked to the world of media information flows and the atmosphere's ever-changing parameters. [Figure 4]

The experimentation - shown here through previous study diagrams, a series of interactive app screens, and a final material graphic artwork - produces a symbiotic digital ecosystem generated by the algorithmic 3D crafting of multiple intertwined branches. In summary, the branches grow from the update of the news flows of the world of journalistic information. Every day is different due to the ecological footprint - associated with a progressive serial number that corresponds to the global warming CO2 ppm present in the atmosphere (for instance, 20.04.2020 Co2: 414.50 ppm) - and the numerical indicators corresponding to the number of trees necessary to compensate for the system's imbalance. (Mancuso, 2017) [Figure 5]

The visualization produced through the use of the digital device's app that informs their daily readers wants to compare itself to a completely distort newspaper, in the form of an iconic natural plant. In this way, the user is stimulated immediately to develop empathy and active

participation towards the daily ecosystem, observing and interacting with the variable information. Moreover, punctual information is added through the input of the user's IP in the only form with open accessibility, not requiring a GDPR approach that is not including sensitive data. A numerical code obtained from his/her location, date, and time of stay enters the algorithm. In this way, the users are also part of the creative process, personally affecting the digital outputs' creation, later translated into a tangible graphic artwork.
In the final phase of the project, not yet realized, Crafting Ecosystems wants to use in real-time both a web platform and the app, creating a multi-layer interface of 365-days from its starting day. Thus, the designed algorithms are detectors of fluctuant ecosystems, whose variations are expressed by the aesthetic, linguistic and quantitative hybridization of different values, both natural and artificial.
This last interaction is still in the final design phase since we are planning to enable the user to interplay with the layouts and share their content, extrapolate meaning, concretely activate a series of actions aimed at the change, building a correlation between the digital and the real world.
The virtual plant visualized suggests so a new design-led scenario: to metaphorically cultivate natural ecosystems which, thanks to the app, can be grown, be shared, and changed through physical actions and behaviors.
As an envisioned result, we imagine an interactive app that allows the users - by purchasing the graphic daily material poster - to contribute to the restoration of the natural balance ecosystem during and after Covid-19. This economic contribution can be in donations to partner associations devoted to the plant of trees.
Crafting Ecosystems is aimed to hybridize virtuality and materiality, infosphere and natural ecosystems, algorithms and critical thinking, information, and empathy. It claims that data-focused design should actively participate in the definition of an advanced Information Age. It opposes digital information's intellectual laziness, employing awareness, nature, crafting, humanity, and transdisciplinarity.

About the Authors:

Author 1 Francesco Dell'Aglio, industrial designer and Ph.D with a background in Architecture, is teaching Project Development and UI/UX Design at Apple Developer Academy in Naples. His research interest is in culturally connecting

materials and manufacturing processes, investigating relationships with the environment and its perception.

Author 2 Enza Migliore, PhD in Design and Innovation, Post-Doctoral Research fellow at Metropolitan University of Tokyo (2017-2019). Currently Design Studio Tutor at Xi'an Jiaotong-Liverpool University in Shanghai. Her research focus is about an interdisciplinary approach and a critical perspective on materials and Design, exploring their impact on society.

Author 3 Chiara Scarpitti, designer and Ph.D, is currently Assistant Professor (RTDa) at the Department of Architecture and Industrial Design University of Campania "Vanvitelli", Italy. Her research activities - theoretical and practice-based - are characterized by a speculative hybridization between digital technologies and high craftsmanship in a vision of post-digital convergence.

Thinking with Card: Curriculum-Led Making Activities Integrated with Distance Learning

Benjamin Hughes[a]
[a] Beijing Institute of Technology, International Design Centre
*benhughes@bit.edu.cn

Abstract | This paper describes the integration of creative making activities into existing curriculum components primarily for Chinese (Middle School) students (approx. age 7-14). The strategy is built on an understanding and experience that while such activities are crucial to the development of design and spatial ability, their presence is generally undervalued and marginalised in favour of higher status subjects. In developing learning tools that reinforce more traditional subject areas, (particularly STEM), the project aims for a greater acceptance of design-led and making activities. The provision of a free (bilingual) online repository of these activities has made them highly suited for use during the Covid-19 pandemic and corresponding increase in distance learning and home-schooling. Early user tests indicate good acceptance of the concept, and recent government policy announcements may improve acceptance further. The design of new models has been built into a standard course for undergraduate design students.

KEYWORDS | EDUCATION, ACTIVE LEARNING, MAKING, CREATIVITY

1. Introduction

This paper presents novel strategies for improving access and acceptance of art and design making activities in the curricula of Chinese middle schools. While recent years have seen some enthusiasm for reform in the area of 'aesthetic' education, this has rarely translated into increased access to making activities in art or design fields (Yang, 2019). The project described in the paper, "Thinking with Card" attempts to integrate these valuable making skills into more traditional subject areas, thereby gaining acceptance as a means of augmenting learning in the traditional setting. These students generally lack the opportunity to engage in hands-on lab activity in science subjects and have limited scope for exploring their learning outside of lectures, essay writing and problem solving (Tatlow, 2019). The project is aimed at Chinese (Middle School) students (approx age 7-14) but has been developed in a bilingual model so that it is also suitable for UK (Key Stage 2 and 3) students. These activities are designed to be available for download from a website and then printed and made at home using simple and widely available tools. The outcomes serve not only to illustrate complex ideas in subjects such as maths, physics, biology and geography, but also to develop students' skills and interest in making card models. This in turn is intended to boost students' spatial and construction ability which is seen as crucial in developing design and problem-solving capabilities (Hughes & Milton, 2006). We have sought throughout the project to gain feedback from both teachers, students and parents in order to enhance the material. Derived as a means to improve making and spatial skills at an early age, the project has also been integrated into a course for undergraduate students (to develop new card models). This is a way of ensuring the sustainable development of the project as successful outcomes from the students work can be incorporated back into the resource.

2. Educational Reform and Shortcomings of Creative Education

While represented in the core curriculum up to grade 10 in China, art education is generally limited to 'Art Appreciation' type courses in secondary schools (Wang, 2003). The responsibility to provide more familiar 'hands-on' learning in this area has therefore fallen to parents rather than schools in China. In the last decade this has created a boom in extra-curricular art and design education as the growing middle classes recognise the importance of this type of activity in terms of creative thinking and problem solving (Tatlow, 2019). Previously only part of a national strategy in the broadest terms, there are signs that the traditionally conservative Ministry of Education is working to improve access to art education for Chinese students. On July 8th 2019, the Communist Party Central Committee and State Council published new guidelines for education reform including a call to strengthen 'aesthetic training with more art curriculums and activities." (Communist Party of Central China Central Committee and State Council, 2019). This includes a desire that "More information technology should be integrated into school teaching with more free and high-quality educational resources in rural and remote areas." These guidelines have evolved into

more concrete proposals such as the announcement on October 20th, 2020 that further promotes 'aesthetic' education in schools. These proposals culminate in a pilot policy that for the first time, assessment in art subjects will be included in the general standards for high school enrolment over the whole country by 2022 (The Chinese Ministry of Education [MOE], 2020).

The issue remains, however that in practice there is much misinterpretation of the guidelines and huge differences between the quality and quantity of arts education, much of it continuing to focus on the accumulation of knowledge to pass exams rather than the merits accorded arts education in a broader developmental sense (Yang, 2019). In terms of fine art, this is likely to mean the ability to assess a movement, style or individual artist from a prescribed viewpoint, in turn taken from a sanctioned historiography of art history (Yue, 2009). Given the large class sizes and limited resources this content is generally delivered in a lecture or powerpoint format. There is little opportunity for the appreciation of real artefacts and even less for hands-on experience of materials and techniques. In some circumstances the guidelines ascribed for 'Aesthetic Education' are interpreted as more akin to citizenship - assessed in relation to being well-disciplined or doing good deeds in public (Li, Xue, 2020). It becomes clear that while there is recognition at a government level as to the importance of creative activity, there is often little enthusiasm for space within the curriculum given the existing pressure on examined subjects.

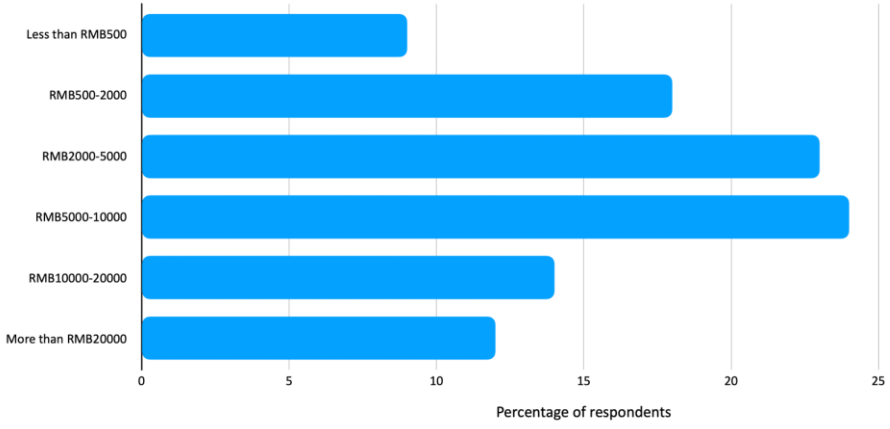

Figure 1. Projected annual expenditure per child on extra curricula art classes (sample taken from parents whose children already enrolled in extra curricula art classes. (Wang, 2020).

This shortfall in provision is therefore left to the parents to pick up - those sufficiently keen to promote creative practice in their children's development (and sufficiently affluent to provide it). Demand in this area has created a growing industry of specialist institutions who provide extra-curricula activities in a wide variety of subjects - painting, ceramics, textiles,

drawing, sculpture, art appreciation. One such provider is Big Ink Dandelion (大墨蒲公英素质美校) which boasts over 200 sites in 150 cities throughout China. The company claim to have taught over 10,000 students (ages 3-16) since their founding in 2001 (http://www.dmpgy-art.com). The branch in Weiyang District, Xi'an, Shaanxi Province has 11 teaching staff and between 500-600 registered customers. In order to better understand this market and some detail of parents' attitudes, spending patterns and interests, a survey was conducted in collaboration with Big Ink Dandelion in September 2020. 100 parents from the company's database which fit the profile of our target audience (age 7-14) were canvassed (Wang, 2020). It was found that while the vast majority of parents expressed their interest in art and design courses, 80% felt unprepared to provide access to these kinds of activities at home. 51% of all parents were planning to purchase art related activities in the next year, prepared to pay over RMB5,000 (U.S.$760) per year, rising to over RMB20,000 (U.S.$3050) for 12% of respondents) for the privilege (figure 1). In terms of the aims of this investment, it was clear that parents didn't expect the children to move into arts education, but that they considered the outcomes beneficial to their children's overall powers of imagination and creativity (51%) and appreciation of art (46%).

As a 'New First Tier City' (Yicai Global, 2019), Xi'an has a wealthy middle-class population where parents are evidently happy to spend money on their children's education outside school, but this research is by no means representative of the whole population. It is reasonable to extrapolate a broad picture, however, of a growing market for, and importance placed on, the provision of suitable art and design activities.

3. A New Strategy for the Integration of Making Activities

In developing a strategy for the promotion of making activities in schools, three issues were considered in relation to each other: Firstly the lack of provision of studio or art-room based teaching in Chinese middle schools; secondly, the acceptance of and demand for creative training amongst middle school parents and thirdly, the traditional focus on core examined subjects in the curriculum.

The strategy itself is based on an understanding of the importance of making in relation to creativity and design (Williams et al, 2010). The author's own experience with hundreds of design students in Chinese Universities reveals that only a small proportion have been able to acquire anything beyond the most rudimentary making skills and that the accepted practice is for model-making requirements within a design course to be farmed out to professional companies. The level to which this approach is normalised runs counter to evidence that links making practice to creativity and problem solving in the design process (Hallgrimsson, 2012).

This project aims to combine the benefits related to the making of physical models with the benefits related to the use of practical elements within the teaching of STEM subjects in

schools. In the UK, this has its origins in the Nuffield Science Projects of the 1960's which imagined the 'Pupil as Scientist' and encourages the natural curiosity of students with the effect of a deeper learning experience with better recall (Millar, 2004). While this has even extended to the teaching of science in a distance learning format in the UK (Fox, 1994), it is relatively uncommon in China where a teacher-orientated approach means that even laboratory work is taught through demonstration or even video rather than direct experimentation (Fulmer et al 2015).

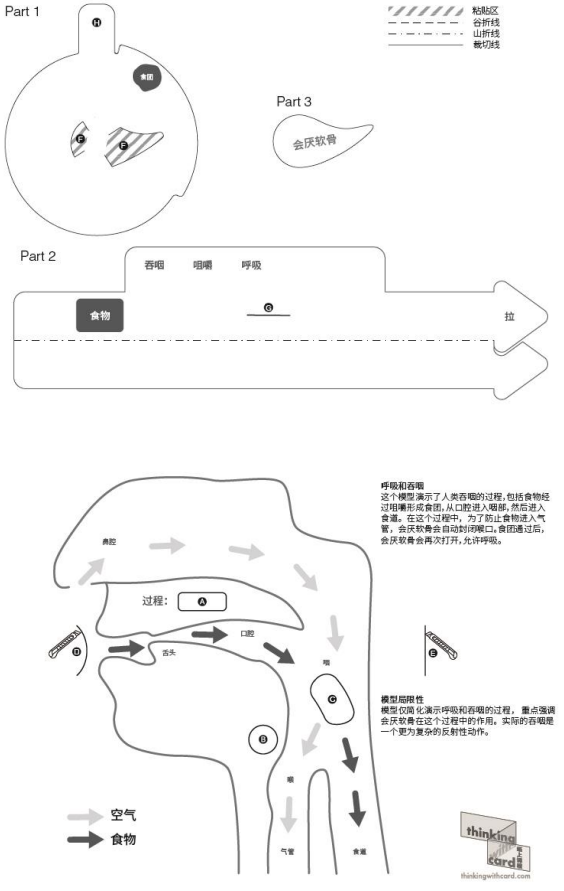

Figure 2. Thinking with Card Epiglottis Function Interactive Model Example (printed spec).

The Thinking with Card project provides targeted curriculum support material that is relevant to specific knowledge that the student needs to acquire. This is a step towards a

more experiential learning model (Dewey, 1938), which is not widely implemented in China. This novel teaching material is in the form of print specifications in PDF format which may be downloaded via a computer or mobile phone and printed out (figure 2). This material comes to life when it is constructed by the student using simple tools either at home or in school. The resulting interactive model, intended to show the concept in an engaging way, adding an extra dimension to existing teaching materials which should in turn lead to greater comprehension and recall. The models generally contain supplementary information to support the concept being demonstrated, but may also be amended and added to by the student. The making and interaction with the model is intended to bridge the gap between the theoretical model of the world (required in order to reproduce the information) and the physical world (that which is directly experienced by the student). This 'changing of register' to make the phenomena appear in a different medium (Figure 3) is thought to help students better construct meaning to their knowledge and be able to apply it in more abstract ways (Tiberghien, 2000).

Figure 3. Categorisation of Knowledge Based on Learning Experiences. Adapted from "Towards Research-Based Design of Teaching Situations in Physics at the Secondary School Level." (Tiberghien, A. 2000).

Whilst the 'hands-on' nature of the learning experience is itself only another representation of the phenomenon described, the fact that this model can be subject to physical interaction and repeated movement makes it a far more valuable resource than a diagram or even a series of diagrams. It becomes possible to represent opposing elements within a particular concept, for example the relationship between current, movement and magnetic field in the process of electromagnetic induction in a coil, (figure 3). This making activity and subsequent interaction provides the kind of opportunity for the reconstruction and retention of knowledge in the mind of the learner that is so valuable (Driver et al, 1994).

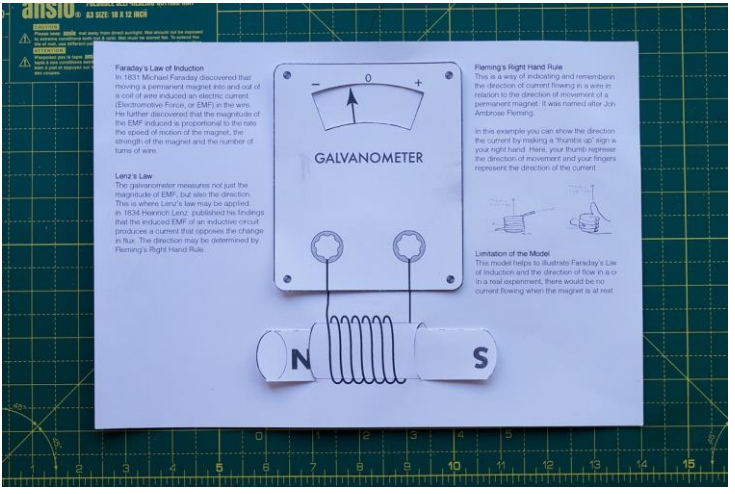

Figure 3. Thinking with Card interactive model demonstrating electromagnetic induction in a coil, Faraday's Law, Lenz's Law and Fleming's Right Hand Rule.

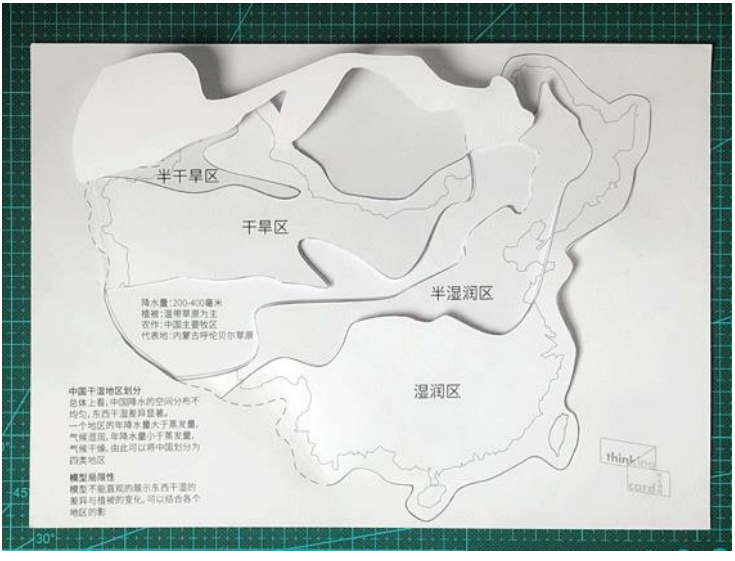

Figure 4. An interactive map demonstrating the zones of Chinese climate based on rainfall. One of a series of interactive models based on standard elements of the geography curriculum.

4. Integration of New Strategy into Learning Schedule

The route to integrating the model and making activity into a student's schedule may be instigated by either teacher or parent. Each activity is intended to fit with a subject in the STEM curriculum, although there have also been models added that relate to the History and Geography curricula (Figure 4). The parent or student can download the PDF model onto a computer or smartphone and print this out either at home or cheaply at a local print shop. Each .pdf document is available in English and Chinese and includes both the parts needed to make the model and the instructions to be followed (Figure 5). Certain models are intended to be made from paper, others in thin card (180-250gsm). Where the latter is required, the model may either be printed onto paper and mounted on card or printed directly onto the card. The basic tools required include a cutting mat, knife, glue stick and metal ruler, with instructions given on how to use these safely.

Figure 5. Example of the instructions required to make one of the models, in this case the structure and function of the middle ear (Chinese Version).

The strategy developed makes use of relatively simple materials and processes but aligns these with the high penetration of computer and smartphone use and the availability of printing resources either at home or in local print shops. The website was created with a simple interface through which teaching models can be downloaded and printed out. This meant that the models can be used both in established school curricula, those developed in

response of the Covid-19 pandemic (and greater need for distance learning tools), and those developed for home schooling.

The website started with a handful of models in order to demonstrate the concept. From this, we sought advice and feedback from teachers, parents and students in terms of identifying suitable models for development. This led to a set of 14 models which address the various areas identified. There are several more models in development, but the complexity of some leads to a lengthy development period. It is interesting to note that while this project was undertaken to address a particular set of concerns, it is not unique in its outlook. In the course of developing the project, we came across interesting historical examples of card models both for education in a conventional setting and also through promotional items. One significant example is a series of card models published in Manchester by John Heywood Ltd. This series of articulated cardboard models show detailed schematics of piston and valve timings in several engine types including diesel, petrol, Corliss steam and simple steam engines (figure 6). These models are similar in concept to models in the Thinking with Card project, albeit more sophisticated and detailed. It goes without saying that the user is not required to make the models, but their implementation, along with instruction in the included booklets, engineering students can create complex calculations related to efficiency and pressure (Jones, 1903)

In addition to historic examples of card models, the potential for combining home printing technology and card modelling techniques as an educational tool have been explored by researchers in the past.

> "As many teachers and parents are aware, building pop-up books and cards can be a compelling creative activity for children. Pop-up forms manage to combine, within a single artefact, artistic and creative invention, spatial and mechanical motions of paper, and (often humorous) writing." (Eisenberg et al, 2003 p.2)

While the activities described do not quite fit the model described in this paper, they share two key components: mechanical pop-up forms and making activities for children. In terms of the development of creative skills, there is broad consensus in the design education community regarding the importance of prototyping and model-making. While the role of visual models and prototypes are fairly familiar, it is also acknowledged that sketch models and experimental models are also crucial throughout the development process.

"Prototyping is a key problem-solving activity in product design. It starts right from the beginning of a project and continues right into production. Given the complexity of product development, it is critical to take as much of the guesswork out of the design process as possible, and prevent surprises from showing up later in a project." (Hallgrimsson, 2012 p.7)

While many design texts focus on the use of foam, clay and timber models, it is clear that card models are widely implemented and valued for their speed, accuracy, reproducibility and cost-effectiveness (Saul G. et al 2010)

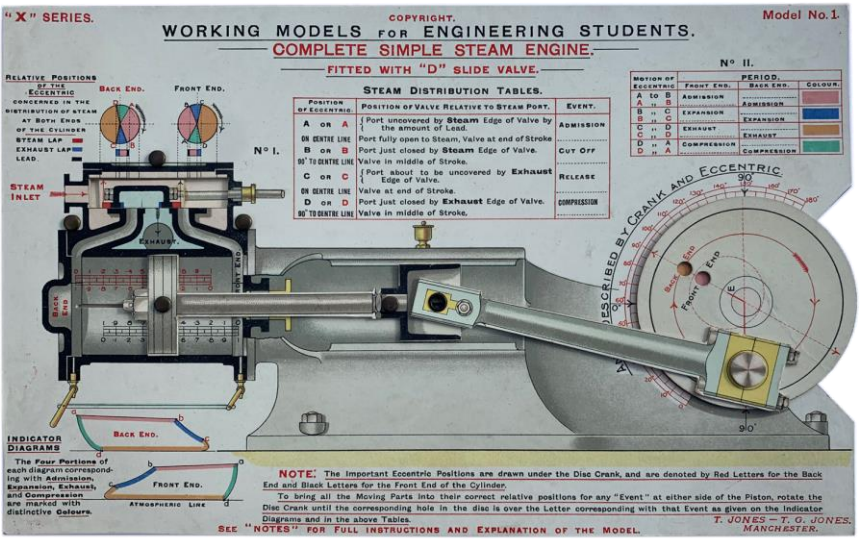

Figure 6. Example of an articulated card model used to teach engineering students the parameters of steam engine performance and design. (Jones, 1903)

5. User Testing and Feedback

From the beginning of the project, an attempt was made to develop an ecosystem for the project from which feedback may be sought from teachers in the area targeted. These teachers, once familiar with the aims and scope of the project, would be able to both select appropriate tasks for their students and suggest models that would be useful in the teaching of particular themes and concepts (Figure 7).

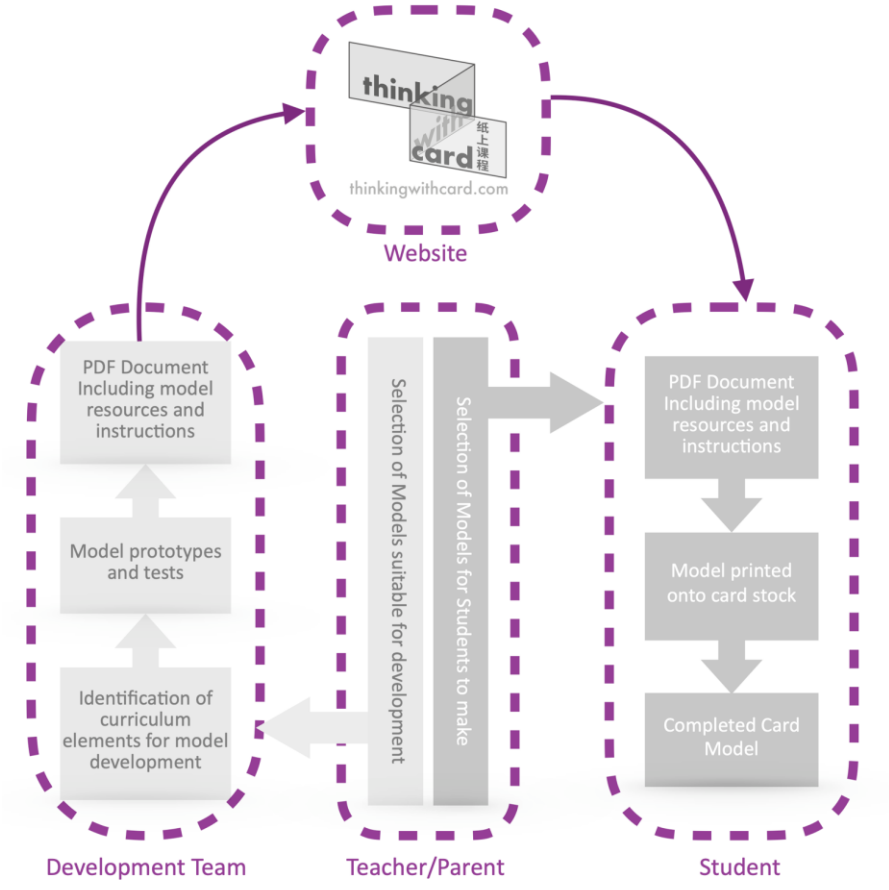

Figure 7. Representation of the different roles within the Thinking with Card ecosystem

Once a series of models had been developed, the website was promoted amongst teachers and parents who might be able to implement the tools in their own teaching. This included posting to relevant social media groups, targeting specific teachers and running workshops with students of an appropriate age where additional instruction could be given and observation could be undertaken (Figure 8).

Figure 8. Workshop conducted with students to build sample models.

The initial interest was good amongst students of the target 7-14 age bracket. They managed the tasks well and reported enjoying the experience. It is clear that this kind of making activity, despite being themed around academic subjects is considered more like 'play,' where the novelty and freedom to explore holds less status than perceived activity of accumulation of knowledge. We were therefore more interested (and apprehensive) regarding feedback from teachers and parents. In order to get as much coverage as possible, this was sought through the more formal means of a survey.

The survey was undertaken to identify areas of weakness in the strategy and as a tentative evaluation amongst the target audience. The sample was chosen through a database of families and teachers who had participated in workshops or been made familiar with the project through introduction by students and tutors in the previous 6 months. 70 respondents were canvassed through Wechat social media, accessed through smartphone. The questionnaire contains both closed-ended and open-ended questions in order that we can use the information in a numerical analysis and also accept more detailed insight where it is available. The closed-ended questions are concerned generally with opinions about the use of practical making activities for middle school students and the use of the Thinking with Card models. These questions have a Likert five-point scale choice to determine the strength of opinion (figure 9). The questionnaire was conducted in Chinese language only amongst Chinese teachers and parents. The results are published online (Hughes, 2021).

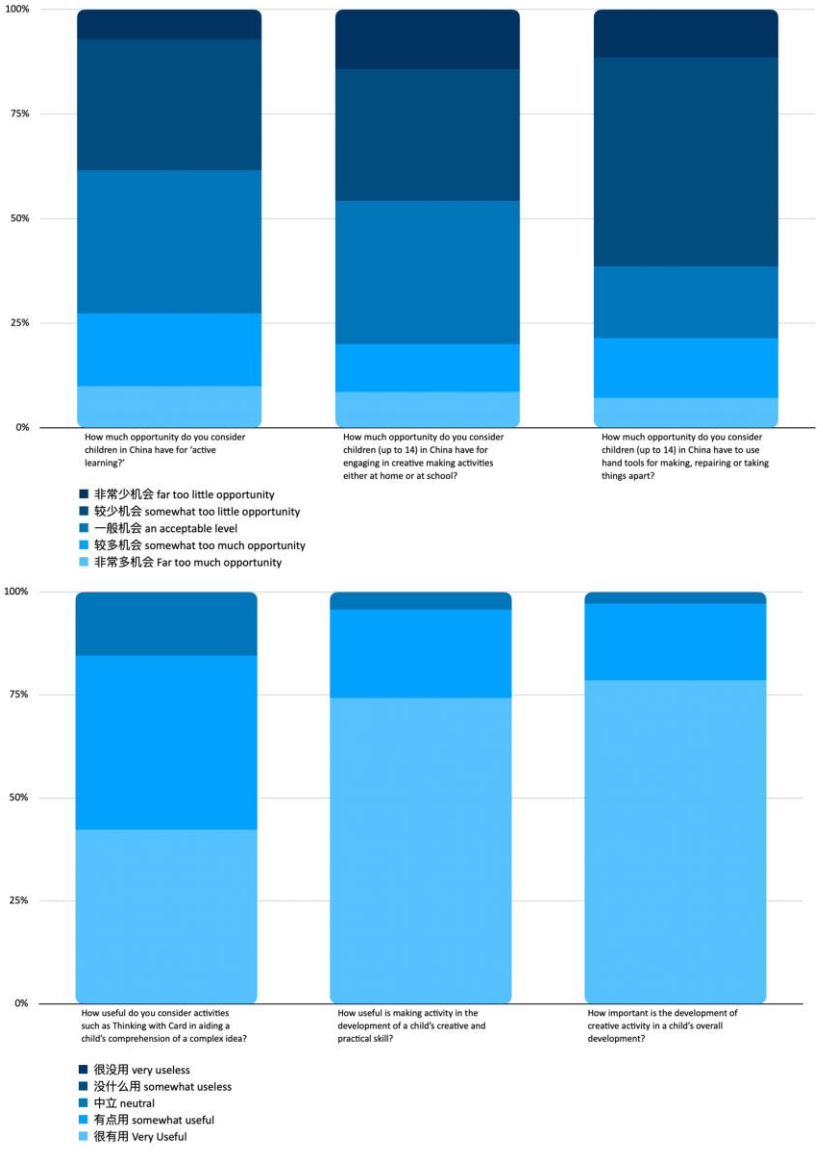

Figure 9. Selected outcomes of survey amongst parents, teachers and users of the Thinking with Card resource.

The findings demonstrated that 95% expressed a belief that 'making activity' was useful in the development of a child's creative and practical skill. The 5 most popular models in the

range were geographical terrain; historical Spring and Autumn Period; geographical climate distribution; earth orbit and seasons and biological plant photosynthesis. Of those with direct experience of using the models, only 5% found any of the models difficult to make, the reason given being that the description of the steps was not clear enough. 84% of these users considered this kind of activity useful in aiding a child's comprehension of a complex idea while 88% of all respondents consider the development of creative activity important to a child's overall development. All teachers canvassed indicated that they were willing to implement the tools in the classroom. They suggested that the content should be more extensive, so as to ensure that the knowledge is common and easy to understand, and that the instructions and operation be as straightforward as possible.

The open-ended questions garnered a good number of supportive comments as well as constructive suggestions, for example:

> "Quite necessary, Chinese children lack such hands-on opportunities. Such activities during adolescence will benefit children a lot in their growth and future life."
>
> "I strongly support the idea, but it should not be simple cut and collage – it needs a variety of materials research and application of divergent thinking."
>
> "Very good to do this kind of learning enhancement activity with children. Whether or not the material is useful, it is still a worthwhile experience."

6. Future Development

As previously described, the project relies in part on an ecosystem from which feedback may be sought from the teachers and parents of the target users. Teachers, in particular, once familiar with the aims and scope of the project, would be able to both select appropriate tasks for their students and also provide feedback to the development team regarding improvements (figure 7). Of particular relevance to design educators is the way that this development team is being configured to include undergraduate and postgraduate student projects. While initial project examples were developed by a professor with a small group of three postgraduate students, the aim in the future is to populate the project with models developed by larger numbers of students attending a course focused specifically in this area. The lack of making skills amongst design students means that tuition on basic card modelling skills are of great benefit and can yield excellent results. This starts with tuition regarding tools, safety, basic cutting and folding techniques and joining techniques. From this foundation, students can be introduced to modelling structures and mechanisms in card of increasing complexity (figure 10).

The Thinking with Card project is a good vehicle for this type of project because it provides a well-defined focus that requires students to put themselves in the position of both teacher and middle school student. Although the task appears relatively straightforward, the time and effort needed to refine a concept into a fully functional proposal is surprisingly great. On

a small scale, this gives students a good insight into the process of create and specify a design for production. Following some initial success with workshops and short courses in this area, the course is being piloted as an online MOOC course. This includes 8 sections: Basic card modelling materials and tools; Basic card modelling techniques; Sample structures in card; Sample mechanisms card; Introduction to Thinking with Card; Selection of Theme; Concept Development and Evaluation; Product communication and specification. A set of 'style guides' have been produced to ensure that models produced for the project adhere to the same basic layout and legibility.

Figure 10. Workshop with postgraduate design students to develop mechanical structures in card.

6. Conclusions

The distance-learning/home-schooling strategy described in this paper was created as a means to not only boost the understanding of complex ideas to an audience starved of rich learning experience, but also to introduce, almost by stealth, a component of making. Each of these elements, it turns out, had been implemented previously in some form or other but their conflation into a single entity became more realistic in 2020. The combining factors that facilitated this this include the penetration of internet and mobile phone usage in China, the proliferation of cheap options for printing; the desire for education reform and the Covid-19 pandemic which meant many students working from home for the first time. The first challenge was to prove that the strategy was feasible - that the DIY construction of physical learning tools was achievable and engaging to the core audience (7-12 Year old middle school students in China); the second was to gain acceptance amongst the gate-keepers of education in China - parents and teachers. The first challenge took time and seemingly endless permutations of model development in the early stages, but our

workshop activity demonstrated early enthusiasm for the concept. The second challenge is ongoing. The Chinese education system is founded on a broad acceptance of the teach-to-examine model which dates back centuries. The legally guaranteed 9 years of education has proved difficult to standardise in terms of quality given that China is such a vast country with huge disparities in income and lifestyle (Postiglione, 2006). It is not unreasonable that initiatives generated outside of the Ministry of Education would be treated with some suspicion. Follow-up projects and further engagement with teaching staff is seen as crucial to the future success of the project. Thinking with Card is a pilot initiative that provides access to a richer and more practical learning experiences (Dewey, 1938). The hope is that it can provide an example of how experiential learning can be integrated into a system that is less informed by exploration and active learning. An elective course for undergraduate and postgraduate students is being developed which will help produce further models for the project; improving and enlarging the content in the next stage.

Abstract | The aim of the study reported in this paper is to develop an understanding of official public health communication design on Covid-19 globally. As a new disease, the rapid rise in the sheer volume of new scientific information about Covid-19 surpasses human processing capabilities, impacting the public and policy makers, creating an 'infodemic crisis'. Following a two-stage message/language framing and visual design analysis of crowdsourced official Covid-19 Public Health material we present findings from 46 countries, across five continents, and more in-depth analysis of 32 material from 17 countries. This is the first of its kind paper offering an analysis of the global situation on Covid-19 public health communication design; and six draft recommendations on how to effectively plan communication and frame messages that are compelling and actionable to the local audiences considering their social, cultural and economic circumstances.

KEYWORDS | COMMUNICATION DESIGN, PUBLIC HEALTH, COVID-19, VISUAL DESIGN, DESIGN FOR HEALTH

1. Introduction

The coronavirus disease 2019 (Covid-19) pandemic has ushered a new era of increased conspiracy theories, fake news and misinformation, regarding the aetiology, outcomes, prevention, and cure of the virus (Tasnim, et al, 2020; Van Bavel, et al, 2020).

This has made it very difficult for the public to distinguish scientific evidence and facts from less reliable sources of information, often leading to counterproductive practices that increase the spread of the virus.

Governmental agencies rely on public affairs messaging to address public health crisis (Barbour, et al, 2015). In this unprecedented situation, Governments across the globe and policy makers are looking at each other for solutions inspiration, trialled policies and interventions they can implement by their own national and regional authorities. But have failed to establish international cooperation and knowledge exchange to cope with this. In this context, local COVID-19 communication plays a key role in informing citizens.

In response to that, the Design Research Society Special Interest Group on Global Health, has developed an open access repository containing crowdsourced information on Covid-19 public health messages and information set by official national and international bodies. The aim is twofold. First, to develop an official of data on public messages and information on Covid-19 that researchers, public health authorities and policy makers can access and forward to communities globally. Second, to conduct a multinational and multicultural visual and language communication analysis of Covid-19 public health messages included in it. The latter is presented in this paper.

2. Background and Related Work

2.1 The Infodemic Challenge of Covid-19

Infodemic refers to an exponential increase in the volume of information associated with a global issue such as an epidemic (WHO, 2020). As COVID-19 has been a relatively unknown virus, in terms of the impact on humans, we are witnessing a rapid rate of new scientific information being published (Eysenbach, 2020).

Since the Ebola outbreak in West Africa, in 2014-2016, the health sector has learned that trust in health authorities, community engagement and accurate information can go a long way to help the public comply with public health measures (Gilmore et al, 2020). The need for official messaging during the COVID-19 pandemic is arguably far greater than in more commonly encountered hazard settings, and the demands on communicators to inform and motivate are higher (Sutton et al, 2020).

Governments and international health bodies are engaging the scientific community for evidence-based recommendations on how to minimise harms and better manage the

pandemic (Sutton et al, 2020). The widespread of misinformation related to the diagnosis and prevention of Covid-19 has confused both the general population and policy makers who are regularly issuing new and revised guidelines for disease prevention and treatments (Tasnim et al, 2020).

The main challenge here is not just the sheer volume of information, but critically its translation and communication into actionable recommendations that are contextually, socially and culturally relevant for different audiences across different parts of the world; especially among countries with low income, low life expectancy, and less education (Savoia et al, 2013; Gagliardone, 2016a; Brisset-Foucault, 2016).

The Covid-19 pandemic has resulted in an enhanced requirement for communication with the public on an ongoing basis, not only to pass on warnings and alerts, but also to inform, educate, and continuously motivate individuals in their roles as de facto responders in the ongoing disaster (Sutton et al, 2020). There is a need for more targeted public health information within communities and for partnerships between public health authorities and trusted organizations that are integral to these communities (Van Bavel et al, 2020; Srinivasan & Lopes, 2020).

2.2 Lessons from past epidemics/pandemics

As demonstrated by recent public health crises, such as the global Ebola outbreak, it is clear that threats to public health do not respect national boundaries (Barbour et al, 2015).

Communication of timely risk information is absolutely vital for behavioural change to protect public health and safety. However, prior work on messaging in response to emerging health threats such as Zika and Ebola has shown that effective messaging strategies can depend upon details of the threat itself (Sutton et al, 2020).

Past outbreaks' analysis, such as that of Ebola and the Zika virus, shows that effective communication about the outbreak to the public and how to prevent its transmission take time and offers lessons for the current Covid-19 pandemic public health communication messaging (WHO, 2015; WHO, 2016). Covid-19 presents a challenging context for communication about prevention, containment, and treatment as well. Rather than a single, one-time big event, we have seen that Covid-19 presents as a rising tide or prolonged risk incident with several waves of occurrence.

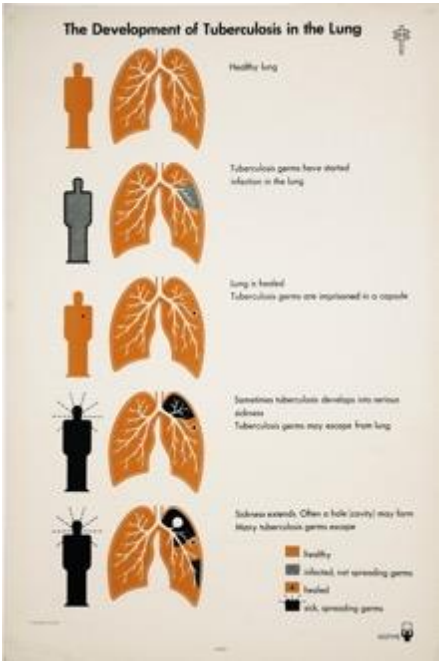

Figure 1. The development of tuberculosis in the lung', 1938. Charts from the 'Fighting tuberculosis'exhibition produced for the National Tuberculosis Association in the USA in 1938 (Black, 2017)

Public health officials and scholars agree that cultural values and traditions significantly influence responses to pandemic (Vaughan & Tinker, 2009; Lin et al., 2014). Work from the early 20th century on poster leaflet design to raise awareness on Tuberculosis (TB) in Nigeria, has demonstrated the importance of mapping visual characteristics, such as the use of colour, to match it with existing cultural associations and perceptions. For instance, lungs marked in yellow, to designate a healthy person; red, to represent tuberculosis due to associations with danger and misfortune – see Figure 1 (Kindel, 2013 in Black, 2017).

As in the cases of responses to influenza, covid-19 risk information, are influenced by existing psychological, social, cultural, health, and socioeconomic factors, which greatly affect how individuals interpret health risk communications, as well as their willingness and ability to act in a timely manner. Lessons learned from historical and recent public health crises suggest that inappropriate communications and insufficient planning can greatly compromise risk reduction (Maunder, 2004; Vanderford et al., 2007; Vaughan & Tinker, 2009).

2.3 The role of Design Communication in Public Health

Public health communication must successfully instruct, inform, and motivate appropriate self-protective behaviour, update risk information, build trust in officials and dispel rumours (Vaughan & Tinker, 2009). Communicating effectively with the public about specific threats is the key to successful emergency management and public health, helping to mitigate the risks. It supports the implementation of protective actions and contributes to minimizing negative mental health impacts of disasters (Savoia et al, 2013).

Traditionally, the field of health communication has been grounded in the natural and human sciences where gold standard research is still based on defining prior hypotheses and testing them (Neuhauser Kreps, 2014). Information design and data visualization has recently emerged as a new field on the communication of public health. Information design is cross-disciplinary, including typography and graphic design, applied linguistics, applied psychology, ergonomics, and systems engineering and has been found to be particularly valuable in health communication (Black et al, 2017; Walker, 2019, Noël et al, 2019; Walker et al, 2020). It is concerned with both language and with visual presentation so that messages are presented clearly and address the needs of the audiences (Neuhauser et al, 2009; Walker, 2019).

Health communication approaches are often intended to translate evidence-based research findings to the public. However, the traditional approach has emphasized the expert design and delivery of generic (one-size-fits-all) messages that are not always relevant to people's personal characteristics or social settings (Neuhauser & Kreps, 2014; Lin et al, 2014). This is because, much day-to-day health communication nowadays (as in the case of Covid-19) is produced by people who do not fully understand typographic principles, which can result is sub-optimal presentation of information (Noël et al, 2019; Walker, 2017). Information design methods involve collaboration and discussion between all those involved, such as scientists, clinicians, designers, writers, technicians and intended audiences (Walker, 2019) and could thus contribute significantly to the design of more effective public health communication material on Covid-19. It can help people retain information that is relevant to them or their situation and it can make the difference between taking action or not, contributing to behaviour change (Walker, 2017).

3. Methodology

3.1 Methods

Our methodology is formed around our research question. This is to explore *how might communication design analysis of official Covid-19 public health material help develop recommendations that are contextually, socially and culturally relevant for public audiences across different parts of the world*.

The study incudes two parts. The first part of this study comprises documentary research of crowdsourced information on Covid-19 Public Health messages and Information, set by official national and international bodies, such as Government, Ministries and International Health organisations. This has led to an open repository which at the time of writing includes data from 46 countries from across five continents. These were collected between April and November 2020.

The second part includes the Information design analysis through language and message framing, as well as visual design framework. The analysis of the language and message framing was done through 15 points divided in five themes: culture, language, social, structure and inclusivity. While the visual design framework analysed another 15 aspects divided in 4 themes: impact, structure, colour and inclusivity. A selection of established documents on public health communication design were collated and reviewed (the WHO Strategic communications framework for effective communications [WHO, 2017]; the Johns Hopkin's Bloomberg School of Public Health Field *Guide to designing a health communication strategy* [O'Sullivan et al, 2003] and the US Centre for Medicare & Medicaid Services The *Toolkit for Making Written Material Clear and Effective* [McGee, 2010]) in the development of the language and message framing and visual analysis framework the team used to analyse the public health Covid-19 communication documents. The process followed the thematic analysis methodology by Braun and Clarke (2008). Once the team was familiarised with the documents, we began the code generation. This was done by looking at each document guideline and coding data by writing notes through the use of notes within the electronic version of the document. After the data coding and collation, we started to look for overarching themes based on the initial research questions. This process produced a number of guidelines, which were reviewed amongst the team and then consolidated and updated to provide the framework guidelines, shown in Table 1. Although we recognise that designers employ picture, symbols, typography, colour patterns in an integrative manner to compose the final visual product, it was necessary for the purposes of our investigation to deconstruct the different visual elements to explore them both individually and as a whole message too.

Message and Language Framing	Culture	Does it use words that are familiar and culturally appropriate for the intended readers?
		Are suggestions or instructions, specific, realistic, and culturally appropriate for the intended readers?
	Language	Is the material/message framed in a friendly/positive way/tone?
		Is the material written in a conversational style, using the active voice?
		Is it keeping sentences simple and relatively short?
		Is it being direct, specific, and concrete?
		Is it written as simply as possible, taking into account the reading skills of the intended audience?
		Does it use devices that engage and involve readers, such as stories and quotations, questions and answers, etc?
	Social	Do readers trust the information sources (is it based on information sources the intended audience will trust)?
		Does it emphasise the health impact here and now?
		Does it encourage action now?
	Structure	Is it giving the context first, and incorporating definitions into the text?
		Does the material say how to get help or more information?
	Inclusivity	Is it gender neutral or inclusive?
		Can readers relate to the health statistics given (do they match as closely as possible to the characteristics of the intended readers and their communities)?
Visual Design	Structure	Is the size, shape, and general look of the material designed with its purpose and users in mind (I,e. more important elements in larger size, etc)?
		Is there a clear and obvious path for the eye to follow through each page?
		Does it have a clear and consistent style and structure?
		Are the visuals that are clear, uncluttered, and consistent in style?
	Colour	Are the colours appealing to the intended readers and free from unwanted connotations or problematic cultural significance?
		Is colour used in a consistent and deliberate way that reinforces the meaning of your messages and enhances their impact?
		Is colour used sparingly (3-5 colour palette)?
		Is text and colour legible?
	Inclusivity	Does the in a colour take into account that some readers are likely to have diminished or limited colour perception (i.e. colour blind, older people vivid colour limited perception)?
		Are visuals gender neutral or gender inclusive?
	Impact	Does the material look appealing at first glance?
		Do the visuals relate directly to the information in the material and reinforce the key messages?
		Are the visuals culturally appropriate for the intended readers?
		Are charts/figures simple and easy to understand?
		Can the visuals evoke affect appropriate for the intended audience?

Table 1: Framework guidelines employed for data analysis

3.2 Data Analysis

Data analysis was carried out in two stages. The first stage was an analysis of the documents to evaluate the guidelines set above and how they were implemented. The data analysis included samples from each country that included a combination of text-based only (i.e. website information on Covid-19, FAQs, prevention instructions/guidelines); visual and text

(i.e. websites, posters on handwashing, mask wearing, prevention, self-isolating, etc). Only documents targeting the general public were examined, as those aimed at expert and professional groups (such as healthcare professionals, etc.) were out of the scope of the study.

The data analysis composed of language and message framing (Akl et al, 2011) and visual analysis (Welhausen, 2015) following the guidelines set in our message framing and visual analysis framework. During this stage, from a pool of eight (with different sociocultural backgrounds, that understood the first language of the communication analysed and with some of them being from those countries), two researchers scored independently (scale 1-5) the documents sampled from a country and added notes. These were reviewed by a third researcher who scored them also ion cases where there was a large score discrepancy (more than 2 points). The stage one analysis took place between July to September 2020.

The second stage comprised of a more in-depth content analysis of the sub-sample of the documents that were explored in stage one. This focused on further analysing good and bad practices of public health communication messages and visual elements applied in the context of Covid-19. The aim was to look at a representative samples of good, mixed, bad and ugly official covid-19 public health message documents, in order to develop recommendations and a toolkit that will guide experts and practitioners to communicate with impact, so that the public understands and supports action on COVID-19. A total of 32 documents from 17 countries were further analysed by researchers individually from October to November 2020. An inductive detection of the primary themes that emerged in the documents was conducted to determine the themes and major issues explicitly stated to examine deeper themes in covid-19 public health communication. A series of groups discussion among all researchers followed, in order to establish common language and message framing and visual analysis practices and patterns, which in turn led to the development of recommendations.

4. Initial Findings

A total of 122 materials from 31 countries across five continents (Africa: 7, America: 8, Asia: 9, Europe: 6, Oceania: 1) were examined. Our findings show that when it comes to the design of Covid-19 public health communication material there are a range of practices (both positive and negative) found across the material reviewed, irrespective of the country or region they come from. Some are found across most material and countries, some across several and a few in more specific materials and countries. We present these below in relation to the message and language framing, and the visual design.

4.1 Language and Message Framing

The analysis revealed that cultural aspects, such as culturally appropriate words or instructions, of the message was considered as an important aspect while transmitting the message. Whereas the structure aspects, giving the context and details about how to get more help, within the visual communications would require more attention.

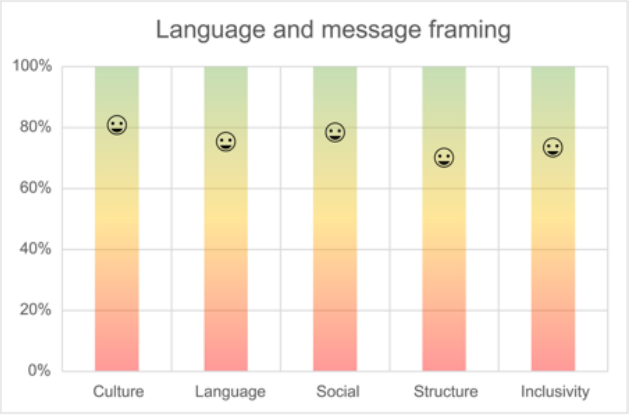

Figure 2. Summary of the language and message framing analysis.

Based on the reviewed visual examples, the most important aspects for a clear language and message framing were considered to be the suggestions or instructions set in the right context and realistic; short and simple sentences; gender inclusivity; and direct, specific and concrete message. While other aspects, such as directing for more information and the emphasis of the here and now impacts were not considered as important.

4.1.1 Good practices

More precisely, the majority of the material reviewed, scored high in terms of some aspects of language. They were written in a gender inclusive language and provided messages that are appropriate to diverse communication means (e.g. Facebook, Instagram, Twitter) beyond the traditional posters, brochures and leaflets. They kept sentences relatively short with most instructions being direct, specific and concrete. Also, several of the materials employ words that are familiar and culturally appropriate for the intended readers. A few of these are written in conversational style. Also, most materials made use of sources that are trusted by the readers, coming from authoritative and well respected national and international bodies.

4.1.2 Bad practices

Structure formed one of the weakest point of the majority of material reviewed. More precisely, many materials did not provide the context first around Covid-19 nor did they explain why it is important that these instructions are followed for the benefit of public health. Some materials lacked accessible further guidance on the measures proposed or guidance on where to get further information if needed.
In terms of language, several of the communication materials may be difficult to be understood. These materials use only plain text and adopt a technical language (from medical sciences). These will likely not to be understood especially by disadvantaged communities and people from a low-education background. On top of not considering the reading skills of the information recipients, many of the materials reviewed did not frame the main message in a friendly or positive tone. A few of the materials reviewed, did also convey contradicting and misleading messages that neglect cultural aspects. For instance, "adopt a friendly behaviour without physical contact but always with *a smile on your face*... *The use of masks is recommended everywhere" was included in a material from a Latin American culture*. In cultures, such as Latin American ones, in which hugging, kissing and handshakes are used to express a 'friendly behaviour' such messages are confusing and would be worth suggesting safer alternatives.
Regarding the social impact of the language and message used, some materials failed to emphasise the health impact of Covid-19 here and now. As a result, they did not encourage immediate action to be taken by the intended readers.

4.2 Visual Design

The analysis revealed that structure aspects, such as clear message framing and consistent and clear structure, of the message was considered as an important aspect while transmitting the message. Whereas the impact aspects, such as making the materials visually appealing and using the appropriate visuals, within the design would require more attention.

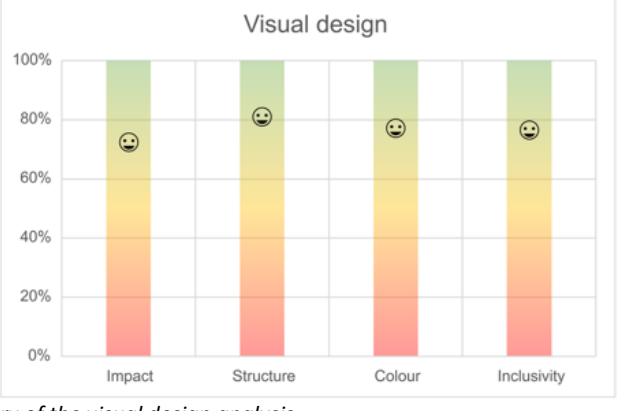

Figure 3. Summary of the visual design analysis.

According to the reviewed visual examples, the most important aspects for a visual design were considered to be a consistent style and structure; obvious path for the eye to follow; and gender neutral or gender inclusive. While other aspects, such as the size of the material and its elements; reader's diminished or limited colour perception; and the text-visuals relation were the least taken into account.

4.2.1 Good practices

In terms of the visual design most material followed a clear and consistent structure offering and easy path to for the eye to follow on the document. Also, those material, which included charts or figures, made good use of these by incorporating ones that are simple and easy to understand. The majority of the materials included legible text and colour, using legible fonts and appropriate contrast of colours. Also, several of them used colour sparingly, employing a maximum of five colour palette. Examples of these aspects are shown in the discussion section.

4.2.2 Bad practices

One of the least scored areas among the materials analysed was visual design. More precisely, the images used, such as photos, illustrations, etc., did not relate directly to the information and conversely, they did not use effectively the visuals to reinforce the key message. Moreover, the visuals in several cases were not culturally appropriate for the intended readers, as they give instructions that do not make sense or are not possible to be followed in the context as our examples illustrate. As such, the visuals employ in certain cases are nor appropriate neither compelling for the intended audience.

In terms of structure, several materials did not consider the size, shape, and general look of the material designed with its purpose and users in mind. Simple visual design practices, such as depicting more important elements in larger size were ignored. Also, some material included visuals that were unclear, cluttered, and inconsistent in style. In most of these cases they visuals were a direct copy paste from other sources without any editing or processing taking place.

Regarding colour, this was generally well applied, except for circumstances where it was used in an inconsistent and unintentional way, (for example using colours randomly without a clear purpose such as in drawing attention to a specific message or instruction, etc) diminishing the meaning of their messages and decreasing their impact.

As far as inclusivity, this was not applied universally and often seemed to be an afterthought. For example, many materials did not take into account that some readers are likely to have diminished or limited colour perception (i.e. colour blind, older people vivid colour limited perception). Gender inclusivity was another issue with several material, which had made use of visuals, being either gender biased or gender exclusive. The lack of diversity is also noticed regarding social, linguistic and ethnic group backgrounds.

4.3 Analysis per Country and Region

Although assessing the official Covid-19 public health communication messages and visuals of each country is beyond our intention, we include the Figure below of the countries analysed, as it provides some useful insights. First it emerges that only about a third of the countries we reviewed their material score consistently for both the message/language framing and visual design. Most of these which scored high for both elements, seem to be countries in North and South America. Also, it becomes clear that most countries did better in terms of language and message framing when compared to their scores in visual design. This highlights opportunities for improvement and the need for more involvement of design researchers and designers in the development of public health communication material for Covid-19.

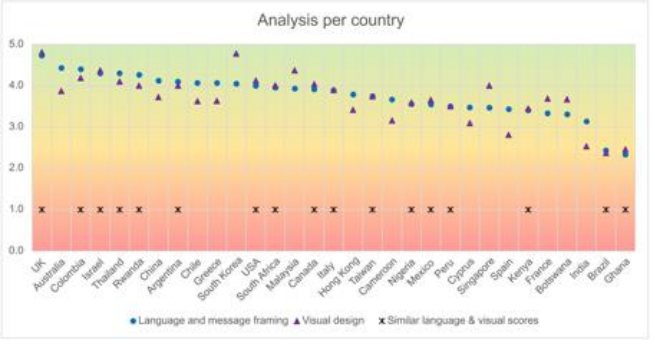

Figure 4. Analysis of language and message framing vs visual design per country

The analysis by countries show that there is a wide segregation between those countries that performed well and those that did not. More than half (17) of the countries had similar scores between language and message framing and visual design. Nine countries gave a higher importance to language and message framing, while five gave it to visual design.

4.4 Analysis of Covid-19 public health communication examples

In this section we present a representative sample of some good, mixed, bad and ugly examples[1] in terms of message and language framing as well as visual design.

4.4.1 Good examples

In terms of message and language framing, the following example, from the Rwandan Ministry of Health on 'The Do's and Don'ts of face mask guidelines', demonstrates several good visual design and communication features. It features a consistent visual style, with an

[1] For more visual samples collected worldwide visit: http://imagination.lancaster.ac.uk/wp-content/uploads/2020/04/Good-Bad-Ugly-Presentation-Analysis.pdf

uncluttered layout that incorporate an easy path for the eye to follow. Important icons are bigger in terms of size and use contrasting colours to help readers distinguish clearly what they can and cannot do. In terms of message framing, the instructions are very practical and culturally appropriate and specific, as they provide a useful context on when, how to use, how to wash and procure, as well as common mistakes people make in all these points.

Figure 5. Communication material by the Rwandan Ministry of Health on The Do's and Don'ts of face mask guidelines

Although there were not many examples of this, offering a variety of complexity levels for the same message are particularly useful. The example below from the Italian Ministry of Health provides granularity of content and instructions on handwashing, which enables readers to access various levels of information at their own pace.

Figure 6. Multilevel communication material by the Italian Ministry of Health on handwashing to prevent the spread of Covid-19

The example, below, from Yukon, Canada answers a single question well, by making use of gentle humour does not detract from serious points. It employs culturally relevant image using a practical, recognisable huskies to demonstrate the two-metre social distance rule, whilst maintaining gender inclusiveness in the visual.

Figure 7. Communication material by the Yukon regional government in Canada on social distancing

4.4.2 Mixed examples

Several materials featured mixed practices, with some good elements but also some message or visual design issues. For instance, the poster in Figure 8, provides culturally relevant image and slogan urging taking action now. It also includes a positive message framing and it is available in both French and English (the official languages of Kenya). Despite these, it includes, at the bottom of the poster, visuals which apart from being gender-biased are too small to see, as are the captions that accompany them.

Figure 8. Poster by the Kenyan Ministry of Health on supporting the fight against Covid-19

In another example, from Peru, with the support of the Ministry of culture two general posters were translated to four Quechua dialects and Ayamara (official languages of Peru), and eight minority native languages. This is very positive in terms of inclusiveness and reach in the wider population of the country. However, the translation of the language did not follow with 'translation' of the advice to the local practices of these indigenous communities; as most people in these minority groups do not have access to running water in their homes rendering the guidance culturally irrelevant.

Figure 9. Communication material by the Peruvian Ministry of Health on protecting oneself from Covid-19 (Left: Quechua language from central Andes, approx. 1 million speakers), (Right: Yine language in the Amazon, approx. 3000 speakers)

4.4.3 Bad examples

The following self-quarantine document targeting the public in Ghana, utilises the third person which although makes it authoritative, it makes the instructions that appear in it impersonal. To make matters worse there is a mix of first and third person confusing the readership and the messages it provides. Overall, the language used inappropriate for the wider public and the everyday person. Following this, there is inconsistency in terms of the advice given, as there is a mix of specific and clear with unclear and unspecific advice. Lack of visuals further add to this, as their inclusion could potentially help in enhance understanding on the practical advice found in the document.

Figure 10. Communication material by the Ghanaian Ministry of Health on self-quarantine

The following example, from Brazil's Ministry of Health website, presents several issues. All information is provided as plain text. So, the guidance is not inclusive as literacy is a requirement for understanding and is still a problem especially among disadvantaged communities. Some proposed measures present higher exposure to risks, compared to standard ones such as "*Keep at least 1 (one) meter-distance from other people in public and social places"*. Also, part of the advice provides confusing and mixed messages. For instance, there is the advice to "*Avoid hugs, kisses and handshakes, adopt friendly behaviour without physical contact, but always with a smile on your face*" and the last preventative measure recommends wearing masks everywhere. Safer ways of greeting during the pandemic should be suggested since a smile cannot be always recognised behind a mask and Brazilians are used to warmly greet people in person as a way of being friendly.

Figure 11. Online communication material by the Brazilian Ministry of Health on how to protect from Covid-19

In the example below, the poster is too busy in terms of visuals, whilst several of the clipart used are too small to see as is their corresponding caption. Some of the advice provided, such as '*Maintain at least 1 metre distance in marketplaces, medical stores, hospitals, etc*' are unrealistic given the high-density population of cities in India. Another issue in this example, is the use of visuals, where the characters featured in them, do not represent the country's population demographics, as they feature only white persons. This is an element which has been observed in several materials from several countries from the Global South who seem to have copied and pasted messages as well as visuals from Global North countries' material.

Figure 12. Communication material by the Indian Ministry of Health on not overstocking

4.4.4 Ugly examples

In relation to the example discussed above, the following one from South Africa does not include do consider ethnic diversity in its visuals, illustrating a predominantly all white family. Furthermore, there are no signposts on where or how to get more information and the text in the centre in white appears blurry due to incorrect application of antialiasing. Lastly, the message it provides appears to be distant '*WHO advise people to...*' as it does not directly address the population and does not call for immediate action.

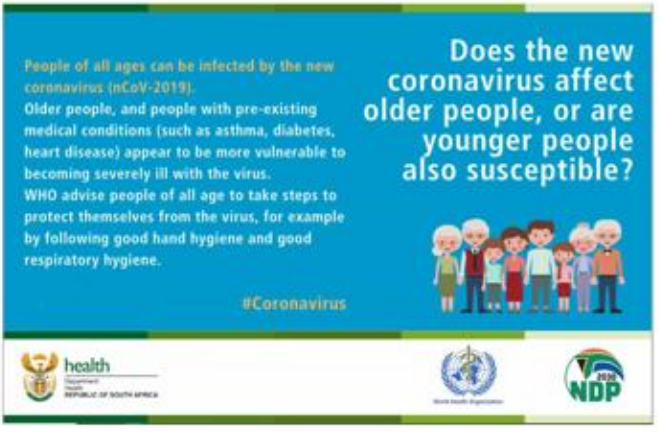

Figure 13. Communication material by the South African Department of Health on Covid-19

The example below, presents a too busy layout design and incoherent messaging. There is an inconsistent style that mixes cartoon with real images. The main image occupies most of the poster whilst not being essential. In fact, the cartoonish doctor clipart contradicts the seriousness of the message that is being portrayed. In terms of visual layout, the composition of the five small images at the bottom of the poster lack alignment. The text for getting more information and the contact number are too small to be read.

Figure 14. Communication material by the Taiwanese Ministry of Health on hand-washing

4.5. Other health related visual examples

The Royal College of Paediatrics and Child Health (RCPCH) has been working to raise the awareness of the impact of air pollution on child's health, particularly to those with respiratory allergies such as asthma and rhinitis. The '*The inside story: Health effects of indoor air quality on children and young people*' campaign was launched in January 2020, just before the COVID-19 pandemic started. Hence, it results appropriate to compare the visuals from this campaign to those presented here.

They have produced an extended report, however, the graphic content is used to advertise this campaign. They successfully use appropriate message and language framing, as well as visual design. A similar analysis as the one presented in this work revealed that the key areas are for the **language and message framing** were the use words appropriate for the intended reader; the suggestions are specific and realistic and are gender inclusive. However, there are some parts that would be benefit for more emphasis such as the impact here and now. While for the **visual design,** the visuals were gender neutral images; have a clear structure

and eye path; reinforce the information presented; and have a defined colour palette used consistently as shown in the Figure 15.

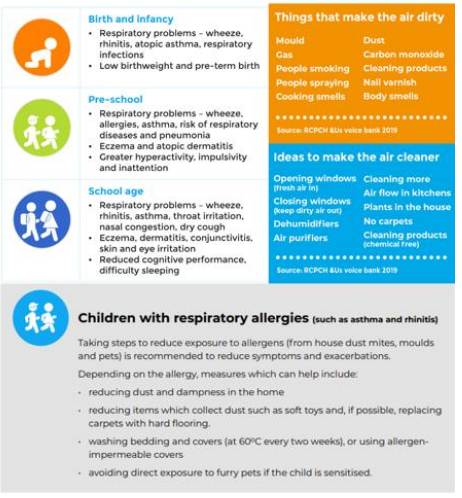

Figure 15. Communication material by the RCPCH for 'The inside story: Health effects of indoor air quality on children and young people.'

5. Discussion and Draft Recommendations

Based on the findings and the examples presented above, we propose a set of draft recommendations for the design of public health communication material for Covid-19

Although there are still a few steps to be completed in the development of a full list recommendations for the public health communication material for Covid-19, our initial analysis reveals some patterns and insights that are emerging. We discuss these below.

First, ***give the context first, and incorporate definitions into the text***. As mentioned above several material did not provide any context regarding Covid-19 or included any definitions in layman terms. Most critical is the clarification of why should individuals, and the public as a whole, follow the guidelines and instructions offered in the material. This is because, even the most valid and reliable scientific information may be ignored, minimized, or processed in a way that results in unanticipated public responses when a communication plan overlooks the reasoning strategies of the audience of the message (Vaughan & Tinker, 2009). Lessons from past health campaigns demonstrate, that these are most successful when communication addresses motivations, emotions, and ideas that might contribute to desirable behavioural change but also are compatible with individuals' reasoning strategies (Vaughan & Tinker, 2009).

Second, ***provide clear messages that consider the cultural aspects, and instructions that are specific, realistic, and culturally appropriate for the intended readers***. Our findings revealed that many materials provided often instructions which were not culturally appropriate and guidelines which could not be practically implemented within the targeted socio-economic groups they were targeting. During a pandemic, the way new information is filtered, processed, and evaluated is influenced by individuals' daily life circumstances, cultural and psychological risk orientation and traditions regarding health practices. Guidance from socio-ecological, social cognitive models, suggest that health communication is more effective when it is relevant to people's personal and social contexts (Neuhauser et al, 2009). As such the messages themselves must be compatible with the cultural orientations and socio-economic priorities of affected populations (Vaughan & Tinker, 2009).

Health communication materials are intended to solve ''wicked'' problems in highly changeable sociocultural, political environments among very diverse people. However, they are often not designed to meet the needs of diverse population groups (Neuhauser & Kreps, 2014). Reaching vulnerable populations, who usually bear the brunt of the effects (financial, health, social) in pandemic situations is very important. Yet, reaching these populations and communicating effectively with them is a critical public health challenge (Neuhauser et al, 2009). The following recommendations consider ways of tackling these.

Third, ***use creative mechanisms that engage and involve readers*** (i.e. stories, quotations, analogies, etc.). Our analysis revealed that this was one of the weakest elements in message and language framing. A handful of material made use of creative devices to engage and involve readers, such as the example form Canada, which used Huskies to provide an analogy for physical distance embedding gentle humour. Still such mechanisms and especially inclusion of narratives and storytelling are very powerful and have in the past been employed in health communication (Edgar & Volkman, 2012; Walker, 2019). More precisely, data suggest that narrative message design encourages information sharing as they are perceived as having a story structure and being more understandable and less information overloading, and more transporting (Barbour et al, 2015). Therefore, mechanisms such as storytelling, form compelling tools for adding credibility and authenticity (Edgar & Volkman, 2012) to Covid-19 public health messages, especially as they are found to be emotionally evocative and thus more likely for us to act on the message(s) they contain. Furthermore, they provide us with a better understanding about a situation for instance, the experience of suffering from Covid-19, which in turn helps us understand more about the disease itself.

Fourth, ***write them as simply as possible, taking into account the reading skills of the intended audience***. Matching readability more closely to users' literacy levels (Neuhauser et al, 2009) is a key component, which several of the materials reviewed did ignore. As already mentioned some material, especially in Global South contexts, literally translated material into the local languages. This increased the message and language complexity. Instead linguistic adaptation should be employed to incorporate culturally relevant concepts, and adapt rather than simply translate messages (Neuhauser et al, 2009).

Fifth, ***use visuals that relate directly to the information in the material and which, reinforce the key messages evoke affect appropriate for the intended audience***. Visuals (photos, illustrations, symbols, and other images) and data visualisations can dramatically shape how risks are perceived. Many of the materials analysed did not take that into account, as there were examples, as illustrated in the sections above. In fact, there were cases where language-based content communicated one message about risk, while the visual strategies used communicate a very different message. Effective use of picture is influenced by the context they are used, the level of literacy skills and the extend they are combined with written direction, and the graphic form of the picture whether a line drawing, cartoon, photo, etc. (Walker, 2017). Incorporating culturally relevant visuals (Neuhauser et al., 2009) as well as use of scale and the simplification of images can attract attention and stimulate curiosity (Walker, 2017) and generate affect.

Sixth, ***use active voice and emphasise the health impact here and now to encourage action now***. Emphasising the health immediate impact in a way that encourages the intended readers of communication material to take action now is absolutely critical. Pandemics are, ultimately, disasters, and the critical role of immediacy that is central to effective disaster response is also inescapable (Sutton et al., 2020) in the case of Covid-19. Much research indicates that using the active voice makes content livelier and easier to read and understand, than the same text written in the passive voice. It can also suggest link with the reader (Walker, 2017; Walker, 2019).

6. Conclusion and Limitations

It is clear from past health epidemics, that trust and accurate information can significantly help the public in following public health measures which help decrease the spread of disease. However, in the COVID-19 pandemic we witness an 'infodemic', which has confused both the general population and policy makers.

Our study presents the positive and negative aspects regarding language and visual design of COVID-19 public messaging in a variety of countries. It also provides draft recommendations on how to effectively plan communication and frame messages that are compelling and actionable to the local audiences considering their social, cultural and economic circumstances.

The analysis presented in this paper focuses on visual communication aspects identifying features that contribute to success and failure of public messaging. There is still the need to understand to which extent visual communication is effective in mitigating pandemic impacts considering for instance dissemination (e.g. web analytics, number of accesses, downloads). This is something we are exploring at the time of the paper write and we aim to present in future papers, once that analysis is also completed.

Mitigation of risks is also influenced by other aspects such as cultural, social, economic and political determinants, including politics and policy. Thus, visual communication works in a two-way relationship combined with other contextual factors that should be considered. Moreover, information should also be accessible considering disabilities. We have also started work on testing some of the material with members of the public and experts, which will be reporting in future work.

In the next pandemic, be it now or in the future, the single most important weapon against the disease will be a vaccine. The second most important will be communication (Gesser-Edelsburg et al, 2014). We envisage that our work will contribute towards the latter.

"United in isolation. An online letterpress festival". A community response to the Covid-19 pandemic

Andrea Vendetti[a*], Elettra Scotucci[a]

[a]Sapienza Università di Roma
*andrea.vendetti@uniroma1.it

Abstract | This contribution aims to investigate the experience of 'United in isolation. An online letterpress festival' which was held during the lockdown caused by the Covid-19 pandemic, and its subsequent development.
In recent years, letterpress has experienced a renaissance: at an international level, several realities have recovered and reused machinery and tools of this ancient technique for quite different purposes. As this is a specific field that is only explored by a few people, the community has developed strongly and reached an international dimension.
Starting from the initiative of a few individuals, a weekly festival has been organised, in which in each episode four or five printers from different parts of the world streamed live from their workshops, showing spaces and tools that are difficult to share publicly in any other way. The ten episodes were well received by the public, representing a concrete response in terms of human relations and the advancement of specific knowledge on the subject.
The online archive that was created represents an important starting point for the study of the contemporary letterpress, as well as the repository of an irreplaceable network for issues such as the history of typography and printing.

KEYWORDS | COMMUNITY, COVID-19, LETTERPRESS PRINTING, MOVABLE TYPES, ONLINE FESTIVAL.

1. The concept of community in letterpress

In the last decades of the 20th century, relief printing was gradually replaced in commercial printing by other, better performing technologies. In particular, movable type printing, which had remained largely unchanged for around five hundred years, became less and less widespread; during this phase, the tools of the so-called art of typography were discarded, and a wealth of widespread technical knowledge became, within a generation, the preserve of a few.

In recent years, there has been a gradual rediscovery of letterpress printing on an international level, which has led various realities to recover printing presses, movable type and everything necessary for the use of this technique (Passerini, 2014). In fact, only a part of these realities has continued to use letterpress in continuity with the profession's past; more commonly, the reasons for this revival lie in historical and cultural issues. In particular, they reside in the relationship with the field of new craft (Bonini Lessing et al, 2019), with the history of typography (Heller, 2019), with the didactic dimension (Marzotto Caotorta, 2007) and with the search for new forms of expression (Barmettler, 2017).

The adherence of many geographically dispersed entities to the letterpress revival has led to the creation of groups of people united by common interests and practices. By its very nature, a phenomenon of collective re-appropriation of craft skills and tools that have declined due to technological obsolescence entails, on the one hand, the search for sources and masters, and on the other, a marked tendency towards self-education: hence, in relation to one's own community, the sharing of knowledge and the need for comparison. For these reasons, in the last two decades, virtual spaces have appeared to serve these purposes: platforms serving the community (two above all: Briar Press and Letterpress Commons), video tutorials dealing with technical issues of printing and machine maintenance (e.g. the Youtube channel of Boxcar Press), Dafi Kühne's site dedicated to sharing information on FAG proof presses produced from the 1940s to the 1990s. In addition to the creation of dedicated spaces, printers have always used more immediate tools such as social media (originally Flickr and later Facebook and Instagram).

In particular, beyond the other best practices, it is worth highlighting the case of 'Drukwerk in de Marge', one of the most successful projects serving the letterpress community. The printers (*drukkers*) in the geographical area of the Netherlands and Belgium represent a clear case of a community that builds its own spaces for dialogue and sharing: they have developed a support network for printers and for the enhancement of the typographic heritage – also musealised – with both research and dissemination purposes.

In addition to a bimonthly physical magazine, Drukwerk in de Marge is a website where members are able to buy and sell printing material, share events and their own printed production, consult a map of participating realities, a forum and an archive section of historical and photographic material (samples, instruction manuals, spare parts for machinery). The functions seem to respond to the needs well expressed by a community

that is able to recognise and organise itself, and, more broadly, to problems that are common to all those who print with this technique, regardless of the geographical factor.

It is clear that the internationality and cross-country character that the letterpress communities themselves possess is due to the fact that, with a few exceptions, they do not share the same urban area. The letterpress community therefore appears to be a group of individuals from a heterogeneous origin who organise themselves above all virtually: this is made possible by the universality of the technique and tools, which makes it possible to overlook national and continental borders, as well as by the strong shared attitude to the protection of the material and immaterial typographic heritage that *typophiles* have in common.

Events such as *wayzgoose* (cycles of conferences, workshops and activities aimed at printers, of which there is a strong tradition in English-speaking countries) and international summits like Letterpress Workers have also contributed to the creation of a strong transnational letterpress community. The latter is an annual meeting held in Milan (Italy) since 2012 where, during a short artist residency, invited printers work together to share knowledge and cultural and design approaches.

The recent experience of 'United in Isolation. An online letterpress festival' fits into this particular and lively context.

2. The festival

"United in Isolation” was born in March 2020 with a simple Facebook post in one of the many groups dedicated to sharing experiences of the international community. A Norwegian printer wondered whether, given the emerging international situation, organising a series of live streams on the general topic of letterpress printing might be of interest. One of the first comments came from two Italian printers who, being already in quarantine – Italy was one of the first countries to be affected by security measures – gave their availability to hold a short talk from their home temporarily used also as a printing workshop and to help with the organisation. Since then, and for about a month, the three printers have worked together assiduously to set up the festival, arrange the technical issues and communicate the event.

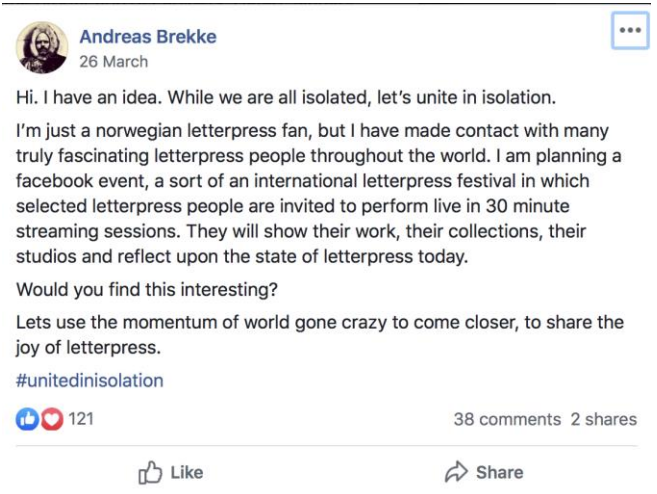

Figure 1. The post that marked the beginning of the festival, March 2020.

The festival format included four or five live streaming interventions via the official Facebook event page. In addition, an Instagram account has been created to advertise the event weekly.

In choosing the guests for each episode, it was decided to give priority to a geographical criterion, with guests representing as many different cultural realities as possible. Gender and racial issues were also strongly considered, although the latter was greatly facilitated by the geographical choices.

Furthermore, the presence in the same episode of very small realities and important institutions – in particular, Tipoteca Italiana Fondazione (De Michelis, 2019) and Hamilton Wood Type – managed to give a sense of the heterogeneity of the letterpress community, making evident both the differences in the means and approaches that the strong common attention to safeguarding the material and immaterial typographic heritage.

Each reality was given the opportunity, in the twenty minutes available, to freely choose the theme of the speech: if most of the participants chose to show their work tools or their production, there was no lack of more specific interventions and deepening on a single theme. In addition, many of the printers talked about their experience with the pandemic, directly informing the international public of the situation in their country of origin and talking about experiences of printing for charity to the reference emergency structures.

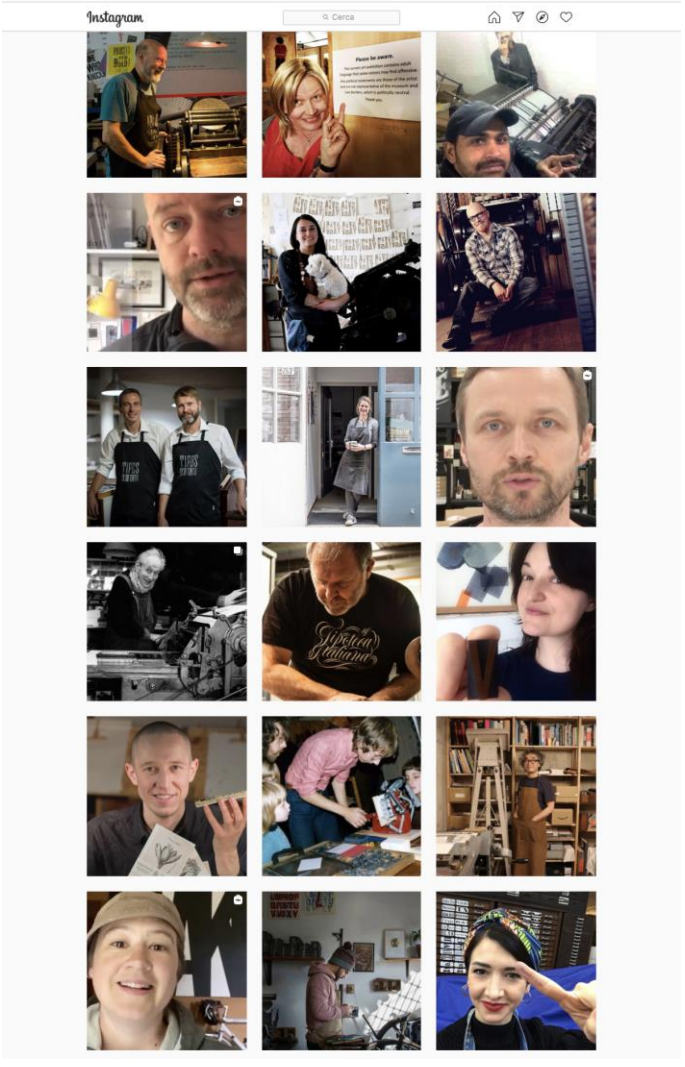

Figure 2. Instagram feed, photos of the printers who got involved are displayed with a promotional aim.

The first instalment was held on 18 April 2020. In addition to an introduction by the two Italian organisers, three printers from Australia, Russia and the USA were also guests: the latter two were later involved in the organising team, which was joined in the middle of the festival by two printers from England and Chile.

One of the festival's greatest achievements was to be able to connect printers from twenty-three different countries, guaranteeing representation from all five continents. Comparing such different experiences directly (one above all, a printer from Japan) has certainly made it possible to understand the differences and commonalities of letterpress printing.

Although a sense of belonging to the various letterpress communities was already strongly felt, this experience during the lockdown helped to generate the idea of a world community, in continuous dialogue and ferment.

Figure 3. A Japanese speaker showing his workspace in Tokyo.

3. Follow-ups

The audience, consisting of printers, graphic designers, students and researchers in the field of design, was extremely supportive of the idea of further development of the festival, leading to the organisation of a second season.

This new season saw some important improvements compared to the previous one. First of all, it has been decided to conduct thematic episodes, which would give the festival an additional degree of scientific relevance. The first episode, broadcast in November 2020, was focused on the contemporary production of movable type, and featured Dafi Kühne, Mark McKellier and Ryan Molloy. In particular, the use of numerical control technologies applied to various materials and the casting of new characters with plastic materials were investigated. Other episodes will be dedicated to topics such as different approaches in the

printing process and the archiving of historical materials. It was also decided to increase the number of minutes available for each speech to thirty, in order to allow a more in-depth presentation.

Finally, the live streaming on Facebook was joined by that on Youtube, extending the possibility of viewing even to those who do not have a social network account. This was possible thanks to the use of StreamYard, a platform for managing live streaming that also allowed a better direction of the live broadcast and therefore a better experience for both the audience and the speakers. Thanks to this platform, a live question and answer section was included, previously impracticable due to the nature of the Facebook live broadcast.

New hypotheses for the preservation of the audiovisual material produced in both the first and second seasons are also being investigated, in order to be able to consult the content more easily through the use of metadata and specific search filters (Dalla Mura, 2016) and to represent a more accessible primary source for both the scientific and the letterpress community.

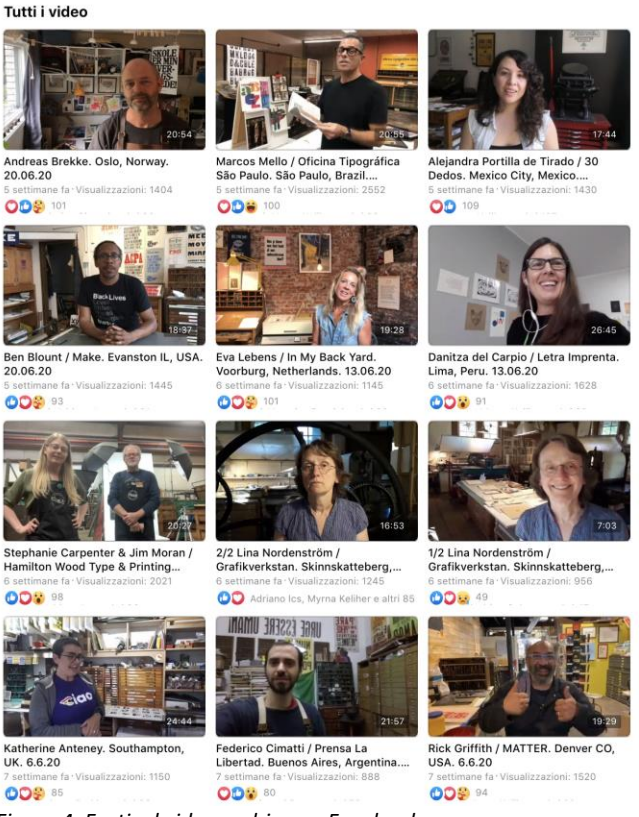

Figure 4. Festival video archive on Facebook.

While the need to find a more durable form of archiving than the feed of a Facebook page becomes evident, the hypothesis is also formulated that the festival could represent the first nucleus of a global archive of contemporary letterpress practices, constituting a form of digital enhancement of an analogue technology.

The festival also gave rise to the idea of a virtual group exhibition of prints related to the theme of the coronavirus, entitled "Letterpress printers responds to a pandemic", in which printers from all over the world, from New Zealand to South America, took part. The variety of the works presented and the processes used tell a lot about the heterogeneous nature of the community, which moves across the fields of art, craft and design.

Finally, the success of the 'United in Isolation' initiative has been documented in various articles and magazines, such as the Lockdown diaries issue in Printmaking Today (UK) and in the online publications of Typograp.her (New Zealand) and Letterpress Workers.

4. Conclusions

The experience of 'United in Isolation. An online letterpress festival' represents a concrete response of a community that found itself, because of Covid-19, only able to continue its activities to a small extent, some of the solutions adopted in other contexts, such as smart-working, being ineffective or simply impossible.

It is important to note the contrast between the peculiar concreteness of letterpress and the intangible dimension of the printers' response to the pandemic; a response that managed to exploit the adverse conditions not only to cancel spatial and temporal distances, but to create something completely unprecedented. It is clear that in no case could the sharing of workspaces – and the consequent assortment of presses, typefaces and tools – have found a better way. In fact, the festival formula shifted the focus from the final artefact to the design process, a fundamental element for fully understanding the specificities of this particular way of designing.

From a scientific point of view, the selection of participants in the festival (that in most cases occurred through self-candidacy) has no claim to completeness; but in fact, it constitutes a first nucleus from which to attempt to draw some minimal conclusions about the letterpress phenomenon in relation to the geographical areas to which they belong.

From all the speeches, it is evident that some issues are transversal to all printers and that nationality is not a decisive variable, while for others the country of origin has a decisive influence on some issues.

For example, the context in which one has chosen to set up the print shop actively affects both the themes of the artefacts and the environment of the workshop – for example, the possibility of setting up the print shop in the backyard or basement of one's home, which is

effectively impossible for anyone living in a metropolitan environment but quite common for those who, regardless of their country of origin, live in a rural environment.

The most important aspects linked to the geographical area concern some technical issues and others related to the equipment available.

In fact, each country has its own peculiarities, such as the type height (height of the physical characters), which must be taken into account especially when using equipment from other countries. In addition, each country had its own reference manufacturers, and therefore its own design, which contributed to the creation of that country's image. However, from this point of view, during the various live broadcasts it was possible to find several very interesting links from a historical point of view: for example, some companies, such as the Italian Nebiolo foundry, had a flourishing market in South America, and this is testified by the equipment of some of these printers; on the other hand, it is well known that often in some countries the design of foreign characters was copied almost integrally and brought back as new in their own reference market, a detail that did not escape the notice of some spectators at the festival.

Furthermore, some cases, such as those of the Japanese and Pakistani printers, were really interesting because they actually represent a unicum regarding certain economic and cultural issues.

Figure 5. A map that traces every printer and location of the first season; colors define the different episodes.

In synthesis, the archive of live streams, although with technical limitations and a spontaneous attitude, represents an unequalled repository on the phenomenon of

contemporary letterpress, which will hopefully constitute an authoritative primary source for any research on the subject.

Finally, the festival was an excellent way of responding on a human level to the pandemic, allowing relationships to be forged on an international level, regardless of geographical boundaries or prejudices. Against the backdrop of daily hatreds on social media, this network of people demonstrated their ability to not only appreciate but actually value diversity, ensuring an inclusive and shared experience.

A Design Experience for Interactive Narrative Based on The User Behavior

Yuan Yao[a b], Haipeng Mi*[a b],

[a] Department of Information Art and Design, Tsinghua University
[b] The Future Laboratory, Tsinghua University
* haipeng.mi@acm.org

Abstract | Research on interactive narrative experiences in physical spaces is becoming more popular, growing into an established new media art format with the development of technology and evolution of audience aesthetics. However, the methods of designing interactive narratives are still similar to the basic video narratology of traditional designers, directors, and producers. This paper provides a design method based on the user's physical behavior and proposes an art installation by this method, where the aim of the installation is to transmit a more vivid story to users, presenting a new research inspiration of interactive narratology for designers and researchers.

KEYWORDS | USER BEHAVIOR, INTERACTIVE NARRATIVE, STORYTELLING, INSTALLATION ART

1. Introduction

The intervention of technology makes the story more vivid and even developed a new narrative method, named interactive narrative. However, research on interactive narrative is mostly theoretical such as (Gerrig, R, 2018), (Gervás, P, 2009), (Weyhrauch, P, 1997), and (Louchart, S. et al, 2004). even in 1970, Roger Schank had already proposed the prototype of interactive storytelling (García, R et al, 2014). Although recently, there has also emerged design practice, most of which are interactive computer programs focused on story plots, for instance (Ryan, M. L, 2008), (Delmas, G, 2007) and (Riedl, M. O. et al, 2013). Taking into consideration of user behavior interaction in physical space, we can also see some cases of interactive installation design, most of which are advertisements to attract users to participate with interaction and incentive mechanisms (Ojala, T. et al, 2012), (Zhang, Y.et al, 2018) and (Müller, J. et al, 2012). In recent years, there have been a lot of interactive narrative cases combined with VR, which is a good start to focus on user behavior, and makes possible the user's immersive experience[1] such as (Bates, J, 1992). However, VR is not a real physical experience but a way of interaction. The development of technology may give us access to multimodal sensors and experience more diversified stories. Because the essence of interactive narrative is both the user's immersion and fascinating stories. *Sleep No More*[2], an interactive stage play, sets a good example of excellent interactive experience.

This paper elaborates a design case of interactive narrative combining user behavior in physical space. In the course of our research, we attempt to find the mapping relation between user's natural behavior and narrative camera language, and to explore the possibility to apply it to an interactive narrative on the large display.

Figure 1. Interactive Installation — Still Walking

1 The VR game, Tree, https://www.media.mit.edu/posts/tree-treesense/
2 The interaction drama, Sleep no more. https://mckittrickhotel.com/

An interactive installation, *Still Walking*, is designed to explore the spatial interaction between the user and the story. The installation's narrative theme is based on temporal change, while the concept of "shadow" acts as the narrative glue to connect the story with the user. As a user approaches the installation screen, the shadow of a woman appears on an endless path. If the user revolves the screen and moves forward, the shadow moves along, the scene changing bit by bit from a child to an older woman. In this process, branching stories at different life stages—determined by the age—of the older woman are triggered by the different positions of the screen. We are taking advantage of this installation to present users with a novel and thought-provoking interactive experience. In this paper, I would dig into the process of designing this installation as well as our various thoughts and takeaways on interactive narrative design.

2. Narrative Design

2.1 Interactive narrative structures

In the traditional film narratology, the narrative structure is linear. Even it has enriched plots. However, the interactive narrative presents a broader range of plot types. It is typically composed of a structure where has multiple starting points that may lead to various outcomes, as illustrated in tree-structure, network structure, and etc. (Figure 2)

In *Still Walking*, the storyline is organized in the circular narrative structure. There are different branching plots in the entire story, and the interaction leads to different endings. The narrative structure is a similar circular network. (Figure 3)

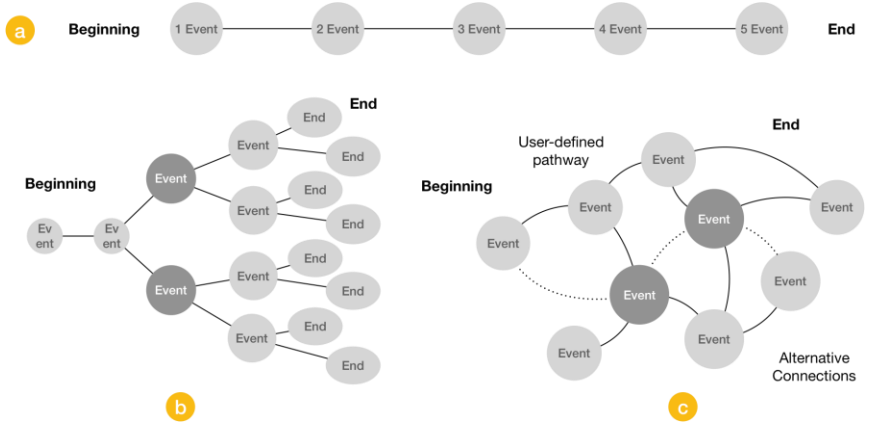

Figure 2. (a)The traditional narrative structure; Interactive narrative structure, tree (b) and network(c);

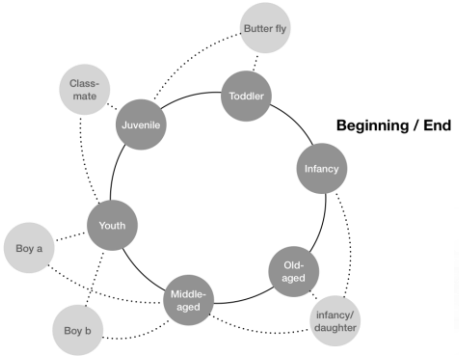

Figure 3. The narrative structure of Still Walking

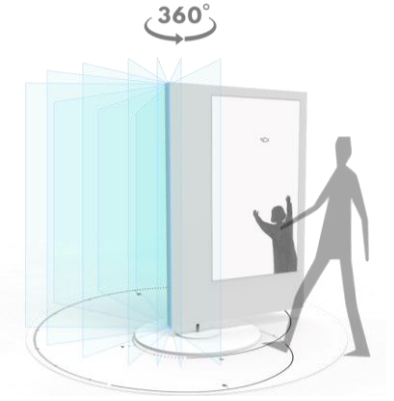

Figure 4. The concept of interaction

2.2 Interaction Design

The core purpose of narration is to establish an emotional connection after the audience has watched and understood the story (Bordwell, D, 2012). This can be realized, when there are clues weaved in the story, guiding the audience to piece together and establish emotional resonance with the whole story. In this design, we try to give back the interaction rights to the audience, make them users. According to the interactive plots and clue to guide the users to explore the story and build emotional connections.

The story of *Still Walking* is a life circle, and the users also need to come back to beginning point in the end. Therefore, we designed a circle road, utilized rotation and pause as the gates of the other plots. Additionally, the rotation of the screen brings out the shadow as a story clue moving along with the user, and guide the users by different states. (Figure 4)

2.3 Story script

The story concerns a woman's lifetime, which is divided into four sections. One rotation of the installation means the story completes for one time, the shadow changing form a girl to an old woman (Figure 5), which takes about 40 seconds. As the installation rotates, the user goes through the four periods in her life, namely infancy, juvenile, youth, middle-aged and old-aged life, each scene lasting 10 to 15 seconds. In other words, the interaction between the installation and the user lasts about 40 to 100 seconds. The whole story, with the help of mimicry and fixed camera angle, is unveiling a woman's growth, symbolized by the changes of the shadow. (Figure 6)

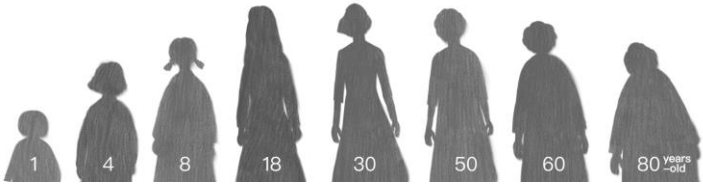

Figure 5. Images of women at different ages

Infancy: a carefree catch

The 4-year-old protagonist, no longer a toddling infant, is jumping joyfully. Suddenly, a butterfly appears ahead of the road.

- Keep walking: The girl is running after the butterfly and reaching her hands to catch it.
- Stop walking: As she stops, the butterfly flies away.

Juvenile: a friendly companion

The eight-year-old protagonist sees a girl in her class with a backpack.

- Keep walking: She waves her hands and catches up with her classmate. Then walking together, until her classmate's shadow fades away and finally disappears.
- Stop walking: If she stops, she can never catch up with her classmate.

Youth: a difficult choice

The eighteen-year-old protagonist finds the boy she likes. One of her hands is reaching to him but pauses halfway. She is about to chase after him.

- Keep walking: No matter how fast she runs, she can't catch up with him.
- Stop walking: Another boy will appear behind her. Accompanying her for a while, the shadow of the boy fades away and vanishes, leaving the girl to go forward herself.

Middle-aged and old-aged life: an affectionate change

The forty-year-old protagonist sees her little daughter walking in front of her. She is waving her hands to get her daughter's attention and wants to catch up with her toddling daughter. As the screen rotates and the user keeps walking, she realizes her daughter's change is much slower than hers, but then she ages quickly from 50 years old to 80 years old.

- Keep walking: As the screen keeping rotating, her daughter is getting close to the camera, while the shadow of the protagonist is backing out and fading away. Push the screen to the original position, and the protagonist becomes her daughter and starts a new circle of life over again.

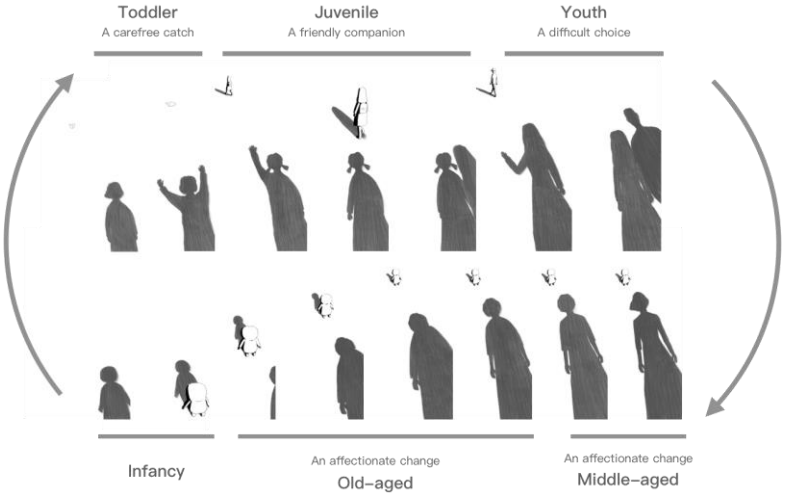

Figure 6. Overview of the story

3. Mapping Behavior and Camera Language

3.1 User behavior in interactive narrative

Created for the 2015 Melbourne Writers Festival and by J. Walter Thompson, Twists & Turns[1] is not only an app but also a case of large-scale, outdoor interactive narrative. This crafty design uses the location, direction, and movement of the user in a large space to deliver a story in which the user can choose the branching plots. To be specific, each street and every corner in Melbourne become twists and turns in the story. This case is an indirect proof that the user's natural behavior serves not only as an inspiration in the design process but also as a chance to develop a new interactive form, which is easy for the user to interact with and for the designer to create. The proxemic in (Ballendat, T. et al, 2010), (Hall, E. T, 1966) and (Vogel, D. et al, 2004) offers us a perspective that the user's natural behavior has both implicit and natural interaction with the installation in physical space. Based on this which many design forms of natural interaction are created for the users. Throughout our research, we take five factors into consideration to explain user behavior: distance, identity, location, direction, and movement. (Figure 7)

1 Twists & Turns, https://andyhincey.com/portfolio/melbourne-writers-festival-twists-turns/

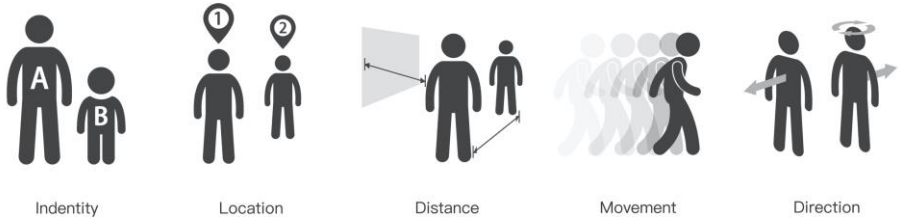

Figure 7. The 5 factors of the user behavior

In this research, we would use the camera language in filmology as the main content for mapping relationships. The camera language provides an opportunity for user behavior, enabling the user to participate in the plot. In traditional film narrative, the camera language includes the camera shot, angle, camera movement, and montage. The only way for the user to understand the camera language is to "watch". However, in this paper, we try to establish a mapping relation between the five aforementioned factors of user behavior and the narrative camera language, which provides the user with a vivid way to understand the story.

3.2 Distance, position and direction of the user VS. Camera shot and angle of the camera

The camera shots of the camera language, in a broad sense, include long shots, full shots, medium shots, and close-ups. Taking narrative patterns into consideration, there is a different system of shots, such as the detail shot, narrative shot, and environment shot. The wider the camera shot, the less the story tells; the closer the camera shot, the more the story expresses. There are also have different camera angle types, such as eye-level shot, low-angle shot, high-angle shot as well as frontal, side, and canted angle. Different combinations of camera shot and angles in traditional film narratives can present different levels of story content for the audience.

At the same time, research on large-display interaction indicates that the user's intention will be stronger as the distance is closer, that mentioned by (Ballendat, T. et al, 2010), (Michelis, D, 2011) and (Vogel, D. et al, 2004). Therefore, we combine the camera shot and angle of narrative language with the distance, position, and direction of the user in the narrative language. The change of user behavior may trigger the transform of camera shot and angle, reinforcing the user's experience.

We have two hypotheses. 1)The mapping between the user's distance and the camera shot: the farther the user keeps from the screen, the wider the camera shot changes, and it means less content in the story. On the contrary, the closer the distance is, the closer the camera shot changes, and it means more content in the story. 2) The position and direction of the user will determine the viewing angle, which has a mapping with the shooting angle. The change of the user's position results in the change of point of view in the story, which can improve the user's experience of story understanding.

3.3 Movement of the user VS. Camera movement and montage of the camera language

Besides the basic cinematography movements, namely zoom, pan, follow, tilt, dolly, truck, pedestal and rack focus, there are two basic forms of motion—mimicry, and spontaneity (table 1). Mimicry indicates the movement of a camera that follows the action of the character or other objects in the story, which makes it easier for users to participate as a character. Spontaneity is more about watching the development of the plot from a third-person point of view.

Table 1. Forms of camera motion

Forms of motion	Moving subject in the film	Camera movement
Mimicry	（1） Object	Stationary
	（2） Background	Synchronous
	（3） Line of sight	Mimic
Spontaneity	（4） Camera	Spontaneous

The camera movements can be combined with the user's physical movements. In *Still Walking*, the user's movement, or rather rotation, is designed to mapping with the "follow" of camera movement. The camera shooting the story moves along as the user continuously pushes the screen forward. Once the user stops, the camera stops as well. What's more, the shooting movement also changes with the speed at which the user pushes the screen.

Also, montage is a major feature of film narrative, using various combinations of images to stimulate emotions and lead the plot to a climax. In the interactive narrative, we attempt to apply the montage to piece together separate sections in different scenes into a continuous whole, for example, similar movement of users and camera shots.

3.4 Identity of the use VS Clue of the story

Table 2. The mapping relation between user behavior and camera language

User behavior	Mapped as	Camera language
Identify	Clue	Clue
Location/Direction/Distance	Point of view	Angle and camera shot
movement	Motion (mimicry, spontaneity）	Camera movement
Above all	Story flow	Montage

In the story, a user makes use of the clues to thread the plots, and in the same way, the interactive installation in the physical space can also use the clues to guide the user to explore the branching plots. And the clues can mapping with the user identity. While in *Still Walking*,

we take the shadow of the user as its clue, and the user can quickly get themselves involved in the story as the protagonist. (table 2)

4. Implementation

Compared with the traditional narrative, the interactive narrative depends more on technology to convey information that facilitates interaction between the user and story. The interactive technology supports tasks such as user behavior perception, data analysis, and information feedback. Interactive technology plays a supporting role in installation design, where we should focus on the theme of the work and procure suitable technology to present information.

4.1 Mock-Up

The technical design has a complicated process, and we have to predict hidden problems that may appear at different stages. Thus, it's necessary to have a mock-up before the formal implementation. We conducted a lot of tests during this phase, such as screen size, animation type, sensors, and main supporting structures.

In this phase, the main content was designing the animation composition. We stuck a 2-squares meter paper on the wall for testing. The first was to measure the distance between the user and the screen. In interaction, the user needs to push the installation to rotate, the distance between them is quite close. If the scene size is too large, it will be distorted and cause the vision burden to users. Therefore, scene composition needs to conform to the comfortable perspective, contain the size and position of shadow, and other characters.

The primary hardware is display device. We compared the effect of projection and LED screen. The projection can be resized, but it needs more space. The advantage of the LED screen is high-definition, but it cannot be resized and much heavier. However, we choose a large-size LED screen in the end, that means we have to consider the stability of the structure during the implementation.

4.2 Interactive technique

The core technique consists of two parts: the hardware and the software. The hardware here is a 65-inch TV screen rotating 360-degrees around a vertical axis and it is the main body of the installation. We have paid great attention to the safety issue and its power supply. For safety concerns, we have added extra weight on both the shaft and base to prevent the screen from falling. It's a steel plate with 1 m diameter and 3 cm thickness. For the supply of electricity, an industrial-grade slip ring allows the transmission of power. And we designed a special structure to break down the tension generated by rotation to ensure the safety of the slip ring. (Figure 8)

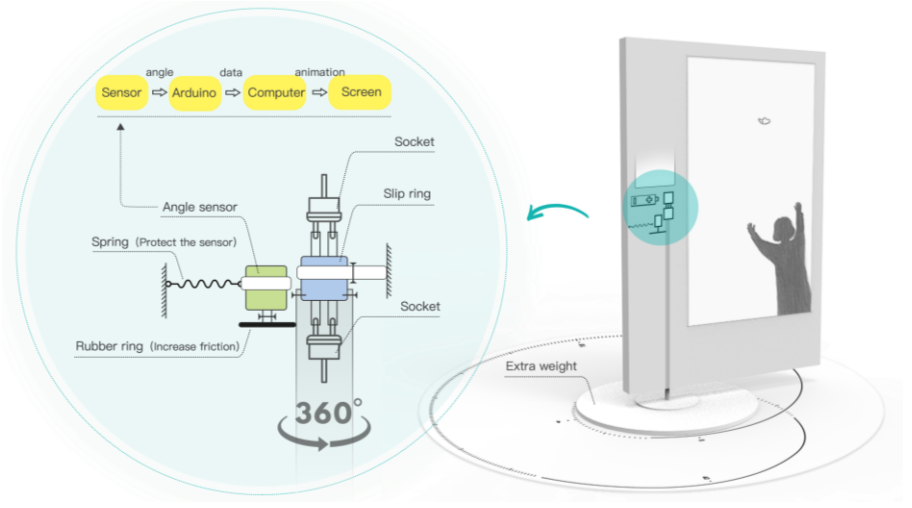

Figure 8. Technological principles in Still Walking

In software design, there are two pieces involved: Angle Sensor is used to register the angle data of rotation and transfer it to computer by Arduino. After that, the Unity3D would render the sequences of animation frames that according to our preset program. (table 3)

Table 3. The numbers of animation frames in each plot.

Age	**1** years old	**4** years old	**8** years old	**18** years old	**30** years old	**90** years old
Age Changes	30	35	34	30	66	
Walk	0	12	35	20	65	
Pause	4	4	4	4	4	4
Wave Hands	0	12	19	20	24	0
Other Characters	0	Butterfly 31	Classmates 10-35	Boy_a 20 Boy_b 22	Baby 4-60	

4.3 Installation

The installation has 1.8m high, 1.5m wide, and covers an area of 3m by 3m. And add ground stickers with age symbols. All surfaces of the installation are painted white to increase interactive immersion. It has a circle motion, the user can stand around and join it anytime and any angle. This display mechanism is quite light and easy to push, however, considering the safety of many young users, we have specially posted a warning banner.

In the interactive narrative, the design process has multiple feedback. Besides the visual feedback, it may get other sensory feedback concerning auditory sense, tactile sense, olfactory sense, and etc. All the feedbacks are using to enriches the users' experience and helps them to enjoy the story.

5. Observation and improvement

During the exhibition, more than thousands of people had experienced the interaction. Even there have audiences posted the video on social networks and watched by millions of people. Most of them would praise the interaction and moved by the story. However, there still have users doubts about the interactive method of the installation if there were no accompanying instructions. It is not easy for the users to figure out that they should interact with the installation through "push". People at different ages respond to the installation in different ways: children from 3 to 10 years old prefer active engagement, but most of them are attracted by the revolving screen and fail to explore it further. Young people from 15 to 25 years old make up their minds on whether or not to take the next step after watching how others may respond first. Middle-aged people over 40 prefer watching to joining. Based on user behavior in the first round, we put up signs "Push slowly" on the frame of the installation, which turns out to be a good reminder for young people and middle-aged people. For the aesthetic, the notice should be designed as part of the installation or put on the ground, rather than putting it up on the frame.

As for the story content design, some users failed to find out the branching plots. Even though they were informed of the interactive method in advance, some users still could not find the proper angle to stop the screen. Learning from this, we need a more attainable angle to trigger the interaction, and users should also have proper guidance on how to interact with the story. Despite all the defects above, the content and form of our story have been recognized by the users. The theme of time and lifespan was clear enough to be consistently understood by the users.

6. Conclusion and Future Work

We have discussed the feasibility of using user behavior as an interactive trigger on the large display. And we prove it can not only help the users to understand the story, but also make the installation more attractive and immersive.

In this case, we discuss the situation of one single person as part of the interactive narrative. However, it can also involve other users. The interaction among them and their user behavior will inevitably change the interactive storytelling.

In addition, we only discuss the interaction in a physical space. The future interactive installation may relate different spaces together, and the users' behavior in different spaces may trigger the interaction mechanism so that they can participate in the story together.

Finally, the interactive narrative method based on user behavior proposed in this paper is only an experimental exploration. It is just the tip of the iceberg in terms of studies on the new media and interactive narrative. We hope this case serves as a good start for further exploration of the relationship between narrative and user behavior.

Abstract | The present article aims to be part of the multidisciplinary debate on the relationship between places and memory. It intends to investigate *mnemotopes* as cultural objects of vertical interpretation of the memory-place axis, capable of including the tension between places of memory and memory of places. After the analysis of selected mnemotopes, the article will focus on the important role of Design of Communication as a mediator of territorial past through significant examples of existing artifacts and projects. A mnemotopic communication, founded on geolocalized map-based systems, can interpret the stratification of places and succeed in translating and reactivating their memories. These practices can be useful to understand how the perception of the places of memory changes over time, reflecting on their entrance into contemporaneity. Mnemotopic communication design can be therefore a valid cultural practice and fertile ground for creative entities.

KEYWORDS | MNEMOTOPE, COMMUNICATION DESIGN, MEMORY, CULTURE, TERRITORY

1. Memory activating places: between reality and fiction

Even if memory may look like a phenomenon that mainly concerns temporality, a closer look reveals a constitutive and not accidental relationship with spatiality (Violi, 2014). Memory and spaces are strongly interconnected and every place can be read as a palimpsest of what has occurred in the past. Spatial localization is also one of the most important devices that supports our abilities to remember, and it would be very difficult to describe an event if one did not imagine the place (Halbwachs, 1997). Places not only help to remember, but they can be a mnestic anchorage and can even activate memories.

It is therefore not surprising that, since the times of ancient Greece and Rome, poets, oratories and politicians have relied on mnemonic systems, the *art of memory*, which made it possible to keep in mind vast stores of knowledge. Frances Yates (1993), emphasizes its importance on a communicative level, in historical periods in which, before the invention of printing, orality played a fundamental role. These internal remembrance processes, were founded only on mental activities and abilities, without the aid of devices, and were based on the invention of artificial places of memory, *loci,* set up in the mind and then populated by a series of objects and figures directly connected to the contents to be remembered. The "images were used for the significance of precise contents of knowledge, while the fiction places to give them order and the possibility of being recalled" (Assmann, 2002, p.331). Cicero himself stated that people wishing to train memory must choose certain places and form mental images of the things they wish to remember and locate those images in the produced places (Yates, 1993). The *images agentes*, "activating images", thus generated, ancient mental unions of concepts, images and spaces, were able to reactivate large amounts of information that could be transmitted as a result.

However, considering the ontologically technological nature of humans, which has always made up for their faults and failings, it is not surprising that, with the passage of time, the art of memory became a sort of "intellectual fossil" (Rossi, 2001, p.60), giving way to technically dependent mnemonic systems (Montani, 2017). This definition, without any negative meaning, helps to focus attention on the externalized segments of memory, which, detaching themselves from their own organic essence, enter into relation with inorganic and technological supports, useful to restore not only parts of the individual identity, but also entire collective areas. These types of mnestic practices no longer need to rely on imaginary places, but can count on real places with which establish a relationship of productive interdependence.

The constant externalisation of memory here introduced, together with the one of orientation, still feeds a lively techno-social issue (Montanari, 2019). This vivid debate finds in devices equipped with geolocation systems a focal point. For several years now, in fact, the precise and immediate territorial localization of information and contents is not only a matter of geographical coordinates and goes beyond the cartographic reason, becoming part of a more articulated discourse, negotiated by different disciplinary approaches, which

is generating a convergence between material and immaterial, between corporeal and localized (Montanari, 2019), surface and stratification. The protagonist of this intersection is certainly space, an aggregate of significant substance (Iacoli, 2017), in which reality, perception and elements of the imaginary densely coexist (Soja, 1996). A system of places (Norberg-Schultz, 1996) far from being considered mere positions, which manifest and develop as complex cultural agglomerations, made up of multiform data. The traditional conception of space as an inert void in which objects just exist, has given way to a new vision that considers it active and full (Kern, 1988), and for this reason the most advanced technological devices with geolocation have to deal with the territorial fixation of increasingly composite details. The principles of georeferencing are therefore no longer just a tool at the service of orientation, but become a new substance of expression, capable of producing original languages, contents (Montanari, 2019) and communication modalities.

Starting from these considerations, we can see that the deep and constantly moving flow of data coming from the content/location axis is generating an unexpected itinerary of personal memories punctually linked to the territory. A real underlying archive, not directly perceptible, of passages on places and spatial frequentations that can be interpreted as a generalized tracking of individual memories that enter into a collective narrative. A concrete example is the case of Google Maps, the main outsourced digital orientation tool, which allows to store and subsequently view all the places you have passed through since 2009. This process, most of the time not perceived, creates what we could provocatively call "the map of our life" (Lana, 2019), where you can see all the small movements, but also the long journeys archived with precision day after day. Let's see then how geolocation systems, not considering here the problem of compromised privacy, can become a useful tool for stabilizing memories and movements, which by their very nature would be fluid and difficult to understand, creating a new and original mnestic-spatial substratum of contents directly connected to the territory and fixed on it.

2. Mnemotope or mnemotopes?

Our preliminary discourse revealed the ancestral relationship between humans and geographical environment of which the connection between territory and memory is an integral and constitutive part. This theme, with a historically multidisciplinary vocation, has over the years seen the multiplication of reflections and debates in fields of knowledge such as cultural anthropology, geosemiotics, documentary photography and sociology. Maurice Halbwachs' (1997) considerations are involved in this last context. He strongly supports the importance of the localization of memory, affirming that places and the spatialization of memory play an important role in the stability of collective memory. The spatial substance in which memory is rooted, however, is not inert, but innervated by the thoughts and feelings of the people of the past (Truc, 2011) and the sociologist therefore distinguishes two different mnestic frameworks. On one hand we find the familiar and local past, “made of

objects, houses and stones" (Truc, 2011, p.149), which is therefore extremely vulnerable to the incessant passage of time. On the other hand, there is a more distant and less intimate memory, but consequently more robust and shareable. If, in order to have control of their perceptions, people usually need to get closer to the object, it seems that they need to move away from it to preserve a collective memory (Halbwachs, 2008). We can therefore define the first conceptual framework as "memory of places", a form of private remembrance, precisely linked to details of specific places, preserved in each individual, very exposed to temporal corrosion and subsequent disappearance. The second instead as "places of memory", less rich in details, but certainly more stable because subject to processes of institutionalization and constant symbolization (Truc, 2011).

A response to the singular relationship between places of memory and memory of places, can be conceptually found in the Greek calque mnemotope (Van Rookhuijzen, 2017), used by Jan Assmann (1997) to identify a culturalized object of territorial interpretation. The term lexically incorporates the source of tension highlighted by Halbwachs, making itself a potentially privileged reference point of a complexity hovering between reality and symbol, between individual and collective, between private and institutionalized. Mnemotopes, however, are not only traces, but real apparatuses (Agamben, 2009), mnestic devices that have a preferential relationship with the territories, going beyond the pure testimony and preservation of the past, to contribute to its active and complete reconstruction, as engines of renewed interpretations. These entities are susceptible to multiple formulations according to the specific sensitivities linked to different views, by culture, geographical and temporal determination (Violi, 2014) and this means that any general definition of the term mnemotope is, in most cases, definitely incomplete and sketchy, without recurring to a dynamic reflection on the different places and memories that may constitute a mnemotope.

Consider, for example, a preliminary, but significant, possible distinction. We are facing a proliferation of mnemotopes that we can call "with trauma", the result of a paradigm shift of the very meaning of traumatic event. If in the past trauma was what cannot be spoken of, today it is all that is spoken of (Giglioli, 2011), because the events are increasingly seeking a sense that makes them feel worthy of being transmitted and communicated. The places of traumatic memories are most often institutionalized through monuments and transformed into museums and memorial sites in which coexist, not without difficulty, the mnestic and evocative power immanent to places and the desire to re-propose the invisible, chronologically disappeared, through dissimulation and reconstruction (Assmann, 2002). A particular case is represented by the Museo per la Memoria di Ustica in Bologna, created by the conceptual artist Christian Boltanski and inaugurated in 2007. It did not rise directly on the site of the trauma of which it wants to be testimony but was deliberately build in the city that saw the departure of the plane, then victim of the disaster. The museum is a "complex semiotic object, which interweaves different dimensions of reading: museum, place of historical memory, funeral memorial, work of art, civil and [...] political testimony" (Violi, 2014, p.307) and this peculiarity contributes to demonstrate the mnemotopic stratification, inhabited by intrinsic complexity, which can be manifested in different ways. The strong

dialectic between material and immaterial also emerges, typical of memory itself, which in this case is revealed through an installation that involves space and visitors. The wreckage of the plane has in fact been entirely reconstructed and is located in the center of the museum, all the other objects found have instead been taken out of sight, closed in black boxes that surround the carcass of the aircraft. This operation excludes the physicality and materiality of the objects-relics, of which only the idea remains.

A very different perspective is proposed by the mnemotopes that we can call “without trauma”. Mnestic entities linked to positive aspects of the experience which, even if not pervaded by controversial and conflictual memories, are equally characterized by strong emotional experiences and that can be very important for the construction of cultural spaces of memory (Assmann, 2002). Multifaceted microcosms, they are interdisciplinary intersections in which territory, past, curiosity and technology coexist, often united by a strong commitment to conservation. There are various mnemotopic types without trauma that are not mutually exclusive, but enrich the places with further stratifications that, if codified, allow the development of new models of territorial reading. In this way the mnemotopes without trauma can remove the risk of illegibility of the places of memory generated by the breaking of the interdependence between memory and its living translation. We can identify as first category the cultural mnemotopes, places of geoattraction and subsequent geoaggregation of varied cultural phenomena, usually concentrated in a given time period. Points of transversal creative convergence are phenomena with socio-cultural implications that have characterized entire eras. Think, for example, of the Montparnasse district of Paris, which at the beginning of the 20th century saw the migration of the artistic community from the overcrowded Montmatre. It became what for Apollinaire was the neighborhood of les extravagates, the refuge of beautiful and free gaiety, simplicity, and carelessness (Shattuck, 1971). A circumscribed area where, in few years, collective ateliers multiplied, the hub of avant-garde experimentation, but also cafés, such as La Rotonde or Le Dôme, a spontaneous meeting place for painters such as Amedeo Modigliani and Chaïm Soutine, aesthetes, poets, patrons and art dealers, places animated by an overwhelming expressive vitality.

The same creative energy accompanied the experience of Bar Jamaica, in Brera district of Milan, which after the Second World War, lived the coexistence of important artistic personalities who were regular customers. Not far from the Academy of Fine Arts and the headquarters of Corriere della Sera in via Solferino, the bar became a catalyst for ideas and design meetings between artists, journalists, critics, writers. The white tiles that still cover the walls today, were the setting and stage for significant intellectual exchanges. Piero Manzoni, Luciano Bianciardi, Lucio Fontana passed through here. The famous photographer Ugo Mulas immortalized the bar and its clients in his black and white images, further stratifying its identity with a new photographic memory of reportage, which still today documents the period with great expressive power.

Within the macro-category of cultural mnemotopes, there are *literary mnemotopes*, places where inspirations and intellectual efforts have been concentrated in order to generate remarkable works. They are physical spaces, inhabited and experienced by the protagonists of the history of literature that, if mapped, can highlight original itineraries of intersections between places and ideas that "could only be conceived where they were materially born" (Pagani, 2019, p.11). This typology also includes places narrated by writers particularly rooted in a territory. An example would be Giovanni Testori's novels, concentrated in the streets of Milan's post-war suburbs. Iconic is the case of *Ponte della Ghisolfa*, a railway overpass that the writer has made the protagonist of one of his most famous stories (Testori, 2013). His characters live this common place, relocating it from being a simple passageway and making it an agglomeration of memories in which urban and social, private and collective experiences merge. The Ponte della Ghisolfa has been further stratified over the years thanks to the cinematic and theatrical transpositions of Testori's novels, including the famous movie *Rocco e i suoi fratelli* by Luchino Visconti, emphasizing even more how the mnemotope without trauma can be linked to creative experiences. In fact, this kind of mnestic-spatial entities invites to ask ourselves how much a place and its physical conformation can actually influence the generation of artistic and design contents, moving away from being a stage, but working as an active part in generative processes.

The same question can emerge when talking about *project mnemotopes*, historical places present and rooted in the territory, such as archives, museum-houses and museum-studios, protagonists of the past of industrial design. They represent important research centres, complex collections of materials of relevant scientific interest with great potential for dissemination, often unexpressed. This type of mnememotope is today at the centre of numerous attempts at systematization, useful to make them accessible to the general public. In this context, the "Design Storico" project was launched in 2019. With the support of Fondazione Cariplo and counting on a network of places of memory already active in the territory, it will map the relevant nucleus of Lombardy design activities and promote a series of events and exhibitions that will turn the spotlight on this heritage and on the territorial memory linked to the culture of the project.

Examples such as the one just mentioned, are the demonstration of a current proliferation of attempts to map not the works, but the places where they were thought or realized, itineraries between ideas and territories. These experimental processes demonstrate how much mnemotopes are involved in concrete and funded projects driven by the emerging need for memorialization and spatialization that engages various areas of knowledge.

3. Communication Design: a mnemotopic point of view

Communication design, "a mature discipline with its own identity that merges traditional know-how with technological innovation" (Baule & Quaggiotto, 2015), plays a significant role in this particular multidisciplinary context. In fact, it can deal with the description and

visualization of mnemotopes, but also with their translation, transforming them into articulated communicative systems that introduce individual memories into a wider and collective narrative. This field of knowledge is able to visualize new mnestic itineraries and consequently laying the foundations for real maps of places of memories, but also for innovative mnemotopic archives.

Through the practices of mnemotopic communication design, in fact, we can uncover significant details and contents of the territories by showing them through communicative artifacts with great expressive potential. These products are made up of various types of linguistic formats whose characteristics vary according to the data to be transmitted.

A nodal language for the transmission of mnemotopes, given the ancient relationship between images and memory, is the photo-narrative, a system of visual editing in which a particular spatial storytelling is concentrated. Gabriele Basilico's urban photographic projects are a significant example of this process, in which the relationship between the past and places becomes the object of visual reflection, giving shape to a scenario that borders on the metaphysical and materializes in bright contrasts between light and shadow and in the precise choice of a monumental black and white that returns a city only apparently uninhabited. Roberta Valtorta (2012) writes that his works are sensitive investigations aimed at that complex object that is the city, with which he enters into dialogue as he would with a person, with a living organism, a reading of that urban experience that somehow remains entangled in its architecture. A moment of exchange between photos and geography that evokes a real commitment to memory that makes images able to look into the stratified past of a territory.

Another interesting case is the *Memofilm*[1] used to reconstruct the individual stories of Alzheimer's patients. Twenty minutes of audiovisual materials that help the self-construction of the patient's identity through the editing and subsequent transmission of personal memories. Although this type of artifact is mainly related to clinical and neuroscientific research, memofilms are useful, within our discourse, to identify further formal characteristics for mnemotopic communication. In particular, perceptual aspects emerge as an important channel of remembrance, materializing in audiovisual systems. The union of sounds, static images and videos can be useful in the reactivation of mnestic contents also in the case of memory of places. An experimentation driven by the same objectives as the ones of Memofilm, has been recently designed in Gavirate, in the province of Varese, Lombardy. Before august 2020, in the square in front of the train station, there will be an old telephone booth, a bench and a mailbox, a corner of memories in which Alzheimer's patients

[1] *Memofilm* is an experimental project born in 2008 in Bologna from the joint commitment of Asp (Azienda di Servizi alla persona) and directors from Cineteca. Each memofilm is a twenty-minute video made to measure for patients by drawing on their heritage of affection, loved ones and familiar objects, assembled together in an evocative way. They aim to improve the behavior disorders associated with Alzheimer and other forms of dementia, being a positive part of the therapy. For more info: https://memofilmontheweb.wordpress.com/.

can find fragments of the past world and feel reassured (Landoni, 2020). In this case, the mnemotopic artifact is not a media, is not digital, but is designed and built directly on and *for* the territory, showing the great importance that real places still have in reactivating memory.

Another practical case is “Distretto Testori”, a project of DCxT, the Design of Communication for the territory research group of Politecnico di Milano. The project started after the proclamation of Milan as UNESCO Creative City of Literature in 2017, a recognition that immediately set in motion reflections on the possible mapping of places linked to the literary memories of the city. The work is focused on the works of the aforementioned Giovanni Testori, who described the places where the narratives took place in detail, up to often mentioning the addresses. It was therefore decided to create an original map-based web platform, made up of several different microformats.

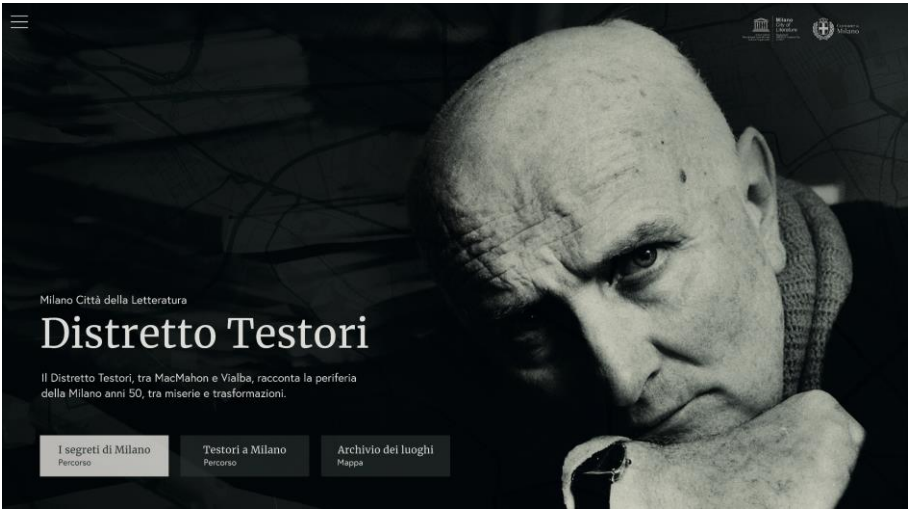

Figure 1. “Distretto Testori” web portal homepage. From this page users can choose between three different digital itineraries: geolocalized photo-storytelling based on the novels, photo documentary of Testori’s life, archive map of Testori’s literary mnemotopes.

Each of them is intended to be part of a collective archive of Testori's literary mnemotopes that can be read at various levels. After an initial and fundamental archival research, which brought to light peculiarities of the memory of the places identified, the most useful and significant materials have been selected. The next phase saw the design of the singular artifacts, eachone as an attempt to concentrate a particular level of the story by crossing literary memories with territorial ones. Three production lines were delineated: a geolocalized photo-storytelling, based on the quotes from the novel, the places described and the imaginary created by the writer, integrated with an interactive structure. A photo-

documentary of Testori's life fixed on a map, realized using original pictures and the author's memoirs. An archive map of Testori's literary mnemotopes, intended to be a new mnestic layer of Milan Creative City of Literature.

Figure 2. "Distretto Testori" web portal. Inside the photo-storytelling section, the user can interactively move in Testori's places, accessing different types of contents (archive photos, quotes, videos).

The project was previewed at the Annual Conference of UNESCO Creative Cities, which took place in Fabriano in June 2019, and is currently being implemented. It aims to become a model for territorial communication systems, capable of offering an innovative approach to the topic of "mnemotopes without trauma" making them more active and easily perceptible, allowing even mute places to speak again.

4. Conclusions

Memory is intimately and indissolubly related to places. The aim here was to outline that this connection can be read through the principle of mnemotope, understood as a culturalized object of territorial interpretation. As emerges from the cases presented in the article, mnemotopes can take many forms, from a bridge in Milan to a café in Paris, but they shared the capability to solve the tension concerning places of memory and memory of places. This duality is not a contradiction (Wüstenberg, 2019), is the way they take a position between the past and the future between individual and collectivity, between temporality and spatiality (Donohoe, 2013).

In this open context, Communication Design can supply tools and methods to design mnemotopes, metabolizing the metamorphic complexity of memory and places. As *images agentes* of the classical mnemonics techniques, could activate in mind a great quantity of memories, mnemotopes, technically dependent on communication design, are now able to interface with territorial past, interpreting its stratification. Considering the examples discussed above, what we have to study is how this discipline recalls the texture of the places (Adams et al., 2001), how it succeeds in translating and galvanizing mnemotopes, how it supports narratives for mnestic territories suffering from communicative insufficiency.

Under this perspective, mnemotopic communication design turns out to be a concrete cultural practice that, avoiding the stereotypes of nostalgic re-enactments, can open the doors to original multidisciplinary discussions on memory-places axis. In sum, designed mnemotopes are able to renew the experience of the territories, and the mnemotopic framework is a useful heuristic tool (Van Rookhuijzen, 2019) for understanding the topography of memory.

Attractive Factors in the Experience of an Online User-supported Learning Platform

Min-Yuan Ma[a], Hsin-Yi Huang*[a], Eric Chen-F Hsieh[a]
[a]National Cheng Kung University, Taiwan
*hanhan7777777@gmail.com

Abstract | The unprecedented growth in information and communication technologies (ICTs) has led to an expansion of online learning. Crowdfunding has been developed to increase self-learning to accelerate advancement in online learning. This research is conducted to understand attractive factors and users' kansei needs in user-supported online course platforms. Broadly, this research is performed in two steps. 1) Exploring user experience with the method of the user journey map (UJM) and the evaluation grid method (EGM). 2) Using a questionnaire design formed according to the map of kansei experience, two types of users, namely, with and without the experience of having taken an online crowdfunding course (experiencers and non-experiencers), are compared using quantification type I. The results show that both types of users highly value expectation as a primarily emotional component before the experience. However, experiencers care more for the sense of achievement during and after finding and taking crowdfunding courses.

KEYWORDS | ONLINE LEARNING, EVALUATION GRID METHOD (EGM), USER JOURNEY MAP (UJM), KANSEI EXPERIENCE

1. Introduction

1.1 Research Background and Motivation

Newly developed and innovative technologies have launched a new wave of a global industry. These new technologies changed the relationship between reality and virtuality and led to the integration of new digital information relationships among things. It is likely that technology will continue to become even more intelligent and indispensable in human life. In response, new learning styles are emerging. Digital instruction, no longer limited by time or space, now provides a range of courses that learners can take that are the product of successful virtual business practices. However, it has not yet been fully established how the needs of learners (users) of the online course platforms can best be met.

In recent years, as science and technology have rapidly developed, and the internet has penetrated ever further into daily life, work, communication and learning have all also changed (Chen, 2000). Demand for human development and professional competence has increased. The development of e-learning has changed how instruction is delivered and received. With technological support, users are less restricted by time and space. Learning, technology and the internet are now linked together, stimulating trends of integrating information into teaching.

According to the Digital Learning Output Survey Report produced by the Industrial Bureau of the Ministry of Economic Affairs of Taiwan, the annual composite growth rate of self-paced e-learning in 2015-2020 is 0.4%, indicating that the market continues to grow. According to the 2016 Digital Learning Output Survey Report, Taiwan's online education market was about 100 billion Taiwan dollars in that year and was expected to grow. The digital learning industry is exhibiting enormous market potential, and digital style is a necessary and essential development direction for contemporary society (Deng, 2017).

Data published by the research institute CB Insights in 2015 indicate that the scale of investment in global educational technology has been rising since 2009. The total investment through 2014 reached 1.866 billion US dollars. In the field of educational technology, the online education platform is a popular investment project, showing that online educational platforms have excellent market potential.

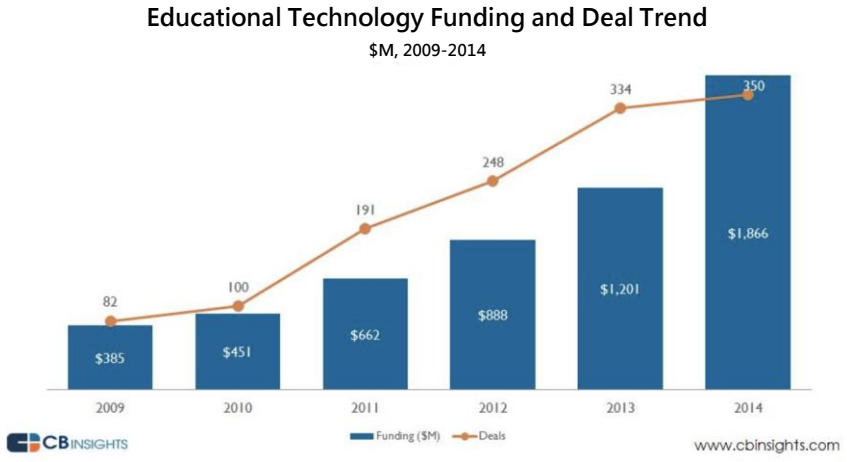

Figure 1. Funding for Educational Technology and Deal Trend (Image source: https://www.cbinsights.com/research/ed-tech-funding-record-2014/)

Along with the public interest of e-learning, the recent trend of crowdfunding is inspiring creative new models of online learning. Crowdfunding provides a web platform for a creative person or organisation to propose ideas and leverages the power of individual funders who can provide relatively small monetary donations to support the proposals (Antonenko, Lee & Kleinheksel, 2014). The user-supported structure for the Taiwanese online school Hahow, which was officially launched in 2015, is a good example. Hahow provides alternative types of experts and instructors with a platform that gives classes to learners for free or for a fee. The courses include subjects like design, business, technology, language and culture. Because learners are free to choose their paths of interest, the threshold for learning is relatively low, and learners are enabled to learn at any time. This enables learners to pursue self-study, self-enhancement and improvement of their professional skills.

Figure 2. Example of a User-supported Online Learning Platform (Image source: https://hahow.in)

Thus, user-supported online learning platforms demonstrate good business prospects and market potential. How to increase learner use of online course platforms and develop an improved learning experience is set as the research goal.

1.2 Purpose of Research

This study explores the factors that attract learners for a user-supported online course platform and assessed user experience with the design perspective of the user journey map (UJM), combined with the Miryoku Engineering, to summarise the users' Kansei experience in online user-supported courses.

To divide participants into those who have experienced the entirety of a course (experiencers) from those who have not (non-experiencers), this study divides interaction with the platform into three phases: before, during and after the course. This will allow the researchers to determine which qualities of the three-stage process are the most attractive elements and which feelings most typify learners at each stage. Using this, we can determine how to ensure the user-supported online course platform is in line with the users' Kansei needs.

2. Literature Review

2.1 User-supported Online Learning Platform

Digital or online learning originated in 1996. It has been defined as part of information and communication technology (Higher Education Funding Council of England, 2005), applied to support learners and improve their learning. This idea forms part of a conception of continuous development and evolution, using a range of understandings and interpretations of information technology. Normark and Cetindamar (2005) interpret digital learning as a system that electronically transmits, manages, supports and supervises education. Specifically, in this context, digital learning is the use of digital teaching technology by learners to break through barriers of time and space and obtain needed information; that is, it represents the opportunity to learn over the internet using computer equipment, regardless of location or time. Urh and Jereb (2014) argue that in digital learning, an essential relationship appears between learning time and average achievement. Today, online learning platforms and web-based applications provide users with direct access to information over the internet (Zamfiroiu & Sbora, 2014).

According to Schwienbacher and Larralde (2010), crowdfunding rests on acts of donation through the internet. In other words, crowdfunding is obtaining necessary funds by tapping a group of individuals rather than any professional institution as such, pooling amounts to support proposed projects or entrepreneurial actions. The crowdfunding platforms that these acts occur on are considered bilateral, meaning that there is an interaction between the two parties (funders and fundraisers) that is coordinated by the platform (Belleflamme et al., 2016). Crowdfunding provides a web platform for individuals or organisations to propose ideas and leverages the power of dispersed funders who provide relatively small monetary amounts to support the proposals (Antonenko, Lee & Kleinheksel, 2014). Such a platform reduces the previous need for cumbersome intermediaries, itself being the transparent intermediary between fundraiser and sponsor (Ordanini et al., 2011), bringing user sponsorship to the significant central position.

2.2 Kansei Experience

Kansei is a Japanese term which by definition from many dictionaries refers to sensitivity, sensibility and feeling (Lokman & Noor, 2006). Kansei deals with people's emotions, feelings and moods. It is about subjective, personal and self-centred experiences (Salem et al., 2009). Kansei also is interpreted as a combination of consumer perceptions, preferences, and attitudes towards objects.
Experience is a combination of various elements, such as the user's outcomes and their internal state (such as emotions, expectations) over time, with a clear beginning and end (Hassenzahl, 2006). User experience is a dynamic and continuous state because it is exposed to a variety of different systems, and the context and circumstances that follow, under changing usage conditions.

2.3 User Journey Map (UJM)

A User Journey Map (UJM) is a way of visually presenting user experience in relation to a product or service in stages. Design tools allow users to make individual assessments and improvements through interactions at every moment in their journey (Bruce Hanington, 2012). UJM is widely used in practical service management and design, including service process and experience. In the field of user experience design, it allows the analysis and understanding of user experience from the user perspective (Mangiaracina et al., 2009). It visualises all possible touchpoints between the user and any product or service (Alves, 2012), and each touchpoint relates to an attitude or feeling held by the user (Samsel, 2013), which enables the systematisation of user experience and design to obtain new customer experiences (Customer Champions Ltd., 2014).

The structure of a UJM varies depending on the designer because their design is not yet standardised (Samsel, 2013), so it can be designed in various ways, depending on the goal and scope of the project. UJM's framework is based on what the user does and can define a grinding process based on the user's daily activities (Heekyung Moon et al., 2016). This study uses UJM to take inventory of and organise the history of the subject's experience of the learning platform.

2.4 Evaluation Grid Method

The evaluation grid method (EGM) is used for personal interviews. It is an important research method for Miryoku Engineering and has been studied by the Japanese scholar Sanui. Kelly (1995) proposed the original method of construction, also known as the square method or the repertory grid method, which was developed to improve respondents' understanding of respondents. This method fundamentally involves in-depth interviews in highly dedicated groups, with the results of the interviews extracted using characteristics of paired-comparison products. The product's psychological cognition, perception and existence value are assessed, and then the traits of the target product are categorised (Kelly, 1955).

This research method is divided into two steps. First, the product is evaluated. The respondent's expression of product preferences enables differences in product to be understood views on the positive and negative aspects of the product to be presented. The second step is to clarify the meaning of the original concept or the understanding of the product through additional questions, then guiding the respondents to analyse their original evaluation concept and their feelings, as well as specific responses. The elements of the product that fascinate the respondent are investigated as well (Sanui, 1986). Using repeated series of questions and answers, the three levels of abstract feeling (upper), original evaluation item (median) and specific conditions (lower) that constitute the median are extracted, a network diagram of a hierarchical evaluation structure is gradually created.

2.5 Quantitative Theory Type I

Hayashi's quantification methods is a unique multi-dimensional data analysis method developed by Chikio Hayashi. Hayashi's Quantitative Theory Type I is a Categorical Multiple Regression Analysis Method, which aims to find independent variables of a specific objective variable and other qualities (1950). Take the approximate (linear) function relationship between the virtual variables of 1 or 0 and use the qualitative regression analysis to determine the intensity of the influence of each "quality project" on the "target variable". Each qualitative project consists of several categories and assumes that all samples are mandatory in each project (and only one of them can be selected), which can be used to establish regression formulas to predict data and event variability. The regression formula can be expressed as a function as follows:

Formula: $y = \sum \beta X + e$

y: Experimental predictive value

β : Class coefficient (weight score)

X: Different categories

e: Random variable

In the quantitative statistical results of category I, the "larger the value" of the Partial Correlation Coefficient indicates that the "category" affects the "target item" to a higher degree. The larger the value of the Multiple Correlation Coefficient (R), the higher the degree of reliability of the analysis.

Table 1. Relationship between R-value and reliability

R	***Reliability***
0.00~0.19	Predicted values exhibit "low" correlation
0.20~0.39	Predicted values are relevant
0.40~0.69	Predicted value exhibit "strong" correlation
0.70~1.00	Predicted value exhibit "very strong" correlation

3. RESEARCH METHODS AND EXPERIMENTAL PLANNING

The primary purpose of this study is to explore the attractive factors and KANSEI experience of the online learning platform. The steps used follow a UJM to check the learner's online course learning experience and combined with the EGM to reinforce attractive factors and

summarise the experience process table. Then, the perceptual experience table is used to design a questionnaire to further compare the needs of the experiencer and non-experiencer with quantitative type I analysis.

3.1 EGM Interview

Before the interviews, an online questionnaire is used to collect the outlines of the in-depth interview and conduct face-to-face EGM interviews. For the EGM interviews, seven highly involved learners on the user-supported online course with the experience of more than three user-supported online courses were selected. The average study time is more than three years. Each person's interview lasted about one hour. To enable the interviewees to focus on the content effectively, an interview outline was prepared and assessed according to the EGM evaluation construction method. The outlines are divided into two parts.

The first part compares the respondents' preferences to the online user-supported platforms they have used. It compares the respondents' feelings and specific answers to capture what factors of online platforms are attractive to the respondents. The second part investigates the respondents' feelings about the use of the online course platform. Therefore, during this interview process, the use of the online user-supported platform is taken to guide the respondents to think about their user experience.

3.2 Mapping the User Journey Map

To organise the learner's Kansei experience, this study uses a UJM as a framework. To compose a UJM, the focus group method is adopted to divide the overall process of using the user-supported online course platform into three phases: before, during and after the course to better understand the user and unify the original evaluation projects (median). Finally, the interviews are performed to establish the overall usage history.

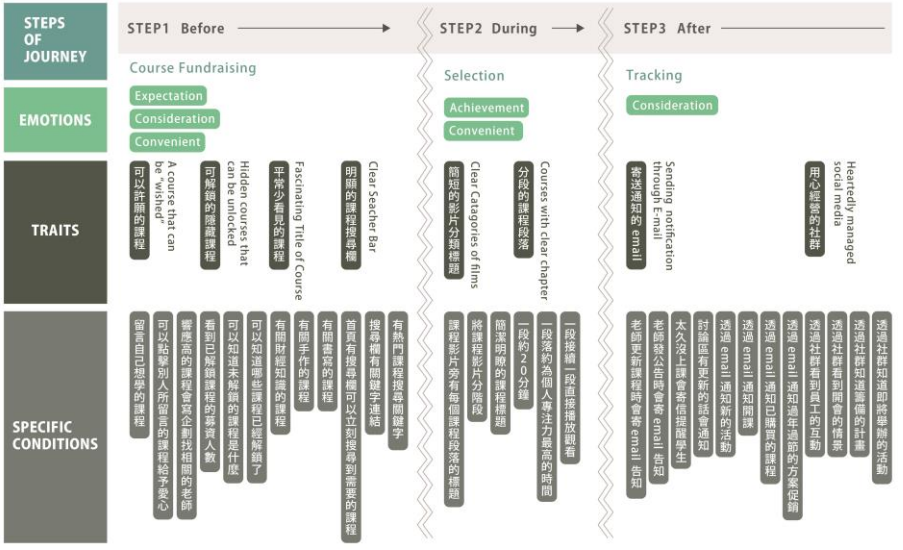

Figure 3. User Journey Map on user-supported online course platform (Simplified version)

3.3 Questionnaire Construction

This study uses a combination of UJM and EGM to draw a Kansei experience process table and to ask about certain subjects in order. The questionnaires are sent to respondents by email.

The questionnaire is divided into four parts. The first part acquires subject information, including their history of taking online user-supported courses. The second, third and fourth sections cover which items are attractive for the before, during and after course stages. Within the attractive factors item, abstract feelings at different stages are used as the central axis, and the corresponding original evaluation objects (median) and specific conditions (lower) are used for the item scores and category selection.

4. ANALYSIS

This study transforms the attractive factors extracted into quantifiable terms, combined with a UJM. The questionnaire and its analysis use quantitative means to understand the learners' most important feelings and attractive factors for the use of a user-supported online course platform, as well as the weighted of relationships among the attractive factors.

A total of 137 questionnaires were collected, of which 132 were valid, with 65 completed by male and 67 completed by the female; 62 respondents had taken courses on an online user-supported platform, and 70 had not. The analysis is divided into two parts:

1. The first part analyses experiencers in relation to the entire process of the use of the online user-supported platform.
2. The second part provides an analysis of the non-experiencer results. Because these learners have never taken a course on an online user-supported platform, and the overall process is not transparent, only the attractive factors before class are analysed to present that preferences and feelings of the non-experiencer.

4.1 Experiencers: Learning Experience Before Class

The combination of EGM and UJM presents the experiencers' three main feelings for the use process before class, which are termed "Security", "Expectation" and "Consideration". The multiple correlation coefficient of Expectation is the highest among all feelings, and 0.782 indicates a very strong correlation.

Table 2. The weighting of "Security" among experiencers before class

Item	Category	Category Points	Partial correlation coefficient
Clear Professionals' Information	Professionals' Experience	0.086	0.461
	Professionals' Background	-0.002	
	Professionals' self-introduction	-1.671	
	Showing Professionals' Facebook	-5.949	
	Provide Professionals' works	0.501	
Clear Introduction of Courses	Provide Course Outline and Planning	0.090	0.108
	Explain what you will learn after taking courses	-0.308	
	List the software and skills needed in the course	0.644	
	Explain who would be suitable for the course	0.106	
Free Trial Class	Provide Free Trial	0.208	0.345
	Know in advance the teaching style of courses	0.644	
	Know in advance the visual effect of teaching video	0.106	
Private information	Do not reveal the lessons you take	-1.018	0.236
	Prevent others from seeing the amount of class taken	-0.638	
	Be able to choose the personal information which you want to present	0.262	

Multiple correlation coefficient: 0.498
Coefficient of Determination: 0.248

The multiple correlation coefficient for Table 1 is 0.498, which indicates that the attractive factor "Security" has a strong correlation with the user-supported online course platform before class. Clear Professionals' Information has the most significant impact on the sense of security, followed by Free Trial Class. The category points indicate that in the Free Trial Class, knowing the teacher's class style in advance has a higher effect on the experiencer and allows the learner to feel the attractiveness of security.

Table 3. The weighting of "Expectation" among experiencers before class

Item	Category	Category Points	Partial correlation coefficient
A course that can be "wished"	Can leave messages to the course you would like to learn	-0.499	0.459
	Can click on others' wishing course to give heart	3.509	
	Invite relevant teachers for taking the course which is highly recommended	-0.359	
Hidden courses that can be unlocked	Show fundraising numbers for unlocked courses	-0.817	0.381
	Show the not unlocked courses	0.437	
	Can know which courses have been unlocked	1.815	
Fascinating Title of Course	Vocabulary for getting started	-3.925	0.582
	Vocabulary for professional	1.573	
	Course name includes "Guaranteed to get started."	0.111	
Reasonable and Preferential Price	Less than two thousand TWD	-0.442	0.504
	Fill in the questionnaire and send a discount coupon	3.538	
	Early Bird Discount	-0.074	

Multiple correlation coefficient: 0.782
Coefficient of Determination: 0.612

Thus, it can be seen that for the experiencer, professional vocabulary has the most substantial positive impact on the attraction of a course title. Therefore, the online user-supported platform can strengthen the description of professional vocabulary for the experiencer in during the course, such that learners can feel the attraction of expectation. In relation to reasonable and preferential prices, the learners reported that filling in a questionnaire and sending a discount coupon was the most attractive feature to them.

Table 4. The weighting of "Consideration" among experiencers before class

Item	Category	Category Points	Partial correlation coefficient
A course that can "be wished"	Can leave messages to the course you would like to learn	0.309	0.334
	Can click on others' wishing course to give heart	1.670	
	Invite relevant teachers for taking the course which is highly recommended	-0.980	
Special Columns of the Course	Learn more about teachers' professional fields	-1.312	0.472
	About the course information	0.928	
	Show the current trend	0.846	
Collectable Courses	Tags of course which can click to collect	-1.135	0.285
	can review the lessons you have collected	0.530	
	Learners could classify their courses' collection	0.698	
Customized learners' course recommendation	Recommend courses you might want to learn	0.126	0.315
	Recommend courses that may be of interest	-0.565	
	Recommend courses you might enjoy	1.831	

Multiple correlation coefficient: 0.572
Coefficient of Determination: 0.327

From the category points, it is clear that for experiencers, information about the course shows the most substantial positive influence in the item of Special columns. Therefore, the user-supported online course platform can include course-related information in its column section and allow learners to learn whether the courses are in line with current trends. For the desired course, learners report that being able to click on another's desired course to give heart would be an attractive trait for them.

4.2 Experiencers: Learning Experience During Class

Through a combination of EGM and UJM, it can be seen that the experiencers have three main feelings during the course: "Practicality", "Consideration" and "Achievement". Among these feelings, the multiple correlation coefficient for inspiring achievement is the highest.

Table 5. The weighting of "Practicality" among experiencers during class

Item	Category	Category Points	Partial correlation coefficient
Multiple learning methods	Learning with videos	0.040	0.220
	Learn by only listening	2.694	
	Learning through slides and texts	-0.410	
Arranged homework	Assignments for each class	0.047	0.150
	Must submit required assignments	1.662	
	Can review the assignment of each class in advance	-0.319	
Platform for timely submission of assignments	Upload assignments instantly	0.310	0.079
	Will know whether the job was uploaded successfully	0.156	
	Will know whether the teacher received the homework	-0.155	
Immediate evaluation	Open-ended question	-0.425	0.233
	2-3 multiple choice test	0.974	
	Ture / False question	0.644	

Multiple correlation coefficient: 0.314
Coefficient of Determination: 0.099

The category shows that for the experiencer, in the item of immediate evaluation, the 2–3 multiple choice has the most substantial positive influence. Therefore, in this item, the user-supported online course platform should incorporate tests with 2–3 multiple choice questions during the course to allow learners to develop a more robust understanding of the content during the study.

Table 6. The weighting of "Consideration" among experiencers during class

Item	Category	Category Points	Partial correlation coefficient
Detailed handout of courses	Can download handout's pdf file online	0.352	0.117
	Provide critical points of the course	-0.213	
	Can fill in the blank to complete the content of the handout	-0.186	
Interactive lesson	The platform mascot will appear as a reminder	0.042	0.022
	The teacher will pretend that someone is in class	-0.095	
	Teachers have a joking tone in the film	0.015	
Hand in homework privately	Teacher gives private feedback in addition	0.334	0.322
	Another platform for hand in homework	0.926	
The complete answer of the assignment	Provide complete answers for assignment	-0.223	0.143
	Provide information relevant to the answer	0.429	
	Provide additional supplementary information related to the answer	-0.302	

Multiple correlation coefficient: 0.334
Coefficient of Determination: 0.111

As shown in Table 5, for the experiencer, within the item, hand in homework privately, another platform to hand in homework is the most influential. An online course platform could incorporate a private platform for handing in homework during the course so that homework is not be made public, which will enhance the learner's willingness to hand it in. In relation to complete answers for the assignment, learners report that the platform should provide information relevant to the answer to be attractive.

Table 7. The weighting of "Achievement" among experiencers during class

Item	Category	Category Points	Partial correlation coefficient
Can see the pages of classmates' homework	Can review the homework submitted by classmates	0.599	0.166
	Can see the teacher's feedback to other students' homework	-0.571	
	Can see the opinions given by the students	-0.191	
Immediate Evaluation	2-3 multiple choice test	0.109	0.229
	Able to quickly jump to the section in the film which related to the answer	-0.223	
	Feedback will be given after the test	0.183	

Multiple correlation coefficient: 0.452
Coefficient of Determination: 0.204

The multiple correlation coefficient reported in Table 6 is 0.452 for the experiencer, indicating that achievement has a strong correlation with the user-supported online course platform during the course. It appears from the partial correlation coefficient that immediate testing has the most significant impact on the sense of achievement.

The category shows that for the experiencer, in relation to immediate evaluation, feedback will be given after the test has the most substantial positive impact. Therefore, in this item, the feedback given after the assessment is most attractive to learners.

4.3 Experiencers: Learning Experience After Class

The combination of EGM and UJM shows that experiencers have two main feelings in the use process after the course, namely "Achievement" and "Affability". Among these, the multiple correlation coefficient for achievement is the highest among all feelings.

Table 8. The weighting of "Achievement" among experiencers after class

Item	Category	Category Points	Partial correlation coefficient
Completion sign of the course videos	After watching the video, you can mark it for record	0.530	0.301
	Automatically mark completed after watching the video	0.036	
	Showing how many times you have watched	-1.270	
Positive feedback	Earn badges by reaching a certain score	-0.838	0.242
	Can collect achievement badges to rank	0.341	
	Achievements unlocked when you reach the course progress	0.356	
Ranking	Provide Taiwan rankings in the course evaluation	-0.522	0.361
	Provide Asian rankings in the course evaluation	-0.383	
	Provide a global ranking in the course evaluation	0.984	
Independent forum	Virtual identity card	0.951	0.182
	Can leave a message to discuss	0.221	
	Can give a response to others by clicking on the mark	0.273	

Multiple correlation coefficient: 0.537
Coefficient of Determination: 0.288

The multiple correlation coefficient in Table 7 is 0.537 for the experiencers, indicating that the achievement has a strong correlation with the user-supported online course platform

after the class. The partial correlation coefficient shows that ranking has the most significant impact on the sense of stimulating a sense of accomplishment, followed by completion sign of the course videos. The category shows that for the experiencer in the ranking results, provide a global ranking in the course evaluation has the most substantial positive influence.

Therefore, for this item, the user-supported online course platform provides a global ranking in the course evaluation, such that the learner can be motivated to complete more courses as a result of the ranking, thereby enhancing the attractiveness of achievement.

Table 9. The weighting of "Affability" among experiencers after class

Item	Category	Category Points	Partial correlation coefficient
Heartedly managed social media	Interactions between employees through social media	0.86	0.421
	Can see the plan in progress through the social media	0.055	
	Know about upcoming events through social media	0.089	
Sending notification email	Notify of new events	-0.048	0.168
	Notify to start a course	0.245	
	Notify of purchased courses	0.089	

Multiple correlation coefficient: 0.423
Coefficient of Determination: 0.179

The multiple correlation coefficient in Table 8 is 0.423 for the experiencers, indicating that affability is strongly correlated with the user-supported online course platform after class. The partial correlation coefficient for personally managed social media demonstrates that it has the most significant influence on the sense of affability. From this category, it can be seen that for the experiencers, in the personally managed social media, interactions between employees through social media are the most influential.

Therefore, in this item, the user-supported online course platform should create more posts on interactions between employees through social media, where learners will see the dynamics of the platform, thereby enhancing the affability.

4.4 Non-Experiencers: Learning Experience Before Class

Because non-experiencers have never taken courses on an online user-supported platform, and the overall process is not transparent, the attractive factors for these users are only analysed for before class, from which we can understand their preferences and feelings.

The combination of EGM and UJM shows that the non-experiencers have two main feelings in the use process before class, namely, "security" and "expectation". The multiple correlation coefficient for expectation is the highest among all feelings, and 0.591 indicates a very strong correlation.

Table 10. Weighting for security of non-experiencers before class

Item	Category	Category Points	Partial correlation coefficient
Clear Professionals' Information	Professionals' Experience	-0.026	0.277
	Professionals' Background	-0.944	
	Professionals' self-introduction	0.342	
	Showing Professionals' Facebook	-1.201	
	Provide Professionals' works	0.526	
Clear Introduction of Courses	Provide Course Outline and Planning	0.217	0.334
	Explain what you will learn after taking courses	0.138	
	List the software and skills needed in the course	-0.022	
	Explain who would be suitable for the course	-0.657	
Free Trial Class	Know in advance the teaching style of courses	0.761	0.334
	Know in advance the visual effect of teaching video	-0.313	
Private information	Do not reveal the lessons you take	0.943	0.342
	Prevent others from seeing the amount of class taken	-1.863	
	Be able to choose the personal information which you want to present	0.157	
Multiple correlation coefficient: 0.519 Coefficient of Determination: 0.269			

The multiple correlation coefficient shown in Table 9 is 0.519 for the non-experiencers, indicating that security has a strong correlation with the user-supported online course platform before class. The partial correlation coefficient shows that private information has the most significant impact on the sense of security, followed by the free trial class and clear introduction of courses.

This shows that the private information, do not show the course you took has the most substantial positive impact. Therefore, for this item, the user-supported online course platform should hide the courses taken by learners when it presents personal information and prevents other users from knowing this, thereby enabling a sense of security.

Table 11. The weighting of "Expectation" among non-experiencers before class

Item	Category	Category Points	Partial correlation coefficient
A course that can be "wished"	Can leave messages to the course you would like to learn	-0.820	0.225
	Can click on others' wishing course to give heart	1.580	
	Invite relevant teachers for taking the course which is highly recommended	0.067	
Hidden courses that can be unlocked	Show fundraising numbers for unlocked courses	-0.889	0.108
	Show the not unlocked courses	0.199	
	Can know which courses have been unlocked	0.138	
Fascinating Title of Course	Vocabulary for getting started	-0.405	0.354
	Vocabulary for professional	1.258	
	Course name includes "Guaranteed to get started."	1.683	
Reasonable and Preferential Price	Less than two thousand TWD	-0.606	0.195
	Fill in the questionnaire and send a discount coupon	0.149	
	Early Bird Discount	0.407	
Special Columns of the Course	Learn more about teachers' professional fields	-0.318	0.469
	About the course information	4.465	
	Show the current trend	-1.465	
Clear Professionals' Information	Professionals' Experience	0.142	0.078
	Professionals' Background	-0.337	
	Professionals' self-introduction	0.462	
Clear Course Introduction Clear Introduction of Courses	Showing Professionals' Facebook	-0.216	0.121
	Provide Professionals' works	-0.458	
	Provide Course Outline and Planning	0.939	
	Explain what you will learn after taking courses	0.513	

Multiple correlation coefficient: 0.591
Coefficient of Determination: 0.349

The multiple correlation coefficient in Table 10 is 0.591 for non-experiencers, indicating that expectation has a strong correlation with the user-supported online course platform before class. The partial correlation coefficient shows that special column of the relevant course has the most significant influence on the sense of expectation, followed by the fascinating course title.

It can be seen that for non-experiencers, in the column for the relevant course, talking about the course information is the most influential. Therefore, user-supported online course platforms should refer to the course information taught by a teacher in the column of the course to allow the learner to better understand the content of the course, increasing expectation for the learner.

5. DISCUSSION AND CONCLUSION

This study explores the attractive factors of a user-supported online course platform through interviews and data analysis. It addresses user experience through the design approach of a UJM, combined with the Miryoku Engineering, to summarise the users' kansei experience in the online user-supported courses.

The above analysis indicates similarities and differences between non-experiencers and experiencers and summarises the learning experience of learners in the stages before, during and after the course to meet learning needs among learners and construct positive learning experiences.

5.1 Learning Experiences for Experiencers and Non-Experiencers Before Class

Multiple correlation coefficients show that for the experiencers and non-experiencers, the highest degree of feeling before class is the sense of "Expectation". The creation of a sense of expectation is significant for learners before class, and it affects whether learners join the learning platform and begin online learning.

Table 12. Sense of Expectation for Experiencers and Non-Experiencers Before Class

partial correlation coefficient	Original Evaluation Item (Median)	
	Experiencer	Non-Experiencer
High	Fascinating Title of Course	Special Columns of the Course
|	Reasonable and Preferential Price	Fascinating Title of Course
Low	Clear Introduction of Courses	A course that can "be wished"

Although both experiencers and non-experiencers focus on expectation before class, they focus on different aspects to create the sense of expectation (See Table 11). According to the partial correlation coefficient, the user-supported online course platform must provide column information on the course before the class to allow non-experiencers to understand the course contents better, thereby increasing their expectation. This can increase their willingness to use the platform to choose and purchase courses. On the other hand, experiencers may wish to have professional vocabulary descriptions to the course names to develop the attraction of expectation and enhance their learning experience.

5.2 Learning Experience of Experiencers in Overall Process

The sense of expectation before class is relevant for the experiencers. Consequently, the creation of a sense of expectation can enhance the learning experience for the experiencer. The highest degree of correlation between abstract feelings during and after the course is the sense of "Achievement". It is clear that the sense of achievement is vital for learners

during and after the course, and it also further affects whether experiencers continue to purchase courses and learn on this online course platform.

Through the analysis, we can know that an online user-supported platform should provide immediate evaluation during the course. Furthermore, giving feedback is more attractive for experiencers.

After courses, the user-supported online course platform can provide a global ranking for the course evaluation, so that learners are motivated to complete due to the ranking, thereby enhancing the motivational achievement. If the sense of achievement is encouraged, the experiencers can thus complete the overall course content, avoiding stopping halfway, to achieve the goal of self-learning online.

Abstract | Triggered by the strategic use of filming locations for city branding, and with a specific focus on Istanbul, this research investigates the role of movies on shaping the image and perception of cities. It aims to consider how a city is depicted in different movies/genres and discuss how such representations affect the traditional image previously constructed through the cultural heritage and the built environment. Through the analysis of twenty-one international movies that were produced between 2000-2020, and were selected out of 3586 movies, the comparison of fictional layers with the traditional tourist attractions of the city were carried out. This research approaches Istanbul's urban visual culture and its many meanings, through Lynch's aspirations for imageability, visibility and legibility in the design and perception of urban environments. The findings underline the influence of the film industry on city's branding processes and perceptions through representations and imaginary layers.

KEYWORDS | FILMING LOCATIONS, CITY IMAGE, CITY BRANDING, FILM-INDUCED TOURISM, PLACEMAKING.

1. Introduction

Recent literature in placemaking underlines the importance of quality of life, amenities, and the social or cultural environment as major drivers for cities (Aubry, Blein, & Vivant, 2015; Glaeser, 2011; Markusen & Schrock, 2006; Storper & Scott, 2009). Placemaking provides tools including hard and soft layers for urban planners, designers and policymakers, for economic development and community enhancement through creative industries. Traditional literature in this field, have always presented hard layers as tangibles that are primarily regarded as the main drivers of economic development. However, recent studies (Bontje & Pethe, 2010; Edmonds, 2017; Murphy, & Redmond, 2009) underline the soft layers that are intangible in nature, and influence the identity of place, such as diversity of population and place, openness, tolerance, networking, as well as cultural and leisure facilities. Highly acclaimed authors, like Ezio Manzini and Richard Florida, consider creativity as a driving force for the global economy and for creation of new jobs, as "human creativity is a limitless resource of human capacity and a real source of economic value-creation" (Florida, 2005, p.4). In Manzini's technical definition of resilient societies "diversity, redundancy and continuous experimentation" are highlighted as the key elements to bring social innovation; nonetheless, he also maintains that such a resilient society "must be a diversified, creative one" (Manzini, 2015, p.21). The film industry as one of the creative industries plays a crucial role in processes of place branding and urban development, particularly by "shaping the physical and cultural renderings of place in material and imaginative ways" (Mathews, 2010, p.171).

Through this perspective, this research explores the ways the cities are depicted in different movies and how these representations affect the traditional image previously constructed through cultural heritage and the built environment. Our approach considers both the hard (tangible) and soft (intangible) layers of placemaking, and explores the pathways to city branding. This conceptualization allows us to discuss the role of visual culture, ranging from instances of art history to very recent movies, in affecting the visitor decisions of experiencing a new city. As the methodology for this approach, literature review, online desk research for data collection and mapping techniques for data processing were used. The case study selection criteria were based on the MasterCard Global Report, and the selection was narrowed down by the cities where the film industry is growing and that were listed in the Globalization and World Cities Research Network. Regarding these two intersecting lists, Istanbul was chosen as the focus of this case study in Turkey.

Therefore, the essential questions raised are as follows:

- How are the filming locations and their narrative values incorporated into perceptive constructions of place and place identity?
- How do the use of World Heritage Sites as filming locations, Istanbul in our case, and television series influence visitor decisions for travelling to such sites? How do they affect the perceptions of the visitors once they are at these locations?

- How do the fictional layers brought about by the film industry add to the processes of city branding?

2. Placemaking for City Branding through Film Industry

Placemaking has many definitions and aspects. It is widely associated with planning principles that focus on spatial interventions, urban design, morphology, public realm, landscape and infrastructural qualities. Silberberg et al. (2013) describes placemaking as a practice to improve the quality of a public place and the lives of its community in tandem. When integrated to practice, placemaking aims at improving public spaces, civic pride, creating connections within the community, cultivating health and safety, enabling social justice, encouraging environmental sustainability, and it brings out the authenticity of place as well as a sense of ownership (Silberberg et al., 2013). It appears as both a design strategy and an urban design practice for improving a neighborhood, city, or region, enabling people to collectively create public spaces by re-imagining and re-inventing (Project for Public Spaces, 2007). As mentioned by Pancholi et al. (2018), a comprehensive understanding of place enables us to rethink the layers in urban environments beyond hard factors. It is significant to consider intangible and soft factors in the form of social processes and interaction, as well as meanings created by the users and their perceptions (Pancholi et al., 2018). In the context of globalization, especially along with the *one-fits-all* strategies that have made every place feel and look the same, the role of physical and cultural assets becomes crucial to create distinctiveness and competitive advantage. The meaningful placemaking decisions and their acceptability have essential roles to play for the image continuity of a city.

The film industry, as one of the creative industries, plays a crucial role in processes of city branding and urban development, particularly by “shaping the physical and cultural renderings of place in material and imaginative ways” (Mathews, 2010, p.171). It provides a viewpoint through the representation, and the place it shows becomes a part of a broader strategy for placemaking, and “something other than what is captured at any present moment” (Mathews, 2010, p.185). Previous studies on a similar topic (Basset et al., 2002; Gasher, 2002; Beeton, 2006; Durmaz et al., 2008) assert that the film industry contributes to the development of cities, and boosts the growth of tourism, through the cultural and heritage quarters, which indicate historical and symbolic context and building types. Countries and cities where the film industry significantly contributes to creative development are listed as City of Film project as part of the wider Creative Cities Network (UCCN) launched by UNESCO. One of the common characteristics of these film cities is the availability of infrastructure related to cinema, such as film studios and filming locations. Durmaz et al. (2008) claim that while the film industry improves global networks, social and economic interactions of creative people, it brings uniqueness and distinctiveness of that place, and enhances its reputation and attractiveness (Durmaz et al., 2008). Their findings,

such as Vancouver's success as a result of geographical proximity to Hollywood, and the government funds, or Auckland's popularity as being the filming location of 'Lord of the Rings' due to its natural assets, prove the essential roles of both hard and soft layers in placemaking through filming locations. Furthermore, the Distillery Historic District in Toronto, which is a famous space for arts and creativity in the city, also became an important resource to the film industry. For the same filming location, Mathews' research (2010) reveals that filming locations affect the way we see the site and show a different, possibly re-inventive, viewpoint "affected by the lure of film" (Mathews, 2010, p.173). Moreover, since the South African film industry is clustered in the metropolitan areas, the city of Cape Town has gained a reputation of being an ideal location for the feature film and commercials market abroad (Visser, 2014).

Considering these recent film city examples, the awareness for the city image and its attractiveness became crucial for tourism-induced development. Recently, there is an increasing attention to city image within local governments and public authorities (Hanna & Rowley, 2011) where they aim to create uniqueness in order to differentiate a city from the others. Ashworth (2009) emphasizes that one of the main objectives of city branding is to improve the quality of public spaces as well as the wellbeing of the residents. Similarly, Baker (2007) mentions that city image and identity are crucial for making a city remarkable among various alternatives. He emphasizes that the aim of city branding is to create a better image for the city in the competitive world with its culture and history. Anholt (2016) also highlights that image and identity of cities closely related to places, safety, public opportunities and other variables affecting the city brand. City branding and image have crucial roles that help to increase the sense of ownership and identity. In this respect, crucial actors can be mainly defined as stakeholders, local people and visitors (Van Gelder, 2011). Dinnie (2010) mentions that city image is important both for city identity and branding. There is a link between the image and attractiveness of a city as a place to travel and invest (Dinnie, 2010) since the city image creates a sense of identity, that attracts attention and makes a place remarkable (2018). The combination of hard and soft infrastructure integrated into historical and cultural amenities and qualities, especially a blend of a symbolic production of culture and vernacular spaces is hard to quantify, and changes with different viewpoints of residents and visitors, however, it presents an alternative dimension to placemaking. Moreover, urban environments in the twenty-first century are rendered attractive with a vast array of graphic objects, ranging from graffiti to billboards, serving many functions. They inform, persuade, entertain and educate, as well as contributing to what Kevin Lynch called the "city image" (1960). Lynch sought to define the image of the city, through identity, structure and meaning, with the concept of "imageability" indicating the qualities of physical objects that give "high probabilities of evoking a strong image in any observer," which he had based on the earlier ideas about the attributes of an artistic object.

Analyzing the city image represented in movies is a complex process involving an understanding of hard and soft layers offered by the placemaking strategies as well as fictional urban experiences presented in movies. The shortfall of *one-fits-all* strategies, the

lack of distinctiveness brought by globalization and also previous examples of film cities reviewed in the literature lead us to consider how these features play a crucial role in terms of city image, as investigated in the case of Istanbul.

3. Analysing Filming Locations: Istanbul as a Backdrop for Movies

In this analysis, the movies that were (partially) filmed in Istanbul were investigated (Table 1). For filming locations in Istanbul, we use the IMDb (Internet Movie Database), the database of information related to films, television programs, home videos, video games, and streaming, as part of our online research. The search enabled us to list 3586 results including documentaries, short movies and so forth that have been filmed in Istanbul. Data collection was conducted in November 2019. We refined our data set based on three criteria: a) the production year that ranges from 2000 to 2020, b) feature film as a type, and c) being produced and/or promoted as an international movie. Turkish movies were excluded from the search. Hence, our focus was limited to eighteen movies filmed in Istanbul. In the following analyses, the movies shot in Istanbul were listed and reviewed for the exact locations and how they depicted Istanbul. Later, the two spatial distribution maps, 1) Top Tourist Attractions Map and 2) Filming Locations Map, given below as Figure 1 and 2, were created.

The movies analyzed for this particular study that are filmed in a certain period of time (2000-2020) have wide variations in terms of their genres including; documentary, drama, romance, mystery, action, adventure, comedy, thriller and crime. Though recent research indicates the significance of certain genres for creating the touristic appeal of different types of destinations, and indicates that the role of movie genres define the appropriateness of movies for promoting such destinations, for the case of Istanbul, it can be said that this theory did not match the expected results. Istanbul is mostly depicted in action movies, which does not greatly appeal to city tourists (Redondo, 2012, p.724). The Basilica Cistern has the highest score in terms of the distribution of the filming locations in Istanbul. The Basilica Cistern was used five times as a filming location in the *Accidental Spy* (2001), *The International* (2009), *Skyfall* (2012), *The Water Diviner* (2014) and *Inferno* (2016). Following that, Grand Bazaar, Süleymaniye Mosque and Hagia Sophia share the second rank by appearing in four different movies.

Table 1. Table 1. Analysis of Filming Locations in Istanbul

Movies*	Year	Genre	Filming Locations
In July	2000	Adventure, Comedy, Romance	Ortaköy Mosque
The Accidental Spy	2001	Action, Comedy, Crime, Mystery	Hagia Sophia Ziya Kalkavan Vocational School

			Grand Bazaar The Basilica Cistern Pera Palas Hagia Irene Çemberlitaş Turkish Bath
A Touch of Spice (Politiki Kouzina)	2003	Comedy, Drama	Galata Tower Pierre Loti Four Seasons Hotel Istanbul at Sultanahmet Galata Bridge Tophane Mosque Haydarpaşa Station Hagia Sophia Kadıköy Neighbourhood Sirkeci Neighbourhood Church of St. Mary of the Mongols
Head-on	2004	Drama, Romance	The Bosphorus The Blue Mosque Grand Hotel de Londres
Crossing The Bridge: The Sound of Istanbul	2005	Documentary	Bosphorus Bridge Maiden's Tower Süleymaniye Mosque Grand Hotel de Londres

Charlie's Angels	2019	Action, Adventure, Comedy	Eminönü Neighbourhood Fatih Neighbourhood The Grand Bazaar The Blue Mosque Veliefendi Race Course

* The following movies have been excluded from the analyses due to the lack of identifiable and sortable data: Iranian movie Hatred (2012), American movies Hitman (2007) and The Rebound (2009).

The locational analysis presents how the above mentioned movies are distributed and their filming locations created attractions within the city. Istanbul Top Tourist Attractions Map (Figure 1) shows that firstly the “sights and landmarks”, and secondly the “museums” category of Trip Advisor, attract most of the tourists in Istanbul. As we reconsider the top tourist attractions correspondingly with the spatial distribution of the filming locations - Istanbul Filming Locations Map (Figure 2) the analysis highlights three major concentrations: 1) Bosphorus Bridge and its adjacent neighborhoods, 2) Historic Peninsula including the most famous landmarks such as the Topkapı Palace, Basilica Cistern, Grand Bazaar, and Süleymaniye Mosque, 3) Taksim and Galata area. In general, the filming locations coincide with the the spatial distribution of the top tourist attractions, and they spread through the entire metropolis, nevertheless, they expand on to many other subcenters and neighbourhoods to add a glimpse of everyday life of inhabitants on to film.

4. Discussion

When we consider the perspective of visual culture, with its strong emphasis on cultural identity and its "weaker" sense of the visual that also considers social factors (Barnard, 2001), the scope of objects, devices or experiences that contribute towards an understanding of the city image is very wide. Urban visual culture emphasizes the products of advertising by foregrounding its relationship to architecture and design (Ward, 2001). This partial perspective takes a narrow view of design for visual communication in urban contexts, expanding the need for the further consideration of what urban visual culture might be. Through such an attempt, we can consider the role of movies in enhancing the city image, and the intricate relation between the filming locations and the fictional worlds that they portray through the use of actual urban settings. This relationship highlights the existence of an imaginary layer, or yet another soft factor of placemaking, that works through the visual perception of the inhabitants of an urban settlement, its visitors and the audiences of such movies.

This analysis provides an introductory exploration of Istanbul's urban visual culture and its many meanings, in relation to Lynch's aspiration for imageability, visibility and legibility in the design and perception of urban environments. Barnard (2001) had divided research and

theoretical work in visual culture into a “strong” sense, which focuses on the cultural production of values and identities, and a “weak” sense, which focuses on the visual aspects of contemporary culture, and the plethora of visual images and media available in the society (Serafini, 2017, p.8). Juxtaposing this distinction with the soft/hard factors suggested by earlier placemaking theories, this research aims to assess the appropriateness of movies for the promotion of tourist destinations, while it also undertakes the evolution of Istanbul’s city image from an oriental, imperial capital to a modern day, metropolitan center of attraction.

The difference lies in a Lefevbrian reproduction/representation of space in two different contexts: The oriental image of Istanbul, belongs to an era in which an image was conveyed and conserved through the visual arts, mainly oil paintings. As John Berger would emphasize, beyond being a demonstration of the virtuosity of an artist, these works of arts were also channels of communication that conveyed “owner’s wealth and habitual style of living,” as well as “what gold or money could buy” (Berger, 1972, p.131-132). Through depictions of the palaces, the Turkish baths and the harems, the wealth of impressive sultans, in older mediums of art, Istanbul was inscribed as the oriental dream, fascinating, ephemeral and unattainable. This image was maintained in earlier depictions of Istanbul in movies, such as *Topkapı* (1964) and the earliest James Bond movie to set scene in Istanbul, *From Russia with Love* (1963), and furthermore, it was fortified and engraved, so much that every time an oriental detail was needed in a storyline, the scene would jumpcut to a silhouette from the Bosphorus with the minarets of monumental mosques reaching to the sky, or a crowded scene of prayer in the patios of the Blue Mosque, all enhanced with a fade in to the sound of ‘ezan’- call to prayer.

Figure 3. Daniela Bianchi and Sean Connery in ‘From Russia With Love’ (1963) with the majestic Suleymaniye Mosque in the background, crowning the oriental city image.
