Research among mature Danish women supports the notion of clothing purchases driven by psychological needs rather than by physical needs. (Harsaae, 2020).Based on findings from my research, this article aims to present and discuss some perspectives on product attachment. In this context, the findings are presented as four small narratives, which are excerpts from larger and more in-depth narratives presented in the final PhD thesis. The narratives illustrate how the desire to radiate contemporary relevance runs parallel to

product attachment, thus challenging product attachment as a path to sustainable consumption.

3. Narratives of product attachment and contemporary relevance.

From 2016 to 2019, I conducted an empirically-based study of mature Danish women's construction of style through clothes. The study consisted of a questionnaire (n= 293) and semi-structured interviews (n=113) among Danish women born 1940 – 2000 and wardrobe inspired (Fletcher, Klepp, 2018) in-depths interviews (n=4) with women born 1941 - 1965. The research design focused on addressing ordinary women's engagement with clothes. The respondents represent a fairly average group of Danish women with respect to education, income and lifestyle.
The data collection formed the basis of narrative analysis to specifically identify mature (50+) Danish women's interaction with and relationship to clothes. The analysis focused on identifying how each women's clothing culture "… speaks itself through an individual story" (Riessman, 1993:5) and aimed to detect similarities and differences among the women's style narratives as a framework for their individual style (Harsaae, 2020). The point of departure for the conceptualization of style narrative is based on Tulloch's (2010) introduction of the concept;

> "I see the styling practices of a layperson's articulation of everyday life through their styled body as equally valid. For me this is part of the process of self-telling, that is, to expound an aspect of autobiography of oneself through the clothing choices an individual makes — what I have come to call style narratives." (Tulloch, 2010, p. 276)

In connection with the research and subsequent analyses, a number of perspectives emerged, including product attachment, which was not included as such in the original frame of inquiry. However, product attachment arose spontaneously in the conversations with the women.
The data strands revealed that several mature Danish women possess – and use – clothes they have bought 15, 20, even 40 years ago. This notion indicates a strong product attachment to specific clothing items, arising through usability, experiences, and memories.

> "Niinimäki and Koskinen (2011) identified a number of determinants of emotional attachment to clothing and other textile products. However, these meaningful garments most often represent a certain memory and may no longer be in active use." (Niinimäki and Armstrong, 2013, p. 191)

Contrary to the findings of Niinimäki and Armstrong (2013) my respondents predominantly emphasize attachment to old products, which are still in active use. This does not exclude that the same women keep and own clothes for nostalgic reasons which are no longer in active use. However, these women generally appeared more inclined to narrate about the clothes they still actively use. *"I have clothes from the last 40 years, but I wear **all** of it."* (Margrethe, born 1947). As product attachment related to clothes in active use was brought

forward spontaneously by the women themselves and appeared significant for them, the perspective on product attachment to clothes not in active use was not pursued.
Short extracts from four selected narratives illustrate some of the dominating and different perspectives on the emotional/psychological mechanisms governing the drive to radiate contemporary relevance operating alongside a strong product attachment.

3.1 "I still wear my 40-year-old velvet dress" - Margrethe, born 1947

Margrethe is a retired doctor born in 1947, she is married and has two grown-up daughters. She is a very petite woman meaning that she sometimes has to browse teenage or children departments for clothes matching her petite size. She has a classic contemporary style consisting of basic garments mainly in monochrome classic colors as black and navy; in the summertime she adds some brighter colors and a few patterns. She does not express any particular interest in fashion as such but valuates her appearance. *"Every morning I carefully consider what to wear".* Financially, she has the means to engage with expensive clothes and invests in exclusive pieces of outerwear, e.g. a mink coat, and a dress for a special occasion. Garments, which she uses for decades. However, she renews her daily wear wardrobe regularly through the purchase of basic t-shirts and other jersey products like short tight-fitting skirts and dresses, which she mainly buys at the supermarket. She feels that a higher price does not guarantee her a better quality and the low supermarket prices justify that she replaces her basic items frequently, when they start to look worn out or outdated. *"My dream style is too expensive, I can afford it, but I will simply not buy it out of principle. I don't want to pay a higher price for better quality, fit, and manufacturing. After all, price is not related to design and trend".* Her main reason for acquiring new clothing product relates to her daughters' opinion about her appearance. *"I want my daughters to think I look smart".*

3.2 "I want to be part of the time" - Jette, born 1950

Jette is born in 1950 and is a retired pedagogue. Her style consists of tight-fitting jeans, Doc Martens inspired boots, colourful knits and printed shirts. She loves shopping and buys, returns, and changes her garments multiple times a month almost exclusively at second-hand shops. *"I have a fast replacement of clothes. It is my hobby to browse for good bargains in second-hand shops and the low prices allow me to take chances. I just give it back for reuse if it is not right"*. Despite her fast replacement of clothing items, she nevertheless presents several items which she will "*… never part with*." E.g. a short patchwork jacket from the 80's and a black leather skirt that was a hand-me-down from her sister and which has been a part of Jette's wardrobe since the late 90's. *"I think it's so cool. It's worn, there is patina on it, and I feel comfortable in it. I inherited it from my sister, and she used it for 10 years before I got it; that is something I like"*. She hunts for the low prices and predominantly buys fast fashion brands like H & M and Bestseller. She takes a great interest in trends and fashion and wants to appear fashionable and ageless. She emphasizes the importance of being part of the time by constantly adding, removing, and replacing styles in her wardrobe and wants her clothes to radiate contemporary relevance as an indicator of her ability to

avoid appearing old, physically as well as psychologically. *"I think it is fun to be part of time. In this way, I feel that my heyday wasn't 10 years ago".*

3.3 "I don't want to feel outdated" - Anne, born 1953

Anne is a professor in psychology and is still working full time. She has a Scandinavian minimalistic style with an emphasis on skirts and dresses. Black is the dominating color, which she combines with simple graphic prints in strong colors. She valuates clothes with *"… comfort, mobility, good quality, it must last several seasons. It must not be too extreme, it must be usable over time*," and she presents 12-15-year-old dresses and blazers that she still frequently uses. She expresses an increasing awareness of the consequences of her own consumption habits but still buys clothes every second month. *"In the last years, I only buy what I need, and I value the philosophy behind. By buying a little less, I show my position and attitude towards child labor and the environment".* Anne takes a great interest in clothes and buys high-end products. She enjoys shopping and prioritizes the effort to find the 'right' garments. Her purchases are characterized by conscious selection, and the few times she has given in to a sudden impulse have been her worst buys. She likes clothing concepts with alternative approaches, e.g. attending events where you pay half of the price upfront and waits eight weeks for delivery and final payments. She never buys from supermarkets or fast fashion chains. Her clothing choices supports her feeling of self and she emphasizes the importance of radiating contemporary relevance as a part of her identity. *"Trends are important. I don't want to feel outdated, to look old fashioned"*

3.4 "I don't want to look like a 70's relict" - Susanne, born 1959

Susanne is currently unemployed; she has an education as pattern maker and is born in 1959. She has a 70's and 80's inspired style with lots of tunics, loose pants and overall patterns inspired by both decades. Her colour choices consist of black and white as the basics combined with strong 80's colours like cobalt and cerise.
Susanne presents a pair of 20-year-old black pants which she loves and still uses because of *"… the comfort, the material, and the fit; they are made for women"*. She has repaired and even enlarged the pants with a white insert in the side seams in order to be able to keep on using the pants despite her changed body. Her wardrobe contains more examples of beloved items and long-lasting items, yet at the same time she buys new items every third month to renew her wardrobe. She buys medium-priced products from recognized Danish designer brands and from time to time makes a good find in second-hand shops. She is interested in clothes and fashion as a part of her appearance and the well-being connected to fitting in to the occasion and situation. She enjoys reading fashion magazines and following online fashion shows to stay informed and updated about fashion both from a personal and a professional perspective. *"Trends are not important as such, but I do not want to be labelled as a 70's relict so I do follow them"*

3.5 Findings

Each of the women reveals a narrative as well as a strong product attachment to several products with life spans from 10 to 40 years thus extending the average times a specific

product is used. However, they still purchase new items with a regularity between a fortnight and every three months. Thus, they are participating in and contributing to driving the wheels of fashion forward and thereby contributing to minimizing the average times of use for products in general. The women concurrently express their agreement on how the need to appear updated and radiate contemporary relevance drive their continuous consumption and acquisition of new clothing items. This corresponds to the findings posited by Evans and Cooper (2010) and cited by Fletcher (2012):

> "Sian Evans and Tim Cooper note, "attachment doesn't necessarily lead to lifespan optimizing behaviour" (2010: 334). Simply because users have formed a bond with a piece, does not mean it will be used or replacement consumption prevented". (Fletcher, 2012, p. 228/229)

These women present clothes still frequently in use and which form a kind of stationarity in their wardrobe. Parallel to 'replacement consumption' prompted by items kept by emotional bonds and not in use, the consumption behaviour of these women appeared to be equally characterized as constant complementary consumption. These women agree on the importance of radiating contemporary relevance through their selection of clothing that follow current fashion trends. This stimulates them to continuously update and complement their wardrobe with new garments of contemporary relevance.

4. Discussion and reflections

The small extracts of the narratives show the presence of product attachment to various garments still in active use. Product attachment is thus a unifying factor in the four women's clothing narratives. The women also unanimously express the importance of appearing updated and radiating contemporary relevance through their clothing choices. Their stories thus all contain the oxymoron between product attachment as a path to sustainability, and the desire to radiate contemporary relevance as a driver for consumption and as such an obstruction for product attachment as a path towards sustainability. Although the oxymoron is present in all four stories, there are still significant differences in the women's clothing and consumption culture. Weekly consumption and replacement of clothes to satisfy the joy of getting something new, being part of the times, and making the good finds that Jette achieves by browsing second-hand stores. Margrethe maintains a stationarity in her wardrobe predominantly consisting of expensive outerwear, e.g. fur coats and beloved dresses. However, she still replaces basic items every second month through purchases in supermarkets, so she appears well-dressed and smart for her daughters. Susanne supplements her wardrobe with the new fashion, predominantly from high-streets brands approximately every third month to appear updated. Though she emphasizes longer-lasting products, Anne buys high-end brands every third month as she does not want to appear outdated.

They all submit to the mechanisms of fashion and the current paradigm of consumption of clothing products as a substantial constituent in their constant construction of identity. The questionnaire (n=293) does not reveal any significant difference in the consumption frequency between the various age cohorts. Based solely on their age, mature women possess better possibilities of exercising engagement with long-lasting products. However,

the desire to express their identity through their clothing selection and purchase of new products of contemporary relevance, does not appear to be remarkably lesser than the younger women as expressed by their consumption behavior. Gilleard and Higgs (2000) similarly emphasize how mature and older individuals continuously construct their identity through consumption; "… the identity that the individual constructs to express and interpret their own aging". (Gilleard and Higgs, 2000 p: 23).
These women emphasize the tangible properties of the specific product as well as intangible feelings related to experiences and memories of use as foundation for their product attachment thus, articulating and supporting Fletcher's differentiation between products that last and long-lasting products.

> "But for fashion clothes, which already endure physically long past their period of use, putting resources and effort into enhancing the physical durability of seams and fabrics is worth little if it is aesthetics or social preferences—or even changing waistlines—not material robustness that determines a piece's lifespan". (Fletcher, 2012, p. 227)

In the past, it was a matter of course that products were produced to last a long time. The materials were durable and processing slow, hence clothing was relatively expensive and therefore clothes were maintained and repaired, and it was not uncommon for clothes to be inherited from generation to generation. The practice knowledge is still possible to include in the current production of clothes, provided we are able to change the current business models of fast fashion with focus on quantity and escalating newness to alternative business models with focus on quality and consideration in relation to the production of clothes. Creating products that last is a factor, though not the solely determining one, in the occurrence of product attachment and furthermore a prerequisite for the possibility of re-use and recycling. Products that last thus accommodate the potential of improving the average times a specific product is used.
The intangible elements related to individual experiences and memories are more complex to address but the more knowledge we obtain about users and their preferences, the more plausible it is that we can also design long-lasting products in terms of product attachment and in this way create longer lasting products.

> "[ ] a "prior to production" approach, where the philosophy behind the product is linked to the user at an early stage with the aim of creating products that have a longer life cycle thereby postponing the disposal of the product". (Harsaae & Terkildsen, 2016, p. 452)

An increased focus on the development and production process of clothes on products that last as well as long-lasting products may provide the foundation for a strong product attachment as a path towards a more sustainable use of clothes and an improvement in the numbers for the current under-utilization of clothes (Ellen MacArthur Foundation, 2017, p.19). But the approach is strongly challenged by the current consumption culture. However, there are changes in consumption culture as posited by e.g. Clark already in 2008;

> "[ ] the slow approach is introduced and presented as something more than a literal opposite to fast fashion. The term is used to identify sustainable fashion solutions,

> based on the repositioning of strategies of design, production, consumption, use, and reuse, which are **emerging** along side the global fashion system, and are posing a potential challenge to it". (Clark, 2008, p. 428, my emphasize)

The potential challenges for the global fashion system emphasized by Clark have further advanced since 2008 with the increasing attention and concerns bestowed on the climate changes, e.g. Towards the Circular Economy (Ellen MacArthur Foundation, 2013), The 17 Sustainable Development Goals (United Nations, 2015), and Doughnut Economics (Raworth, 2017). Within the fashion system changes have predominantly focused on materials, though new business models do emerge as well.

The critical system thinker Donella Meadows accentuates paradigm shifts as the most influential in improvement of systems. (Meadows, 2008). Several researchers within the realm of fashion similarly advocate a paradigm shift in consumption behavior as necessary for improvement of the fashion industry's devastating impact on the environment. (E.g. Clark, 2008, Fletcher, 2012, 2019, Skjold, 2019, Klepp, 2019, Author, 2016).

5. Concluding remarks

The "right" fit, good lasting manufacturing, durable materials, or materials aging gracefully, are definitely elements that are initial prerequisites for the creation of product attachment. These elements are all possible to address even if they are not dominant in the current business models prevailing within the fashion industry. Though the creating of products that last not necessarily prevent replacement (Fletcher, 2012) or complementary consumption for the individual, products that last have the potential to increase the times a specific garments is used through wear and use by multiple users from hand-me-downs to second-hand bargains.
The emotional attachment obtained through experiences, memories, and usability is equally significant for the creation of product attachment. This aspect of product attachment is more complex to orchestrate and even when it occurs, it does not appear to prevent further consumption. The desire to express identity through the use of clothing products, to radiate contemporary relevance by following new and upcoming fashion trends, to follow fashion through consumption are still strong drivers.
Maybe we need a completely new definition of what it means 'to be in fashion' to drive the necessary paradigm shift in consumption that can truly improve the global fashion industry's currently devastating impact on the environment.

Abstract | Visualization is one of the key elements for problem analysis and characterization. Designers are key players in the entire process of the product-service chain and are relevant actors in the linear economy model of consumption. The growing unsustainability of this model of production and consumption challenges the design methodology to deal with the new environmental, social and economic reality, that promote the need of holistic approaches to problem-solving, for a more sustainable production-consumption paradigm. To support the transition towards Circular Economy (CE), designers have the opportunity to act in this field where the value of products, materials and resources is maintained as long as possible in the system. By using tools and strategies they can help multidisciplinary approaches to support the development of more holistic solutions. The CE Journey tool promotes project-based learning and it has been tested with students from various fields of training, professionals and companies from various sectors of transformation. Based on a canvas approach it allows visualization of the flows (of goods and information), touchpoints and interactions of materials, partners, producers and users, it helps to analyse and optimize scenarios throughout the product lifecycle (uphill, tophill and downhill).
This document will provide comments on the several testing phases and optimization, reporting on the integration of CE in project development. The main focus of this approach is the development of educational content and tools to support the CE. However, a holistic approach can provide a closer relation to the real context, increasing the applicability of the

tool and thus, the proximity with industrial and business partners. The CE Journey tool intends to promote direct contact between the various actors involved in decision making for product-service development. Through a visual representation of the journey, it aims to identify the touchpoints between the factors identified: materials, producers, stakeholders and users, providing a model for analysis and identification of opportunities to optimize the journey and to enhance the closing of the loops to present a more circular solution. The expected result is a visual matrix that allows the players visualize journey and stakeholders' interactions to optimize the journey and closing of the loops.

KEYWORDS | DESIGN FOR CIRCULAR ECONOMY, TOOLS, CO-CREATION, VISUALIZATION

1. Framework introduction

With the need to act in complex scenarios and fluid modernity [1], project methodologies need new holistic approaches as well as new resources or design tools. The principles of Ferdinand Saussure [2] - the sign, the meaning and the signifier - are considered relevant, in terms of what and how people communicate. In this case, visualization is understood as one major aspect to clarify what the various stakeholders are talking about.

For the last decades, we have seen the consolidation of a linear consumption model supported by an economic model that emphasizes this reality and brings new social, economic and environmental challenges. Promoting a circular model, in one hand, fosters how waste and production systems are designed to enhance the reduction of virgin resources and on the other hand, products and materials are kept in use and values sustained for as long as possible - lowering the stress on natural systems [3].
Designers can impact in the entire process of the product-service chain and are relevant actors in the linear economy model of consumption. To do so, it is important to support and promote skills and multidisciplinary competences towards design for circular economy [4].

The European Katch_e project (Knowledge Alliance on Product-Service Development towards Circular Economy and Sustainability in Higher Education), develops several training materials on CE, including both theoretical background materials and tools for practical implementation of CE solutions in organizations. Katch_e aims at addressing the challenge of reinforcing skills and competences in the field of product-service development for Circular Economy and sustainability, with a particular focus on the construction and furniture sectors. A previous analysis of the implementation of CE showed that the interviewed students, mostly industrial design engineering students, indicated that CE was not taught in a specific way but was included horizontally within other disciplines related to environmental science and sustainability. Some indicated that they had not received any related training, and all agreed that the received training was insufficient. According to the analysis of needs and the interview results, a set of specific contents on CE has been proposed in Katch_e (Figure 1). These materials (eight modules and seven tools) meant to be used in academic teachings, in-classroom context, as well as in companies. They address how to define new business models, how to develop products and processes and the assessment and communication of the circularity. This paper describes de development of one of this seven tools and how it was tested.

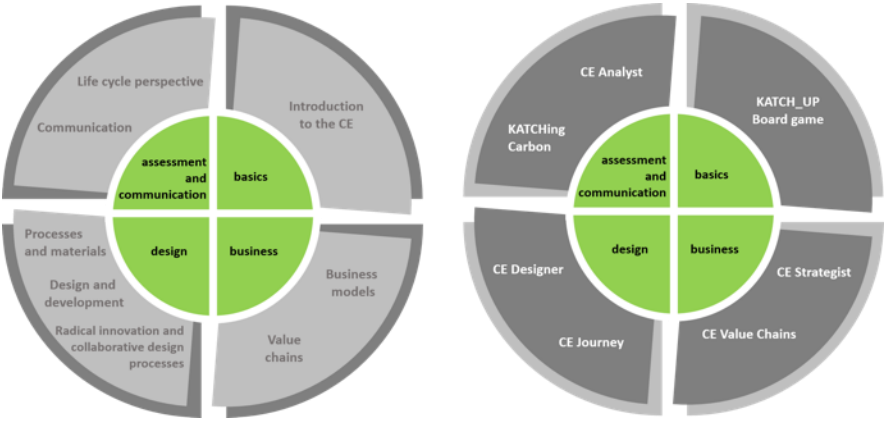

Figure 1. Modules and tools developed in Katch_e project.

1.1 The power of visualization

The implementation of design processes to new contexts of action and the involvement of new actors requires consideration in the choice and definition of the procedural approach. The relevance of the procedural model increases when we act in complex scenarios and when we have to support the transition from more traditional approaches to contemporary approaches [5], as well as in the articulation of different languages characteristic of multidisciplinary teams [6]. To enhance positive and effective results, resulting from the elaborated work, a taxonomic analysis of models [7] [6] and procedural design approaches [8] [9] [10] was developed. This analysis allowed us to assess the importance of two main issues. The first, that the power of visualizing knowledge in problem-solving is considered remarkable as a means of communication and support for generating, analysing and synthesizing information, as well as facilitating dialogue between actors and revealing data, relationships and fields of exploration and construction solutions [11]. In other words, the visualization of knowledge emerges as support for the definition of a real context (to understand) and to enhance an approach to the abstract (to deconstruct). An analogous approach to the process of characterizing what (*what is*) and the consequent abstract deconstruction (*exploratory and constructive*) of possible scenarios (*what could be*) [11].

The visualization can act as an enhancer of projectual fluidity, an accelerator of convergence and understanding of the different team elements, as well as reducing the possibility of divergent forms of interpretation [12].

As a complementary form of this conceptual framework and the principles of Ferdinand Saussure [2] - the sign, the meaning and the signifier - are presented as relevant. The first two are bases that are potentially interpreted stably, according to specific codes and social contexts, and the last assumes a personal dimension, a unique interpretation and relative to

the individual experiences of the person. This reflects the material and sensory side represented or visually idealized, which is understood as a possible point of divergence between people through its particular characterization. In this way, we assume the relevance of the resources or tools used, as supports that promote clarification, inter- and intra-group dialogue and eminently visual representation. Finally, we resort to an approach centred on the positive core [10], as an initial starting point, intending to enhance the identification of opportunities instead of the identification of problems. By adopting a gradual strategy is considered useful in facilitating communication between people who seek to: stimulate understanding between and within groups, through the development of a common language; and facilitate the introduction and use of visual resources, initially based on spelling that is gradually being contaminated by the graphic aspect;

2. Circular Economy Journey Canvas - Tool goals and development

The main focus of this approach is the development of educational content and tools to support Circular Economy. However, a holistic approach can provide a closer relation to the real context, increasing the applicability of the tool and thus, the proximity with industrial and business partners. The Circular Economy Journey Canvas tool intends to promote direct contact between the various actors involved in decision making for product-service development. Considering this, the tool was designed based on three distinct but interconnected moments, which encourage the analysis of *materials*, *partners*, *producers* and *users*, constituting a tool for validation or exploration of the product-service lifecycle. The first two moment of CE Journey tool were inspired by IDEO Circular Joint Venture Workshop. They aim to clarify the *Superpowers* (meaning the roles and assets) and the *Challenges* (regarding activities, barriers and motivations) of the various actors/factors that are involved in the product-service already defined. These serve to create a common understanding between the parties of which role, motivations, added value and difficulties they may have when confronted during the project. These two moments described are materialized with specific cards that must be distributed and analysed, fostering reflection upon the superpowers and challenges. This can be particularly helpful for multidisciplinary teams, for it implies to be invested in those actors/factor's specific role. After these first two moments it was defined the need to produce some visual support were the several stakeholders could see all the interactions, flows and touchpoints of *materials*, *partners*, *producers* and *users.* This task must be fulfill in group and using a canvas that was grounded in the customer journey concept.

The tool was intended for testing with different audiences: not only students but also professionals already working in product-service development. It should be made available for free, easy to be download and printed.

2.1 Tool description

The CE Journey is a tool that through a visual representation of a product/service journey, it aims to identify the touchpoints between several identified factors: materials, producers, partners and users, providing a model for analysis and identification of opportunities to optimize the journey and to enhance the closing of loops to present a more circular solution. It promotes an exploratory and visual assessment, which allows the representation of an overall Product / Service / System journey, in the three stages (uphill, top hill and downhill). After a clear problem or challenge definition, it promotes two analysis tasks that allows the player to reflect on their roles and challenges toward a circular and sustainable solution. As a consequence of this previous tasks, in group, the players can develop an overall journey and explore possible strategic solutions to further develop possible future ideas and improvement opportunities can be identified. The analysis of this creativity session induced the design and development team to define and explore new opportunities, that will be further developed. With the results, the project team can demonstrate where and how the problem or circular opportunity can be address.

The application of the tool is composed of 3 tasks:

1st Superpowers (30 minutes);

2nd Challenges (30 Minutes);

3rd CE Journey Canvas (60 minutes)

Target Group: The tool targets product developers and designers which aim to integrate circular design approaches in the development of new products and services – both professionals and students in related fields alike.

Prerequisites: The users should clearly define a problem and have group of participants with a good knowledge of the sustainability of a product or service along the life cycle, or be provided with such information, related to the defined problem (in the case of the tool being used in an academic context).

Previous knowledge about CE and Product Service System (PSS) is recommended.

Results:

- A prioritization of roles, assets, challenges, tasks and barriers that can be found as applicable design strategies for a more circular and sustainable product/service;
- A common understanding of the flow of relationships and exchanges between the various solution factors.
- A visual canvas that allows the user to understand the journey and touchpoints of the products, producers, partners and users in order to optimize it and potentiate closing of the loops.

- A visual outcome for one overall analysis of the product or service solution according to the possible PSS proposal;
- Immediate improvement ideas and opportunities, through the reflection and assessment of possible solutions and flows;
- Background information for a brainstorming or other creativity session;
  Limitations:
- This tool was developed for exploratory or assessment purposes, in which there is no quantitative data – that for some stakeholders/professional can be more abstract in terms of circularity and sustainability. By that reason we think this tool can be complemented with a Life-Cycle Analysis tool. Despite of this limitation, the solutions that can be achieved with the tool may be more incremental or more radical, depending on possible creative solutions.

Time of tool application: Up to 2 - 3 hours (with coffee-break)

There are available several types of cards (Figure 2):

Instructions cards that presents What is, goals and how to use it description (3 cards);

Circular Economy Focus Card (1 card) The major focus of this game is to achieve or enhance Circular Economy solutions, so please keep the purple card under your sight!!

Superpowers and Challenges' cards (set of 8 cards each, two for stakeholder/factor) these cards are identified by the order of the task, name (e.g. 1.2 Producer Superpowers, 2.1 Producer Challenges) and colour code (orange -material; blues – producer; green – partner; red: user) related for each role.

Blank cards of each stakeholder/factor (set of 8 cards, two for stakeholder/factor) to be fullfill in order to the trigger question that are presented (10 questions in total per stakeholder)

Stages' cards these 17 cards can aid you to further analyse the potential of each stage when you are developing your path in the canvas. They present trigger questions that might be helpful to think about the specific stage in a circular economy approach.

Figure 2. Set of cards: "0" instructions; "Focus Card" major goals of the activity; "1" Superpower instructions task cards; "2" Challenges instructions task cards; "3" CE Journey Canvas instructions card and trigger questions cards for activities 1st and 2nd activities.

The third task to fulfill in the CE Journey Canvas is essential to outline the journey and identify where the starting point of each stakeholders/factor (it can be in an uphill, top hill or downhill stage) (figure 3). Each actor must identify the journey starting point and sequentially number and fill their tasks and goals, outlining the path (with pins and colour threads). In collaboration, the participants must try to identify their touchpoints. The participants must aim to optimize the solution in its economic, environmental and social dimensions. The CE Journey canvas printable version available is 1200x900mm (figure 3)

Figure 3. Pre-set CE Journey canvas and stage cards organize by color code: blue – uphill; orange – tophill; coral – downhill); pins and color threads.

2.2. Testing and adaptation

As already mentioned, the tool was intended for testing with different audiences: not only students but also professionals already working in product-service development.

2.2.1 TEST WITH STUDENTS

In a preliminary moment, the tool was tested with master's degree students enrolled in a specific Circular Economy curricular unit. The students, from various backgrounds, worked in multidisciplinary groups that were developing furniture pieces applying cork and other materials, such as wood or metal. After the tests and according to the results and feedback obtained, changes were made, simplifying tasks and time reduction of the use of the tool. This was applied by reducing the total number of questions and including most elements on the canvas. The tool was intended to help players and/or stakeholders to assess the overall Product/Service/System journey, in the three stages (uphill, top hill and downhill) and along with the several factors: materials, producers, stakeholders and users. Figures below show the first version tested by students. This session lasted 3 hours.

Figure 4. Master's degree students test sessions.

2.2.2. TEST WITH PROFESSIONALS AND INVESTIGATORS

Validation among professionals and investigators was also taken into account. This took place at two different session: the first together in a consortium meeting staff (figure, involving the different partners in testing activities; the second through testing at a national workshop by inviting national partners (companies/organizations, professionals, teachers, researchers, students).

Figure 5. Consortium partner meeting test sessions.

In the first session, we determined with a national partner (cork company) a challenge related to its production and business area, which was presented together with the instructions and objectives of the tool. During a 1h30 session the tool was tested. Despite the short experimentation time, the considerations were in line with the indications of the first test of students. However, the presentation of a closed and concrete challenge proved to be simpler to use and explore the tool. This same strategy was applied on second session (national Stakeholders where), where we had two groups of 8 persons each testing the tool. After a brief introduction and explanation of the tool, for each group was presented a specific challenge related to national companies/partner. One related to cork industry and another in the business area of production of wood products. In each group there was an element of each company, which facilitated the process of explaining and clarifying of specific challenges or doubts related to the product / service in question. This session lasted 2 hours.

Figure 6. National stakeholders' workshop

Although the majority of the participants made positive comments. It was notorious, like the test with consortium partners, the difficulty in develop conceptual thinking solutions without validation or use of objective data. This difficulty was more evident in professionals related to LCA, although several of them demonstrated an interest in using this tool in parallel with studies or data on product life cycle. Another consensual remark was the lack of time to complete all tasks, highlighting the number of cards as a negative point

2.2.3. ADAPTATION AND IMPROVEMENTS

After the tests and according to the results and feedback obtained, it was clear the need to made changes in order to simplify the tool use. The remarks in both sessions underline the need for the simplification of tasks and time reduction of the use of the tool.

After the tests developed and gauging of the criticisms and suggestions, the tool's improvement proceeded. These had the following objectives:

Number of components - reduction of the number of elements/cards

Clarification of use - Creation of rules and how to use it paper sheet separate from the card strategy; Creation of the problem example and open problem cards, the first presented an example of a possible project opportunity, the second a filling matrix with the various elements for defining a possible project.

Supports - derived from the large format of the canvas, A3 versions were developed, as well as digital versions (PPT) with a pre-defined canvas, such as an open and customizable canvas. This made it possible to add more actors or subjects depending on the number of factors related to the defined scenario.

Relationship between tasks - in order to facilitate its use and relationship between the first two tasks and the canvas. In this sense, the 17 cards initially presented in the first version were reduced to 9 cards. In order two the number of questions we reduce 50% of it, passing from 10 questions to 5. We started to present the questions related to the first two tasks, however, the answer to them was placed on the canvas. In this way, we seek to stimulate the relationship between the three moments of the tool, as well as the centralization of information on the same support (figure 7)

The major modifications reflect on the **reductions of cards** as well in the **relation between cards/questions and canvas**. Also, the reduction of cards was possible by the development of the **foldable instruction paper** as well the text improvements of usage regulation.

Example and open problem cards Present an example of a problem or particular context along with several stakeholders related to it. The open problem card has blanks guide you to define your specific problem before you start using the Circular Economy Journey as showed in figure 7.

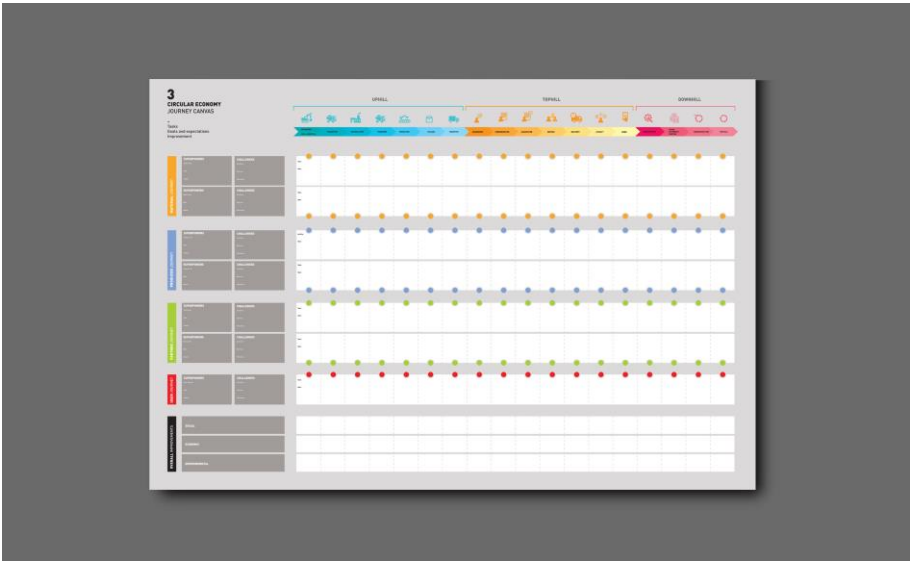

Figure 7. Tool redesign and updates: Canvas (top); instructions (bottom-left) and example card and open problem card (bottom-right)

2.3 FINAL TESTING

The final test was developed in a curricular unit (Ecodesign and sustainable development) of the last year of the industrial design degree. In the project-based discipline, students developed a proposal and after stabilizing the solution, they were asked to analyze the proposal to associate the product with service and define the necessary changes to stimulate the evolution of a design for the circular economy. The tool was presented, and it was notice

that the images facilitate the understanding of the tool and the final outcome of the exercise. They add access to all the files and formats of the tools, and they were allowed to change if they want to. As you can see in the figure bellow, they adapted different strategies and sizes.

To start each task, it was used the time proposed but after completing each task they were allowed to further develop the analysis and solution. The use of the tool was made in three session of 3 hours each. Although they were allowed used the canvas digitally, all of the 42 students, during the first stage/solution preferred to use the analogic version so they could explore it. The only adaptations identified in the canvas were made in order to add or reduce the number of stakeholders.

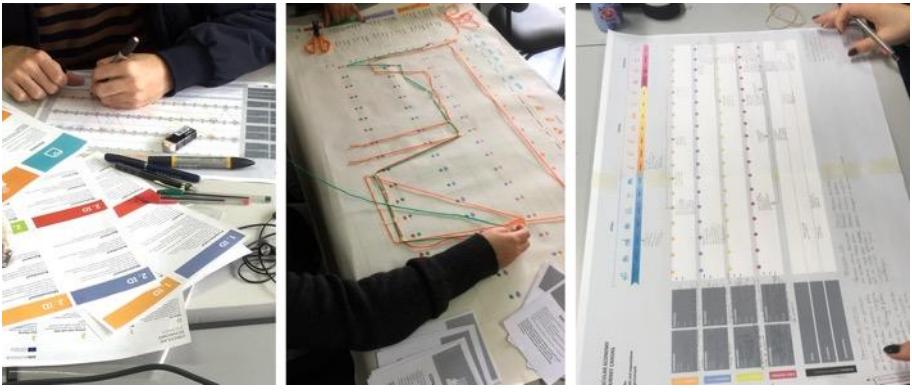

Figure 8. bachelor students using tool in different strategies

In the end they introduce the CE JOURNEY canvas in a poster that was used to present the overall solution. In this final presentation they used a digital version to present the information more clearly. We can consider that the exercise was demanding, since the students need to deal it the overall complexity of a product-service, but they could understand their relevance and impact in term of product design development. The majority of the first product proposals changed to achieve solutions that enhanced circularity by adapting strategies of assembly and disassembly, changing materials or maintenance strategies and services.

3. Conclusions

After testing and consequent development described, some conclusions were possible regarding the final version of the Circular Economy Journey Canvas tool. The tool should help the players and/or stakeholders to assess the overall Product / Service / System journey, in

the three stages (uphill, top hill and downhill) and along with the several factors: materials, producers, stakeholders and users. Through a visual representation of the journey, it aims to identify the touchpoints between the factors identified: materials, producers, stakeholders and users, providing a model for analysis and identification of opportunities to optimize the journey and to enhance the closing of the loops to present a more circular solution. The user should have a specific product/service in a specific context (materials, producers, stakeholders and users) in mind, which is then analyzed further. The expected result is a visual canvas that allows the tool user to see the journey and touchpoints of the products, producers, stakeholders and users in order to optimize the journey and closing of the loops. All the described process made it possible to test the tool with multidisciplinary participants, ensuring it would be fine-tuned in order to minimize efforts to understand and apply the tool, maximizing its possible results.

Abstract | The research focuses on family caregiving problem, i.e., the care of a family member suddenly suffering from a health condition. Reference is made to the context of Shanghai, but the extent of the problem in China is ubiquitous, given the trend of aging population as a result of the one-child-policy only recently abandoned. Although the government introduced the Healthy China 2030 policy in 2016 to dramatically improve the health of 1.3 billion people, there are no measures to support those who take care of a sick family member. The research, currently underway, proposes methodologies and tools of the Product-Service System Design to reorganize the network of dedicated services already existing on the territory in order to eliminate inefficiencies and strengthen the social fabric. Besides, the concept of unforeseen "change" is investigated according the traditional Chinese Weltanschauung so to reactivate human creativity in the face of adverse events in daily life.

KEYWORDS | FAMILY CAREGIVING, MAJOR LIFE TRANSITION, PSSD, TRANSITION DESIGN, CHANGE, YIJING

1. Introduction

1.1 Area of research

The elderly will reach 33% of the whole population in China by 2050. About 60% of this quota will need daily care because of a range of conditions in most cases not curable or terminal, and requiring regular support (Tang et al., 2013). Providing family caregiving is still very rooted in China, mainly due to the concept of filial piety (Wu et al., 2005). Therefore, the caregiver role is undertaken by family members, often not fully aware of the implied burden and the actual patient's condition.

Becoming a caregiver is a significant life transition since it can dramatically impact family life, especially when the change is unexpected or for the long term. People naturally have different response capabilities to stress management. Caregiving exerts a lot of pressure, and in general those affected find themselves in a difficult position. Lack of support during the transitional stage may originate adverse symptoms: stress, depression, and anxiety reflect decreased life quality in long-term caregivers (Guo & Liu, 2015). Psychological, economic, educational aid should be available through specific governmental policies. At the moment, in China, the actors' ecosystem is poorly managed (Glass et al., 2013), and new sustainable lifestyles for caregivers are in demand to face the staggering numbers.

1.2 Observed problem or paradox

As a matter of fact, due to the psychological burden, the financial toll, and the lack of specialist information (Guo & Liu, 2015) (Hu et al., 2018) (Guo et al., 2015), adequate aid should be available to caregivers also through specific governmental policies. However, although the Chinese Government targets to improve the health of 1.3 billion Chinese by 2020 through the Healthy People 2020 policy, the government has no specific measures to support caregivers; neither does it through the new Healthy China 2030 policy (Tan et al., 2017).

1.3 Research question

The research wants to investigate how Product-Service System Design (PSSD) can stimulate the creation of participated and shared strategies to improve both short and long-term caregivers' lifestyles and resilience.

1.4 Working hypothesis

The authors put forward the working hypothesis that PSSD offers the appropriate methodology and tools to facilitate the integration of services already existing on the territory, to the benefit of family caregivers in the long haul. However, through co-creation

methods, PSSD can help reactivate creativity in times of great stress, to deal with an immediate emergency.

1.5 The aim of the project

The aim of the project is to investigate how PSSD can support family members becoming caregivers. The research focuses on PSSD tools suitable to explore the problem through in-depth interviews and co-creation workshops and to ideate effective support systems for a resilient society.

1.6 The objectives of the project

The overall aim is split into four objectives:

1. It is necessary to investigate whether there are targeted policies or support services currently available for caregivers in Shanghai;
2. Subsequently, the research addresses the private plan of the caregiver patient relationship to understand what facilitates and hinders the creation of temporary and immediate solutions to deal with the emergency;
3. Desk and field research combined with trends' study will generate insights helpful to create long-lasting future visions through scenario building, hence contributing to Transition Design, a research area that advocates "design-led societal transition toward more sustainable futures" (Irwin, 2015);
4. Finally, a workshop prototype in a Chinese multi-stakeholders' context is created.

Overall, the objectives focus on the long-term time frame, with the only exception of second point, which addresses immediate solutions to face the emergency.

2. Desk research

2.1 Caregivers and policies to support family members in Shanghai

From 1979 until 2016, Chinese society has been under the one-child policy, whose aim was to control the rapid population. The regulation beneficially contributed to economic growth and standard living improvement. However, age breakdown and more significant gaps between the different generations followed (Liao, 2013).

President Xi Jinping, in 2016, introduced the Healthy China 2030 policy (HC2030). The "plan gives due recognition and resources to both population-wide approaches and targeting of high-risk patients, focusing specifically on chronic diseases such as heart disease, diabetes, and cancer" (Tan et al., 2017). The policy comprises four dimensions: "health priority; reform and innovation; scientific development, justice, and equity." More than that, the policy

target to benefit patients, children, discriminated individuals, and despite claiming inclusion, it does not emphasize a particular reference to caregivers. However, the high rate of caregivers is a natural consequence of the one-child policy, and the projections should serve as a base for building new plans. Namely, "by 2050 it is predicted that there will be 110.5 million dependent people in China, of whom 66 million (60%) will be at least 60 years old" (World Health Organization 2015, n.d.). Given this, there are some support systems on different dimensions, including:

- Compound Community Support Service aiming to alleviate caregivers' duties by providing the help of professional caregivers, currently available in one Shanghai neighbourhood only (Zhang et al., 2015);
- Non-Governmental Organizations seeking to financially support caregivers and their sick family members (Serious Illness Fundraising Website in China, n.d.);
- Governmental financial support aiming to reduce the treatment and medicine costs for the patient (Caregiver 1 et al., personal communication, December 20, 2019).

2.2 Trends of the aging population in China

The effectiveness of the healthcare system has enormous consequences on caregivers' life. The HC2030 policy is heading toward a system that pushes prevention (Tan et al., 2017) through better lifestyles and early detection symptoms. The plan provides for a more conscious economic development, aware of a high rate of pollution that affects the citizens' health, so it aims at a coordinated development of ecology, health and economy. On the more practical side, the plan includes incentives to improve facilities and services that meet the needs and desires of the new Chinese middle class, mostly formed by those born in the 1990s (PricewaterhouseCoopers, 2010). It is precisely among this young middle class that the trend of a healthy, sustainable life that wants to achieve "personal well-being" is growing (Global Wellness Summit, 2019). Higher education possibilities, higher disposable income, and a more frequent encounter of the Western culture have been shaping a mindset capable of positively react to the new policy. Nonetheless, the significant risk of chronic and non-communicable diseases, which has been a significant cause of death (80%) in China in the last years (Fang et al., 2015) is caused by unbalanced lifestyles, which include alcohol consumption, smoking, unhealthy diet, and inadequate physical activity.

2.3 The Chinese concept of Yi

In addition to retrieving data on the dimension of the family caregiving phenomenon in China and, in particular, in Shanghai, the authors carried out semantic research on the concept of change in Chinese culture. We want to understand how the average affected family most likely would face such an overwhelming fact filtered through the rooted Chinese Weltanschauung.

The term yi in Chinese has multiple meanings, including change. The Yijing (The book of change), one of the cornerstones of Chinese philosophy, probes the concept of yi (Shantena Sabbadini & Ritsema, 2011). The text does not analyze the change that is predictable in natural cycles, such as the circadian rhythm, the seasons' changing, the stars' motion, or the tides' ebb and flow. Instead, yi stands for the irruption of an utterly random fact of nature irreducible to the pre-established order of things. Unimaginable events of a harmful magnitude have a destabilizing effect that has always driven people to search for the meaning to justify their occurrence.

For the modern Western mentality, unpredictable change is often inexplicable. When it is not possible to establish a chain that leads back from the effect to the cause, it is concluded that the fortuitous and unfortunate event is an expression of chance, understood as a lack of meaning. According to Jung (in Wilhelm, 1950), for the ancient Chinese mentality, everything that happens at a given moment is neither the product of causality nor of chance. Instead, everything has its origin in the constant struggle between order and chaos, construction, and destruction. Life can regenerate itself because every form of order is instantly swallowed up by disorder, in a constant alternating flow.

Observing the occurrence of an event is equivalent to taking a snapshot of the field of forces at play in constant mutual subversion. Every small detail bursting onto the scene participates in the forces active at that moment. Nothing is meaningless. On the contrary, every element bears a portion of overall meaning, like the tile of a puzzle. However, one must be able to decipher the overall 'configuration' of the items. Going back to the causes is of no interest at all; the ancient Chinese goes in search of the hidden meaning.

The Yijing was born under the Zhou dynasty (1122-256 B.C.) as an instrument of divination. In practice, three coins are thrown: the random configurations, into which they fall, appropriately decoded with the help of the manual, reveal a message informed by the same meaning of the event under investigation.

Faced with a particularly disconcerting fact, the ancient Chinese formulates a question that is particularly close to his/her heart and uses the method of throwing the three coins to visualize the configuration of the forces in the field concretely. The throwing is random, for there is no intentionality in it; therefore, it is the key to the buried and hidden meaning of things. The configuration that is determined short-circuits every response that the human mind, chained to linear reasoning, would be able to produce. It is then up to the intuitive ability of the interpreter to establish the links of meaning between the configurations obtained and the question asked. The connection belongs to the plane of significance, never to that of cause and effect.

The investigator of the fortuitous event's meaning is similar to a participant observer. In other words, the psyche of the observer and the observed matter are mirroring each other. The uncertainty of the question and the ambiguity of the obtained configuration are symmetrical. Since the latter is a symbolic image, it will return a cloud of semantic content

that cannot be unambiguously circumscribed. The ambiguity of meanings, far from being a source of frustration, is the opportunity for the ancient mentality to project completion of the sense at will outwardly. Projection is the act of interpretation: the applicant throws a dart into the dense cloud of the unconscious mind and pierces a meaning inaccessible to the logical mind. If, due to their ambiguity, the images are universally adaptable to all questions and circumstances, it is the interpretation that leads them back to the question posed Hic et Nunc.

The Yijing is a tool that ancient Chinese people have used over the centuries to navigate and follow the meanders and whirlwinds of life's changes, to open a meaningful dialogue with the shaping forces in the field, instead of being blindly swallowed by them. The material world is endowed with meanings that are always in resonance with the human psyche.

At this point, one might wonder what the usefulness of such a method might be for the contemporary man. First of all, the unforeseeable change in daily life is a constant of mankind, regardless of time and place. The unpredictable occurrence of an unfortunate event has an immediate paralyzing impact which, if not promptly tackled creatively, can lead to a situation of psychological and emotional agony impossible to recover.

According to some studies in the field of neuroscience (Öhman & Mineka, 2003), humans make an illusory correlation between an adverse event and the threatening presence of snakes or reptiles. In other words, there is a cognitive affinity between the vision of a snake and a harmful or dangerous event. In both cases, what scientists call the fear module in the brain is activated: a neural circuit at limbic level, like the amygdala, located in the anterior temporal lobe, which emerged during the evolutionary transition from reptiles to mammals. This module, belonging to the ancient nucleus of the reptilian brain, is much older than the neocortex and is relatively encapsulated from more evolved cognitive functions. It would be activated by the stimulus of a snake (or an accident) and would control the emotional output: the flight or fight behaviour.

The sudden occurrence of a stroke to a family member causes the same freezing fear response as a reptile's vision a few inches away. In such adverse circumstances, the neocortex and more advanced cognitive functions are inaccessible, only the limbic nucleus of the fear module is active. Creativity is not available to seek adaptive strategies for the new situation. The yijing method is a trick to bypass the cognitive block and access a pool of unconscious content that intuition (and not logical thinking) can bring to the light of consciousness. We will see later how this method has been proposed to the workshop participants to tap into the creative intuitive mind and put in place countermeasures to face the sudden unfortunate event.

3. Field research methods

3.1 Workshop

The Lost in Transition workshop was part of the Design for Transition International Conference held on October 24-26, 2019, at Jiangnan University, Wuxi, China. The workshop aimed to designing solutions for caregivers in China. Thirty students of Interior Design and Product Design, besides two professional designers and a Design professor, participated. The plan of the workshop was divided into four phases with related activities:

Discover:

- Ice-break activity;
- Presentation on the caregivers' current situation in China;
- Hints on scenario planning techniques,
- Division in three teams

Define:

- Empathizing with caregiver personas assigned per group;
- Assigning teams different scenarios as a mandatory framework;
- Formulating implicit and explicit needs through user stories;
- Formulating the key question about the challenge to overcome;
- Interrogating the oracle through the yijing;

Develop

- Building a stakeholders' map (Figure 1);
- Concept ideation and selection;
- Future scenario system map;
- Future scenario user storyboard.

Delivery:

- Presentation of the ideation process of future scenarios and the entire design process (Figure 2).

Figure 1. Students working on the stakeholders' map depicting the caregivers and the related actors. "Lost in Transition" Workshop, Design for Transition International Conference, October 24-26 2019, Jiangnan University, Wuxi, China.

Figure 2. A presentation of a design concept, its process and tools followed by the Team N.3

3.2 The formulation of the design challenge

There were developed three personas (Figure 3) illustrating different personality types and having peculiar relationships to the family members in need of care. Age, gender, financial status, and occupations were also detailed. The teams were encouraged to address the caregiver's explicit and implicit needs. Furthermore, to empathize with the caregiver, "Key Questions" cards were distributed to generate a variety of doubts and challenges and finally focus on one. The three caregivers' profiles were designed based on the literature review findings, reporting the challenges on distinct dimensions, including:

- Financial burden: A middle-aged extravert wife in a financially difficult situation.
- Mental Health problem: A single introvert mother struggling with depression.
- Balancing caregiving with the previous lifestyle: A grandson who recently became a caregiver in addition to being a student and sporty person.

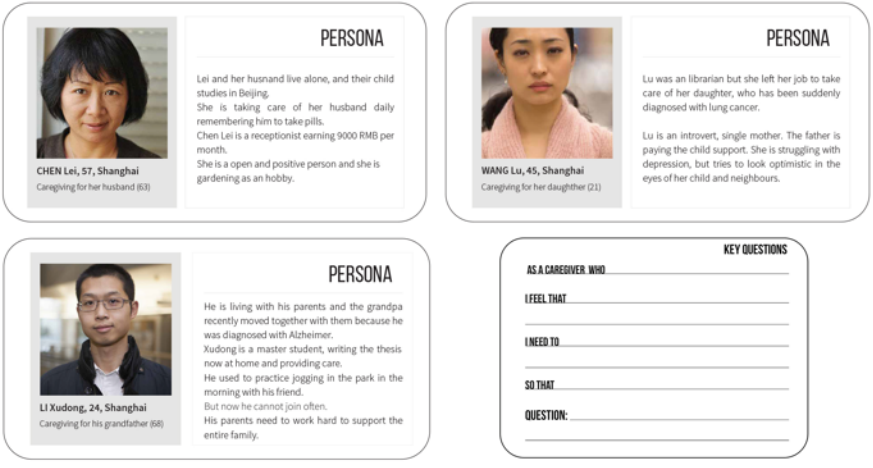

Figure 3. Pre-developed personas and Key Question cards facilitating the teams to create design challenges.

The three teams developed specific design challenges that are illustrated below (Table 1).

Table 1. The characteristics of pre-designed caregivers personas and the teams' ideated design challenges.

Team	Challenge category	Caregiver Persona	Design Challenge
Team N. 1	Financial burden	A middle-aged extravert wife in a financially difficult	How can I find more time to explore my own 'earning'

		situation.	potential while looking after my husband?
Team N. 2	Mental health challenge	A single introvert mother struggling with depression	How can I reinforce my mental health while being a caregiver?
Team N. 3	Balancing caregiving with previous life order	A grandson who recently became a caregiver in addition to being a student and sporty person	How can I balance my personal time to take care of grandpa and me?

3.3 The oracle's question

During the preparation of the workshop, we asked ourselves how to facilitate the groups' empathic understanding of the crippling situation of loneliness, confusion, helplessness, and fear in which the persona finds him/herself after the family member's sickness. We prompted the teams to refine a burning question that the persona turns in their minds obsessively. Being frightened, the personas have no way to use their creative faculties to find a solution; they react by automatically activating the fear module in the reptilian brain. One way of bypassing the cognitive blockage is to throw the three coins according to the yijing procedure, obtaining a suggestion from the oracle, namely from the intuitive faculty of the unconscious mind.

The first team works on a middle-aged wife who has to find extra income to take care of her husband. The oracle suggests hexagram N. 2 mutant to N. 24. Without going into the technical details of what a mutant hexagram is, hexagram N. 2 suggests not to do anything rash, stand still, remain concrete, and with feet on the solid terrain, to begin with. Once the stability is recovered, move on to the suggestion in N. 24: go back to a starting point to retrace your path by correcting it. The group works on a gardening service that the woman offers to her neighbors, rekindling her relationship with them.

The second team deals with a divorced mother who doesn't know how to take care of her mental health when dealing with her teenage daughter's illness. The hexagram obtained is N. 44: mating. After a moment of bewilderment and hilarity, the group worked on the relationship networks of the young mother so that she could find a new understanding and supportive partner and included funny remedies like the "husband pills."

The third team faces an active and sporty student who must take care of his grandpa and does not wants to give to the previous active lifestyle completely. The hexagram retrieved was N. 43: the oracle suggests responding to the new situation with decisiveness, and finding a way to vent the energy after the accumulation of so much tension, like a river

breaking its banks. The group works on innovative VR goggles that allow them to connect with friends both indoors and outdoors, for jogging and workouts together.

3.4 Interviews. Data Collection

We conducted the study in Tongji Hospital in Shanghai, where three caregivers and a doctor, were interviewed, besides one more caregiver, unrelated to the hospital. We used a qualitative design, in-depth interview method (IDI). The general aim was to find similar patterns across caregivers, during their critical periods of caregiving. Moreover, we wanted to discover different perspectives of caregivers within the same family: the second and third caregivers are satisfying this goal. Finally, we aimed to find out an expert's viewpoint on the caregivers' situations, and comments on the challenges from a professional perspective. The criteria to choose the caregivers were age, gender, diseases affecting their family members, financial status, years of caregiving, and family structure. The demographic data and caregivers' responsibilities are described in Table 2.

3.5 Interviews. Procedures

Three interviewed caregivers were met in the emergency hall in the Tongji Hospital in Shanghai. The interviews were conducted in Mandarine Chinese by two trained interviewers, one of which was speaking Chinese and was translating the caregivers' responses to the colleague. Caregivers IDIs encompassed their personal stories of becoming caregivers to a family member, how they learned about the disease, what was their perception, and what were the new responsibilities. The IDI explored how the event had been impacting their personal lives, and how smoothly the new role integrated with their previous habits, what were the facilitating factors. The caregivers were asked to share their strategies of alleviating their states of mind and easing their duties. The IDI of the doctor working in the Hepatobiliary Department of Tongji Hospital tackled the general perceptions of the challenges faced by caregivers for pancreatic and liver cancer patients as well as their duties and finally, the doctors' response to the caregivers' phenomenon they are witnessing.

Table 2. The demographic data about interviewed caregivers and their family members in need of care.

	Caregiver 1	Caregiver 2	Caregiver 3	Caregiver 4
Age	62	49	73	40
Gender	male	female	female	female
Occupation	salesperson	accountant	retired worker in a textile factory	design researcher
Number of family members needing care	1	1	2	1
Relationship to	mother (84)	father (80)	husband (80)	father (72)

the family member in need of care (age)			and son (44)	
Number of years to be caregiver	8	13	13 – for the husband, 5 – for the son	5
Family members' disease	heart problems	Locomotory problems, low immune system	husband: 2 strokes, locomotory issues, weak immune system; son: mental problems	prostate cancer
Type of care provided by the caregiver (arranged by priority)	Physical care, psychological support	Informational and financial aid, mental support, physical care	Physical care, mental support	Informational support, psychological support

3.6 Interviews. Data analysis and results

We summarized significant themes and challenges of the caregivers' experiences.

- Skills needed to become a family caregiver and the implicit changes of the previous life orders;
- Duties and challenges of the new role: fear of uncertainty, fragile mental balance;
- Belief, time for oneself, and social support as factors facilitating regaining emotional equilibrium;
- Caregiving as an opportunity for rethinking the self.

A clear difference emerged between middle-age caregivers and elderly caregivers. The younger caregivers have a higher likelihood of focusing and satisfying their emotional needs by traveling and disclosing their feelings. Some caregivers take the challenge as an opportunity to rethink their values, family relationships, and life.

The interview with the doctor was held last. He confirmed the challenges and also flashed a light on new topics.

1. Chinese cultural beliefs and values:

- The ethical question of hiding the actual diagnosis to the patient;
- The moral virtue of "endurance" as a prerequisite for a Chinese person in a difficult situation;

- Family togetherness in facing the problem;
- The difficult trade-off between investing in a terminal disease treatment and saving money for the future of the family;
- Chinese community and organizational solidarity towards caregiving peers.

2. Unprepared emotional and critical thinking response due to high pressure:

- The refusal to accept the disease of the family member;
- Ignoring symptoms and underestimating the health issues of family members due to a lack of knowledge.

The doctor mentioned the importance of alleviating caregivers' burdens through support systems. However, there is a lack of connections between the caregivers' support structures and the hospitals, on both administrative and medical staff levels.

4. Conclusions

4.1. Research output

The research is currently ongoing; however, the ultimate goal is to present a transformative scenario, evolving on fifteen years, proposing a long-term change at the societal level. The workshop at Jiangnan University generated personal strategies to cope immediately with an unfortunate emergency thanks to the strong presence of technology as a social connector. As researchers in PSSD applied to Social Innovation, we imagine a future less dominated by technology and more oriented towards social relations and resilience of human relations, especially in urban contexts like Shanghai. The following scenario builds on previous research, interviews, and workshop, and it is presented as a tentative output but also as a tool for further open discussion and refinement.

In five years, the current situation will likely have some incremental changes. There will be a slight improvement in health facilities in terms of physical spaces and technological devices. To date, the existing facilities do have limited reception services for caregivers during the permanence of their relatives. At this stage, the high uncertainty of the moment and the disconnection from everyday life increase stress. If the government is willing to help citizens both on the psychological and economic levels, it is necessary to support caregivers in the most acute phases, especially during the hospitalization or treatment changes.

In ten years, the HC2030 objectives should have been partly achieved, especially in terms of facilities and services improvement with refined data synchronization among venues, which currently is still an issue. Such advancement might help equally distributing the number of patients across hospitals. Healthcare would benefit from a spread-out Eco-system that, in turn, would influence how caregivers follow their relative's journey.

In fifteen years, more changes might occur. The young and middle-aged generations are now following more responsible lifestyles. Social innovation initiatives have spread around the city of Shanghai to activate major collaboration and socialization among neighbors. Stronger relationships fabric most likely can relieve local structures supporting caregivers. Community centers provide dedicated functions enriched through a community-based approach. Art and acting activities relieve stress during long-term degenerative diseases (Quinlan & Duggleby, 2009).

4.2 Research outcome

The social sensibility towards the topic is impressive, as confirmed by the interest raised by the workshop and the interviews. Potential ways to alleviate the impact of family caregiving include the connection to beliefs and Weltanschauung, keeping personal life balance, benefiting of community, and organizational support (Caregiver 1 et al., personal communication, December 20, 2019). The Chinese culture preconceptions are prompting these alleviating methods, especially for elderly caregivers. PSSD can offer suitable methodologies and tools to raise social awareness and solidarity by inviting on the stage different actors capable of co-building sustainable, more desirable future scenarios of family caregiving.

Abstract | Materials designers is an emergent professional profile which has its roots in the maker movement and whose role can have a positive impact in the development of a circular economy. As preliminary research for the development of the MaDe (Materials Designers) European project, a qualitative analysis was performed in order to identify the specific needs, opportunities and skill gaps for materials designers training and exposure, as well as for the requirements for enhancing social and industrial awareness towards circular economy issues. Based on the collected data from existing materials-related design projects, educational programs and existing initiatives, a series of recommended key-actions have been developed to define a European project that boosts creative talent towards circular economies.

KEYWORDS | MATERIAL DESIGNERS, CIRCULAR ECONOMY, CIRCULAR DESIGN, DESIGN SKILLS, EUROPEAN PROJECT

1. Introduction

The transition towards a more circular economy ((European Commission, 2015) brings great opportunities for Europe and its citizens. It is closely interlinked with crucial EU priorities on jobs and growth, investments, the social agenda and industrial innovation. The European Commission has promoted an ambitious program on Circular Economy by establishing "a common EU target for recycling 65% of municipal waste by 2030; a common EU target for recycling 75% of packaging waste by 2030; a binding target to reduce landfilling to a maximum of 10% of municipal waste by 2030." To be achieved, these goals require the involvement of civil society in creating new opportunities for materials to be used as resources for local production, and by establishing new supply chains between SMEs and industries at the city and regional levels.

Circular economy starts at the very beginning of a product's life. Both the design phase and production processes have an impact on sourcing, resource use and waste generation throughout a product's life. This circular design approach can make products more durable or more comfortable to repair, upgrade or remanufacture. It can help recyclers to disassemble products in order to recover valuable materials and components. Overall, it can help to save precious resources. Circular Design involves Service Design, Product Design and Materials Design. Most materials have an infinite life cycle. They can be reused, reformed and redesigned with a new purpose. By harnessing the unexplored potential of materials, we can implement social, economic, environmental and political change through a cross-sector approach.

Designers will play a strategic role in this transition. New industrial niche markets are developed, and new multidisciplinary creative professional profiles are spontaneously emerging. Designers and creatives are called for a more responsible role on the advancement of society, and the industry is starting to appreciate the several facets that designers can have thanks to their creative skills: designers are also changing agents, problem solvers, anthropologists, technologists, culture influencers, and environmental agents (World Economic Forum, 2016)). Design is a transversal creative discipline that can dialogue with materials science, information science and social sciences, amongst others, in order to address environmental and societal issues. Design, art and culture are driving forces to bring environmental perspectives to life in an attractive, innovative and human-centred way, such as in the European Green Deal (European commission, 2020).

More specifically, materials and material-driven design (Karana et al., 2015) have emerged as an essential driver in the transition to the circular economy (3). Studies show that more than three out of four decisions influencing the final choice of materials and manufacturing processes are made during the design phase whilst over 80% of the ecological and economic costs are made before the object is created. Design and materials have a pivotal influence on the way that products and services are made and used – they are, therefore, a crucial element in a shift towards more resource-efficient economy (Whicher, 2015).

In a time where there is this need for a more responsible role of design into environmental, technological and social issues, new designers' profiles that are aware and embody their work with the immediate and far-future concerns, emerge. In the last decades, the domain of design materials has been increasingly studied and developed due to technological advances that broadly expanded the capability to operate on the materials and due to more and more attention to sustainability issues. Remarkably, the dissemination of the Maker culture through the FabLabs and the diffusion of the do-it-yourself phenomenon changed the relationship between designers and materials, bringing designers to relate to production processes and materials manipulation. A specific emerging profile is that of materials designer, that merges circular design, materials experimentation, and new creative processes. This specialist material designer evaluates, ideates or develops materials and inspires approaches to manufacture materials for use in products that must meet specialized design and performance specifications. Some sector experts foresee Specialist Material Designers as a job of the future (Brownlee, 2016).

However, in its emerging role, industry and creative industries are not yet fully aware of the existence and potentiality of these new materials designers and how they could boost their adaptation to a circular economy. An analysis of needs, opportunities and skill gaps and the definition of key-actions to boost material designer profiles and social and industrial awareness is needed.

2. Methodology

Data of existing materials-related design projects, educational programs and existing initiatives have been collected at different levels: desk research, field research and expert sessions.

Desk Research: Extensive desk research has been performed under trends research methodologies that allow for the detection of emerging opportunities. Primary and secondary resources have been used: specialist literature (Journals (Ferrara, Rognoli, Arquilla, 2016), (Rognoli, Bianchini, Maffei & Karana, 2015) , Books (Karana, Pedgley, Rognoli, eds., 2014), (Lee, 2015), (Solanki, 2018), Forecasting reports (Viewpoint Magazine), (Wunderman Thompson Intelligence, 2017), (Space10, 2017), Conferences (Chawla, 2017) and European Commission reports (European Commission, 2013), (European Commission, 2009) and existing European projects (Design and Advanced Materials) have been reviewed to provide an accurate analysis of the field and detect barriers, weaknesses and identify needs.

Field research: This desk research information has also been complemented with field research through visits and analysis of various Design Festivals (Dutch Design Week 2017, London Design Festival 2017).

Expert sessions: a co-creation session was performed between the three authors (partners of the MaDe project), counting on their expertise and their privileged position as observers of the reality in the area of new materials, design, and its impact onto the circular economy (The Materials Experience Lab, Elisava Master in Design through New Materials).

The process for analysis follows the Futures Research methodology: collecting the information through the mentioned channels, building the evidence wall, clustering of concepts, and cartographic categorization of results (Raymond, 2010).

3. Analysis

With all this collected and analysed information, the following opportunities and needs have been identified:

Opportunities

- Materials design is a new professional profile and an emerging discipline. Specialist Materials Designer is one of the seven jobs that will grow, according to design leaders at Frog, Ideo, Artefact, Teague, and more (Brownlee, 2016).
- Transversal impact on design disciplines. There is a huge opportunity for materials designers since materials span all the design disciplines with 'physical' production.
- Materials for a circular economy quality label. There is still no specific quality label for materials designers with a focus on the circular economy. There is an opportunity for a quality label such as an Award that contributes to a more responsible purpose of design (e.g. materials for circular economies), creating a label of creative talent, knowledge and positive environmental impact.
- Fostering new alliances. There is an opportunity to create early alliances between designers and material manufacturers or industrial producers to incubate radical design-led technology ideas and start-ups.

Needs

Overall Needs

- New creative revenues. Materials designers need to understand the new economic context and the ways to interact and sell their added value to industry; as well as to understand the alternatives to find new sources of revenue. They could be entrepreneurs, creative forecasters, or materials designers within an existing industry (El Taller Esfèric, in Spain, a materials-based start-up that needs support in understanding what kind of business model they can apply to their creations).

- A common vocabulary needs to be set in place. The different disciplines of design, engineering and materials science all have a different language to describe materials, and processes and this cannot bring together a constructive collaboration. There is an imperative need to develop a mutually understandable vocabulary of definitions and techniques so that they can begin to engage at a deeper level.
- A new creative sensorial approach. Materials have been historically considered from the engineering point of view, which leads to poor communication of their tactility, sensoriality, and creative possibilities. There is a need to communicate the realm of materials and materials design from a more creative and impacting approach. There is an emerging need to create a simplistically complex platform that can bring the nature of new materials in their many processed states to the design community.
- Systems thinking. There is a need to consider local identity, lifecycles and systems thinking, proposing an alternative approach to applying materials, encouraging a positive economic, environmental and social change, revealing the truth of how we live today and might live tomorrow.

Specific needs for creatives and designers

- Skill gaps. Addressing skills gaps appears often highlighted as a challenge in multiple policy papers in the domain of Cultural and Creative Industries (i.e. Design), Key Enabling Technologies (i.e. Advanced materials) or the Circular Economy: COM(2012) 537 final "Promoting cultural and creative sectors for growth and jobs in the EU"; COM(2016) 381 final "Working together to strengthen human capital, employability and competitiveness"; COM(2015) 614 final "Closing the loop - An EU action plan for the Circular Economy"; COM(2014) 446 final. "Green Employment Initiative: Tapping into the job creation potential of the green economy"; SEC(2009)501 final. "Design as a driver of user-centred innovation". The Design Council (UK) has recently published "Designing a future economy. Developing design skills for productivity and innovation" (Design Council, 2017). This report catalogues the skills intricately connected to design and innovation. Design skills are the fusion of creativity with technical ability and interpersonal competencies and will be essential for any economy seeking to maximise the opportunities of technological advancements. Yet with these opportunities come significant challenges. The research, as mentioned earlier, shows that the UK has skills gaps and shortages in design and a narrowing pipeline of young designers who could otherwise fill these roles.

Specific needs for companies and industries

- Future-fit production. The industry is not aware of the existence and potentiality of these new materials-designers and how they could boost their adaptation to a

circular economy. There is a need to evaluate and certify new materials in order to introduce them to the value chain.

- Impacting message. There is a lack of common consensus in the language and opportunities that materials design is and can impact on. The industry is in need of a comprehensible language that they can adopt to be more aware of sustainability issues linked to materials.

Specific needs for Design Stakeholders and General Public

- New perspectives on sustainability. Associations, regional public bodies and NGO need to address from new perspectives the sustainability issue. There is a need to generate more dialogue between these design stakeholders and the designers and companies in order to understand the new context for the circular economy and how materials can address it.
- General awareness. Citizens need to understand how materials are the Trojan horse for sustainable solutions, becoming more aware of their consumer choices.

Skills gaps

These are the identified appropriate skills to become a Specialist Materials Designer:

1. Sectorial Transversality. Understanding the transversality of materials and connecting solutions from different industries.
2. Scientific and creative. Adopting a multidisciplinary view of materials, both from a creative and scientific approach.
3. Sustainability and circular economies. Understanding circular economies in the context of design and materials.
4. Hybrid of traditional and computerised skills. Mastering hybrid skills that bridge traditional craft techniques with technological innovation in the field of materials processing (3D printing; Computer-aided fabrication,…).
5. Locality. Understanding the potentiality of local materials knowledge and culture
6. Business models. Gaining new business models' knowledge that enables materials designers to envision alternative mainstream industry solutions and new sources of revenues.
7. Different production sectors. Understanding the different productive sectors, they can impact with their creations.
8. Hands-on experimentation. Adopting experimental methodologies and DIY techniques from other disciplines and bringing them into the creative ones.
9. Visual communication. Creating an attractive visual project to ensure high communication impact of any experimental creative project.

4. Results

Material Designers (MaDe) is a Creative Europe programme that addresses specific skills needs for designers within the circular economy paradigm. MaDe's approach considers materials design and materials making as a remarkable driving force behind innovation and responds to the question: What if we used creativity to provide better circular economy solutions through the ideation of new materials?

Based on the previous analysis and identification of opportunities, needs and skill gaps, a series of key actions have been defined and are the ones applied in the development of the MaDe project:

Objectives

The objectives of this programme are as follows:

1. To explore and obtain a better understanding on how can materials' design contribute to attain a more circular economy; providing thus tools, strategies, guides, contents, education, in order to enable designers (i.e. fashion, furniture, objects, packaging,...) and new creatives (i.e. materials designers) to connect to the industry.
2. To spot the European materials designers emerging scene in order to identify the most talented and promising creatives in this domain.
3. To provide 120 European students from different creative areas (design, arts, ...) with the appropriate skills to enhance their career as Specialist Materials Designers, which is foreseen 14 as a job of the future in the design industry.
4. To foster the career development and recognition of emerging materials designers through the circulation of their works, awards and professional stages in order to make them gain visibility among the industry, which is keen on incorporating a circular economy approach.
5. To connect new materials with designers and the industry through a digital platform that makes the tactility of materials come to life by enhancing the experience.
6. To ensure the broadest impact for MaDe's educational resources and primary outcomes through public presentation events to European industry (i.e. when main Design Weeks occur) and a proper communication and dissemination program.

Training

Workshop implementation is aimed at addressing Specialist Materials Designers skills gaps by training a selected group of 120 European designers and new creatives; and at generating a new breed of materials designers and 120 materials design projects to be displayed and

promoted. This training action addresses Specialist Materials Designers skills gaps and covers the need to gain a deep understanding of challenges for designers when approaching a more circular economy. In order to promote international cooperation capacity and foster exchange of experiences, the workshops take place in 3 different European cities and have a cooperative scheme with other material network stakeholders.

Material Network and Platform

A MaDe network is necessary to cover some of the identified needs. MaDe gathers two complementary academic partners: ELISAVA from Spain and POLIMI from Italy; and a disruptive design studio from the UK (Ma-tt-er). Partners pool expertise in the area of new materials, design, communication and its impact onto the circular economy with a complementary approach, which derives from the preliminary analysis of needs. Additionally, a network of other associated European design institutions reinforces talent spotting, skill training insights and transnational mobility. Dissemination of results and visualization of material designers towards the industry and the wider public needs the support and engagement in the network of other stakeholders that reach industry and professionals (FAD Spain, ADI Italia to name a few), and a platform that can reach society, such as the Ellen Macarthur Foundation. This platform works to inspire a generation to re-think, re-design and build a positive future circular economy. They have an educational department as well as a dissemination department, which includes the managing of the Disruptive Innovation Festival (DIF), and the generation of publications such as the Circular Design Guide together with IDEO.

An online platform will be key to connect multiple levels of agents and generating engagement from our target audiences and to disseminate the results of the project thus creating awareness regarding the importance of materials in the circular economy. This online platform has to aim at tackling the visual challenges of materials' tactility as well as providing a platform for new sources of revenues for designers.

Quality Label

There is a need to establish a quality label for material design, recognizing excellence. A MaDe Award should be the vehicle for this excellence recognition through each of the following categories: Best start-up potential / Best future vision / Best industry application.

The MaDe Award categories will be:

(A) MaDe Award 1 - Best start-up potential.

(B) MaDe Award 2 - Best future vision.

(C) MaDe Award 3 - Best industry application.

The MaDe Award Jury, from the MaDe network, is a key factor for the dissemination and excellence of the Award. General and specific criteria for excellence of the MaDe Award is defined as follows:

General: Degree of innovation | Degree of creativity | Formal and Technical quality | Self-explanatory quality | Symbolic and emotional content | Number of potential applications, short or long term.

Specific for each category:

(A) A project with a high potential to become, in the short term, a materials-based start-up with a focus on the circular economy.

(B) A speculative materials project with an elevated future impact on society and industry in terms of the circular economy.

(C) A materials project that has a high potential to be applied, in the short term, in industry, initiating the transformation towards circular economy.

The MaDe Award prize consists of a fellowship to perform a stage into a Company or Institution and develop a materials design project.

Fellowships

The MaDe Awards grants the three winners with a unique opportunity to develop a materials design project in a professional environment and mentored by high-skilled tutors. The goals are to raise awareness on industry, companies and organisations for the need of materials designers professionals with a circular economy vision and to boost materials designers professional careers by introducing them to the industry.

The fellowship is a paid internship where each winning designer will develop a project at a different company/organisation and with different objectives depending on the category of the MaDe Award:

(A) MaDe Award 1 - Best start-up potential:

Objective: Stage in a business incubator to develop the final business model of their own company.

(B) MaDe Award 2 - Best future vision:

Objective: Stage in creative industry company or marketing department to develop a communication project that helps raise awareness on the importance of materials in the circular economy.

(C) MaDe Award 3 - Best industry application:

Objective: Stage in a Company to develop a joint capsule collection, promoting circular products in companies.

Exhibition

In order to cover the need to raise awareness among industry and the wider public towards materials design for circular economies and to give important visibility of the MaDe project to a broad audience an exhibition or showcase of the materials design projects is a key action to develop.

Key awareness messages

Another key action is to inform and explain how Specialist Materials Designers can contribute to a better circular economy and to disseminate a clear message for each different audience:

a) For creatives, designers:

- MaDe will provide you with key skills to promote your professional career in the design industry.
- By being present in the MaDe on-line platform, MaDe will help you to improve your visibility and chances for an extra communication channel and/or a future job opportunities.

b) For companies:

- They can be prepared for the future by incorporating materials adapted to a circular economy.
- They can improve the quality of their products thus their competitiveness into the market regarding the systematic use of design and a material-driven design approach.

c) For opinion leaders:

- To get a glimpse on the future of design, acknowledging the most disruptive designers.

d) For wider audiences:

- Design takes responsibility and provides more sustainable futures.

5. Conclusions

MaDe project results aim to provide a platform which recognizes the potential of designers and the material they could create across all creative sectors aiming at creating a circular economy. The combination of key actions such as Training, Network and platforms, Quality label and Awards, Fellowships and Exhibition aims at covering needs and skill gaps for material designers and industrial and societal awareness towards a circular economy. MaDe

project will showcase and demonstrate the positive impact that material designers can have across the industry which will kickstart the futures of those hoping to affect the European material landscape.

[b] Università Iuav di Venezia, Italy
*noemib@technion.ac.il

Abstract | Natural disasters appear to be growing in number and intensity due to global warming, population explosion, widespread travel and the overcrowding of cities. We aimed to augment students' knowledge and awareness of disaster situations with a focus on the needs of special populations (e.g., elderly people, people with disabilities, children, pregnant women) to develop the infrastructure needed for improving preparedness and resilience. Design concepts were developed in studios by industrial design and architecture graduate students. Representative design concepts of infrastructures, including designs for shelter and storage facilities and communication and information hubs, solutions for rescuing individuals from fires using smart innovative technologies and design concepts for people with special needs, are presented. We believe that preparedness and the development of infrastructure designs will increase individual and national population resilience, increase trust among the citizens in the municipality and enable people to successfully cope with potential traumatic events, thus leading to a physically and mentally healthy community.

KEYWORDS: DISASTER, EMERGENCY, INFRASTRUCTURE, RESILIENCE, PREPAREDNESS

1. Introduction

Climate change and global warming are expected to be the greatest threats to worldwide health in the 21st century, and together with population explosion, widespread travel, and the overcrowding of cities, they will result in an increased frequency, severity and coverage of natural disasters (Alexander, 2006; Guha-Sapir & Hoyois, 2015). Common natural disasters include earthquakes, tsunamis, storms such as hurricanes and tornadoes, floods, avalanches, epidemics (e.g., SARS, Ebola outbreaks), droughts, and cold and heat waves.

The basic assumption is that thousands of people will be harmed and remain homeless, infrastructures will be damaged or unusable, roads will be blocked for extended periods, and this damage will be followed by economic loss, so the population will need to be able to rebuild (mentally and/or physically) (Norris et al. 2002; Norris et al. 2002). Disasters require a rapid response; this need is currently met by national and international organizations sending medical and humanitarian assistance and support, including food, temporary housing, clothing and more (Alexander, 2006; Bitterman & Zimmer, 2018; Franco et al, 2007; Guha-Sapir et al., 2004).

Past experience has shown that external humanitarian support will arrive a few days after a disaster, but immediately following the disaster, the locally available resources and community (neighbours, friends and family) help people recover. Thus, the by-standers are the immediate responders (Ashkenazi & Hunt, 2019), and they should therefore be supported with the necessary resources.

Moreover, rescue delegations stay for a limited time period, and they mainly address acute situations and direct disaster causalities. The equipment transported is not always suitable for the specific type of disaster, conditions at the disaster location and people's needs and may not last for long-term use (Tierney, 2019). There is no continuity of care for "Day Two" or the treatment of the local citizens (e.g., chronic disease); thus, long-term deleterious effects on the healthcare status and on the resilience of the population occur.

It is therefore the responsibility of the nation and local communities to be prepared for disaster situations, so that they can support citizens with the needed resources and enhance their ability to recover and return to normal everyday life as soon as possible after the event (community resilience) (Kimhi, 2016).

2. Aims

Based on the prevalence and importance of emergency situations following disasters, we have decided to integrate the topic of 'design for emergencies' into the curriculum for design and architecture studies. Specifically, studio sessions were designed to achieve the following goals:

a. To augment students' knowledge and awareness of disaster situations (natural and man-made disasters) with a focus on the needs of special populations (e.g., elderly people; people with motor, cognitive or sensory impairment; children; pregnant women).
b. Be familiar with the principles of exposure to extreme environments (extraordinary physical, psychological, and interpersonal demands that require significant human adaptation for survival and performance).
c. Design products, structures and services to rescue, treat, support, and improve the quality of life of the people affected by disasters based on literature review and market survey, task analysis and applying human factors principles and structured design procedures.

3. Methods

Full semester-long studios that were dedicated to the topic "design for emergencies" were held for graduate students in industrial design and architecture programmes.

The studio/workshop curriculum included lectures on theoretical and practical topics related to disasters and performance in extreme environments, lectures presented by invited speakers, visits to the Civil Protection Centre, short-term and mid-term assignments, and a final project that was completed and presented by the students.

The first assignment was to conduct a literature and web survey based on the following keywords: disaster, rescue, hazard, natural disasters, specific types of disasters (e.g., earthquakes, floods, storms, tsunamis), climate change, and global warming. The search was performed via search engines such as Google Scholar, Scopus, PubMed, Internet sites, the National Geographic website, journalists' reports, TED videos, personal stories of people who experienced disasters, international websites of disaster-related organizations and even movies.

The lecture topics included physiological information, performance in extreme environments (e.g., hypothermia), the physiology of subpopulations (elderly people, people of specific genders, children, people with disabilities), sensory physiology, biomimicry and inspiration from nature, smart innovative technologies (monitoring, sensors, Big Data), human factors and principles of task analysis, data collection and presentation .

The mid-assignments were to select a specific disaster and population at risk, conducted a more focused literature review and market survey, design several concepts that may be selected for the detailed final project.

The final assignment was to design a product or system for designated users in disaster situations according to their needs. The final report contained a detailed report documenting all stages of the work and drawings, a storyboard, an engineering description, the final design concept evaluating the trade-offs, constraints and future directions, a class presentation with a video, 3D models and a poster for the final exhibition.

4. Results

4.1. Overview of natural disasters and people's needs

Natural disasters can be classified as direct or indirect manifestations, as shown in Figure 1. *Direct disasters* are major natural disasters, including earthquakes, storms such as tornadoes and hurricanes, tsunamis, avalanches, floods, droughts, cold waves, heat waves, epidemics, floods, and sandstorms (Figure 1), generally resulting as a direct effect of climate change and global warming. A high level of synergism and interrelations across the different disasters is common, resulting in multidirectional, multifunctional disasters; therefore, people should expect events of multidimensional types of damage.
Indirect disasters (cascading disasters) are those that threaten population health through adverse changes in the air pollution and air quality, diseases (e.g., asthma), water-related contamination, the spread of disease vectors, food insecurity and under-nutrition,

displacement, and mental diseases (Field et al., 2012; Tierney, 2019; Watt et al, 2015; Norris et al., 2002), as shown in Figure 1.

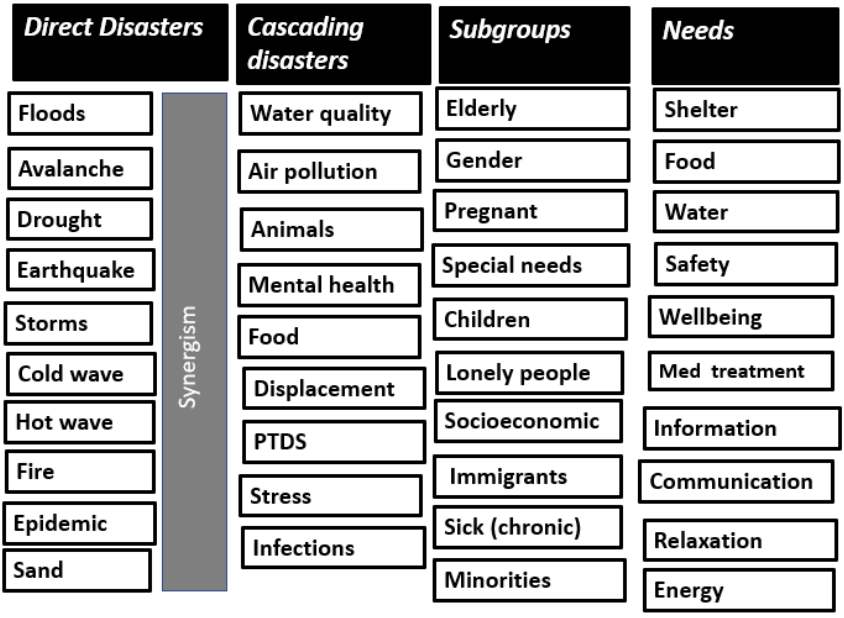

Figure 1. Overview of the natural disasters, subgroups of individuals at risk and specific needs during emergency situations.

The special subgroups of individuals at risk include weakened and vulnerable populations (Figure 1). The ageing population seems to be the greatest challenge of the coming century (Harper, 2014; Eurostat), and in the future, more elderly people will be exposed to emergency situations and their cascading effects. Elderly and specifically lonely people have been reported to be among the most vulnerable individuals who suffer and die in emergency situations (Fernandez et al., 2002; Ngo, 2001; Pekovic, Seff & Rockman, 2008; Tierney, 2019). Other subgroups at risk include females, pregnant women, children, people with special needs and disabilities, minorities, immigrants and people of low socioeconomic classes (Figure 1) (Tierney, 2019).

The needs in disaster situations are basic and immediate physical requirements, including shelter and clothing, food and water, safety, medical treatment, information, communication, relaxation, wellness and energy.

4.2. Student projects

Based on the overview (Figure 1), we identified the main design challenges associated with disaster and emergency situations as the early detection of danger, fast and effective information and communication, locating survivors, a supply of food and water, shelter, clothing and mental health relief, to be supplied on-site immediately after disaster events. The students were asked to select one specific disaster, while considering its synergism with other disasters and its cascading effects. If possible, a specific group of users was identified, and the students were asked to find ways to address to their needs.
Examples of students' work are presented under five categories in the following paragraphs: infrastructures of facilities for shelter and salvage, communication and information hubs, designs for people with special needs, rescue (mainly from wildfires) and a relaxation site for children. All projects presented herein are primary design concepts developed by students and should therefore be regarded accordingly.

Infrastructures of shelters and rescue facilities

Disasters arrive largely unannounced, although some disasters such as storms may have some warning (Tierney, 2019); because there is often little time to prepare for disasters, the autonomous activation of available infrastructures for shelter and rescue is needed.
Figure 2 presents concepts for shelter and rescue facilities that have been designed as integrated parts of the landscape that can be activated autonomously by smart sensors upon the onset of emergency situations. The basic idea is that shelter and rescue systems should be available and accessible in public areas, ready to be activated whenever needed, without interrupting or burdening individuals' daily activities or the landscape appearance (e.g., systems stored below ground, installations that have other functions the absence of disasters, or rescue systems that are embedded and integrated with an exterior public component) or being activated in an unmanned manner.

A B

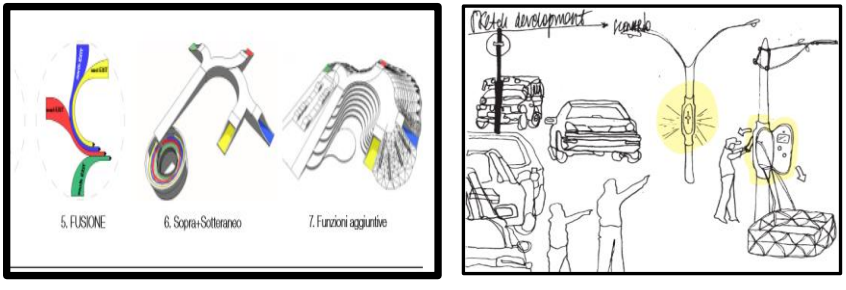

Figure 2A. An underground shelter built as part of a recreation park that is normally closed and opens automatically, unmanned, for citizens use on the onset of storms (e.g. hurricane or

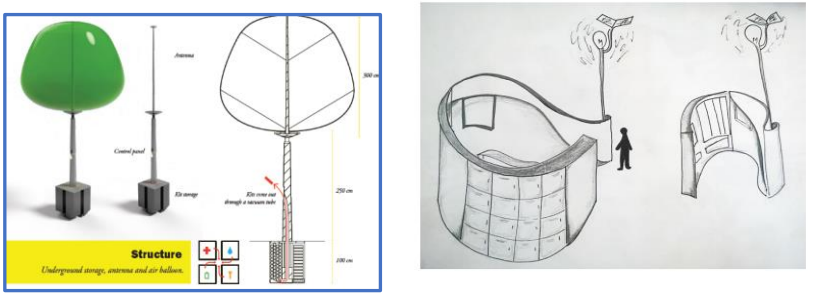
tornado) (Veronika Basova). B. A rescue boat to be released and inflated after floods from light column pillars distributed in the public space containing also first aid equipment (Piazzon Eleonora)

Communication aids and information centres

The needs to communicate and obtain information are among the greatest needs of people in emergency situations, especially because wireless communication and mobile phones are not reliable during disasters and may collapse and power may be down, preventing people from charging their cellular phones. It is therefore essential to guarantee redundancy in transmission options and keep cable (wired) phone and public phone boxes functioning or develop independent local communication nets that are continuously active and functioning. Several projects were developed based on the pop-up principle; temporary information and communication hubs containing solar energy sources for charging cellular phones and storage facilities that are located underground, activated and erected automatically when needed by specific sensors were developed. The facilities were located at central and well recognized places containing necessities for the local people for the first days after a disaster, including water, food, first aid supplies, protective clothing and basic equipment for rescue and the removal of ruins, as it has been shown that bystanders are the first responders after a disaster (Ashkenazi & Hunt, 2019) (Figure 3A).

A B



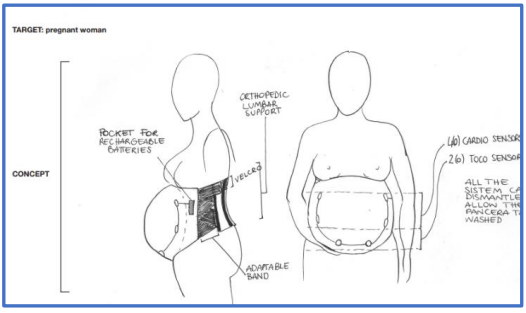


Figure 3. Communication, information and storage infrastructures: A. A meeting hub to be erected automatically after a disaster; it has a green balloon that is inflated to indicate the location of the information and communication centre and emergency kits with medication, water, and food that are stored underground (Marco da Rose). B. An underground storage unit located below bus stations to be erected when needed for the immediate use of locals after an emergency situation; they contain medication, water, food, tools needed for rescue and digging and a power bank for charging mobile phones (Kena Sofia Flores Sierra)

Design solutions for people with special needs

A line of products was designed for people with special needs, who are vulnerable in emergency situations. All products are generally easy to use, foldable or lightweight, made from conventional materials or equipment and have multiple applications, even for non-disaster situations; thus, they are promising, sustainable and cost-effective solutions. Figure 4A presents a kit for pregnant women to be delivered to disaster areas for women who are naturally under stress, cannot contact their doctors and are concerned for their baby. A solution for an elderly and disabled person at risk during earthquake is presented in Figure 4A.

A

B

Figure 4A. A wearable belt with back support for pregnant woman, containing cardiotocograph equipment that is embedded into the adjustable elastic material for follow-up monitoring of foetal movements and heartbeats and the capability to send the data to a medical centre located at a safe remote location (Marzia Bello). 4B. A standard wheelchair for elderly people and people with movement impairment that is equipped with protective elements for falling particles; the protection is normally housed within the wheels and handles and can be erected automatically during an earthquake (Andrea Zamboni)

Additional projects (not presented herein) included a foldable, lightweight, inexpensive "all in one" baby cot for fast, easy air transportation; adaptable, personalized air masks for babies and toddlers during hazardous air pollution conditions; and eye masks equipped with a light source, calming music and audiobooks to provide companionship for elderly people during lonely and stressful periods after disasters.

Infrastructure to rescue individuals from fires

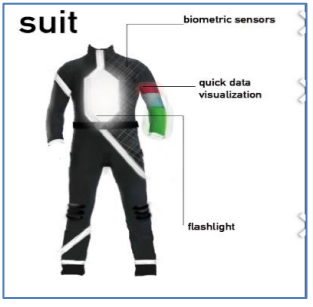
Fires are a global hazard, a primary disaster, and a cascading event accompanying several types of natural and man-made disasters. Numerous fire-related events have recently occurred, and unfortunately, we were unable to save people from the fires, especially those

on high floors in skyscrapers, crowded areas and remote locations, such as forests. The designs developed by students involved smart innovative technologies for the early detection of fires, setting effective alarms, identify trapped people and people with special needs (e.g., disabled and lonely people) and autonomously rescue individuals without risking the lives of firefighters (Figure 5A).

In particular, people with dangerous occupations who are frequently exposed to extreme conditions were considered. Figure 5B presents a concept for a firefighter's uniform including advanced technological aids to ensure the safe monitoring of physiological parameters and environmental conditions. A related design, a protection suit, for healthcare staff and volunteers in areas with highly infective diseases (e.g., Ebola, SARS) and other risky conditions was developed using high-tech accessories and advanced innovative materials for the suit. In addition, the suit is designed to be comfortable to operate in extreme temperatures and easy to don and doff in a safe, unobtrusive manner without being risking infection of the user.

A

B



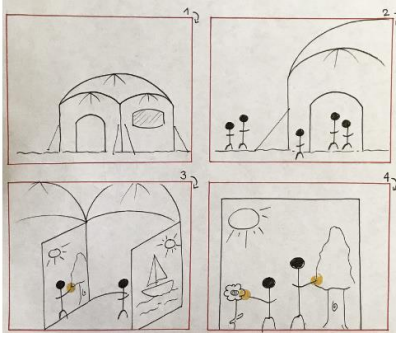


Figure 5A. A concept for a rescue system to be used for people trapped in fires (e.g., in the forest); the system includes automatic/smart sensors to detect trapped people, a system for the autonomous delivery of a protection suit, and important information, and it provides safe, unmanned evacuation (Malia Priola). 5B. A full-body suit for firefighters that provides protection, information display, has a light source embedded in the front of the suit, has shoes that leave behind markers for persons needing to follow the firefighters route and location, and smart wearable display on the sleeve for physiological data and personal warnings (Luigi Leopizzi).

Early treatment for on-site relief and relaxation

Children and elderly people are among the most sensitive age groups, as they have a high chance of being ignored during emergency situations (Tierney, 2019) when the main rescue efforts are focused on searching for people, rescuing them, treating injures, obtaining information about missing people and other tasks. Over the years, studies have shown the

importance of early mental treatment to reduce damage and even prevent post-traumatic stress disorder (PTSD) (Neria, Nandi & Galea, 2008; Lai, 2017). Posttraumatic stress symptoms can occur in children after disaster exposure (Lai at al., 2017). It is important therefore to deliver mental health relief to children at the first line of rescue. However, the human resources needed for immediate on-site mental health help and accessibility to consumable leisure equipment (e.g., games, painting supplies, books, leisure equipment) are limited. Therefore, the concepts that were suggested by students involve unmanned, smart virtual technologies that use non-consumable tools integrated into a portable, flexible structure that can be safely stored until needed or transported with the first support of humanitarian delegations.

A

B

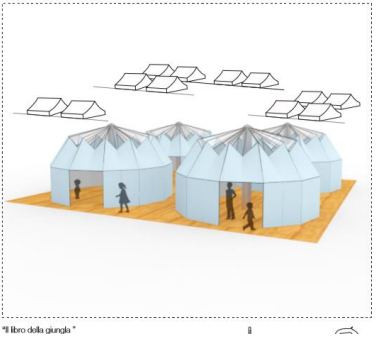

Figure 6A. An interactive display for children that is placed in a shelter structure to induce relaxation and reduce stress; the children can use this display at any time of the day without adults, as it is based on interactive stories and smart electronic virtual technology (e.g., electronic ink) (Edda Zearo). 6B. An overview of an interactive unit for children; a portable, foldable, modular, "all-in-one structure" with a virtual interactive display embedded within the walls (all-in-one installation) .

5. Summary and future directions

Most of the projects developed by the students are based on the concept of planning an infrastructure of shelter facilities, storage units, information and communication hubs and aids to assist people with specific needs (elderly people, children, persons with sensory and motor impairment, pregnant women), who are at risk in emergency situations. The basic principle involves using a variety of sensors and actuators that are dispersed or integrated within the environment to continuously collect follow-up data and allow smart autonomous responses to be elicited when needed in active, pre-prepared infrastructure.
The suggested future directions for the design of infrastructure for emergencies are as follows:

A. Autonomous systems, such as robots and drones, can be used to increase the safety and accessibility of individuals, to overcome the shortage of human resources, and increase extend and abilities of identification and rescue of victims (Murphy et al., 2016).
B. 3-dimensional (3D) building technologies can be used in disaster areas to enable fast and safe construction and repurpose local materials, enabling a personalized, sustainable and cost-effective building tailored to a specific site and the local people's needs (e.g., utilizing the wreckage after an earthquake as a building material using 3D printers).
C. Advanced innovative materials that have multiple qualities and contain embedded smart technologies, such as actuators, illumination, smart sensors that are responsive to different temperatures, and solar panels that supply energy, can be used (McEvoy & Correll, 2015).
D. Buildings can be constructed with air (Airtecture), as using air-inflated fabric structures offers numerous benefits. Air, a natural and no-cost substance, is available everywhere and is universal and sustainable. Air can replace traditional load-bearing components and offer temperature isolation, lightness, ease in shipping, and options for modularity by partial inflation. The benefits are the decreased use of building materials, reduced material waste, and easy re-use of facilities (Kronenburg, 2013).

6. Conclusions

Designing infrastructure for emergency situations is a multidisciplinary challenge that should involve researchers; scientists; professionals in the fields of design, material engineering, psychology, and emergency and military medicine; search and rescue (SAR) teams; and humanitarian organizations. Given the prospect of an increase in disaster situations, both natural and man-made, and city crowding, the need for building infrastructure and preparedness for emergencies is growing. Thus, innovative solutions and redesigns of facilities that allow them to adapt to the various humanitarian needs arising in emergency situations can be developed with the use of advanced and innovative methods and concepts. We believe that this approach will be sustainable and cost effective, will further serve as a beta site for innovation and enterprise, and will contribute to the resilience of society.
We believe that introducing graduate students with multidisciplinary backgrounds to issues of disaster preparedness will increase their awareness on how to incorporate physical infrastructures in their future projects.
Preparedness and the development of designs of infrastructures will increase individual and national resilience, improve the trust of the citizens in the municipality and enable people to successfully cope with potential traumatic events, thus leading to a physically and mentally healthy community.

Replicating the Unpredictable: Board Games as Prototypes for Wildfire Evacuations

Thomas Maiorana*[a]

[a]University of California, Davis
*tmaiorana@ucdavis.edu

Abstract | As the frequency and scale of wildfires grows it is critical that communities in fire prone areas are able to develop and implement effective evacuation procedures. Yet, despite the high degree of danger associated with wildfire evacuations, there are very few chances to explore these types of procedures in a way that are low-risk, iterative, and leverage local knowledge. Very little progress has been made on the way we might "prototype" evacuation events. This paper draws on an expanded notion of prototyping and demonstrates the ways a board game has been used to develop greater understanding of wildfire evacuation procedures. The game supports cross-disciplinary collaboration, insights from the community, and elevated an understanding of a highly complex scenario. The findings suggest a rich potential for the ways games can be used to quickly explore other complex systems with minimal risk in dramatically reduced timeframes.

KEYWORDS | PROTOTYPING, SYSTEMS DESIGN, DISASTER RESPONSE, COMMUNITY RESILIENCE, DESIGN THINKING

1. Introduction

As the increasingly severe impacts of climate change affect communities around the globe, evacuation events are becoming far more common[(1)]. Within this realm, escape from wildfires has proven to be particularly vexing for emergency personnel and community members. The complexity and scale of wildfire evacuations makes it very difficult to explore these types of events in an iterative and low-risk way. The result is that few future evacuees ever get a chance to experience how they might respond, communicate, and make decisions until they are in the midst of a life-threatening situation.

Our team addressed this challenge though the disciplinary lenses of design, public policy, and civil engineering. Our goal was to enhance effective decision-making by community members during wildfire evacuations. As the lead designer on the team, I was responsible for finding ways to prototype evacuation scenarios that would help our team surface knowledge from the local community, uncover nuanced information, and support the generation of new ideas and approaches by a group of diverse stakeholders.

Prior to this project, several members of our team had conducted research on the evacuation from the Camp Fire of 2018 that that resulted in the loss of 86 people in Paradise, California. Although that event had many factors that were unique, the need for safe evacuations is a consistent theme for all communities at risk of natural or human-caused disasters. Our team's goal was to increase the efficacy of evacuations so that communities in wildfire-prone areas could more resilient in the face of this increasing danger.

2. Project Overview

2.1 The Growing Threat of Wildfires

The frequency and size of wildfires in the last several years foreshadows the types of events that we can expect as the effects of human-caused climate change become more prevalent. The swift movement, scale, and unpredictable nature of these disasters make them particularly dangerous for the growing number of people who live in areas that are susceptible to this type of hazard (Radeloff et al, 2018). Wildfire evacuations are particularly challenging because, unlike more foreseeable evacuation triggers like sea level rise, flooding or hurricanes, wildfires arrive with little notice and they grow and change in dramatic and unpredictable ways. Few community members are trained how to act in the event of a wildfire and fewer still get to practice their responses in a low-risk environment. In these scenarios, an evacuee must mobilize quickly, react under pressure, and make decisions with incomplete, changing or conflicting information (Comfort et al, 2020). Given the stakes of this situation, our team has been seeking ways to empower communities to develop

strategies for resilience and communication to when they are affected by these massive events.

2.2 A Community at Risk

As part of this project, our team partnered with the community of Bolinas, California. This unincorporated coastal community of about 1500 people is situated in the beautiful natural setting of Marin County, to the northwest of San Francisco. Although Bolinas is technically not far from more populated areas, the fact that it is only accessible by Highway 1, a two lane road that clings to the dramatic coastline with countless switchbacks, gives the town a sense of seclusion. But the isolation that makes Bolinas an attractive place for its residents also presents challenges during the very likely event of an evacuation. The community is at risk of multiple natural threats. In addition to lying on top of the famous San Andreas Fault, much of Bolinas is in low-lying areas which make it vulnerable to sea level rise and tsunamis. Bolinas is also part of the Wildland-Urban Interface (WUI) which makes it particularly susceptible to wildfires.

While the geography and limited access make Bolinas it a fitting analog for other at-risk communities, Bolinas has a few unique challenges of its own. First, its small population means that it does not have the emergency resources that would be common for a larger municipality. Bolinas has just two full time firefighters so it relies on part time staff and volunteers to operate its two Engines and one Ladder truck. The community does have a "mutual aid" agreement with Marin County whereby any available firefighters would be sent to Bolinas in cases where the Bolinas Fire Fighters needs additional assistance. While this type of agreement may work for localized fires it puts Bolinas at particular risk in regional events when the Marin County firefighters will likely be addressing fires in their own community. [(2)]

Bolinas' geography, infrastructure, and governance means that it has an outsized threat and limited resources. In the event of a large scale wildfire, the community is unlikely to have the luxury of waiting for help from the outside. The only safe course of action will be to get out.

2.3 Evacuation as a Complex System

Evacuation is a deceptively simple term for a series of intersecting systems of communication, behaviors, artifacts, policies, as well as natural and unnatural phenomena. To design an effective evacuation procedure, one must view the system as a whole. Unfortunately, a systems lens often results in meeting complexity with complexity so that a "prototype" in the policy realm is a pilot program that may be years in the making (Kontschieder, 2018).

In the emergency preparedness realm, interventions usually manifest as awareness campaigns or yearly drills. Educational campaigns are relatively inexpensive way to share best practices, but they have few, if any, mechanisms to tap into the knowledge of the

community or learn from the uncertainty that will surely impact any live scenario.[3] Disaster response drills bring people together to create a more embodied experience of an emergency, but the logistics of these events is complex enough that they are usually only yearly events. While these efforts are beneficial, much more needs to be done to adequately prepare community members for these complex events that require rapid decision-making in stressful, high-risk scenarios. With the exception of military, law enforcement and emergency personnel, few people ever get the chance to "practice" how they would respond in these types of events.

2.4 Project Objective

Our goal was to enhance the ability of community members to make effective decisions during wildfire evacuation events. Our team recognized that our combined expertise not be fully sufficient. Any successful intervention would also rely on the specific, local knowledge of the community members. Our broader group of academics, emergency personnel and community members aligned with what Ezio Manzini describes as *expert* and *diffuse* designers (Manzini, 2015). In this sense, the author, in the role of the *expert designer*, sought to develop a prototype which would "feed and support" the community's ability to develop more effective evacuation procedures (Manzini, 2015).

3. Prototyping Complex Systems

In order to achieve this ambitious goal, our team needed to find a way to *quickly explore behaviors during a life-threatening event, with innumerable variables, in way that supports collaboration, idea generation, and understanding between a diverse group of stakeholders?* We did this by utilizing an expanded notion of prototyping that defines the practice as "any intervention that enhances our ability to learn about an aspect of a design challenge with limited risk, investment and time" (Maiorana, 2017). Traditional prototyping definitions which rely on notions of validation and progressive iterations are not possible because the system itself is in flux (Senge, 2006). Furthermore, systemic challenges defy "solving" in a traditional sense as noted by Horst and Rittel in their seminal work on "wicked problems" (Rittel and Webber, 1973). By shifting our understanding of a prototype from an early version of a solution to a tool for exploration, we are able to create more "cycles of learning" in a systems context than would be possible if we think of a prototype in a traditional way (Kelley and Kelley, 2013).

This new approach to prototyping can be summed up in two deceptively simple questions.

1. What do we need to learn?
2. What is the fastest way we can learn it?

The first question helps a team to be more efficient by narrowing the scope. The team only builds what is necessary to support the most critical learning objectives. This approach is

effective for bounded and unbounded design challenges and has been popularized by terms like *Minimum Viable Product* (MVP) from The Lean Start-up (Ries, 2011). A thoughtful answer to this first question requires a team to explore their "solution" in a way that acknowledges all of the potential ways it might fail, and then explore the weakest aspect first[(4)] (Ries, 2011). A team must be willing to take a critical look at their solution from a broad perspective and not simply set out to solve the challenges that fall within the team's core domains.

If the first question establishes the intention of the prototype, the second question is about using creative ways to explore the area of focus as quickly as possible. When addressing this question, a team must relax the typical conception of what constitutes a prototype. In doing so, they can open up new possibilities to uncover meaningful information in dramatically reduced timeframes (Maiorana, 2020).

Our grant proposal articulated the areas we needed to explore in order to develop a more effective approach to evacuations. Simply put, our team needed to more deeply understand how community members would respond in the event of a wildfire evacuation. Within that, we knew that the elements of ***communication***, ***transportation*** and their ***specific strategies*** (where to go and how to get there) would be most critical. With these objectives in mind, we then moved to the next question; What was the fastest way we could learn about the community members' communication, transportation, and strategies during a wildfire event?

Escaping from a wildfire places an evacuee in a situation with more pressure, risk, and ambiguity than they may have ever faced in their lives. As a result, gathering data about these experiences through surveys or interviews will only yield so much data (Beckman and Barry, 2007). Furthermore, many people have never lived through an evacuation so any information gathered purely hypothetical. In addition, while a survey would provide effective data for questions we understood, it wouldn't provide a space for new questions or community knowledge to emerge (Portigal, 2013). We needed a situation which would yield insights about how the community members would interact with the messy, stressful and ambiguous aspects of an evacuation without the associated risks. We did this by creating a board game.

4. Game as a Systems Prototype

A tactile game may seem to be an unlikely way to address something as complicated as a wildfire evacuation scenario, but the simplicity of the platform is actually quite well suited to prototype a system. Although the technology is modest, simple elements like cards and randomized spinners can bring a complex set of scenarios and behaviors to the forefront. The approachability of a board game supports a richer conversation by minimizing the power differentials that are implied by more elaborate offerings (Rettig, 1994). Finally, board games can be played in relatively short periods of time which results in greater learning in a more

compressed timeframe that would be possible with more full scale experiences like evacuation drills.(5)

4.1 Overview of the Game

The game is played around a large table with a 3' x 5' map of Bolinas at the center. There are several types of game pieces including cards, spinners, and tokens that represent fire, people, vehicles, and communication options. Players inhabit one of the three following roles:

- The Fire - *acts like a referee and is played by a single person*
- Emergency Personnel - *an amalgam of police and fire personnel and is played by the professional fire fighters or law enforcement.*
- Community Members - *The remainder of the players occupy this role*

Because the prototype is intended as a tool for learning, it is essential that the Emergency Personnel and Community Members respond as they believe they would in a given scenario. In this regard, the experience is far more akin to design ethnography than it is to a traditional "test" in which one might validate a proposed solution (Beckman and Barry, 2007).

Each type of player has a different motivation. The Emergency Personnel has the goal of getting as many Community Members to safety whereas the Community Members only need to worry about getting themselves and their loved ones. While the person playing The Fire cannot win, their role is critical in maintaining a sense of urgency and persistent threat.

Before we begin playing the facilitator verbally states the rules and goals of the game. The players are reminded that even though this is a game it is also a prototype and a research tool so it is important for them to "play themselves". The game starts by determining the specific time and day of event through the use of analog spinners (Figure 1). Players then place their game pieces on to map to show where they would be at that moment in time. They then select from two modes of communication and choose a "loved ones" tile which signals who they would bring with them. Once the starting locations are established, the location, size and direction of the fire is selected at random and the Emergency Personnel choose to either warn the public or address the fire. Community Members only get to move once the Emergency Personnel issue a communication through the alert system. The Community Members then choose a vehicle that they will use for their evacuation.

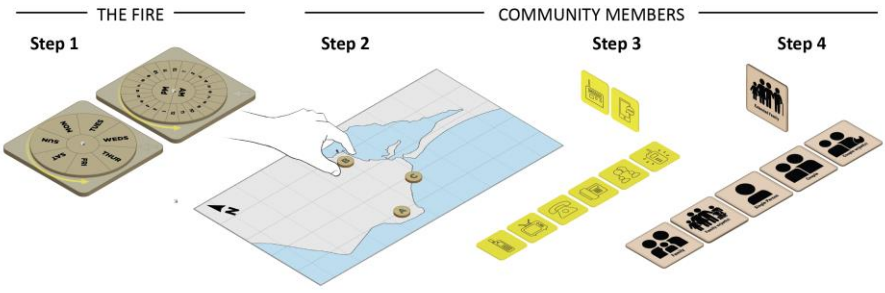

Figure 1. During the set up for the game, time and day of the week are selected using spinners. Step 2-4. Community members choose where they would be at the start of event, communication choices and their evacuation people.

4.2 Rounds of Play

Each round of play simulates roughly 15 minutes of actual time. The Fire always goes first, followed by the Emergency Personnel, and then the Community Members. The Fire uses a series of custom developed spinners to simulate the dynamic nature of wildfires. The Emergency Personnel always have two options. They can address the fire or issue warnings. During each round, the Community Members start by selecting a Chance Card. These cards may indicate a blocked route, flooding, lack of gas, or a favor from a neighbor. Community members may then choose to communicate with one of their selected methods or move.

Game play continues until the Community Members are have made it too safety or have been overtaken by the fire. The game typically lasts 45 minutes and is followed by a facilitated discussion.

4.3 Game Mechanics: Setting the Stage for Systems Learning

Although games are most associated with the general category of "fun", they are commonly used in service of more serious pursuits such as strategy, planning or education (Djaouti et al, 2011). For analog games, these various objectives are achieves through the design of physical components (game pieces) and the game mechanics, defined as "the various actions, behaviors and control mechanisms afforded to the player within a game context." (Hunicke et al, 2004).

For the purposes of our project, each of these elements had to be designed to help illuminate the ways community members approached transportation, communication and strategies during an evacuation. We needed both a concrete and an abstract understanding of how they might behave. The design of the game pieces supported our understanding of *what* they were doing while the game mechanics, or rules, helped tease out *how* they were likely to behave with all of the uncertainty and stress of an evacuation event.

The game board is as table-sized map which harkens back to the plotting tables used by WWII military strategists and illustrates the greater region with roads and a few geographical features (Figure 2). For the purposes of the game, additional elements were added to the map. A grid overlay is used to indicate fire locations and a series of “steps” correlate to road sizes and congestion. For example, each “step” on a curvy, single lane will be much smaller than a step on a 2 lane highway.

Figure 2. Game pieces on the map prompt the players to discuss the implications of the wildfire scenario during a round of play.

Each player gets their own set of custom-designed game pieces. The shapes were laser cut from mat board and finished with engraved icons or a customized set of stickers. Each player chooses from a set of tiles representing communication, transportation and “loved ones”. In addition, the players each received a small folding piece of paper with a communication icon. This is used to share messages (hand-written notes on a Post-it) without other players being able to benefit from the communication. The tactile feel of the game pieces were a critical part of making the game clear and fun, but the game pieces real function is to help bring the game mechanics to life.

Game mechanics bridge the gap between the simplicity of the game and the complexity of the system. These rules can be used to create a sense of anxiety, intrigue, delight, or any number of human emotions (Hunicke et al, 2004). For our project, each aspect of the game was designed with the specific purpose of foregrounding elements of the system that might not be visible with more traditional research methods.

We designed the game mechanics to concentrate the play around the issues that made wildfire evacuations so challenging. Specifically, we needed to make sure that the game

would put players in a situation that would force them to make quick decisions under stress with high degrees of uncertainty and potentially conflicting information (Table 1).

Table 1. Aspects of the evacuation experience were translated into game mechanics

Systemic element	Game Mechanics
Urgency	Limited Moves – Players can only communicate or move during each turn Players must make their move within 1 minute
Stress/Anxiety	Limits to the amount of steps a player can move per turn The rules insure the fire is ever present and moves quickly Chance Cards add difficulty to plans Traffic choke points are replicated through the "steps" overlay
Uncertainty/Changing Situations	Prior strategies may change due to the Chance Cards Chance Cards may introduce anything from new fires to power outages, road blockages or penalties based on vehicle choice The location of the Fire isn't always clear[6] Different players receive different communication based on prior choices

The set of Chance Cards were an essential piece of the game mechanics in that they created a way to introduce many possible variables without disrupting the rapid pace of the game. By forcing player to choose a Chance Card at the start of every turn, we were able to replicate the dramatic changes that can take place during a wildfire evacuation. Certain cards alter the dynamics of the fire, while others pose challenging decisions (such as whether to help a clueless tourist) which have impacts on the short term moves, but also act as provocations for the discussions after the game (Figure 3).

Figure 3. An example of the chance cards that are at the beginning of each turn. The chance cards introduce various forms of uncertainty that emerges in an evacuation scenario.

5. Going Beyond Learning

The game is a tool that enables rapid learning that would not be possible in the context of an actual evacuation. However, the game also plays an addition role in the community as an educational tool. Much the way one might learn from an experience of a real life evacuation, the game offers players a glimpse into a world without the associated risks.

We designed elements of the game to amplify this potential aspect of the prototype through our use of intrigue and unexpected elements. We leveraged the ways curiosity can support learning by prompting the players to choose not just between cars and SUV's, but also by presenting more unusual options like surfboards, bicycles or tractors (Gruber et al, 2014).

Some of the more quirky options generated interest, and often a few chuckles, but the wide range of possibilities also helped to create a sense of ownership from the players. After looking over the available transportation tiles, one player suggested we should include horses as well. This sort of idea generation demonstrates the benefits of collaborative design. Not only did it provide a useful suggestion for the next iteration, but it also prompted an additional conversation about the challenges of evacuating large animals. This type of impromptu discussion is exactly the type of unscripted behavior we hoped the prototype would spark. Occasionally this type of insight emerged during an informal discussion, in other instances we teased out these surprises during a more structured conversation.

The facilitated debrief creates a space where both the research team and the community members can develop a deeper understanding of the experience. Even the richest game will be a far cry from an actual evacuation so the debrief plays a critical role in helping the research team to inquire about interesting behavior that may have come up during the game. In doing so, the team can mitigate some of the risk that might come from trying to draw conclusions from a brief moment in a rapidly unfolding game. The post-game discussion also provides the players with a context that helps them reflect upon the experience and clarify what they took away from it (Dieleman and Huisingh, 2006).

Although this board game is a prototype with a serious purpose, that should not diminish the role that fun plays in the overall experience. By making the game something enjoyable, we increase the odds that people will want to play it again. Each experience of the game creates an opportunity for new insights to emerge and offers the players a way to develop more tools, strategies and approaches to wildfire scenarios. An additional benefit of repeated play is that it increases the likelihood that the players will develop relationships and ties that go beyond the game. Many cities are currently finding ways of bringing people together in order to nurture what is known as *bonding social capital* because it correlates with greater survival rates during disasters (Aldrich and Meyer, 2015; Hawkins and Mauer 2010). It is possible that by merely playing a game together, the community is developing a greater sense of resilience.

6. Conclusion

This paper highlights the ways that a new approach to prototyping can be used to explore complex systems with minimal risk and time. Due to the fact that this is an evolving research project, we have yet to produce concrete recommendations or potential policy interventions. Yet, even though we are still in the initial phases, our team and our community partners are confident enough in this approach to continue to expand the use of the game with a wider community. As of this writing, I am developing the third major iteration of the game which will be played with larger group in Bolinas during the winter of 2021. Our interdisciplinary research team is currently developing a version of this game for evacuation planning with one of the largest universities in California as well as several communities throughout the state. The initial findings suggest a rich potential for the ways board games can be used to quickly explore other complex systems in dramatically reduced timeframes.

Revised Function Analysis of Sustainability - understanding the complexity of sustainability.

Paul Topf Aguiar de Medeiros, Charlotte Sjödell

Lund University, Sweden
hello@pauldemedeiros.nl, charlotte.sjodell@design.lth.se

Abstract | This article presents and discusses the case study "Scraping the surface," a workshop about sustainable design held for master's students of different design majors at the FHNW Academy of Art and Design. Through marketing we, as consumers, are bombarded with products claiming to be sustainable. As a result, sustainability has become a buzz word. "Scraping the surface" highlighted the complex factors a designer needs to consider when designing sustainable products. During the workshop students discussed how a designer can have an impact on the lifecycle of a product or a system through material choice, production method, design for longevity, design for sustainable behaviour using the principles of behaviour change and design for the end of product use. Students were asked to bring a product that they found to be sustainable and to justify their reasoning using its characteristics. A list of criteria was compiled and converted into a function analysis. After the workshop a literature review was conducted to identify words and actions that could be added to make the list more holistic, focusing on ecology. To conclude, the proposed Revised Function Analysis of Sustainability can be used as a tool in the early design process to identify opportunities, specify deliverables and aid communication in development teams in terms of sustainability. The tool can also be used as a teaching and learning tool to provide a visual overview of possible traits that can be applied throughout the life cycle of an object. This can help to encourage upstream activities to prevent product renewal and avoid landing in the waste hierarchy. The template includes the potential benefits to the ecosystem and gives examples and further references. Consequently, the purpose of the tool is to be used as a creative tool rather than an assessment tool, specifying both desirable and undesirable outcomes.

KEYWORDS | DESIGN, SUSTAINABILITY, FUNCTION ANALYSIS, CREATIVE METHOD, SUSTAINABLE DEVELOPMENT GOALS

1. Introduction

Every year Institute FHNW Academy of Art and Design offers workshops for their Masterstudio design students. External partners are invited to host the workshops for students of all four specializations: integrative, fashion and industrial design as well as scenography and exhibition design. The Master workshops serve as the program's experimental production platform.

The workshop "Scraping the surface", that was given in the fall of 2019 included 35 students with 6 different nationalities with bachelor degrees from different institutes and subject specializations. The given theme of the workshop was sustainability. The goals of the workshop were for students to understand the complexity of ecological and social sustainability, learn about sustainable design methods and gain new insights that can be relevant to future projects. By building on students' prior knowledge and establishing a common vocabulary, students could discuss what can be done as a practicing designer to raise awareness of sustainability issues in the design industry and to avoid or minimize unintended impacts of one's work.

The approach of this workshop was not to give students instructions on what is or is not sustainable. Instead, discussions about complex issues served to point out how complex and interdependent matters of sustainability are. By encouraging critical conversations about the impacts of design decisions, students could realize that we are merely scraping the surface.

While this workshop was not centered around distinguishing what is or is not sustainability, some subsets, amongst many, have often been found as parts of the whole – Design for Ecology, Environment and Social. The plethora of opinions about this vocabulary have led to much confusion, debate and misinformation.

Aside from these discussions, the majority of the workshop time was spent on a project. The brief was to suggest a design aimed at changing a certain behavior. The focus of the workshop was primarily on the dilemmas associated with ecological and social sustainability and how (unconscious) behavior of users can be considered in the design process.

> "Within the field of sustainable product design the focus has been strongly on the supply side; how can impacts be lowered through design-for-disassembly, recyclability, use of environmentally conscious materials and dematerialisation. However, the way users interact with a product may strongly influence the environmental impact of a product. Designers can try to influence this behaviour through the products they design" (Wever, van Kuijk, Bok, 2008).

Nudge strategies (Rothman, 2013) were introduced in the beginning of the workshop to suggest ways to influence behavior and decision making of groups or individuals. Reinforcing an automatic and unconscious behavior through design could help consumers to operate in a more sustainable way. *Behavior change strategy cards* by Artefact group (Artefact) were also introduced and used as inspiration.

The most interesting result of the workshop was not the design proposals but rather the discussions around sustainability, inspiring the *Revised Function Analysis of Sustainability* presented in this paper.

2. Design and sustainability

2.1 A change in perspective

Over the past decades consumers have become increasingly critical towards corporations and the impact businesses have on the ecosystem and on society as a whole. In recent years the public has become better informed about pressing environmental matters. Most agree that we will face significant issues in the near future as the result of our current linear consumption-based economic system unless effective and radical changes are made. Scientists have long been aware of society's impact on the environment, but it took multiple years for a public debate on this matter to emerge.

In 1987 the World commission on Environment and Development issued a global manifesto commonly referred to as the Bruntland Report where the concept of sustainable development was introduced.

> "A sustainable development can be defined as a development that satisfies the needs of today without compromising the ability of future generations to meet their needs" (Bruntland, 1988).

Sustainability within design is not a new concept. In 1971 Victor Papanek released *Design for the Real World* (Papanek, 1971) and it has since become part of many design curriculums around the world. Yet in the 2000 edition of the *Getting an industrial design job* (Siegel, 2000) the word "sustainable*"* is not even mentioned. In the *Core Skills Assessment Worksheet* from 2000 we find "environ. impact" listed but not much more. In the 2008 version now called *Get a design job* (Siegel, 2008), you have only to read through the first pages to find the words "sustainability and green design." In the Core Skills Assessment Worksheet from 2008 you find "Uses empathy, informed judgment, reason", where as in the earlier edition the word "empathy" was not mentioned at all. This shows a change in attitude towards the designer's expected skillset. Design will inevitably have an impact on

the many challenges related to climate change, ecology, living patterns, transportation, digitalisation, urbanisation, alienation and an aging population.

2.2 Education on Design for Sustainability

In some design education curricula, it is obvious by course titles and literature lists how design for sustainability (DFS) is covered; in others, DFS is not universally standard in the design project process. Since the topics within the subject of design are increasing while the time for education remains the same, effectively covering all areas of sustainability within the curriculum is a challenge. Although design educations are already relatively successful at integrating aspects of sustainability into their curricula (Melles et al., 2010), significant improvements still need to be made to educate designers that are equipped to produce work suitable for a sustainable future during their careers. There is a need for DFS to become an integral part of all projects and not only the ones specifically dealing with sustainability as the main topic.

In *Preparing the way for mainstream sustainable product design- Methods and approaches to inspire change* Vicky Lofthouse discusses designer's capabilities in relation to Design for Ecology, a subset of DFS:

> "A survey by the Design Council in the UK identified that only 15% of design businesses feel they are very well-equipped to advise their clients on sustainable design issues (Design Council, 2010). This lack of confidence in their ability to address sustainable design issues has repercussions when it comes to developing appropriate briefs and challenging the client's constraints and assumptions. Having the confidence and ability to do this for a sustainability brief depends on the skills, abilities and knowledge of the designer and is formed by the designer's education, training and experience (Stevenson, 2013). If this knowledge has not been gained at university, there are few options available through ongoing professional development" (Lofthouse,2017).

It is unclear if students, teachers and design professionals are aware of the tools available to them. Much of the confusion results from Design for Environment, another subset of DFS, having many names - green design, eco-design, life-cycle design, clean design, etc. One major entity, the Ellen MacArthur Foundation, works with business, government and academia to build a framework for an economy that is restorative and regenerative through design. On their website there is a section called *Schools & colleges resources* with a generous offering of free workshop material as well as methods made by partners such as IDEO (Ellen MacArthur Foundation). Despite the convenience, a potential reasoning for relevant parties not being aware of these resources may be a result of the rapid expansion of the field of Design for Environment. Experts are producing valuable resources at a rate difficult to follow.

"There are many issues that determine the likelihood of designers to have the opportunity to engage in more responsible design (Stevenson et al., 2011) such as time challenges and a lack of demand from clients" (Lofthouse,2017). Lofthouse offers an opposing argument that a key barrier to engaging in responsible design is a lack of confidence because of a lack of education and practice amongst designers. This was supported by empirical evidence collected during a number of consultancy commissions. To lower the barrier, Lofthouse stresses the importance of introducing student designers to tools and methods while they are still in school.

> "The ability to confidently work with eco-design and sustainable design issues could be improved by using tools as part of brainstorm processes, where they can be a useful way of guiding the consideration of environmental and social issues across the product life cycle. By providing students with practical tools, they will be equipped with skills that are not widely held in current industrial design practice, increasing their value as graduates" (Lofthouse, 2017).

It is important that education addresses a range of approaches and alternative methods. Ideally students should be familiar with concepts addressing both life cycle thinking and systems thinking, being familiar with approaches such as: zero waste, design for circular economy and design for sustainable behavioural change.

2.3 Changing the system from within

The 2030 Agenda for Sustainable Development was adopted by all United Nations Member States in 2015. At the heart of this urgent call to action are 17 Sustainable Development Goals (SDGs). Both developing and developed member participation makes this a global partnership (United Nations). Working with visual communication, a mission to present the goals clearly and understandably makes a complex topic approachable. The SDGs are a helpful tool to give an overview of the complexity of sustainability by dividing it into individual, easier-to-digest topics. The goals can be helpful for designers in their practice, as well as for the public, creating a common framework to refer to.

SGDs Awards, launched by Kyushu University, challenge design students to develop concepts to transform society. In their competition statement we can read:

> "Society is increasingly raising its expectations for design. Problems targeted by the UN's Sustainable Development Goals, which include such concerns as hunger, poverty, and the issue of food, may seem irrelevant to design, but efforts to solve them through design are materializing all over the world. The role of design is moving beyond 'formative expression through color and shape' and is becoming a valid method to solve the issues faced by society" (Kyushu University).

This statement gives design students a more hopeful outlook on the role of the designer than the title of the book called *Design is the problem* (Shedroff, 2009). Shedroff recognises

that the role as a designer comes with a lot of responsibilities. He suggests, “Don’t do things today that make tomorrow worse” (Shedroff, 2009), which is a great suggestion, but in many ways stands in conflict with today’s businesses’ models and consumer behaviours. Many students struggle with the prospect of their future role as a professional designer and are disturbed by the fact that their future income likely will be dependent on making and selling more goods. History tells us that with the introduction of products made to solve problems, we also create, new unintended problems.

> “Despite how optimistic, idealistic, and future-oriented most designers are, design has sometimes created big problems in the world. Even where our best intentions have been engaged, our outcomes have often fallen short—sometimes making matters worse— because we didn’t see the whole picture when creating what we envisioned.” (Shedroff, 2009)

Entering the design industry at the time when great change is needed poses several challenges. Even though you possess both knowledge and ideas of what needs to be done, getting all stakeholders onboard will be difficult.

> “An observed side effect of this disconnect between theory and practice is that motivated students become disillusioned when they look for work in the area of sustainable design because they become aware of the limited options within the industry, where sustainable design practice is typically of minimal importance for most of the design industry” (Lofthouse, 2017).

Industry might be interested in sustainability but only when not competing with their bottom line. It is difficult to compete in price while producing locally in small batches compared to others who are producing in large batches overseas.

> “The measurements we must take to secure a just, equitable and inspiring transition away from fossil fuel, clash directly with the reigning economic orthodoxy at every level. Such a shift breaks all ideological rules, changing everything we think about economy” (Klein, 2014).

In his book *Design for the Real World: Human Ecology and Social Change*, Papanek (1971) suggests that as a designer you have the following options:

- Continue to design luxury items for a privileged few
- 10% of your time on solving problems of abject need, while continuing with their job
- Find new areas of opportunity solving social needs
- Teach or curate
- Drop out of design
- Change the system from within

If you are serious about working with SDG as a designer, you will soon realize that is currently not a very cushy field and sacrifices have to be made. Finding employment is challenging, work conditions might be difficult and salaries are low.

Changing the system is not an easy thing. Where should one start?

Johan Rockström, the founding director of the Stockholm Resilience Centre argues for the benefits with the SDGs as a common road map but reveals in his speech that scientists are concerned that the roadmap looks more like a "smorgasbord" from which you can pick a topic of interest. The integrated framework called "The Wedding Cake" focuses on the safe operating space, stating that there are some non-negotiable SDGs, namely nr. 6 on water, nr. 13 on climate, nr.14 on ocean and nr. 15 on biodiversity (Rockström, 2018).

While all the SDGs are of importance, goals 6, 13, 14 and 15 need to be considered in all design processes. In short, we need to priorities any damage to the biosphere. This includes a range of actions, sometimes in conflict with each other. How should we prioritize?

- Avoid global warming
- Avoid use of non-renewable resource
- Avoid pollution
- Avoid harm of diversity
- Avoid destruction of eco-services

It is important that designers both understand and have the capacity to communicate to others that design for sustainability is much more than considering recycling or using recycled materials. The SDGs can be used by designers to inspire socially and environmentally sustainable projects. This new hopeful perspective on the responsibilities of a designer is important to students and relevant to the challenges we face as a global society However, this outlook is not reflected in career opportunities nor entirely in students' education.

3. The Workshop

3.1 The initial assignment

Preparing a design workshop lasting 5 days that feels relevant to 35 students is a challenge. When the given topic is sustainability and the target group consist of people with very different backgrounds the tasks become even more complex. The risk is high that what is new to one individual is obvious to another.

To quickly get an overview of the students' knowledge a task was designed and communicated to the participants in advance of the workshop. Each person was asked to

identify an object that they thought was sustainable and bring it, or a picture of it, to the event. Sustainability was not defined and no one asked.

The students were divided into teams of 4-6, which were carefully considered in order to mix people's educational backgrounds and cultures. Once in their teams, students were asked to discuss their objects and explain how they related to sustainability. Subsequently students took the identified characteristics and turned them into single-word descriptors. They then created categories of their own choice and placed the words into these categories. Students were also asked to enter the words into "Answer garden", a digital tool which can show how often words are used. If a word appeared several times in the group discussions they were asked to put it in more than one time.

Figure 1. Answer garden word compilation

3.2 The assignment results

The result was interesting. Many of the students had German as their native language and struggled to get a correct translation of their characteristics. People constantly looked up definitions in their computers and discussed if the word suggested was accurate to what they actually meant.

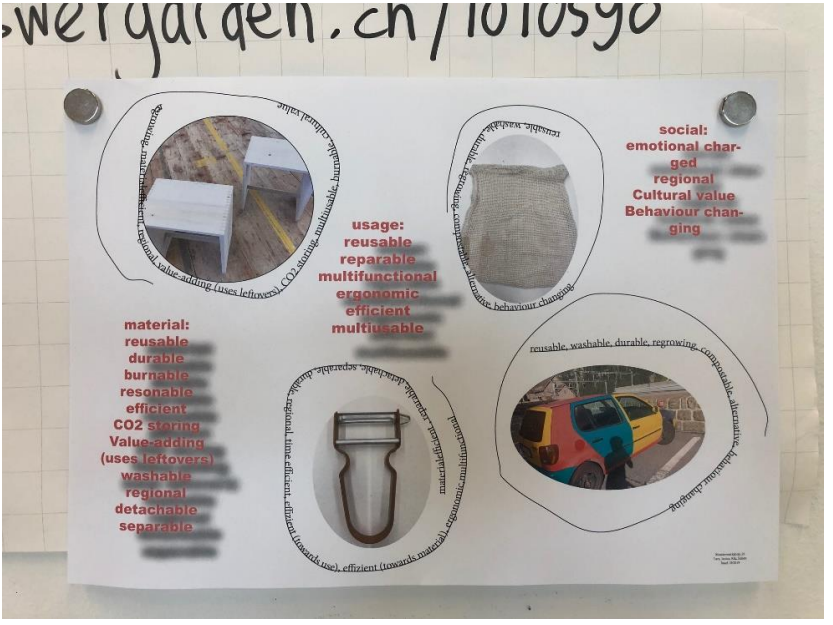

Figure 2a. Example of student work

Figure 2b. Example of student work

Some of the words, such as *wabi-sabi,* were not known to all of us. Many of the suggestions were easy to relate to, whilst for some suggestions the link to sustainability was not immediately obvious. Claims were often built on assumptions made on no or limited information about the origin of the product.

At the end of the session a list with a selection of words was compiled, showing the results of all groups.

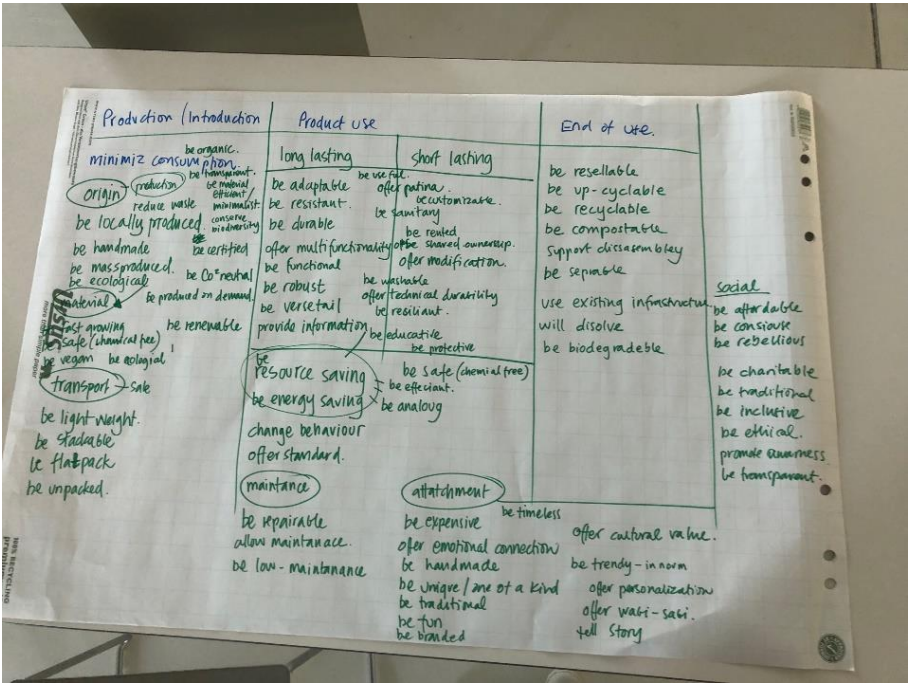

Figure 2c. Summary of words

The result showed similarities to a functional analysis, focusing on the expected performance of a product rather than on specific features of the product. The list was a reminder of the many ways in which a product could be considered sustainable, but it lacked an explanation and information to how the mentioned characteristic/function had an impact. Students were interested in the result and asked to receive a copy.

4. Methods for a more sustainable practice

There are many methods available to guide every step of the design process. Deriving from the field of engineering, Function Analysis is a rudimentary method often used by industrial and product designers, based on Function Structures as popularly described by Pahl et al. (2007) in their book *Engineering design, a systematic approach*. "There are many concepts and terms for describing what a device actually does. For example: function, behaviour, performance, property and purpose." (Lagerstedt, 2003).

In the classical functional analysis, the functions are described by a verb and a noun. This is a clever way to make the information short and quick to process.

Enable Writing
Discharge Ink
Refill Ink
Protect Nib

Figure 3. Function analysis example of a fountain pen

By analysing each function, the tool forces the creators to think through the aim of the product in an abstract way. Correctly performed, the functional analysis becomes the document that ensures, to both the creator and the client, that nothing has been forgotten and all relevant areas have been considered (Landqvist, 2001). The function analysis is a useful creative tool that can be used for development of new or existing products. It allows for a focus on function rather than focus on features of existing products, broadening our view in order to find more creative solutions. Each function can be classified in the categories: main function, necessary function, desired function and unnecessary function. Each category can then be given a descriptor such as basic functions, production, ergonomic, construction, marketing, etc.

The early phases of the design process are both exciting and challenging. In her thesis, *Functional and environmental factors in early stage of product development-Eco functional matrix*, Lagerstedt discusses the importance of this early stage.

> "When designing a completely new product, at the outset the knowledge of the new product is small but the freedom is almost total, as nothing is established. Information about the product increases as the product develops, but at the cost of design freedom. A basic dilemma is that sustainable design solutions often demand radical changes and 're-think' of product systems and therefore rely mainly on decisions early on in the product development process" (Lagerstedt 2003).

A risk with tools, methods, guidelines and checklists is that they can limit the creative process. Many of the current methods created to promote design for sustainability are

complex and do not correspond to the ways in which designers work in the early creative phase. For example, the Life Cycle Assessment (LCA) tool aims to give an accurate picture of the environmental impact of a product. This key instrument requires expertise and time-consuming, detailed calculations, which can make it cumbersome to creativity.

As product development teams are often made up of many individuals with different specialities there is a need for appropriate tools. These aids should be capable of being used cross-disciplinarily to help establish objectives and identify opportunities. To be useful, information must be kept simple and be limited. There is a need for tools that do not require advanced calculations, but rather can be used for brainstorming. The purpose of these needed tools is to identify potential areas of inquisition and gaps of fact-based knowledge to challenge preconceptions

Lofthouse explains in one of her papers (Lofthouse 2017):

> "Many of the tools that the students are introduced to provide a structure through which they can think about eco-design and sustainable design issues. By using them as a brainstorming tool, they can be a useful way of guiding the consideration of environmental and social issues across the product life cycle. Often they are also useful as a mechanism by which design teams can communicate proposed product improvements to a client or interested party. The ability to do this confidently is clearly missing in current design practice. "

Some sustainability tools include suggestions and information, but others aim to spark discussion. The Tarot Cards of Tech created by Artefact (Artefact) do not give any answers or solutions but merely encourage the user to think of the impact technology and products we design can have in the future, aiming to avoid unintended consequences.

Figure 4. The Tarot Cards of Tech created by Artefact (Artefact)

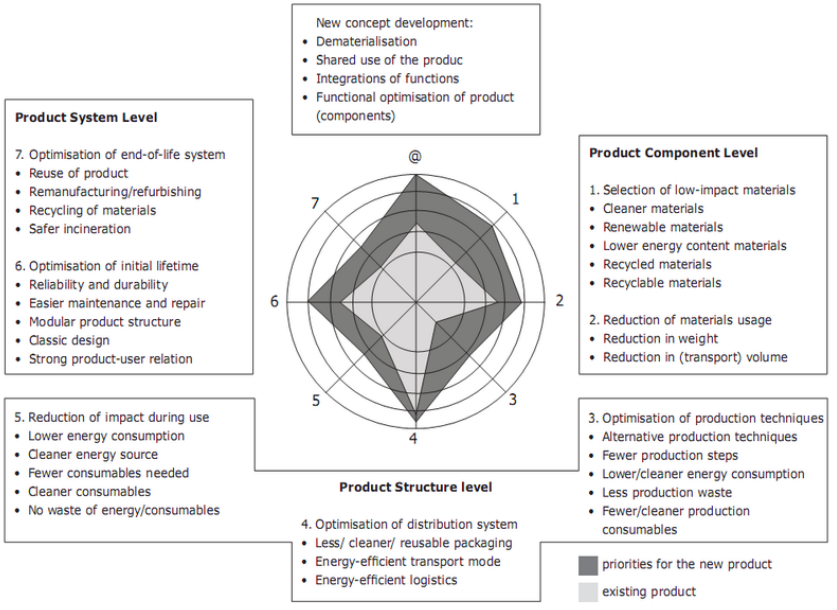

Figure 5. The EcoDesign Strategy Wheel (Brezet and van Hemel, 1997)

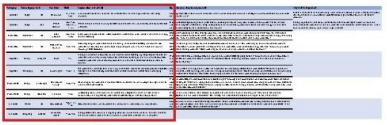
Other tools such as The EcoDesign Strategy Wheel (Brezet and van Hemel, 1997) look at impact in comparison to existing systems. The Eco Design checklist helps to ask relevant questions that can impact the different stages of the life cycle of a product.

Life cycle stage 5: Recovery and disposal
What problems arise in the recovery and disposal of the product?
How is the product currently disposed of?
Are components or materials being reused?
What components could be reused?
Can the components be reassembled without damage?
What materials are recyclable?
Are the materials identifiable?
Can they be detached quickly?

Are any incompatible inks, surface treatments or stickers used?
Are any hazardous components easily detachable?
Do problems occur while incinerating non-reusable product parts?

Table 1. Example of The Eco Design checklist (Brezet and van Hemel,1997)



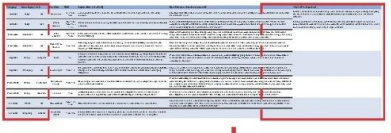
5. The Revised Function Analysis of Sustainability

After the workshop, the list of "sustainable" functions suggested by the students was put into a new format. Only the functions related to the SDGs 6, 13, 14, 15 (with focus on the environment) were added to the list. A verb was added to each function and they were sorted into the following categories: material, production, logistics and end of life. A column was added to better describe the environmental impact of each function. A literature study was done to identify more characteristics. One of the books used was *Products that Last-product design for circular business modells* (Bakker, den Hollander, van Hinte, Ziljstra, 2014).

The *Revised Function Analysis of Sustainability* presented below is inspired by the result of the exercise from the workshop and merges approaches used within existing methods. The list of functions is organised to reflect the product's life cycle. There is also a possibility to add questions and to fill in which SDG is being addressed.

Category	Subcategory/verb	Function	SDG	Explanation/What is it?	Question you should ask yourself	Why is this important
Material	Origin	Be	Renewable	6.4, 12.2, 15.2	How long does it take to renew the resources used? Are the resources received in healthy and resilient conditions? Are resources of the ecosystem taken?	Makes it necessary to renewable, using up the resources without leaving waste right to recycling plan. It might be hard to live with the potential of this to give rather to make use of bad resources.
Material	Origin	Use	Waste streams/ materials	6.3, 11.6, 12.5, 12.4, 14.1,	Is the material really coming from a waste stream, or taking the waste away from another country purpose? Is the use of a recycled or recycled waste stream really helpful, does it be important for product, or do the recycled energy and chemicals make it look costly to use (extraction) as a product?	Finding ways to add value to our waste streams as a circle edged product we does the amount of waste produced but the overproduction and of the waste streams can take a new / import look. If they were using a virgin material.
Production	Processes	Be	Water produced	7.3, 12.2, 12.5,	Does it take producing that then actually bring does the sustainable import product, or because it? How can it adapt the design to make it more sustainable waste produced during production? How can it adapt the design to make it more energy-saving production? How can it adapt the design to make it more toxic chemicals used during production?	
Production	Processes	Be	Production demand	12.2, 12.5	Producing only the products or parts that are needed, instead of filling warehouses with products and according to a prototype being shipped when demand drops, can lower a company's CO2 footprint.	Do I need to change the design to make it possible to produce on demand? Can producing on demand impact the product features in a negative way? Are the processes used for on-demand production in an even more energy saving way? How many inspired products are actually produced? Does producing on demand make the product unsustainable for users?
Logistics	Design	Integrate	Label	12.4	Making sure that the information on the label is not the last e.g. by integrating the label into the product mold, and/or making sure this information is easily perceivable for the consumer. Information about the product's size, weight, composition and durability should be possible to find in a few steps.	Who needs access to what information and how are they most beneficially going to find it? How can I ensure the information is available after the product's other material? What information is necessary to inform proper reuse and feasible repair and upcycling or recycling?
Logistics	Packaging	Be	Unpackaged	12.5, 14.1	Fit a product can be designed in a way it will travel and require packaging for travel or retailing, storage and before display, but with a low CO2 emissions. Added to the packaging, altogether.	How to we want and energy consumptive are involved in the packaging, relative to the product itself? Do the changes in the design to make waste or energy loss in the future making or packaging plans? Could the more beneficial to make the packaging sustainable, instead? Does the sustainable unpackaging increase the risk of the product being damaged or broken on?
Product Life	Design	Encourage	Evaluation/ change	12.6, 11.6	Depending on the product and context, different methods can be employed to nudge users to make sustainable choices.	What are potentially the most disruptive material changes? How big is the impact? Can be easier compared to the rest of the product's life cycle? Does the weighing the need for the consumers outside make people from using the product? How effective is the weighing during real usage? Does adding or weighing the item also energy usage or waste creation during production more than the benefits of the product's use?
Product Life	Design	Consider	The Whole	12.6	Anticipating future needs of the consumer that is technological advances and standards is important to make long-lasting products that sustainably be used for a long time.	What are the most material new or different or options the product can improve or do by this? Can it be more standard or technologies in the product should it? Can I design the product to adapt to the changes in the near future?
End of life	Waste	Be	Compostable	12.5, 14.1, 11.6	Biomaterials that can be composted can become the nutrients for new biomaterials.	How do I make sure the product is actually composted? Is the material compostable with existing infrastructure in all the places where the product/waste ends up? Can the material be non-compostable materials are added to the product owing to the? Is the use making and properties of the material sustainable?
End of life	Recycling	Indicate	Separation points	11.6, 12.5	Making it clear to a worker in a recycling plant how a product can be taken apart can increase the chance that the product's take apart and more of its materials can be recycled.	

Figure 6a. Examples from The *Revised Function Analysis of Sustainability*



Category	Subcategory	Verb	Function	SDG	Explanation (What is it)	Que

End of life	Recycling	Indicate	Separation points	11.6, 12.5	Making it clear to a worker in a recycling plant how a product can be taken apart can increase the chance that the product is taken apart and more of its materials can be recycled.	

Figure 6b. Examples from The *Revised Function Analysis of Sustainability*

Category	Subcategory	Verb	Question you should ask yourself
Material	Origin	Be	How long does it take to renew the resources used? Are the resources renewed in reality and what impact does the renewal of the resources have?
Material	Origin	Use	Is this material really coming from a waste stream, or taking the source away from another useful purpose? Is the use of a upcycled or recycled wastestream really helping to lower the impact of my product, or do the required energy and chemicals make it more costly to use a wastestream as a source?
Production	Processes	Be	Does mass-producing this item actually bring down the sustainable impact per product, or increase it? How can I (adapt the design to) minimise or eliminate waste produced during production? How can I (adapt the design to) minimise energy used during production? How can I (adapt the design to) minimise or eliminate toxic chemicals used during production?
Production	Processes	Be	Do I need to change the design to make it possible to produce on demand? Can producing on demand impact the product features/functions? Are the processes used for on-demand production more wasteful or energy intensive? How many surpluss products are actually produced? Does producing on demand make the product unavailable for some?
Logistics	Design	Integrate	Who needs access to what information and how are they most realistically going to find it? How can I ensure the information is available after the product is off the market? What information is necessary to inform proper use and to enable repair and upcycling or recycling?
Logistics	Packaging	Be	How much waste and energy consumption are involved in the packaging, relative to the product itself? Do the changes in the design increase waste or energy use more than leaving out packaging saves? Could it be more beneficial to make the packaging sustainable instead? Does the elimination of packaging increase the risk of the product being damaged or thrown out?
Product Life	Design	Encourage	What are potentially the most impactful behavioral changes? How big is the impact of this behavior compared to the rest of the product's lifecycle? Does the nudging limit users too much or even exclude some people from using the product? How effective is the nudging during real usage? Does adding a nudging function increase energy usage or waste creation during production more than the reduction of impact it effects?
Product Life	Design	Consider	What are the main reasons users dispose or replace this product, can I prevent or delay this? Can future standards or technologies make this product obsolete? Can I design the product to adapt to future changes in the user's needs?
End of life	Waste	Be	How do I make sure the product is actually composted? Is the material compostable with existing infrastructure in all the places where the product will be used? Can I be sure that no non-compostable materials are added to the product during its life? Is the sourcing and production of the material sustainable?
End of life	Recycling	Indicate	

Figure 6c. Examples from The *Revised Function Analysis of Sustainability*

Category	Subcategory	Verb		Why is this important
Material	Origin	Be	nd what impact does the renewal of	Unless a resource is renewable, using up the resource without having a watertight recycling plan is wasteful and harmful to the potential of future generations to make use of that resource.
Material	Origin	Use	useful purpose? Is the use of a e required energy and chemicals	Finding ways to add value to our waste streams is a double edged sword: we lower the amount of waste produced and the new products made out of the waste streams can have a lower impact than if they were using a virgin material.

Figure 6d. Examples from The *Revised Function Analysis of Sustainability*

Some of functions presented in the *Revised Function Analysis of Sustainability* are in conflict with each other, hence the list cannot be used as a checklist. Each function must be evaluated and potentially weighted based on importance.

The benefit with the *Revised Function Analysis of Sustainability* is that it builds on the function analysis, an already familiar tool for designers in their practice. The *Revised Function Analysis of Sustainability* can be used as inspiration and relevant functions can be directly extracted to create a project specification or, simply, to inspire and formulate completely new suggestions. This way one can take an already existing function analysis and add to it or conduct a brainstorm session focused on sustainability, depending on what suits the project best.

6. Conclusion

The *Revised Function Analysis of Sustainability* offer many potential uses. The tool can be used similarly to how it was used in the workshop: to facilitate a discussion and to create a compilation of the knowledge within a group. Instead of viewing the list as a static instructional tool, the structure of the list itself can be used as a creative or pedagogical tool by either compiling one's own list from scratch or adding new functions relevant to one's own work.

The tool can be used by designers in the early design phase to:

- aid conversation with stakeholders by offering a vocabulary to talk about ecological sustainability
- raise aware of factors that could have impact on the ecosystem
- get ideas of possible approaches to be considered in order to minimize negative impact
- give tangible examples of how products/systems have been designed to address a certain function
- save time in generating a functional analysis by offering options
- get agreement on a design brief by identifying which functions that are necessary, desired, etc. (without having to evaluate a concept.)
- ensure that all relevant areas have been considered
- explore potential directions for a product and question if a decision that, at first glance might seem positive, could have a net-negative impact
- to explore other areas of sustainability (i.e. gender, labour rights…)

The Revised Function Analysis of Sustainability needs practical validation, but design students who have reviewed it have expressed interest. Hopefully the tools can be used to improve existing products as well as to help identify new businesses that can build on a green approach. The value provided by this tool is perhaps not only financial, but rather focused on the mitigation and prevention of negative ecological and social impacts. Value in this case surpasses only financial consideration and adds value to saving the environment. We already have evidence that consumers are willing to pay more for ecologically

sustainable products and businesses need to see the efforts made towards design for sustainability not as a treat but as an opportunity.

Role of Social Ecologies within Social Design and Social Innovation

Neeta Verma*[a]

[a]Associate Professor, Visual Communication Design
University of Notre Dame
*nverma@nd.edu

Abstract | The paper examines how the understanding of social ecologies helps the design processes drive social innovation and systemic change, specifically in the area of social design. The paper defines the term social ecology as it relates to the design process and how it's understanding impacts problem framing. As with all systems (ecological, societal, or political) what surfaces to the top is not the problem but only an indication of the problem. Beneath this surface, there are several contributing factors that are referred to as "social ecology." For the designer, therefore, to be able to arrive at a solution that is sustainable, there needs to be the ability to recognize the factors that create the core socio-ecological environment. These societal contexts have made it imperative for designers to broaden their approach in gaining a deeper understanding of the social ecologies within which they operate in an effort to create sustainable impact. There exists a symbiotic convergence between the design process and social innovation, and it is within this convergence that this paper positions the crucial role that the understanding of social ecologies plays — one that is not only essential but critical.

KEYWORDS | SOCIAL DESIGN; SOCIAL ECOLOGY; SOCIAL INNOVATION; DESIGN PROCESS; PROBLEM FRAMING

1.Introduction

The paper examines how the understanding of social ecologies helps the design processes drive social innovation and systemic change, specifically within the area of social design. Social Design is an emerging area where design methodologies are used to address societal imbalances. Designers are increasingly transitioning from their traditional roles and expanding their footprint by addressing 'wicked problems' (Rittel & Webber, 1973) like poverty, urban renewal, digital divide, youth violence, and education through participatory and co-creative practices that instrument and render social innovation (Mulgan, et al., 2007). With the emergence of new areas of influence like complex systems, or environments for living, working, playing, and learning, (Buchanan, 1992) the role of the designer has expanded and evolved to embrace broader expectations. The emergence of the virtual realm in the 1990s created a paradigm shift and brought a sharp focus to the crucial role that users came to play in influencing design. In addition, designers increasingly started shifting their skills towards addressing systemic problems (wicked problems). The two factors together contributed heavily to this critical deflection. In a world that is rapidly becoming more global, economies are traversing several boundaries, cultures are converging and as a result, many socio-economic challenges are becoming a shared predicament that we as humans face today.

The challenges for the designer within this context become much steeper. This has made it imperative for designers to extend and broaden their approach in gaining a deeper understanding of the context within which they operate in an effort to create sustainable impact through design and social innovation. Within this new paradigm, in addition to serving as innovators, the role of designer transformed to incorporate additional roles: to that of being collaborators, facilitators, catalysts, and cocreators. Today, the designers, therefore, are not just designing products or communication vehicles for limited audiences but have broadened their realm of influence significantly to include the design for communities, societies, and cultures. This shift within design clearly illustrates a very intentioned move from addressing consumer-driven problems to more systemic ones. In this widening scope of influence, the singular role that designers have traditionally played has given way to more collaborative and participatory practices where instead of working *for* the designer works *with* and *within* a group of equally invested stakeholders. Given the extensive nature of problems being addressed, the aim is not only to share knowledge but also to share the decision-making power amongst all shareholders that have stakes in the defined issue (Del Gaudio, et al., 2016).

2.Defining Social Design

Social design, its definition, practice, and pedagogy still remain nascent. Due to a significantly increased preoccupation with social design within the design discipline more and more programs are offering it as an area of research and specialization. Given expanding

opportunities in practice, increasingly curricula are folding it within their design programs with much of the investment being dedicated to developing pedagogy to prepare future designers to help them confront the new challenges that wicked problems and systemic issues within a societal context pose. There are several descriptions used for this new emergent area. For the purposes of this paper, the term that will be used is Social Design. However, given the fact that it is still developing and there are various definitions that are being used contemporaneously to describe it, it might be important to review these interpretations to see not just how they work together to define an area as a whole but more importantly, help in understanding what might be a succinct definition that might emerge from this examination to create a clearer understanding of the area that we are using the term social design to mean.

In reviewing the literature, there are three approaches to defining the term that emerge, while some offer a direct definition, others imply social design by talking about its expanded need through the role of the design within societal contexts and lastly in the way it manifests itself through social innovation. The term design for social change has been used the longest (Koskinen & Hush, 2016). However, there are several other descriptions that the term social design concomitantly occurs with. Some of the early references begin with the questioning of the professional designer in how they have failed to look beyond their solutions and the need for a more expansive definition of design has been examined (Cross, 1972). Chick & Micklethwaite reference the major research project by Lauren Tan titled *Understanding the Different Roles of the Designer in Design for Social Good* (Tan, 2012) where she examines the design methodology of projects in the Design of the Times (Dott 07) Initiative. In her project, she describes the seven roles of the designer that helps create a better understanding of the paradigm shift in the definition of the designer's role. The roles described are designer as co-creator; designer as communicator; designer as strategist; designer as capacity builder; designer as entrepreneur; designer as a researcher; and designer as facilitator (Chick & Micklethwaite, 2011). Others have located social design with social entrepreneurship, social movement, social innovation, and design activism (Armstrong, et al., 2014). In regards to social design, the arguments and context set forth by both Victor Papanek (Papanek, 2000) and Victor Margolin arise out of similar arguments in defining the role of design and thereby the role of the designer in impacting change for the better. Papanek positions his argument for design as… the most powerful tool with which man shapes his tools and environments (and, by extension, society and himself). Rooted in the model followed within social work Victor Margolin and Sylvia Margolin (Margolin & Margolin, 2002), introduced the concept of "…design for populations in need rather than for the market alone…" and introduced the Agenda for Social Design. They question, "…what role can a designer play in a collaborative process of social intervention?"

However, increasingly now the term social design has largely been associated with social innovation. The European Commission defines social design as, "…used to describe particular approaches to social innovation. It is meant to empower people at local level to invent together solutions to economic and social problems. It contributes to offer new values to

guide public administrations' actions through collaborative working, experimentations, and prototyping." This definition combines several elements like "particular approaches" which may be read as methodologies; "invent together" which implies collaboration and therefore alludes to the idea of participatory practices and lastly "social problems" where it defines the new realm of problems that the designer today is confronted with. According to Andrew Shae, "Some call it design for the greater good. Others call it social design. Whatever you call it, it's clear that an altruistic impulse is on the rise in the design community" (Shea, 2012). In The Social Design Methods Menu, the definition offered is, "A practical learning journey taken by people including managers and entrepreneurs, to create useful, usable and meaningful ventures, services and products that combine resources efficiently and effectively, to work towards achieving desired outcomes and impacts on society in ways that are open to contestation and dialogue" (Kimbell & Julier, 2012).

Ezio Manzini repositions the role of design(er) within innovation, "… (social initiatives) emerge from the creative recombination of existing assets (from social capital to historical heritage, from traditional craftsmanship to accessible advanced technology), which aims to achieve socially recognized goals in a new way. This common trait also gives us a first definition of what social innovation is and why it appears" (Manzini, 2014). Another comprehensive definition of social innovation comes from the initiatives of the Young Foundation where Murry (Murry, et al., 2010) defines it as, "…new solutions (products, services, models, markets, processes, etc.) that simultaneously meet a social need (more effectively than existing solutions) and lead to new or improved capabilities and relationships and better use of assets and resources. In other words, social innovations are both good for society and enhance society's capacity to act." The interesting but critical difference that Manzini (Manzini, 2015) outlines are the differences between social design, social innovation, and design for social innovation.

All the attempts above demonstrate the need to redefine the role and impact of a designer and describe his/her contributions through social design or the resulting social innovation. Often the two terms are often used either in conjunction or as substitutes for one another, this paper argues that while social design is a methodology, social innovation is a goal for social design in that it instruments social innovation. Both social design and social innovation operate within very similar parameters of scope and influence, viz-à-viz design. However while social design addresses process of defining design interventions, social innovation shifts towards the impact that these interventions affect. The definition therefore that is proposed within this paper is that *social design is a design methodology used to facilitate and promote social innovation through collaborative and participatory practices to address societal imbalances*.

3.Understanding the term “social”

Within this paper, the use of the term *social* has significant import whether we use it as social design, social innovation, or social impact. The Oxford dictionary defines it as, “relating to society or its organization.” The key takeaway is that the use of the term ‘social’ is an acknowledgment that design in its considerations cannot address the individual alone but that it needs to do so within the context of the society and lies deeply embedded within inherent and interdependent social connections within a society. In looking at problems therefore while an individual can be at the center of design considerations, it can be argued that it the context within which the design considerations are being examined that are equally important because the problems exist within a larger complex ecology created by interrelationships between the stakeholders. It is this argument that leads to the importance of understanding the import of the concept of social ecologies within the area of design. As with all systems (ecological, societal, or political) what surfaces to the top is not the problem. These are mere symptoms and therefore serve only as an indication of the problem. Beneath this surface, there are several contributing factors that within this paper are referred to as *social ecology*. For the designer, therefore, to be able to arrive at a solution that is sustainable, there needs to be the ability to recognize the factors that create the core socio-ecological environment and the resulting interdependencies and interrelationships. Instrumenting social innovation, therefore, becomes dependent on the understanding of these social interdependencies and interrelationships.

4.Emergence of social ecology as a concept

Social ecology as a concept emerges from the discipline of ecology and while rooted within ecology social ecology as a term aspires to connect the concepts within biological systems and apply them to social systems.

The origins of the term ecology are attributed to Ernst Haeckel, a German biologist who in the mid-19th century defined ecology, as “the study of interactions among organisms and their environment.” What is focal here is the use of the word *interaction* because that, in turn, creates a system of interconnections that are being referred to here as ecology. The concept of ecology and the recognition of the interdependencies in the natural world was further elaborated by positioning it as “an entire science of the relations of the organism to the surrounding exterior world, to which relations we can count in the broader sense all the conditions of existence. These are partly of organic, partly of inorganic nature.” (Friederichs, 1958). Based on the seminal work of Haeckel, the idea of an interdependent system in how it defined the struggle for existence was further developed by Charles Darwin and Alfred Wallace whose theory expanded and introduced the concept of the struggle for existence and development of hierarchical systems and relationships defined by a need for survival that they defined as *natural selection*. This concept of natural selection was later reframed

by Herbert Spencer as *the survival of the fittest*. Its succinct and clear framing allowed it to be understood as a concept of progression within living beings.

This methodical and systematic research lay the clear groundwork for not only in the way we came to understand biological ecology but also in how that model came to be applied to be used in understanding the ecological systems within human communities. Originally coined by Ellen Swallow Richards in 1907, the idea of human ecology was further developed by Park and Burgess. (Park & Burgess, 1921) In a study located in Chicago, they demonstrated how the concept of biological ecological systems could be used and applied as a blueprint to explain the human struggle for survival (biological) in its fight for resources (economic). However, his approach was questioned by Milla Aïssa Alihan (Alihan, 1938) who argued that the work as being too narrowly tied to the biological model and that it ignored the cultural or social aspects of human ecologies and in her book she presented a broader framework of defining ecologies by introducing the term social ecologies.

It was Murray Bookchin, (Bookchin, 1996) who helped expand, define, and contextualize the term social ecology as distinct from the biological ecological models. An American social theorist and political philosopher, it was Bookchin who explained social ecology as, "The ecological principle of unity in diversity grades into a richly mediated social principle; hence my use of the term social ecology." As is evident, instead of just constraining himself to the relation of ecology to society he was looking at a more philosophical explanation for ecological balance in human societies. Stokols (Stokols, 2018) developed the idea to position it within the current context by defining it as a "transdisciplinary, overarching (or *metanalytic*) perspective for framing scientific and societal problems in relation to alternative spatial, temporal, sociocultural, and virtual *contexts*". He offered a framework within social ecology "as a dynamic analytical framework—a conceptual mapping system or problem framing device". With its roots in the work of Alihan and Bookchin, the term social ecology today is being expanded and is used concurrently by different disciplines as it pertains to defining interrelationships within their discipline. Hong, Crosby, and Lee (Hong, et al., 2017) use it in an attempt to understand criminal behaviors within the social-ecological framework. Here they are using the term social ecology to describe an "…overview of the factors associated with criminal behaviors within the social-ecological framework, which is conceptualized as an interaction between the behavior of an individual and his or her environments." Manzini positions it as favorable environments that serve as "enabling ecosystems" of cultural and social systems (Manzini, 2015).

It is clear that the hallmark of ecology is its encompassing and synthetic view of nature, as opposed to a fragmented view. It is the "relationships" and the "synthetic" aspects of that definition that the paper hopes to graft and transcribe to promote and position social ecology within the design discipline. What this paper hopes to extract from the ecological context is the interpretation of *the relationship between elements* (in this case all stakeholders) and how it can be used to instrument sustainable social innovation. Social

ecology within this context is being viewed in how social orders end up affecting the inter and intrarelationships within a societal context.

5.Role of social ecologies within design

Ideas of participatory design and co-creation are rooted in the recognition that increasingly designers are turning towards seeking effective, efficient and sustainable solutions to address major social problems and challenges. (Phills, et al., 2008) In this process oftentimes, given the complexities of the problems being addressed, it becomes necessary for designers to work in larger groups that involve multiple multi-disciplinary stakeholders. Stakeholders are defined as participants in a process where an issue being addressed affects each and every one of the participants. (Dille & Söderlund, 2011) This paper posits that social ecologies provide a framework for understanding the structure of relationships and the forces that help define and direct these relationships between these large groups of stakeholders. An understanding of the social ecology gives an understanding of the inherent relationships between stakeholders. This clarity in understanding therefore can lead to design interventions that are well rooted within the specific problem being addressed increasing the chance for sustainable solutions that can be defined as social innovation.

6.How social ecologies drive social innovation

If designers are to use social ecologies as a framework for engaging in participatory and co-creative practices it might be useful at this point to understand what distinguishes biological ecology from social ecology. Biological ecologies are by far uniform across the planet. The relationship between species remain consistent regardless of the geographical region we are examining. By that argument, biological ecologies are therefore also predictable. Social ecologies in contrast are deeply fragile and are often predicated and determined by deeply held cultural norms/beliefs, the precarious political temperament, and pre-existing social factors and mindsets. This inherent predisposition of complex relationships is something that the designer needs to carefully analyze in order to make sure that the process of participation and co-creation are informed by and framed within this understanding. Fundamentally rooted in the awareness of the complicated web of intersectionalities, the challenge for the designer is to understand and acknowledge the kind of relationships that pre-exist within stakeholders. The mapping of social ecology, therefore, helps mitigate some of the fragility that systemic issues pose for designers by giving them a tool to develop a deeper understanding and insights into the systemic issue being addressed. However, the biggest impact the understanding of the social ecology creates is that it gives designers/stakeholders a deep insight into the intricacies of the problem allowing them to recognize the deep-rooted details in the interrelationships by helping them identify the points of deepest impact.

Lidicker quotes from Edward Haskell's paper titled, *A Clarification of Social Science*, where Haskell states that "All theories of world importance, theories which affect world policies, are basically co-action theories." Lidicker (Lidicker, 1979) takes that social model and reframes it so that it applies both to the biomic and the social models by categorizing interactions into two groups, intra-action, and co-action. In borrowing that idea and bringing it into design, intra-actions can be seen as relationships between larger stakeholders and their sub-entities. and co-action on the other hand can be used to define the relationship between one stakeholder group and another.

The paper posits that for the designers to be able to navigate the complexities of the systemic problem they need to understand the nature of interactions that produce the resulting interrelationships. These interactions can be divided into four categories that characterize the following relationships — competitive (resulting interaction is a double negative), predatory (resulting interaction is a negative/zero), commensalistic (resulting interaction is a positive/zero), or mutual (resulting interaction is a positive/positive).

This gives us the ability to use these interactions as a tool in mapping any systemic problem. Given below are the five steps:

- examining the symptoms/causes:
  the first step is to gather what is surfacing to the top
- mapping the symptoms/causes and connecting them to stakeholders: every cause emerges from a stakeholder
- determining the stakeholders: the previous step then allows for the identification of the stakeholders that become major players/participants/co-creators
- identifying the nature of interactions between stakeholders to see if relationships are competitive, predatory, commensalistic, or mutual: this is by far the most crucial of all stages of design and this is where the understanding of social ecologies helps understand the interrelationships that exist. Because the understanding helps identify root causes for the designer
- defining the intervention: having a clear idea of what a problem looks like at its most basic and fundamental level allows the designer to clearly recognize the intersectionalities of the relationships among the stakeholders

Design interventions, therefore, could be constructed in several ways. Relationships that are the weakest (predatory) provide maximum opportunity for instrumenting design interventions that can be targeted to help mitigate, modify, or change the fundamental quality of interaction. From an unfavorable outcome, the aim of design would be to push that relationship towards a more favorable outcome for the interaction. However, from the standpoint of design, one can also look at strengthening some of the existing relationships. So commensalistic or mutualistic relationships could be reinforced but in uniquely re-positioned ways pushing them towards different outcomes. If social innovation is defined as the *creative recombination of existing assets* the hope is that this paper gives designers/stakeholders the ability to use the understanding of social ecologies as a tool to

frame their problems and approach it so that they are able to drive social innovation through their design interventions.

7.Discussion

For the designer, the more systemic the problem, the greater are the scales of complexities that determine its social ecology. If designers are going to expand their footprint by increasingly addressing more systemic problems, they will need to find the tools to cope with the complexities of scale that systemic problems have inbuilt within them. Although borrowed from the social sciences, the paper locates the concept of social ecologies within the design process and positions its understanding as a tool to demonstrate how it can help designers/stakeholders identify areas of strengths and weaknesses within the problem. Above all, it helps position design interventions to succeed in instrumenting social innovation that is both propitious and sustainable.

Slow Engagement & Widening the Frame – Emerging Models of Social Innovation and Design Culture

Diana Nicholas AIA, NCIDQ, LEED GA [a]*

[a] Drexel University, Department of Architecture, Design & Urbanism
*dsn35@drexel.edu

Abstract | Design can be seen as a subtle process of creativity, but often it also requires different modes of leadership, and thought that are deployed to solve complex problems (Kolko, 2010). As such, the field of social interest design, and the related practice of socially responsive design, offer direct opportunities for outcomes that create change in people's lives, and generate tools and knowledge for other designers to guide their journey (Anderson, 2014). Within the emergent nature of working and co-designing with communities, socially responsive design allows designers to shift their roles, and accept the shared knowledge of the stakeholders, while social interest design has a much more fixed role for the designer (Anderson, 2014). The design research group, Integral Living Research has been working as both social interest and socially responsive designers, for the past eight years with a variety of community partners to create new solutions to ease the stress of underserved urban communities. This research group uses design research and "insightful deep design thinking" a term coined by the author to assist with housing stress through five lenses: access to green space, access to fresh food, expanding privacy, expanding security, and enhancing self-efficacy all through spatial interventions or tools in the urban environment. While these solutions are often met with enthusiasm; implementation is frequently trickier, riskier and takes a longer engagement. "Widening the frame" for designers involves an adaptive and complex process of examining sustainable solutions and capacity as a part of the design engagement process a new kind of problem definition phase. It also requires what the author calls "slow engagement" wherein the designer allows their role to respond to context over extended periods to construct successful collaboration. Within this emerging ontology of design praxis and research; the Integral Living Research Lab deploys a novel complex process to help relieve the housing crisis from the inside. This approach is, in part, drawn from current social science literature on complex adaptive leadership theory in which leaders work within such complex systems in an emergent manner to adapt to the needs of an organization or team (Uhl-Bien et al., 2007). Placing

Complexity Leadership Theory (Uhl-Bien et al., 2007) and Adaptive Leadership (Heifetz, Linsky, et al., 2009), as a way forward for design groups; this paper examines the Integral Living Research Lab approach as a process case study to position such leadership theory in analog to the generative and adaptive nature of socially responsive design and social interest design . In examining the attendant experience-based process of this group, a new culture of design leadership is emerging that is responsive to communities in need while giving them unique voice within the design process.

KEYWORDS | DESIGN RESEARCH, HOUSING, SOCIALLY RESPONSIVE DESIGN, SOCIAL INTEREST DESIGN, LEADERSHIP THEORY

1. Introduction

The Integral Living Research group has collaborated with those providing housing services, and related care, to co-develop human-centered designs for the shared spaces in emergency and transitional housing, and substandard rowhomes (Nicholas & Anandan, 2017, 2016; Nicholas et al., 2017, 2019, 2017, 2020; Nicholas, Stein, Nguyen, Krespan, et al., 2018; Nicholas, Stein, Thanh Nguyen, & Michael, 2018; Nicholas & Michael, 2017). Solutions developed by this group include examining the linkages in home repair data for clients to provide wrap around care; examining privacy and stress related solutions in shelters; introducing fresh food and green space into the urban home; helping families with creative co-housing; and convening community around co-design processes for their own spaces. Previously the group also produced design-build gardens for the active seniors aging in place; and a mobile autism assessment unit to help mitigate the stress and stigma associated with autism diagnosis. Through these projects, the group has determined the need for a widened frame in the problem definition phase, one in which designers and their community stakeholders allocate energy to understanding the capacity for true implemented change. Specific projects by this lab have been documented elsewhere, and the goal of this paper is to use the lab's community leadership as a case study to draw conclusions in light of leadership theory models that are emerging. As stated above, the work primarily engages with a variety of third sector organizations, and such organizations that often have a heavy compliance burden related to their funding. Thus, the problem at the root of this paper is the limited capacity for these social support organizations to engage in sustained implementation of new or novel ideas that might ultimately benefit their clients.

In design problem-solving the basic process of discovery, inspiration and implementation anchor the path to solutions (Cross, 1999; Design Council, 2020; Frayling, 1994; Hambeukers, 2019; IDEO, 2011). Problem definition is a distinct process that underpins the work at early stages (Design Council, 2020). Many of the urban problems that society currently faces are

entangled with larger societal issues, and common design modes have limited efficacy in the face of such intermingled issues. Data-driven disciplines such as epidemiology now have much knowledge and expertise that can also inform a necessary adjustment in the design process towards a more evidence-based approach. Complex teams, and thinking, must now also be deployed to accomplish long term outcomes and change. Designers are pragmatically oriented, and outcomes are an integral part of the conventional work and process of a designer. As such, the field of social interest design, and the related field of socially responsive design, offer direct opportunities for outcomes that create change in people's lives, and may create tools and knowledge for other designers to guide their journey over time (Anderson, 2014).

2. Developing Design Leadership Theory

Design leaders are often judged in terms of business success; however, one goal of this paper is to advocate for another type of design leader, one with civic change in mind and the processes to create such change. Currently our societies in America, and beyond, face a housing crisis that is based in issues of access. This crisis is both complex and evasive to typical single silver bullet solutions. Such problems require that those involved bring diverse points of view and professions to bear at many points in a complex system that includes public services and facilities at many points. Buchanan, and others, defined a wicked problem as one that needs intensive collaboration, and out of the ordinary thinking to create positive change (Buchanan, 1992, p. p.15; Crowley & Head, 2017; W. J. Rittel & M. Webber, 1973). The housing crisis is just such a problem. The Complexity Leadership Theory (CLT) literature repeatedly discusses the need for adaptive leadership and adaptive space to operate within these types of complex environments (Uhl-Bien et al., 2007). Uhl-bien in particular provides multiple descriptions of both complexity and the fear that leaders often experience in dealing with complexity and change (Uhl-Bien et al., 2007; Uhl-Bien & Marion, 2009). Both social interest design and socially responsive design demand that we come to the table without preconceived notions of the problems we will need to help solve.

The American social system does not serve these in-need populations in a comprehensive manner, especially at the metropolitan level. Thus, regional governments must look to "informal coalitions, alliances, and networks that weave together nongovernmental actors with existing units of government in metropolitan areas (Adams, 2014, p. 1)." Such networks are the developing third sector in America, between private and public (Adams, 2014). Many of the types and scope of challenges that a third sector organization deals with, are related to capacity, nonprofit capacity is defined by Christensen and Gazley as follows: "the processes, practices, and people that the organization has at its disposal that enable it to produce, perform, or deploy resources to achieve its mission (Christensen & Gazley, 2008, p. 266)." Capacity is directly linked to an organization's aptitude for reaching goals, satisfying a mission and satisfying mandates (Christensen & Gazley, 2008).

2.1 Social Interest Design:

In the Integral Living Research work with community and community care providers, the term that is most often used for the initial work with stakeholders is social interest design. Integral Living Research has worked with shelters, behavioral foundations, local developers, and urban residents. Here, social interest design is a type of design practice in which community engagement is central to leading designers through the process of solving a problem (Anderson, 2014). Social interest design has evolved from the developing connection between public service and design, and social interest design has also been defined as pragmatic design processes and projects that benefit those who might not normally get the services of a designer (Anderson, 2014). Integral Living Research approaches the social interest work of housing insecurity through working in shelters to improve the environment and working with communities to improve substandard housing conditions. Habitat for humanity has long been involved in social interest grassroots design through their shared housing production process in which families themselves contribute to the building process (Habitat for Humanity, 2020). Much of the Integral Living Research Lab work, to date, was undertaken with nonprofit partners to assess and help solve physical or service-oriented issues. The Integral Living Research Group seeks every opportunity to be more effective when partnering with those in the third sector. In this work, socially responsive design and social impact design are clearly limited by the capacity of third sector partners who bear heavy compliance burdens (Gargan, 1981).

2.2 Slow Engagement

The author has coined here the term “slow engagement” to refer to the long-term collaboration, shared goals, and processes that have emerged over time with partners. For the Integral Living Research group, “slow engagement” is deemed necessary for solutions to be implemented in space, place, and behavior. This type of engagement requires the design team to contribute to their partners’ processes in ways that might be helpful outside of the frame of the project area, and to create space in which the partners are leading the process. Examples might include leveraging team expertise to advise on seed grants, supplying additional expertise and materials for larger funding opportunities, serving as advisor to nonprofit partners on their forays into social design, running community workshops that contribute to the organizational culture within the partner organization, and looking for opportunities to cede control to community member and stakeholders. Central to slow engagement is the ability to recognize that stakeholders’ and community members’ lived experience within the issues we are trying to solve are a form of expertise (Nicholas et. al, , 2019). These activities over time, can build both capacity and trust between community members and the researchers, but more importantly they give the research group the ability to witness the full process they are trying to assist with.

Several of the community partnerships in this group have been in existence for the better part of a decade and require leadership skills that differ at many stages. Literature on third

sector capacity has also emerged as an important resource to understand the partner roadblocks in the socially responsive processes engaged in here. The need for adaptive practices, and a commitment to the uncomfortable uncertainty this brings, has echoes in a truly socially responsive practice. Next this paper will examine capacity, and how it limits innovation, as a bridge to understanding how capacity relates to the work of social interest designers, struggling to implement with their third sector partners.

3. Capacity, Design and Complexity

As stated earlier, design is often a process that leads to a tangible outcome. This need to create something in the world is the key frame of reference that many designers are trained to operate within. Often, designers come to the table when a perceived improvement is needed by a "client". Social impact design and socially responsive design both require that designers attempt to check their preconceptions at the door.

3.1 Organizational Capacity

In defining organizational capacity, there is a consensus that the ability of an organization to complete work or meet its mission is a part of the defining characteristic of this term (Yu-Lee, 2002). Yu-Lee also defines the most granular aspects of organizational capacity as: "Entities" that include "space, labour, equipment, technology and materials" (Yu-Lee, 2002, p. 28). Despite such a well-defined schema of what makes up capacity however, the level of investment in capacitive "entities" does not alone reflect the true operational capacity of an organization (Yu-Lee, 2002). It is due to this inability to directly measure capacity that it is often defined differently, and with some confusion, by various organizations and industries. Such confusion is especially true in terms of how it might drive the abilities of organizations to work effectively (Gargan, 1981). The Integral Living Research group has anecdotally observed that in the current American housing environment, many organizations that serve these at-risk populations must use considerable capacity to maintain their compliance and funding. Many of the collaborations with designers seeking to improve the situation for stakeholders, are limited by the allocation of staff, counselors, and resources to the vital compliance arena that these organizations operate within.

3.2 Socially Responsive Design – in response to complexity:

Uhl Bien wrote extensively on the current complexity driven era, and how that has changed the face of organizational management (Uhl-Bien & Arena, 2018; Uhl-Bien & Marion, 2009). Social interest design is similarly influenced in that groups are emerging who choose to focus on solving specific pieces of the challenges faced by urban or rural stakeholders. In addition, there is a movement to a design problem solving process in which designers are a constituent in the process and not only the facilitators (Thorpe & Gamman, 2011). Referred to as socially responsive design, this participatory-oriented work is the natural next

version of social interest design in which designers create team co-design processes that draw on the expertise of community, care providers, and all stakeholders to drive the process of innovation forward (Sanders & Stappers, 2013). There are many groups that are coming to prominence for their socially responsive topic-driven work. These include: Design Resources for Homelessness that has created a repository of empirical research and tools for designers to design for the homeless (Jill Pable, 2019); Creative Reaction Lab's equity centered co-design model (Creative Reaction Lab, 2020), and Design for Social Interest and Sustainability, a network of centers and groups that focus on equity and socially sustainable models (Young Foundation, 2020).

The Integral Living Group often leads groups both as facilitators and conveners; the group seeks to cede creative voice to community, whenever possible. Giving over control gives the work a shared authorship, and a responsive nature. The main components of the process that the Integral Living group has developed as a socially responsive design practice are centered on the core concepts of *learning, creative, positional, and contextual orientations* as follows:

- Learning: iterative data gathering, iterative question making, engaging with community leadership; here community lived experience is treated as a form of expertise
- Creative: iterative ideation and synthesis, conversation making, problem validation with community leaders
- Positional: frequently checking bias, frequently checking transaction, frequently checking approach; here community lived experience is treated as a form of expertise
- Contextual: Slow engagement, engaging over time, showing up in the community, expertise from all quarters, reflection and compartmentalizing, confidential approaches

In order to put this work into a leadership theory context it is necessary to next examine the concept of complexity leadership, and briefly discuss the concepts that are most relevant to the practice of Socially Responsive Design.

3.3 Complexity Leadership Theory

Complexity Leadership Theory (CLT) (Uhl-Bien et al., 2007, p. 299) is drawn from complexity science. It is, a model for leadership that enables a flexible, creative, and learning oriented approach to leading and is oriented to what are called Complex Adaptive Systems (CAS) (Uhl-Bien et al., 2007, p. 299). Complexity Leadership Theory (CLT) was developed in part, in response to the struggle of many organizations to understand the changes in workforce, production and management required by the knowledge driven 21st century (Uhl-Bien et al., 2007). Unlike other models of leadership theory, complexity leadership does not call on leaders to control specific situations; however the goal is to create the correct environments for innovation (Uhl-Bien & Marion, 2009). CLT is a way of describing, studying and

understanding how leaders can adaptively control and grow innovation, while still being efficient in their business practices (Uhl-Bien & Arena, 2017, p. 11).

The CLT system is composed of two "lobes" that have distinct tensions; the entrepreneurial and the administrative (Uhl-Bien & Arena, 2017, p. 11). The "Administrative Lobe" is all of the functions that run an organization efficiently, they include top down administrative and productive functions (Uhl-Bien & Arena, 2017, p. 12). The "Entrepreneurial Lobe" consists of the practices that are flexible, dynamic, top down and will encourage innovation (Uhl-Bien & Arena, 2017, p. 12). The tensions inherent in this framework are at the very root of what limits many organizations to establish a continued environment for innovation (Uhl-Bien & Arena, 2017). Figure 1 below is adapted from Uhl-Bien and Arena's diagram "Theoretical perspectives on organizational adaptability. Dynamic Capabilities Transformation Process" (Uhl-Bien & Arena, 2018). The diagram shows the tensions arising between the two lobes, as a way of creating an "Adaptive Space" between ordered administrative space and the less predictable entrepreneurial space.

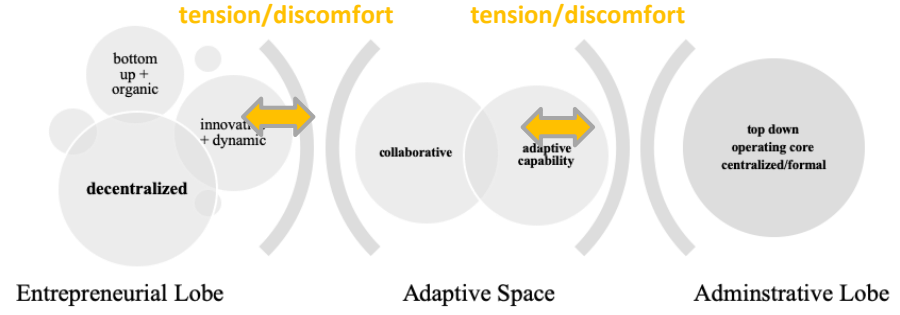

Figure 1: Adapted from Uhl-Bien and Arena's diagram "Theoretical perspectives on organizational adaptability. Dynamic Capabilities Transformation Process" (Uhl-Bien & Arena, 2018) Image Credit: Author

The Complex Adaptive System (CAS) emerges from the adaptive practices that work to connect these two lobes, and innovation arises from the tensions between them (Uhl-Bien & Arena, 2018). This model requires that leaders act to support and create spaces in which unexpected and uncontrolled aspects of their work can create novel situations and innovative moves (Uhl-Bien & Arena, 2017). "Emergence" as outlined by Uhl-Bien and her team, relates to the self-organizing nature of CAS and CLT and the creation of a space of discomfort for many leaders (Uhl-Bien & Arena, 2017). The true goal of a leader in this space is to enable the type of environment in which adaption leads to success, deploying the abilities and knowledge of every part of teams to solve complex problems (Uhl-Bien & Arena, 2017). In fact, in an interview with the Oxford review, from 2018, Uhl-Bien maintains, in support of the academic literature her team has produced, that many organizations unwittingly stamp out the very environments that are necessary for emergence, and

innovative practice. This is primarily due to their reliance on the administrative lobe, and their discomfort with and inability to recognize the value of, these tensions (David Wilkinson, 2018). In summary, CLT holds within it the concept of adaptive practice and spaces that are an important component of our process with community. These practices clearly require leaders to act creatively and with an open mindset (David Wilkinson, 2018). The similarities between the conceptual framework of CLT and Social Interest Design are striking and will be examined further below. Of particular interest is the tension between creative (or entrepreneurial) processes and administrative processes, as this tension has been found to limit the work of our group. Capacity in particular limits the social impact work done by our group and aligns with the administrative core functions of our partners.

4. Adaptive Leadership Design and Complexity Leadership

To better understand how leadership in design and this type of social interest work might build further capacity, here we examine how Adaptive Leadership (Heifetz, Linsky, et al., 2009) and Complexity Leadership (Uhl-Bien et al., 2007, p. 266) might be a more influential part of the design process to expand the frame within these engagements for both third sector partners and the designers who are trying to serve them. The ultimately, we hope to uncover the parts of these models that have the most in common with Socially Responsive Design.

4.1 Adaptive Leadership and Socially Responsive Design: a critical complexity lens

Adaptive leadership is an important component of a complexity driven approach (Uhl-Bien et al., 2007). Within the complexity driven approach, we have ambidexterity, activating triggers, and ideation, as core processes that push towards change for leaders (Uhl-Bien & Arena, 2018). In thinking critically about both CLT and AL, mapping these frameworks across the Integral Living Group's core processes began to take on a currency as a critical step to examine possibilities in these frameworks for design leadership with our group and other similarly oriented labs. The social design process consists of many rounds of iteration and ideation, driven by information, feedback and reflection to synthesize diverse inputs into the problem-solving process. As stated above, many designers come to a problem after it is already somewhat defined, however in socially responsive design it is important to maintain a "beginner's mindset" pre-supposing the nature of the problem limits our abilities to solve the problem (Cross, 2011). In addition, in the Integral Living Research group the process of engaging with constituencies in order to create a shared culture is part of the work vis a vis the original concept of slow engagement mentioned above and reviewed in Figure 2.

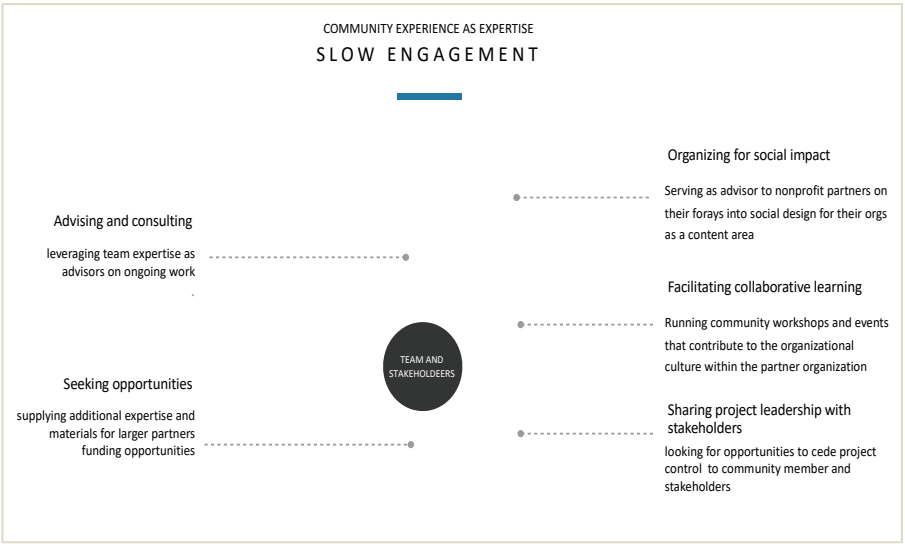

Figure 2: The core of the Integral Living Research group's process of Slow Engagement. Image Credit: Author

Undertaken in concert with stakeholders, the group is able to give input at many parts of the process, and at times will lead the process through community preceptors, and our processes of slow engagement. In past work, our group has uncovered a framework in which we examine how community lived experience is a form of expertise and should be treated as such (Nicholas, et. al., 2019).

The mapping of the socially responsive design process onto Uhl-bien's theoretical framework, gives us the opportunity to orient the process towards community more directly and ask the question, will CLT be a useful lens to the socially responsive design process? If we organize the socially responsive design process according to the lobes of CLT we learned about our ability to create adaptive space within our design processes. Through further examination of the slow engagement process we found that it aligns within the CLT concept of ambidexterity, defined above as the ability of leaders in this process to create and sustain a place in their process where ambiguity and a control create opportunities for unexpected success. Figures 3 reviews and maps our core processes according to the administrative, entrepreneurial, and adaptive lobes.

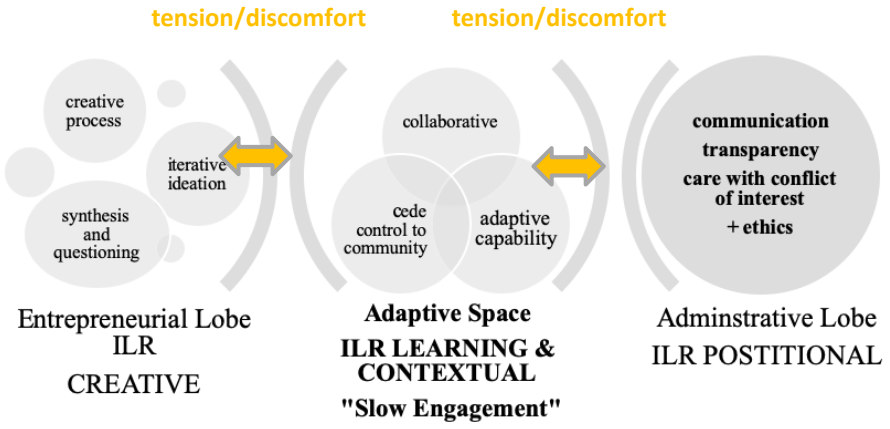

Figure 3: Adapted from Uhl-Bien and Arena's diagram "Theoretical perspectives on organizational adaptability. Dynamic Capabilities Transformation Process" (Uhl-Bien & Arena, 2018). Mapping the core process the Integral Living Research (ILR) Socially Responsive Practice within the CLT model. Our adaptive space is driven by community interaction. Image Credit: Author

Through aligning the Complexity model Uhl bien and Arena's "Lobes", it becomes apparent that the Integral Living Research work aligns with the adaptive space through the process of slow engagement. The following falls into the entrepreneurial "lobe": Ideations, iteration, learning, open mind-sets and creative thinking. The administrative "lobe" aligns with: engaging respectfully, managing conflicts of interest, transparency with clients, showing up, planning ahead, and communicating effectively. Most interestingly, the adaptive space of this model consists of our ability to cede control to the client and the community, often our goal is to reach a point where stakeholders are driving the control of the processes, and we are learning from them, as a way to help them create meaningful change. If the design team is able to be a participant and lead through creating an adaptive space for stakeholders, we will truly uncover the needs and functional limitations of those we work with including their functional capacity issues.

Adaptive leadership (AL) functions as a core orientation for many leaders, consciously and unconsciously, it can easily be mapped to the social interest problem solving method that was laid out it the earlier part of this paper. Using the underlying process employed by Heifetz to examine, diagnose and take action in relationship to a problem (Heifetz, Grashow, et al., 2009), the goals of the group were aligned in the quadrants below. In contrast to the CLT approach, Heifetz sees adaptive leadership as a process versus a set of capabilities; it is not a defined set of capabilities but rather an orientation towards problem solving (Heifetz, Grashow, et al., 2009). This orientation towards a process of problem solving in AL gives it a

natural affinity to design processes as varied as design thinking and design research, each of which are predicated on studying the problem to understand what the issues are before diving into solutions. Figure 4 below identifies the proper quadrant of the AL model in relationship to the socially responsive design process that we deploy.

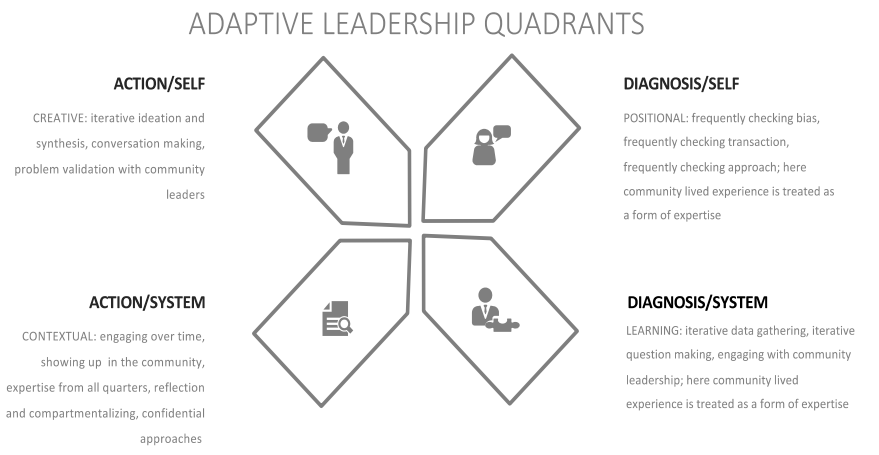

Figure 4. Diagram showing how the Integral Living Research Process maps onto the Adaptive Diagnosis and action quadrants—Adapted from Heifetz, R. A., Grashow, A., & Linsky, M. (2009). The practice of adaptive leadership: Tools and tactics for changing your organization and the world. Boston, Mass.: Harvard Business Press.

The contextual nature of AL specifically orients well with design processes which by their nature are inherently contextual. Figure 4, above, maps the core socially responsive design processes of *Learning, Contextual, Positional, and Creative* within the diagnosis and action quadrants in the AL model. Of particular interest here are the ways one might consider systemic diagnosis and context in the design process. The critical question here remains one of clarity and action, could approaching a socially responsive process with the adaptive and complexity-oriented lens give designers in complex socially responsible arenas a more successful approach? Will it help us focus further on the needs of those we work with? If we are able to deploy consciously as adaptive leaders, could we sit at the table with our constituents earlier before problems are defined? Opinions formed? Directions decided? These frameworks over time will re-organize the socially responsive design approach, through a novel re-orienting and reflecting on the process in relationship to context and community and affords an opportunity for further study.

In adapting the socially responsive design process in this way, the goal is to re-orient the work around our partners so that we become true allies in solution seeking with them as

stated in our definition of slow engagement. The critical point here is to slip into the idea that leadership is both a process and a capability that can be shared.

5. Conclusions

"Requisite complexity" refers to the nature of complex adaptive systems to evolve complexly in the face of new environmental conditions (Uhl-Bien et al., 2007), and this concept takes on special meaning when considering the complexity of the current, and future, housing crises. A cursory study of design leadership literature has revealed that the field is wide open in terms of formal theory. Many designers consider formal design leadership to be comprised of leading a design firm to be profitable or managing multinational teams. While this is definitely the leadership that drives the design industry, especially in America, the conception of design leadership as a type of stewardship to move our creative fields in a more ethically responsible and equitable direction, has not been examined at length in relationship to the formal leadership theories offered by social science-oriented leadership fields. These theories offer an opportunity for new ways to look at leadership in the field of design, beyond profit or business success. The goal of this paper has been to give voice to such formal leadership theories within the practice of socially responsive design, and at the same time examine those theories as possible vehicles for change in design process. This is a beneficial lens as socially responsive design is a truly complex process, and Complexity Leadership Theory holds much that can augment those that practice it. In return, Complexity Leadership Theory deploys some concepts that may draw on design processes – perhaps design can lend itself to leadership theorizing in the future.
The process space of the housing lab Integral Living Research has served as an ongoing test bed to examine leadership, design leadership and possible future directions of practice. The value of social equity leadership in the arena of housing inequities cannot be overlooked. Further study within the social impact and socially responsive practices that are emerging to solve our most complexes of problems is of course, necessary.

This paper has found that the subtle process of slow engagement, defined for the first time here, is aligned with the parts of complexity leadership and adaptive leadership that are most necessary for successful change, and the hope is that this work will strengthen such social equity leadership efforts in the future, and lead to further study on Design Leadership Theories.

Abstract | This paper - after an overview of the sector's issues - aims to present Smart Safe and Green System, a working prototype for small and medium-sized buildings and industrial warehouses. It is an integrated and scalable green technological system, aimed at the energy adaptation of pre-existing façades, at the improvement of ambient air quality, at the aesthetic redesign of urban spaces, at the structural and thermal monitoring of buildings. What we intend to propose in this paper is an economically accessible and easy to implement project, which represents the synergy between methods, processes and tools of Design discipline and the most advanced research in the field of Smart Products, IoT and plant-based technologies, for the promotion of a Do-It-Yourself approach as well as a Transition Design as a guide for a resilience-based social change aimed at a more sustainable future.

1. Introduction

As recalled by ISPRA (Istituto Superiore per la Ricerca e la Protezione Ambientale) and Rapporto del Sistema Nazionale per la Protezione dell'Ambiente (SNPA), for several decades our continent has been facing the unavoidable issue of sustainability, which any project proposal and resource management depends on necessarily (SNPA, 2019). In the building and energy field, the common goal is to reduce building organisms to "zero energy" - or even transform them into POA, "Positive Energy Architectures" (Tucci & Monticelli, 2018) - by 2020 and also to reduce to zero the consumption of new land by 2050. In practical terms, therefore, the feasible strategies will be directed towards a more responsible use of materials and sustainable building technologies, together with an adaptation of the existing buildings through a redevelopment and conversion of disused structures and unused land (Finocchiaro & Di Leginio, 2019). The theme of redevelopment of buildings is therefore the core of this project, in fact the research focuses on the recovery of the existing and energy improvement, through the study of hypotheses of application on various types of construction in order to cover a larger percentage of cases. There are two main areas of interest to which the project is addressed: on the one hand the housing area, and on the other disused industrial areas. In the case of housing, the main problems of adaptation are in the energy field, as most old buildings do not have (or are strongly lacking) any criteria in terms of sustainability and energy saving, as they are characterized by traditional technological systems, now obsolete, or because they are the result of design errors. In the case of industrial areas, these are abandoned buildings: according to the WWF's Report "Re-use Italy 2013", from a functional point of view, out of 575 reports no less than 131 relate to buildings that have had industrial use in the past (Ombuen, 2013), which could find new life through an adaptation of technological systems and a use reconversion. More in detail in this paper, an overview of the themes that frame the design proposal will be followed by a description of the prototype structured in three sections, one for each part of the project.

2. Plant-Based Technologies for energy adaptation

The preliminary analysis phase of the research was based on the investigation of construction techniques more widely used or experimental, effective for the buildings' adaptation, focusing interest on those "hybrid" systems consisting of the integration of the building with vegetation, or the so-called "green façades" - or VGS, Vertical Greenery Systems (Radić et al., 2019), winning in terms of effectiveness on both the building and urban scale. The design of the green façade is not only an excellent remedy to the problems of overheating of poorly insulated and energy-wasting buildings, but also a proposal for the aesthetic redevelopment of anonymous, poorly maintained and crumbling façades in urban or industrial areas where the presence of designed greenery is particularly scarce (Tatano, 2008). The presence of vegetation in urban areas is nowadays a fundamental reflection

theme regarding the adaptation of cities to the important climate changes in progress, which must be faced with effective and intelligent systems. The design of green surfaces (both horizontal and vertical) is in fact relevant in the abatement of the so-called "heat islands" inside urban centres, in the thermal absorption, in the production of oxygen and in the purification from pollutants, which plants are responsible for, through physiological mechanisms such as chlorophyll photosynthesis, phototropism, evapotranspiration (Bellomo, 2009).
The state of the art analysis has made it possible to identify, first of all, the distinction of two main categories of green façades, which are on the one hand green covering - or green façades - and on the other hand vegetated walls - or living walls (Bit, 2012). These two systems differ in their technological characteristics and used components: green covering is a relatively simple technological system, which provides for the application of vegetation on any envelope, as it is not integrated with the structure, but rather supported or detached; while the vegetated wall is a type of façade integrated with the envelope and equipped with an organization, and therefore a more complex realization with functions of support and nourishment for the vegetation (Patrick Blanc's patent of "mur vegetal", in Blanc, 2008).
As far as the realization of the supports is concerned, it varies according to the envelope on which they are assembled. They can be divided into rigid or stretched support structures: in the first case the elements are parts of the structure, or lattice panels, as well as elements modules-moulded and assembled in different configurations, while in the second case they are tensioned cables, meshes and nets, mostly made of steel or fibre-reinforced synthetic materials (Bellini & Daglio, 2009).
In parallel, the variety of plant species most commonly used was examined, each with its own characteristics of growth, appearance and exposure. The green cladding, compared to the vegetated façade, allows a greater versatility of configuration at a much lower cost and maintenance, while maintaining a very high level of energy efficiency, including a good result with respect to the solar radiation shielding, a good success in the control of heat and energy flows, in the management of noise pollution, as well as in the protection of the envelope from atmospheric agents, in some cases up to excellent results that see significant energy savings (Flores Larsen et al., 2014).

3. DIY approach and Transition Design for smart resilience

"The art of resilience" (Bohigas & Montlleó, 2018, p. 28) is a complex operation that requires interventions of radical change, of redesign not only on a large scale, but also of precise green oriented interventions, focused on the small scale. Since the objective of the research is the application of a sustainable system for the redevelopment of existing buildings, case studies and technological systems that respond to the category of green coatings have been analysed more specifically for their flexibility of use, adaptation to the pre-existing and

energy efficiency. As argued by Calzolari: "In recent decades the concept of resilience to be developed at different scales has emerged: from the product, to the building organism, to the city". (Calzolari et al., 2018, p.191) and consequently the need to act with modular and scalable systems, applicable according to different configurations, depending on the structure to be upgraded.
From an economic point of view, most of the green cladding systems currently on the market, despite being less expensive and easier to manage than vertical gardens, are still subject of specialized companies that offer different products at different price ranges. Smart Safe and Green project is based on the desire to fill the gap between the ordinary user and the highest forms of technological sophistication, particularly in the field of energy adaptation of building structures. It represents an intervention hypothesis designed ad hoc by a multidisciplinary team, characterized by a high degree of flexibility, adaptability and simplicity of implementation that directly involves the end user in the installation and operation of the technology.
The inclusive and participatory approach reflects emerging trends in the field of Transition Design, a "design-led approach for addressing complex, wicked problems and catalysing societal transitions toward more sustainable futures" (Irwin, 2018, p. 19). Transition Design argues that the unsuccessful problems solution results from a wrong involvement of stakeholders in the processes, because social and environmental problems that people face today are too complex. The Do-It-Yourself approach of this kind of design is core in the process of individual user empowerment and action, in the will to face very complex problems and systems such as climate change and energy adaptation of buildings. The involvement of users within the process is considered as a "more democratic design process" and "closer to the user" (Atkinson, 2006, p.1), not identifying it as the opposite of professional designers' activity (the most amateur form of bricolage), but as an opportunity to "express a greater aesthetic individuality not bound by the constraints of mass production" and to avoid "passive consumption" (Atkinson, 2006, p.1).
Professional-user interaction, in a process of Transition Design, is identified as a potential, not a deterrent, within the design process of renewal and transformation. As claimed by Sangiorgi, in fact, "the key ingredient for transformative practices is the understanding of citizens as agents and their active role in the creation of well-being" (Sangiorgi, 2010, p. 4). Objective of the transformative approach of these processes is the definition of the most effective tools and methods for the realization of what is called Lifestyle or Lebensstil, explained by Smith as a "kaleidoscope of transformations realized and imagined, a complex collage of activities, values, visions, roles and skills" (Smith, 2014, p. 5).

4. Smart, Safe and Green project

The proposed experimentation is a prototype of a technological system applicable in a rather wide range, in particular in the energy adaptation of pre-existing façades, in the

improvement of the air quality of indoor and outdoor environments and in the aesthetic redesign of urban spaces, as well as in the structural and thermal monitoring of buildings. First of all, the research has been carried out according to a desk mode, oriented to the collection and analysis of case studies, both from a technological and botanical point of view: some examples of realization (both green coverings and vegetated walls) have been examined and analysed according to different parameters to verify their effectiveness in terms of microclimatic control functions (both in summer and winter), depending on the used configurations, materials and species. Each case study was analysed in the form of a sheet, taking into consideration the geographical location and exposure, structure, construction details, used species, in order to identify compatible and efficient solutions. After the preliminary desk research phase in the field of green systems, we moved on to the development of the prototype project, analysing what emerged from the comparison between different technologies and the collection of case studies: Smart, Safe and Green consists of a light support system to be fixed dry on the skin of existing buildings, aimed both at housing purifying plants and at positioning a data collection system using sensors, with the aim of improving the energy performance of buildings, structural monitoring and air quality improvement. In order to fulfil these functions, the project involved the construction of a prototype set out in three parts: a façade system, a roof system and a series of specially developed markers accompanied by special monitoring software. The third function of the system differs from the first two because it is not part of the green theme of energy adaptation, to focus on the equally important one of the structural health of the buildings, thanks to a monitoring system (Fig.1).

Figure 1. Left: assembled prototype of the steel mesh screen, with Tillandsia plants leaning against it. On the right, detail of the position of the plant on the prototype.

In the project, both for the façade system and the structural one, the same screen/structure is used both to support the vegetation, to be affixed to façades to be redeveloped, and to monitor their stability and deformations related to external actions through intelligent technological systems. The creation of grid systems with a modular configuration would make it possible to adapt the cladding to the pre-existing envelope, also referring to the presence of openings for lighting and natural transpiration, using suitably designed uprights and knots.

4.1 Façade system: one green screen, many benefits

The green system for the façade consists of a kit of stainless-steel stretched cables - with cheap accessories and fastening elements - configured as a frame and put together at a distance from the wall to ensure adequate ventilation behind it, on which plant species are housed. For the greening of the support, the research experimentation proposal foresees the use of the Tillandsia Usneoides species also known as "Spanish moss" or "Moses' beard". Belonging to the Bromeliads species, it is native to Central America which prefers therefore very humid and warm climates. The main characteristic of Tillandsia is the absence of underground roots: in fact, it looks like a tangle of long leaves with aery roots, which feed on the air's humidity that they absorb through special structures placed on the epidermis (trichomes) that open when the plant needs to hydrate and close under a certain threshold of humidity to prevent the evaporation of what has accumulated (Kuaanan et al., 2014). Another very important peculiarity of this species is its function as a detector and purifier of pollutants and fine dust (polycyclic aromatic hydrocarbons). A team of researchers at the University of Hidalgo (Mexico) claims that Tillandsia Usneoides is "one of the most widely used organisms for the biomonitoring of atmospheric metals due to its ability to accumulate and retain pollutants" (Martínez-Reséndiz et al., 2015, p. 262). In addition to the phyto-purifying action, the advantages of Tillandsia are different: the skin's trichomes of this plant have the dual function of shielding the sun's rays and facilitating the water reception by ensuring a reduction of solar radiation on the façades; this species can live in direct sunlight, therefore preferring a south-east orientation and can withstand the winter cold up to several degrees below zero; it does not require maintenance because of its rather slow and regular growth.
Although from the technical point of view, therefore, the façade-prototype falls into the category of stretched systems, it lends itself to further customization: the steel rope mesh can also be combined with prototype segments made with the proprietary patent of the Med Marine s.r.l. company, made of composite fibres, which allow the insertion of plant pots (and therefore the possibility to choose crop species other than Tillandsia Usneoides), drip irrigation or hydroponic systems and humidity sensors.
It should be remembered that, for the prototype, it was decided to prefer an executive project that, not anchored directly to the building walls, but fastened to protruding elements

of the roof (in this specific case wooden beams) would allow a greater detachment of the frame from the external perimeter surface. In fact, being able to detach the frame 30-50 cm from the subfloor, allows to maximize the advantages of the shading effect of the frame itself, as it guarantees a back ventilation. In this way, the heat generated by any uncovered parts can be taken away, as well as the moisture generated by any irrigation, residual moisture from rainfall, condensation from low temperatures at night, or simply moisture and escape from the interior of the building through the perimeter wall. In the case of adherent plants, this humidity may not dry out, resulting in the formation of mould and biological patina.

In addition, in the components' executive design, an attempt was made to standardise the lengths of the eyelets in order to simplify assembly as much as possible: therefore, the presence of the difference in height was managed through the cable tension system itself, consisting of a lamellar wooden beam, anchored to the floor of the courtyard with threaded rods (Fig.2). The use of threaded rods drowned in the floor allows, in combination with anti-slip nuts, to adjust the height of the wooden beam from the ground and therefore the tension of the steel ropes. Being able to easily manage the length variations of several eyelets with a single adjustment (the beam system), is an important simplification of maintenance activities.

Figure 2. Left: detail of the anchoring system of stretched cables to the ground through a wooden beam; right, detail of the steel mesh knots.

4.2 Roof system: green indoor comfort

Referring to the roof, the project foresees a micro-ventilated horizontal greening system, consisting of a main element, a container tray in composite material (derived from fibres processing), also made with proprietary technology developed during the project, which through assembly and fixing components is easily anchored to the main types of roofing envisaged (tiles, corrugated sheets, shaped panels), together with accessories with windproof function to prevent it from tipping over. The production technology developed has made it possible to customize the tray's shape, making its use possible on any type of cover, without the need for adaptation. In order to meet the specific requirements of energy regulations and economic evaluations two issues have emerged: on the one hand, the need to switch from longitudinal profiles to a continuous coating package and, on the other, the replacement of the Tillandsia plant species (used in the façade system), which is excessively expensive for the entire roofing surface, with different species which, not being epiphytic, adapt perfectly to a pre-cultivated soil substrate (Fig.3).

Figure 3. Left: installation of the trays on the roof for the experimentation phase; right, detail of the installation of the cultivation layer

The crop selection aimed at the use of species capable of withstanding both summer heat, with periods of reduced water supply or drought, and resistance to winter temperatures. In particular, has been organized three zones, with three different species: a zoysia matrella

meadow (macroterma species), a zoysia tenuifolia meadow (macroterma species) and a sedum miscellany meadow (belonging to the crassulacee).
Using rockwool layers put between the trays and the meadow, and applying techniques typical hydroponics techniques, it is possible to obtain both the insulating effect and the substrate effect to house the plant component to be developed within the system. The wool mat, although flexible, maintains its shape and does not fill the central gutter: in this way the excess water flows and flows into the gutter (Fig. 4).

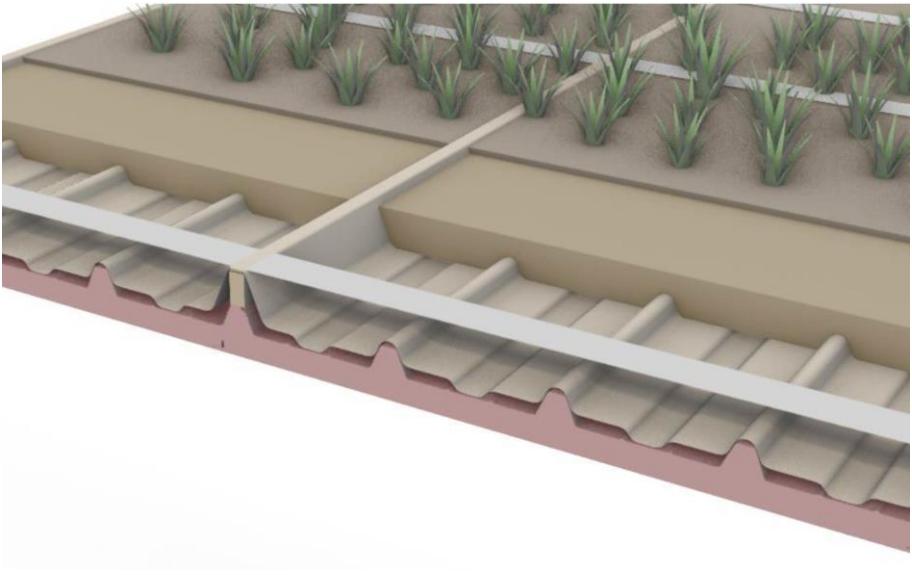

Figure 4. Three-dimensional representation of the roof system: detail of the stratification

The windproof function is achieved by fixing the rock wool under a fibreglass mesh. In a short time, the plants, rooting beyond the soil block and stretching inside the rock wool, will also anchor the crop finish to the whole system, which will remain firmly on the roof.
The strength point of the roofing project is the capacity of the fibreglass tray to maintain its shape, creating a ventilation cavity and, at the same time, a sufficiently flat surface to be trampled on. Compared to previous applications of the existing patent, in fact, the shape of the trays is particularly innovative due to the continuous ribs that increase the moment of inertia of the section and the resistance to vertical weights, allowing the trays to be walked on during assembly and in case of maintenance. It is important to note that the creation of the trays was based on a completely new application of the existing patent and therefore required a strong commitment to research, development and experimentation. In addition, together with the innovative shape, the dimensions of these elements are also particularly

important, as they are modular, with a width that can be raised as desired, limited in the prototype to one metre for ease of transport and assembly. The experimentation has also revealed a considerable reduction in temperature during the summer climate and good thermal insulation during the winter, making the energy-wasting environment of an industrial shed, as comfortable and habitable area.

4.3 DIY monitoring: Smart product for structural safety

As the third and last part of the Smart system, we describe the technological prototype of the software for structural monitoring of buildings. The objective of installing a structural monitoring system is to verify the availability of non-invasive diagnostic tools, able to provide detailed information on the state of conservation of the monitored structures and to detect risk factors at an early stage.
The prototype for the structural monitoring function of the test building uses various techniques and technologies: a minicomputer connected to a camera takes photographs at regular intervals at the structure to be monitored and then sends the captured images to a remote server, while expert software processes the images stored on the server. Using computer vision techniques, the points to be monitored are recognized, the data sets are produced and then analysed, using machine learning algorithms, for the actual detection of any anomalies (Fig. 5).

Figure 5. Monitoring system: detail of markers applied on the structure for the point detection

The identified system exploits the branch of technology linked to DIC (Digital Image Correlation), which is essentially a non-contact optical method to measure displacement, deformations and vibrations in objects or materials subject to applied forces. The method, in fact, compares two images, before and after the deformation and displacement, acquired in white light or IR with a camera.
In order to take into account irrelevant displacements (such as possible camera rotation due to wind or other small instabilities), a complex artificial intelligence system has been developed that compares the relative positions of the various monitoring points, making the system reliable even when unskilled labour is used during assembly. The entire complexity of the measurement has been moved to the server side, so that the user does not have to worry about anything. For this reason, systems for self-calibration and self-configuration of devices via Qr Code have also been developed so that the user only must position the devices to start the entire monitoring process (Fig. 6).

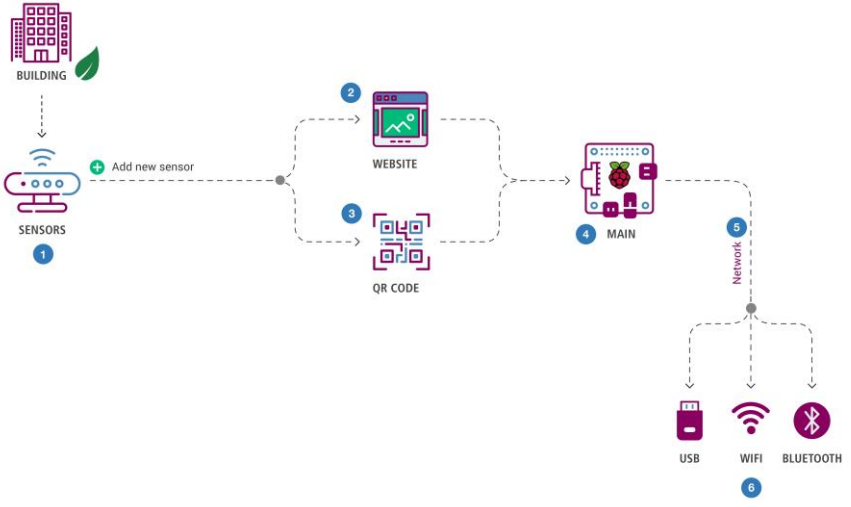

Figure 6. Representation of the installation and operation process of the monitoring system

Since the system stores and detects images and metadata in a database, it was decided to extend the database also to the data monitoring from third-party sources such as weather or environmental data on air quality, as well as data from other sensors, such as electricity, water consumption or other. Each of these parameters can generate specific alarms when pre-set thresholds are exceeded, warning of the need for specialist intervention. In order to simplify the specialist intervention, the database also contains the entire design history of the building, so that all relevant information is stored in a single repository: from

construction projects to consumption, from authorization documents to the various interventions to the description of maintenance operations carried out. With a view to simplifying the user side, a data access grid has been created so that the data can be seen or managed according to use: owners, tenants, administrators, professionals have all been profiled and each of them has a visibility of the data linked to the specific need for intervention or monitoring.
Therefore, we can say that the monitoring system's core is an expert system related to a series of sensors and an informatics network, an intelligent device in full IoT area, connected to network. Moreover, it falls within the well-established category of Smart Product-Service Systems (SPSS), which "integrate intelligent and e-service products in a single solution" (Lu et al., 2019, p.1). These systems, in fact, go beyond traditional services, as they are based on sharing and access, no longer based on ownership, and are "preferred (by consumers) because they provide more benefits at a lower cost" (Lu et al., 2019, p.4).

Conclusions

Referring to the issues raised upstream of this proposal, concerning possible building adaptation interventions, energy-wasting buildings and disused industrial sheds, an attempt was made to respond through the study of current proposals' panorama, overcoming it through an innovative project. Smart Safe and Green intends to propose itself as a modular, adaptable, scalable and customizable model for interventions on problematic building structures. It represents a possible answer, alternative to the commercial proposals, often too expensive and impossible to realize without a skilled workforce. Referring to the green façade and roof system, "the use of plants in the façades of buildings is a useful bioclimatic strategy that offers many advantages for the thermal, acoustic and psychological comfort of the inhabitants. There are also environmental benefits through the reduction of energy for heating/cooling indoor spaces and CO2 emissions" (Flores Larsen et al., 2014, p. 1772). Referring to the software, simulating the operation of this system in a wider range, we could think of using this detection technique for monitoring the structural integrity of even large buildings and large transport infrastructures, such as bridges, viaducts and dams, since monitoring has become a crucial aspect for the prevention of natural disasters, in order to ensure the safety of people and things. In design terms, the bottom-up approach is certainly representative of this proposal, as it would allow individual citizens (inhabitants and consumers) to provide for their own change, to be actors in an evolving change project over time. As argued by Burns (2006), it is no longer a question of "designing a response to a current problem, but [...] designing a means to continuously respond, adapt and innovate" (Sangiorgi, 2010, p.3). The Design objective, in this climate of enormous and immanent changes, is therefore denoting itself as a promoter of practices and projects as flexible, economic and efficient as possible, which review the role of the end user in a non-marginal position: not simply a "user" of a product-service, but a participant in the implementation process.

Strengthen Ties of Social Bonding Through Design from and Emotional Perspective.

Deyanira Bedolla Pereda

Metropolitan Autonomous University, Cuajimalpa, Mexico City
dbedolla@cua.uam.mx, deyanirabedolla@hotmail.com

Abstract | Emotional perspective of design has pursued until now mainly economic, and commercial objectives, however has a great potential to benefit society, because human emotions, have a central role in the determination and construction of human social relationships, also are elements that shape certain human behaviors that can produce pro-social effects, much needed in the current context.
This paper presents the most relevant studies of the research project which aims benefit society from the emotional perspective of design, through them, the paper responds questions as, what role do emotions play at the social level? what are the emotions that could be useful to achieve ends in favour of society? what could be the paths that allow the development of a design from the emotional perspective and the benefit of society?. Finally, is presented design set up categories of application, to materialize design from the emotional perspective with a social accent.

KEYWORDS EMOTIONS, SOCIAL BENEFITS, SOCIAL DESIGN

1. Introduction

This paper presents the most relevant studies of the research project, which aims to take advantage of emotional design in favor to contributing solutions to some of the complex social problems of our time, as social fragmentation, as intercultural tensions, social discrimination, and civic burnout.

The potential role that design plays and could play in collective problems of our time, is an issue that is not new in the area, since it has been discussed in a variety of studies from different approaches; such as the social responsibility of designers from a historical and ethical point of view (Papanek, 1984; Madge, 1993; Margolin, 2007; Woodham, 1997); or the potential damage of the design in terms of the damage caused by leading users to constant consumption and by extension to a huge generation of waste (Whiteley 1993; McDonough 2002; Chapman, 2005), and how to change people's wasteful behaviours through design (Lockton, Harrisson, & Stanton, 2008; Bhamra, Lilley & Tang, 2008; Lilley, Lofthouse & Bhamra, 2005; Lilley, 2009)

Considering the studies mentioned, an aspect that needs to be discussed widelier and even to extend the study perspective, is by one hand the question of how far the use, of rather than the production and disposal of products design of all kinds (objects, services, spaces, etc.), has led to unwanted social implications. By the other hand and above all, it is necessary to reflect on the potentiality that is offered by the design to, through its use and interaction, guide people to have prosocial practices and behaviors lead in a relevant way to improve the current social context.

There are few studies with this perspective, this means, to encourage a change in behavior through design, we can mention by its relevance the Tromp (2013). It points out that the human perspective from which the industrial products have been developed by now, has led to the effective satisfaction of the individual user's needs, but has ignored or even been detrimental to the collective goods. The influence that undoubtedly the design has carries important social implications, this influence considers Tromp (2013), is often hidden and is involuntary by the designers, so that's why it becomes an important study object.

Design perspectives as emotional design, are still young, so they mainly respond to economic and productive considerations. These considerations are based on the power of emotions to seduce and change human behavior. In this way, the emotions induce to consume products.

Emotional design has a great potential to benefit society, from the basis of human emotions it has a central role in the determination and construction of human social relationships. In this way they are also raised as elements that guide, motivate, shape, certain human behaviours and interactions. In this manner emotions can lead pro-social implications, much needed in the current context.

There are important contemporary examples of collective human situations, that demonstrate the pro-social implications of emotions which are experienced collectively. The

potential of emotions to modify behaviours, seduce or motivate could be exploited from the design for other objectives such as human and social purposes.

In this manner, exploring the topic from other disciplines, allow to propose its theoretical bases, and at the same time conceiving specific guides to design´s developed with the purpose of increases the designer's understanding on how to actually materialize this positive influence of a design from the emotional prosocial perspective.

Based on these ideas, three relevant studies on the subject which are presented in this text:

- The study of the role that emotions play in determining the human social dimension
- The identification of specific emotions that can lead to behaviours with clear pro-social effects from examples of contemporary social situations
- An initial proposal of specific modalities to develop and materialize design from the emotional perspective with a social accent. The objective is to guide interactions and behaviours for the benefit of society.

2. The Emotional Design

The emotional perspective of design can be said that formally begin in 1999 with the foundation of the International Design and Emotion Society (1999) at the University of Delft based in the Netherlands. Later, in 2004, it becomes widelier known with the approach and conception of the term by cognitive psychologist Donald Norman through his book Emotional Design (Norman, 2004).

The emotional design in Latin America is also a subject of a great interest as it is that the academics who work on it have formed in 2014 a network dedicated especially to the study of the subject, called the Academic Network of Design and Emotions (RADE, 2014).

At being recognized that the success of an object in the market can be determined largely by its appearance, the pleasure and satisfaction it produces in the user, the emotional human field has become a relevant issue and of a great interest, in general, in design of mass-produced products (Helander, 2006). Donald Norman has underlined this fact by pointing out that emotions have the power to change our perception, as a result of the interaction and emotional relationship with the objects in which we coexist in our daily environment (Norman, 2004).

The identification and explanation of the process in which objects generate emotions, was explained by Desmet who, from the discipline of industrial design and based on the tradition of the three cognitive theories of emotion (Lazarus, 1991; Ortony, Clore & Collins, 1988; Roseman, 1996), conceives a basic model to explain the generation of emotions through products (Desmet, 2002).

So, from the great potential of emotional design to lead to the success of product in the market to now, it has mainly pursued economic, to mass production product objectives. Are many products and services which, have applied the principles of emotional design, so through the evocation of emotions by means of its design or advertising, associates the product with specific emotions and feelings and thus induces its consumption.

In order to maximize the view of the great potential of the emotional approach, we looked for projects with a social perspective in the design area. We searched for projects that in some way take advantage of the emotions. We explored different approaches of design like "design for social innovation" and could find examples of projects which involve in some way the emotional human dimension. An example of an academic project from this area consists of offering a sensible tourism services where the heritage, cultural and natural resources of a Brazilian lagoon were enhanced through the connection of fishermen´s memories, knowledge and traditions from the local community, particularly the fishing activity, and the fishermen themselves (Franqueira & Gomes, 2017).

From the industrial design approach there is a relevant study, it is that of Tromp & Hekkert (2010). Describes a project of graduation of the industrial design engineering of the Delft University of Technology in Netherlands, in which it was developed a product with the objective of contributing to a social change.

The project called "design for social cohesion", we can say that involves the approach of emotional design, because it evoked to lead the integration of immigrants into a certain social context, through promoting an identification between the involved human beings, those who migrate and those who welcome them.

It was a proposal based on knowledge and affective identification among these actors as people as they are, since as human beings we usually have aspirations, desires, emotions and feelings many of them similar among us, although our geographical and cultural origins are very different.

This project was developed based on the assumption that receiving a gift from someone in the neighbourhood, accompanied by a personal message, could stimulate, or induce people, to a reciprocity. So that increases the possibility of that individuals responds positively to the issue and be encouraged to send a gift to someone else in the neighbourhood. The gift was also intended to offer a specific starting point of a conversation.

Another example which take advantage of emotions, is in the design area called "games for change"; the project called "iBeg" is a game that simulates the life of a homeless person living on the streets of Vancouver. In this game players step into the shoes of that homeless avatar and have to beg for money in order to survive. This game will hope raise awareness of them and also provide a mean for players to support organizations that help homeless (Worboys, 2014).

By the other hand, in the field of advertising, a discipline that in some way can be considered related with design, there are countless social campaigns that could be taken emotions into consideration. We must say that the majority of advertising campaigns always have sought to move in some way, but recently emotional approach in that area has been highlighted and taken advantage of (Forrester, 2018). These are examples that have clearly taken advantage of the emotional approach with some social objective. Some of them will be mentioned below, since they allow us to point out the potential of emotions in a meaningful human sense through specific examples.

There were advertising campaigns planned and presented in order to lead people to have pro-social behaviours. One example is a campaign developed by the advertising agency Neozink from Asturias Spain, called “Unicef Xanadú Action” whose objective was to encourage people to be generous, charitable, and donate small amounts of money to mainly help poor and disease children (Unicef, 2018).

By the fact that almost 7 million children die each year from causes that can be avoided and through the questions, “would you help to save a child's life for what it costs you a potato chips? Would you help save a child’s life with a simple gesture?”, The Neozink agency designed, adapted and produced blue envelopes vending machine from Unicef, and placed it into a shopping center in Madrid.

3. The role that emotions play in determining the human social dimension

It has been widely noted in previous studies (Bedolla, 2018; 2014; 2013), the great importance of emotions, that through design, lead to the improvement of quality and promotion of learning, care and increase human wellbeing, as well as to contribute to sustainability by strengthening emotional ties with objects.

This paper will pointed out a different approach of emotions, its potential as human subjective reaction analyzed from a social perspective, unlike the individual as has been done so far.

Emotions have a central role in the determination and construction of human social relationships, thanks to their ability to guide, motivate, shape, certain human behaviours and interactions that provide the possibility of producing prosocial effects, so necessary in the current context.

Affectivity is inherent in human nature and being a term derived from psychology, refers to the set of feelings, and passions of a person, as well as their preferences or aversions. Emotions are a central part in the construction of affectivity and have been defined (Dictionary of Psychological Terms, 2016), as a temporary alteration of mood, pleasant or painful, which is accompanied by a certain somatic shock.

One of the most relevant studies that provided knowledge about the importance of human emotions, belongs to the area of neurology and neurosciences (Damasio, 1994). It presents and explains extensively the mechanism by which emotions guide behavior and decision making based on the idea that the dualism proposed by Descartes is a mistake because it has separated mind and body, rational and emotionally.

The traditional concept of emotion from psychology assumes that it is an essentially internal and personal reaction of every individual; as a consequence, it has been assumed that emotions can be better analyzed from an individual in a psychological or cognitive perspective (Parkinson, 1996).

However, Parkinson (1996) proposes another perspective that leads to consider emotions more than as individual constructs but as social phenomena. Social psychology provides important theoretical foundations to understand other very relevant aspects of emotion; in this way the author does not deny that cognitive and physiological processes also contribute to the emotional phenomenon; the issue implies, rather, he says, the conceptual priority given to each of the factors involved in the emotional human process. In this way, the organizational principles of emotion depend ultimately on social aspects.

Parkinson identifies three modalities of social interaction that according to him clearly originate emotions in individuals:

- Social relationships, that is, emotions that are the result of real, anticipated, imagined, and memorable social relationships.
- Interpersonal influence, that is to say reciprocity and emotional contagion often unconscious and nonverbal among individuals of a certain social group.
- Cultural values, refers to the social establishment of emotion, based on the implicit and explicit objectives in which the individual lives.

Le Breton (2013) on the other hand, from the field of Anthropology, points out that emotions are relationships, a social and cultural construction. The author explains that an emotion is at the same time interpretation, expression, significance, relationship, and regulation of an exchange. They are collective expressions of the individual and the group simultaneously, and represent signs of a collective language; an open system of meanings, values, rituals, and vocabulary.

From the field of Sociology, Hochschild (1975), one of the three pioneers of the so-called sociology of emotions, incorporates emotions as a key access path for the knowledge of any phenomenon or social situation.

4.Specific emotions that can lead to behaviors with clear pro-social effects

Once the social relevance of emotions was clear, from the question “What are the emotions that could be useful to achieve prosocial purposes?” the study of the classifications of social emotions was carried out.

Based on Shlomo et. al. (2008) there are various classifications made in this regard. One of them indicates that social emotions are not innate and that they are those caused by some kind of social event (Oatley, 1987). Another classification indicates that they are simply those most frequently communicated to other people (Fridlund, 1991). A third classification mentions that they are those that characterize social processes that are generally shaped by emotions (Frijda, 1986).

The previous classifications said that the specific emotions indicated as "social" are many. The most frequently mentioned are: guilt, envy, shame, gratitude, admiration, pride, jealousy, sympathy, obfuscation, and crush. And then they will be those that make sense in relation to others and that arise in a particular social context. Based on this, Shlomo, Anat and Parkinson (2008) broaden the characterization of social emotions; they propose as a basis for identifying them, the nature of the evaluation or assessment that gave rise to them; which can be a direct or indirect social situation and not necessarily involve or make direct reference to another person.

From this idea, there are significant emotions socially experienced, which regardless of the direct or indirect nature of the social situation that create them, it is clearly seen the benefit in the community. In this way an example is social anger which is a social emotion that led people to agree, to organize and integrating the social movement called “de los indignados” that emerged in Madrid Spain, in May 2011. One of the participants of this movement, said that it represented a time when people woke up and began to identify, to feel together, and to talk about certain issues that were socially implicit and that worried everyone (Grueso, 2012).

Another social situation which is socially experienced involve empathy and solidarity. Both are human capabilities that contain different emotions, mainly a certain degree of sadness and anger. An example of this case is a voluntary woman group self-designated “the Patrons” from the community of Amatlán de los Reyes, in Veracruz Mexico. They had a generous interest of helping immigrants in need, providing them food and assistance in their passage through Veracruz in the train called "the Beast” (Solis, 2016).

Another example of solidarity and empathy is undoubtedly the experience lived by a large part of Mexican society in Mexico City. During the earthquakes on September 19, 1985 and 2017, in the face of the human and material disaster that occurred, a large number of the

city's inhabitants took over the streets to offer selfless help to everyone who needed it (Campoy, 2017).

We also can mention collective sadness which is social emotion recently experienced in Venezuela, as a result of the social, economic and political situation by the population. Sadness was noted as the emotion that 95% of people lived. At the same time, the sadness of contemporary societies was described as a revolutionary power, as a direct consequence of the dynamics of the political and economic system of that country which it was also, it was identified as the germ that could overcome it (Impulso, 2014; Tristeza, 2017).

Collective joy is shared and guided by a group called "underground joy" which is a group of musicians and clowns. Originated with the objective of carrying out interventions in people´s world traveling by public transportation, mainly the subway in the city of Buenos Aires. They share music, dances, smiles and looks, with the aim of people disconnect from their internal dialogue (Alegria, 2012).

By analysed these examples and others, of them, in an initial way (since it's a subject that starting to be explored), it was possible pointed out some of the pro-social reactions or effects:

A reaction of cohesion, cooperation, participation, and meeting mainly related to positive emotions. A reaction of awareness, concern, and interest in others, related mainly to negative emotions.

From this, four groups of social emotions were identified based on their effect in favour of the social field:

1. Social adhesive effect: Empathy, Solidarity, Joy, Anger

2. Social adhesive effect based on its great cultural load: Patriotism, Religiosity

3. Concern and concern for others: Sadness, Compassion, Anger

4. Awareness effect: Shame, Guilt, Fear

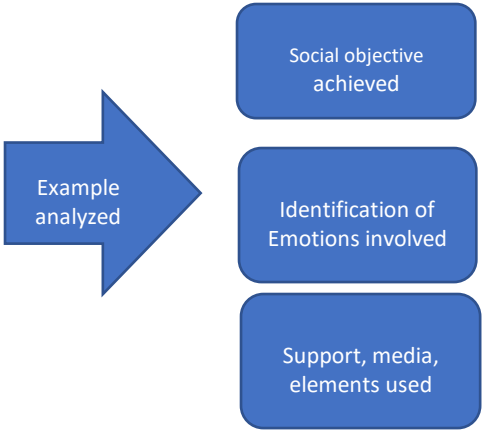
The examples that have been presented were not intended to be exhaustive in any way, but simply to show the social effects of the experience on certain emotions at the collective level. Thus, based on these social reactions, initially and incipiently, we propose the identification of emotions that produce clear pro-social reactions or effects.
Effects that are independent of whether they are emotions that are qualified as positive (for the pleasure and satisfaction they generate) or negative for the type of experience the individual lives. Both emotional experiences, stimulate in people attitudes that benefit society.

In relation to the qualification of negative emotions (as sadness, anger and disgust), Fokkinga (2013) claims, these are also very useful since on one hand, they are also able to lead a rich experience, which generates great interest, and by the other hand, they are

especially able to emphasize the morality of our actions as they stimulate and focus people's attention.

5. Modalities to develop and materialize design from the emotional perspective with a social accent

Previous studies, were the basis to know the core of emotions and their social implications. Also point out that emotions could conduct people to pro-social behavior.



From that, the research project continuing into search a way to know how to materialize the positive social influence of design, from pro- social emotional approach. Which aims to increases the designer´s understanding of how to integrate this approach into design.

According to this, we carried out an initial proposal of specific modalities, which goal has been proposed a guide to engage pro-social emotions in design, and in this way, take advantage of the potential of social implication of it. Is an initial proposal, because it looked for taking advantage of social emotions to develop pro-social Design, is a topic that starting to be explored. For this reason, the needs to continue the research and widelier reflection ahead and mainly, develop projects with social objectives based on this group of modalities

Thus, based on the pro-social actions (like cooperate, share, and collaborate) that social emotions conduct, which were identified previously (empathy and solidarity, collective anger, sadness and joy), the way followed to conceive an initial proposal of the modalities, was based on searching some examples of ítems from Design, Advertising, Computer science or any discipline, which in some way, they accomplish lead to the prosocial actions mentioned.

The examples of items, were analysed to identified if they allow pro-social actions. The analysis was done independently if they were related with some emotion. In fact, this analysis of ítems done, was the initial approach in which we began to visualize and conceive, specific manners to conduct into pro social actions, that are related directly with social emotions that we identified.

The analyses of the mentioned examples were carried out through the identification of the following aspects in each of them:

Figure?

The goal of that, was to identify these pro-social actions through some examples of items, that is based on taking positive behaviour of social implications, in relation to coexistence and social integration, educational and communicative processes.

In this way, three modalities are initially proposed to conduct to pro-social actions: cognitive modality, interactive modality and sensory modality; which are described below:

5.1 Cognitive modality

It has been proposed cognitive modality base on the analysed and the reflection of some examples of ítems, services and design products, which function is based on explicit and textual ideas. These ideas make a clear reference to affective situations which could conduct to pro- social actions, making reference to emotions or else directly to pro-social actions. In this way would have a notorious influence in people's behavior.

Below are presented the analysed aspects of some design items in a brief way, for space reasons (Table 1):

Table 1. Analysis for the cognitive modality

Examples of items analysed	Social emotions involved identified	Modality identified
-Product whose function is to make an audio recording of personal experiences	Recording personal experiences could generate empathy in others.	Cognitive: Influence through explicit emotive ideas
-A table game based on textual ideas	Textual ideas could promote respect, diversity, and tolerance	
-Digital networks such as Twitter, Facebook and others.	These allow anybody to see at any time the problems and concerns of millions of people. Which can cause empathy by helping users see other people's perspectives and thinking processes	

Since disciplines like conductual economy and cognitive psychology (Smith 2016) we can raise the theoric basis which can explain the relevant influence in people of explicit emotive ideas communicated through different ways.

Between factors that allow this, Smith (2016) claimed that the person´s formation of moral judgments, is raised, within the framework of a "natural order" of social extension.

On that matter the concept of sympathy has particular importance to Smith (2016), because is the principle that explains the formation of moral judgments, and over all, is also a method through which the individual expresses a favourable judgment of the neighbour´s behavior and expect others to do the same.

In the field of teaching the design degree, it is possible to mention very briefly a class exercise in which a conceptual application of this cognitive modality was proposed. It was a concept for a project whose objective was to promote solidarity between people. It started from the idea of looking for the most appropriate means to send a message to adolescents and young people about the importance of solidarity and mutual help in order to achieve a common goal. For this, video games were identified as an element of great popularity among adolescents and young people to transmit an explicit message; An existing video game that has some popularity ("Battlefield V, Medic Edition") was chosen for this, set in a warlike context, which states that a group of doctors help a battle squad survive and triumph.

Given that the game somehow already involves team support, the project simply consisted of redesigning its packaging, seeking to emphasize the importance and emotion of teamwork, help, communication and mutual support. ; in this way, the game's packaging presents textual ideas that stand out: "teamwork will lead to victory, if you go on your own you will find defeat."

5.2 Interactive Modality

It has been proposed interactive modality base on the analysed and the reflection of some examples of ítems which modalities of interaction lead in some way, to cooperate, share, and collaborate; which can offer the opportunity of coexistence and social integration. These items allow through them, a behavior that presented some positive aspect of social or collective interaction for the benefit of the community.

Examples of some design elements analysed are presented below in a brief way, for space reasons (Table 2):

Table 2. Analysis for the interactive modality

Examples of items analysed	Social emotions involved identified	Modality identified
- A collaborative digital table which modality of use is collective	Induce to collaborate, share, and considering neighbour. In this way invariably organize and conduct a collective teamwork in an educative or laboral context.	**Interactive:** User behavior can be regulated externally This regulation is primarily a logical consequence of restricting the operation of an object or space to a specific mode of use. Secondly, it represents an external influence element motivated by the design element.
- Products that perform their function through ludic or playful interactions, derived from basic games and devices from social psychology. These devices are a kind of games which set targets and challenges. Set an operant conditioning by means of reinforcements and unpredictable rewards, which manage to invite people to use them and through this they generate a social or even environmental benefit.	Ludic is directly related with joy, which is an emotion that Ekman (1972), pioneer in psychology in the study of emotions, classified like a basic human emotion and in this common sense to every human being. The ludic leads people to be solidarity with others.	

In the field of teaching the design degree, it is possible to mention very briefly a class exercise in which a conceptual application of this interactive modality was proposed. This is the proposal to apply the ludic approach, in exchange for donating some kind of humanitarian aid. The project application consisted of the conceptualization of a machine that offers the user to play a game of bowling in exchange for donating money to provide some type of humanitarian aid that the same machine describes and offers to provide. In this case, the ludic approach is used as the initial attractive element to interest and bring people closer together and later a donation is requested from them in exchange for said ludic experience: a bowling game.

5.3 Sensorial Modality

The sensory modality was identified based on examples whose common element was to somehow take advantage of the emotional expressiveness of different elements that integrate the aesthetic language of the product. Aesthetic language composed of visual, tactile, auditory, and olfactory characteristics or attributes that can constitute the aesthetic language of some design ítem.

Examples of design elements analysed that led to the identification of this modality (Table 3):

Table 3. Analysis for the sensorial modality

Examples of items analysed	Social emotions involved	Modality identified
Multisensory language of the screens of different devices capable of causing sensations and emotions on a conscious and unconscious level. More than two senses favour on greater information retention. Use of color, images, shapes, sound, music, aromas or other sensory stimuli that manage to establish a particular emotional state for the interaction of a user with a system, space, or object.	May be made reference to color images, sound, music, that refer all together to social situations or collective events that generate positive emotions for example expressions of solidarity or empathy	**Sensorial:** The intervention of the senses in the human emotional dimension explains why sensation perception is the primary level of receiving information from the environment. There is a parallel level, which we find to the emotion, which will occur once the vision, hearing, touch, taste, smell have informed us of the colors, sounds, tactile sensations, perfumes, etc., for which both the sensation as perception have acted as a first filter in emotional unleashing.
System that based on hearing, reflects or mimics the mood of a user by voice, to increase the commitment that the user feels to an action or service (chatbots or computer programs with which it is possible to have a conversation, to request some type of information or to carry out an action).	Voice, sound, or music, that refer to social situations or collective events that leads to positive emotions, for example expressions of solidarity or empathy	
Characterized objects with a significant character to attract people's emotions, or make them emotionally connect with their behaviour	Emotions have the ability to guide, motivate, shape, certain human behaviors and interactions that provide the possibility of producing prosocial effects, so necessary in the current context.	

We can explain the emotional implications on the human being, of the expressiveness of the aesthetic language of the product, because human sensory systems, are integrated by processes that determine human emotions widely and deeply. This statement is based on previous work (Bedolla, 2002), which study was developed based on disciplines such as medicine, and mainly experimental aesthetics.

In this case, the proposed application in the context of teaching the design degree consisted of an object that has the objective of encouraging the adoption of pets (dogs) that are in foster homes. The Project consisted of a panel that presents emotional images of dogs that need a home and the affection of an owner. In this proposal, the objective was to soften and visually and audibly sensitize people to these needs of these animals through the aforementioned emotional images and sounds of solitary pets, as well as an explicit invitation to dog adoption.

6.Conclusions

The study presented here has been an initial exploration. The modalities to developed design, in order to modify behaviors, for the benefit of society from the emotional perspective of design, are not definitive or exhaustive. They represent different modalities, to begin the identification on how to materialize pro-social emotional approach in design is necessary to explore its application and usefulness.
The emotional approach is based on a relevant human dimension, which by now has been studied from a social perspective in a very limited way. It is necessary to keep continuing the studies of this topic in a widely manner. Design discipline has already taken advantage of emotional approach of design but in an implicit, limited way, with commercial goals and in an individual and non-collective human approach.

As a strategy to modify people´s behavior, the emotional perspective proposes motivate, lead, influence, and guide people to change their behavior based on emotions. This is a proposal which aims encourage people to improve their behavior in a more human and sensitive way.
These are the characteristics that define this human approach, which are very different from others strategies that change behaviours, cited by some authors like coercitives or persuasive. (Tromp 2013; Lockton 2009).

From the human's innate affective dimension, emotional prosocial design approach claims that, people are able to get sensitizing, worrying, caring, love, and even outrage. Design ítems are presents in many ways in people´s or their neighbor´s daily experiences that could promote people to reflecting, responsibility, and reaction directly and indirectly to have a positive social implication in society.

Emotions studies from social approach are such an important topic for the current society. In order to successfully resolve social problems of our time, we would have to consider that

people who conform our societies are the source and the strength to counteracting many of them. Global and local social problems are not only a governmental task, individuals play a crucial role on it. And everyday design ítems can represent the means for this.

On that matter, is necessary to study and reflect on the ways in which is possible through design change people´s behavior, mainly by emotional approach of design. We reiterate, emotions have a great potential, a great powerful to seduce, to move and touch people and in this way can encourage their decisions and behavior. Emotions can become a relevant tool to designing for social benefit.

Study on the Sustainable Design of the Young Elderly Oriented Smart Wearable Products

Chen Han[a], Shen Lei*[b]

[a]School of Design, Jiangnan University, China
[b]School of Design Jiangnan University, China,
*sl999@sina.com

Abstract | At present, the problem of aging has become a major strategic issue that has attracted the attention of the world. As the most active group in the elderly, the young elderly is closely related to the demand change of two span of middle age and old age, so its applicable products are transitional and easy to be abandoned. The young elderly-oriented design is helpful to grasp the sustainability of the products. The researcher grasps the core demand elements of smart wearable products for the young elderly through the sustainable design method and puts forward three principles which further put forward a set of sustainable design standard paradigm. Therefore, it can systematically solve the problem that the current smart wearable products cannot meet the demand of the young elderly and the problem of easy abandonment, as well as expand the extension direction of the concept of sustainable design.

KEYWORDS | SUSTAINABLE DESIGN, ELDERLY ORIENTED DESIGN, SMART WEARABLE, THE YOUNG ELDERLY, STANDARD DESIGN PARADIGM

1. Introduction

With the general improvement of people's living standards and medical technology, it has led to the changes in the age structure of the population. There are a large number of social and economic issues because of the increasingly severe problem of aging around the world. Compared with the elderly, the characteristics of the young elderly include better average physical health, higher social participation, more average education and learning ability, and higher use frequency of smart products, which determines its status as one of the important audiences of smart wearable products. How to make smart wearable products better meet the needs of the young elderly and improve the quality of their life is a valuable research topic.

The researcher establishes the core demand factor system of young elderly oriented smart wearable from four aspects of physiology, psychology, social participation and lifestyle through the sustainable design method guided by user needs. On the basis of it, the researcher puts forward three design principles, which are usability principle, experiential principle and low additional burden principle, and utility evaluation module to construct the standard paradigm. It is of great significance for improving the life quality and consuming structure for the elderly.

2. Aging problem and current status of elderly oriented smart wearable products

Since 2003, the world has entered an aging era as a whole. By 2015, 12.3% of the world's population is over the age of 60, which will rise to 16.5% by 2030. Most countries in the world have entered the age of aging. As the "silent revolution", aging has exerted extensive and profound influences on the development of various social structures and functions in the world. The large number and complex elderly people have various demands for the elderly oriented product, which is a double-edged sword. On the one hand, these demands bring tremendous pressure to the design optimization and update iteration of the elderly oriented products. On the other hand, these requirements also provide a lot of opportunities and development space for the industry of elderly oriented products, as well as designers.

With the rapid increase of aging, the market for elderly oriented products has expanded greatly. However, the elderly related industries, especially the smart wearable industry, are still relatively in their infancy. In the face of the complex needs of the elderly, there is still much room for progress in the design of elderly oriented smart wearable products. It is also far from the concept of sustainable design. One of the main reasons is that there is no further segmentation of the elderly. At present, young elderly oriented smart wearable products are in the state of relative lack and blank. The transition and discard ability of products suitable for this group of people are ignored, which not only causes unnecessary

waste of resources, but also fails to meet the multi-level needs of the elderly. Through investigation and research, it can be concluded that there are common design mistakes in the following aspects in the elderly oriented smart wearable products that have been developed and released.

2.1 Misunderstanding 1: Products for the elderly are the simplified versions of conventional products

Although there are many excellent elderly-oriented products, most products for the elderly in the large global elderly market are the simplified versions of conventional products. Many so-called elderly products in the market are actually formed by processing existing conventional products by simplifying, degrading, and enlarging their functions. These products do not consider from the user's perspective whether the design is really suitable for the elderly and whether it meets the real needs of the elderly. Without the standard design and development process, this type of product is generally based on the personal experience of designers or reference to existing similar products in the market for design transformation, which not only results in inaccurate design positioning, but also generates unnecessary waste of resources and environmental pollution, violating the concept of sustainable design.

2.2 Misunderstanding 2: The elderly is not differentiated by refinement

In the traditional sense, people over the age of 60 are collectively referred to as the elderly, and elderly oriented products are products targeted at this group of people. With the increasingly serious aging problem, as well as the gradual improvement of living requirements and consumption levels, the elderly group also presents complex and diverse demands for the related products. Therefore, the refined differentiation of the elderly plays a crucial role in the sustainability of the design of elderly oriented smart wearable products. Sufficient refinement of the elderly group is conducive to the design of applicable products, the improvement of product application period and the reduction of the wasteability, so as to make the products conform to the concept of sustainable design. There are many specific manifestations in the refined differentiation of elderly population, such as gender, income level, family member structure, and medical condition of the living place, among which the most basic is age differentiation.

However, most of the refined differentiation modules in the design process of currently elderly oriented products are missing. The public generally regards the elderly group as a terminal-level user group, which obviously does not meet the specific practical needs of the elderly nor conform to the concept of sustainable design.

2.3 Misunderstanding 3: The elderly is thought to have only physiological needs

Based on the gradual aging of physiological functions, the most obvious characteristics of the elderly, designers will more consider the material functions, and lack of the emotional experience, such as spiritual comfort and entertainment requirements. Due to the continuous improvement of living standards and the change in consumption concept, more and more elderly people pay more attention to the quality of life and spiritual enjoyment. In other words, purely physical functions can no longer satisfy their needs for emotional experience. Although the original creative motivation of human beings originates from the material needs of life, it should not be limited to the material level. In particular, in the face of special elderly groups with diversity and complexity, designers should focus on their inner world, re-examine the user needs, and find the appropriate design methods to carry out design practices. When it comes to the issue of aging, most people passively regard the elderly as the “weak” image of “being supported” and “taken care of”, so they only focus on helping them physically and materially, ignoring their needs to realize their self-value. It has to admit that this traditional concept is ambiguous and one-sided.

3. Young elderly and sustainable design

Sustainable design refers to the harmonious development of people and the environment, which requires that the design can not only meet the needs of the current generation, but also take into account the development needs of the future generations. The establishment of sustainable consumption mode, the extension of product’s life cycle, and the reduction of product’s discardability are all the concrete manifestations of sustainable design. Lisa Rogers proposed that sustainability has become one of the basic principles of design innovation, and the environmentally sustainable compatible methods of products are warmly pursued, especially when they are attractive designs. Manzini Ezio said that sustainable design focuses on planning the whole life cycle of products through systematic products and services, which has achieved the purpose of prolonging the service life of products, while reducing resource depletion and environmental pollution.

Based on the refined distinction of the elderly in the age dimension, the classification standard of the young elderly is usually defined by their physiological age. Peter Laslett, a British sociologist, divides human life into four stages. He defined the third age stage, that is, the stage of young elderly people, as the stage when they just retired but their physical functions did not show obvious decline. According to UNESCO, young elderly people are those between the ages of 60 and 69. Between the middle age and the old age, the young elderly is closely related to the changes in the needs of the two spans. Therefore, the applicable products for the younger elderly are transitional and easily discarded. The elderly oriented design for this age group is helpful to grasp the sustainability of the products.

Compared with the elderly, the characteristics of the young elderly include better average physical health, higher social participation, more average education and learning ability, and higher use frequency of smart products, which determines its status as one of the important audiences of smart wearable products. In addition, the cultivation of the habit of using smart products makes it easier for the young elderly to accept and use smart products, which is conducive to solving many social pension problems caused by the increasingly severe aging trend. To sum up, as a continuous design research, the research of smart wearable design models for the young elderly is not only consistent with the concept of sustainable design, but also has great social significance and economic value. It is worth noting that the main target population in this study is defined as the young elderly aged between 60 and 69.

4. Analysis of young elderly oriented smart wearable product demand factors

Facing the current and future trend of population aging, the researchers use the pre-test questionnaire, industry expert interviews and focus group research to mine the demand factors of intelligent wearable function of the young elderly.

The pre-test questionnaire included three groups of open-ended questions about the intelligent wearability of the young elderly, including instinct level demand, behaviour level demand and reflection level demand, with a total of 12 open-ended questions. We invited 4 intelligent wearable designers and 8 young elderly people to participate in the pre-test questionnaire survey. By collecting the pre-test questionnaire and collating the text data, we get 11 key requirements semantics of intelligent wearable for the young people in three groups, as shown in the Figure 1.

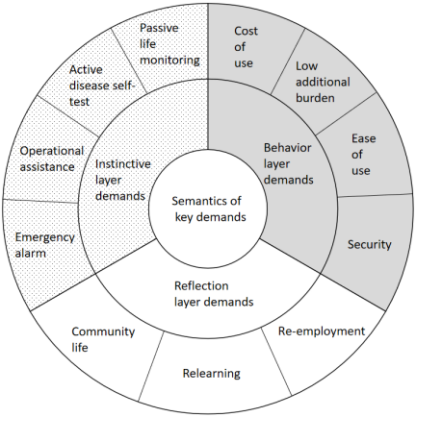

Figure 1. The key requirements semantics of intelligent wearable for the young people

Three associate professors of industrial design, one intelligent wearable product development manager and six design doctorates were invited to draw up the outline and content of the focus group survey through expert interviews based on the key semantic references obtained from the pre-test questionnaire. Focus group research adopts the method of group interview. In Jianggan District of Hangzhou City, China, we selected 20 target users of young elderly people. The inclusion criteria of the group were as follows: A. familiar with the basic concepts of intelligent wearable; B. using or understanding at least one intelligent wearable product and being able to objectively evaluate it; C. agreeing to this study and participating in the research voluntarily. The interview process was recorded and organized into text information with the consent of participants. We conduct in-depth coding analysis on the NVivo analysis tool through the grounded theory analysis method. Grounded theory analysis method is a qualitative research method. Its core idea is to summarize experience from the collected raw materials and upgrade it to theory. Finally, the code analysis results are shown in the table. Five spindle codes and 15 open codes will be used as two-level elements and three-level elements respectively to form a hierarchical demand element system.

Table 1. Young elderly oriented smart wearable demand factor system

Spindle coding (Secondary elements)		Open coding (Third level elements)	
Element name	Word frequency	Element name	Word frequency
B1 Physiological needs	60	C11 disease monitoring	21
		C12 action assistance	9
		C13 visual assistance	14
		C14 memory assistance	5
		C15 low burden	11
B2 Psychological needs	32	C21 interactive experience	12
		C22 loneliness relief	6
		C23 inferiority relief	7
		C24 anxiety relief	3
		C25 depression treatment	4
B3 Social participation	27	C31 re-employment	9
		C32 community connection	6
		C33 organization association	10
		C34 information sharing	11
B4 Life style	28	C41 scientific health	7
		C42 learning needs	13
		C43 interest cultivation	8

According to the factor system, Likert scale questionnaire is generated. The questionnaire involves 160 young elderly people randomly selected from the Hangzhou Civic Centre and the surrounding rural areas of Hangzhou city in China, of which 142 are successfully recovered, 11 are excluded and 131 are valid. Based on the hierarchical structure of the young elderly oriented smart wearable demand element system, the analytic hierarchy process is applied to determine the influence weight of each criterion layer element on the target layer. The final composite weights are shown in Table 2. It can be concluded that the core demands elements

are C11, C21, C15, C32, C42 and C13; the sub-core elements are C22, C41, C31, C12 and C43; the peripheral elements are C14, C23, C33, C34, C24 and C25. According to the results, it can be concluded that in the current development of aging issues and smart wearables, the core elements of young elderly smart wearable needs include disease monitoring, interactive experience, low burden, community association, learning needs, and visual assistance, while the sub-core elements include relief from loneliness, scientific health, reemployment, action assistance, and interest development.

Table 2. Weight analysis of young elderly oriented smart wearable demand factor

Index level	Criterion level				Weight to total objective	Index weight sorting
	B1	B2	B3	B4		
C11	4240				1818	1
C12	940				403	10
C13	1662				713	6
C14	723				310	12
C15	2436				1045	3
C21		5461			1322	2
C22		2565			621	7
C23		1020			274	13
C24		467			113	16
C25		376			91	17
C31			2497		410	9
C32			5329		873	4
C33			1297		213	14
C34			889		146	15
C41				3236	533	8
C42				4487	739	5
C43				2278	375	11
Impact on overall objectives	4289	2421	1642	1647		

5. Principles of young elderly oriented smart wearable sustainable design

There is a huge market for young elderly oriented smart wearables. Because of its popularity and interdisciplinary nature, it has also received extensive attention and research in this field from the academic community. However, there is no appropriate discussion on the principle of young elderly oriented smart wearables from the perspective of design. Based on the theoretical research foundations, design practices, and experimental data in the smart wearable direction in recent years, this paper combines first-hand data from interviews with groups of experts and scholars in related multi-disciplinary fields, summarizes the sustainable design principles of young elderly oriented smart wearable products, including usability principle, experiential principle and low additional burden principle.

5.1 Usability principles

Intelligent and digital products not only bring convenience to users, but also improve the technical barriers to their use, which have certain requirements on user's learning ability and may lead to the psychology of fear and avoidance of elderly users who are weak in learning new things. Therefore, designers should follow the usability principle when designing products for the elderly, reduce the difficulty and psychological pressure of the elderly on the use of the product as much as possible, and improve the operability of the products. As an important indicator for measuring design quality, usability is to judge whether the product system is attractive, easy to learn, efficient, controllable and error-proof from the perspective of users, which will be explained in detail below. Firstly, attractiveness means that users are interested in the product and are willing to use it. Secondly, efficiency refers to the rapidity with which users can complete tasks by using the product. Thirdly, learnability refers to how the product supports first-time use and in-depth learning. Fourthly, controllability refers to the user in the process of using the product as far as possible through control operations to achieve their own ideas. Fifthly, error-prevention refers to how the product helps guide users to avoid incorrect operation.

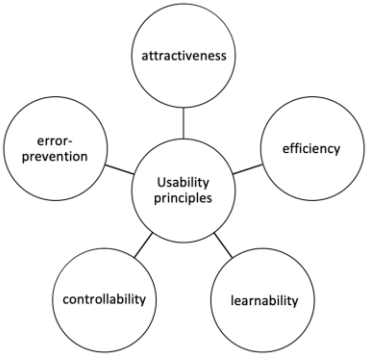

Figure 2. Usability principle of young elderly oriented smart wearable

5.2 Experiential principle

Experience can be divided into two parts, namely the technical system, and product design and service. The experience design of smart wearable products should incorporate the design semantics commonly associated with the elderly. For example, in terms of operational behaviour, the design can add elements familiar to the elderly, and mimic the interface, creating a feeling of familiarity, familiarity and nostalgia that the elderly is willing to communicate with. In addition, simple swipe gestures, voice and gesture recognition should be applied. In this way, a set of operation system that is easy to understand and consistent with the behaviour of the elderly can be formed, thereby better realizing the autonomous management and application of wearable products for the elderly.

5.3 Low additional burden principle

Despite having a higher average physical fitness and learning ability than older people, young elderly people are still below the average for all ages. Therefore, the design principle of low additional burden is particularly important in young elderly oriented smart wearable design. The low additional burden principle requires products to minimize the additional burden on the elderly during the use process, which mainly includes two aspects of physical burden and psychological burden. On the one hand, the principle of low physiological burden requires designers to fully understand the physiological characteristics of the target group, so as to avoid problems such as complicated operations, excessive product volume and self-weight. It is necessary to optimize the design by means of selective design in combination with the physiological decline that may occur commonly in the elderly. On the other hand, the principle of low psychological burden refers to the maximum embodiment of the design equality, that is, the care for the elderly. People's cognition of the information begins with the intuitive feeling of objects. Therefore, smart wearable products for the elderly group can mitigate the additional psychological burden brought by the use of traditional products by imitating them in the appearance design and control interface, thus effectively reducing the cognitive costs.

6. Young elderly oriented smart wearable sustainable design paradigm

The young elderly oriented smart wearable sustainable design paradigm is the most important part of this paper. Through preliminary theoretical research and a large number of design practices, this design paradigm can be divided into four modules, which are demand determination module, design principle module, multidisciplinary design module and utility evaluation module.

6.1 Demand determination module

According to the results of the investigation and analysis of the demand factors of the young elderly, the demand determination module is summarized. Through the questionnaire survey, this module uses the analytic hierarchy process to rank the weight of 15 level-3 demand factors under the 4 level-2 demand factors, and finally obtains 6 core demand factors.

As shown in Figure 3, the demand determination module is composed of 4 level-2 demand elements, including physical needs, psychological needs, lifestyle and social participation, as well as 6 level-3 core demand elements, including disease monitoring, interactive experience, low burden, community connection, learning needs, and visual assistance.

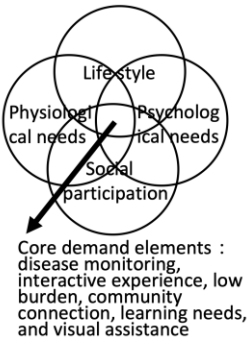

Figure 3. Demand determination module

6.2 Design principle module

Based on the concept of sustainable design, this module is composed of the 3 design principles of young elderly oriented smart wearable products mentioned above, namely the usability principle, the experiential principle, and the low additional burden principle. These three design principles constrain and guide the thinking and direction of young elderly oriented smart wearable design and put forward various design requirements for designers.

6.3 Multidisciplinary design module

Due to the convergence and intersection of the research directions of multiple disciplines, there must be a multidisciplinary design module in the design paradigm. Smart wearable design can be divided into three parts, which are monitoring and acquisition part, analysis part and sharing part. Among them, the monitoring and acquisition part consists of electronic information technology, composite functional materials and structural modelling design. Through near-field communication technology, the monitoring and acquisition part is associated with the intelligent mobile terminal of the analysis part, which is linked to the remote cloud service of the sharing part through the network.

6.4 Utility evaluation module

In this study, young elderly oriented smart wearable products are comprehensively evaluated in a hierarchical way from the aspects of biophysical performance test of materials, electronic unit performance test, controlled simulation test of environmental chamber, information data operation test and user experience. Designers can test and evaluate smart wearable products through the level-5 utility evaluation module and adjust the design according to the comprehensive evaluation results at all levels, so as to obtain rigorous design products that can truly meet the demands of users.

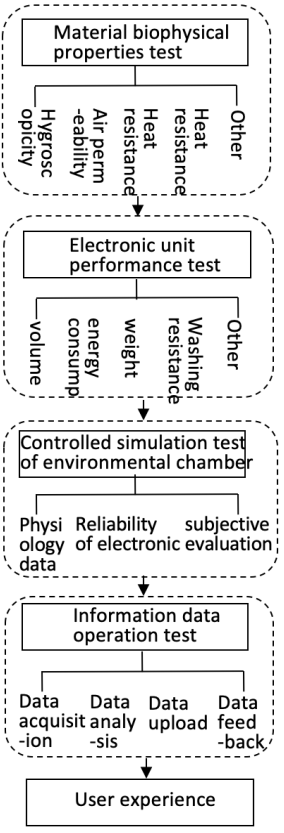

Figure 4. Young elderly oriented smart wearable utility evaluation module

Based on the concept of sustainable design, the design integrates four modules in order, so as to achieve a reflective closed-loop system with perfect or redesigned standards, and continuously promote the development of young elderly oriented smart wearable design. Throughout the process, paradigm is the basis of design. At the same time, through continuous improvement and optimization of the research and development model, the design standard has a higher universality, aiming at providing theoretical basis and research and development reference for the product design in this direction.

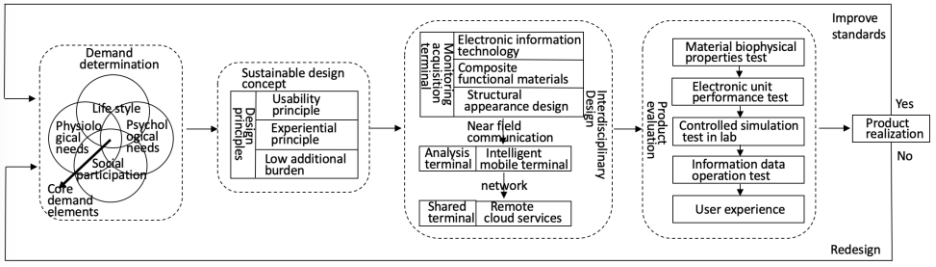

Figure 5. Young elderly oriented smart wearable sustainable design standard paradigm

7. Conclusion

With the increasingly severe problem of aging, there are a large number of social and economic issues around the world. With the development of artificial intelligence, big data, Internet of things, 5G and other technologies, it is inevitable that a new wave of smart wearable products will explode. The smart wearable industry with increasingly mature technology is undoubtedly one of the best ways to solve the problem of aging. How to make smart wearable products better meet the needs of the large and complex elderly and improve the quality of life of the elderly is a valuable research topic, among which the research on the applicable product design paradigm for young elderly is more critical. On the one hand, these products are transitional and easy to discard. On the other hand, the understanding of the needs and habit development of the young elderly to use smart products will have an important impact on the same group of elderly people ten years later. Therefore, there is an urgent need for in-depth sustainable design research in this field.

Based on the investigation and analysis of the multi-dimensional demand elements of the young elderly, the core demand factor system of young elderly oriented smart wearable is established. In accordance with the previous research practices, this paper creatively innovatively proposes four design principles of young elderly oriented smart wearable and combines the multidisciplinary design module and utility evaluation module to construct the standard paradigm of young elderly oriented smart wearable sustainable design. The whole research and development program process is a sustainable ecological closed loop. This research fills the relative gap in the field of academic design in this direction and has a high level of cognitive leadership. However, there are deficiencies in this research, which hopes to be further improved in subsequent theoretical and practical research. This study provides theoretical basis and research and development reference for the relevant design practitioners, promotes the smart wearable industry for the elderly, and proposes valuable solutions to many problems caused by aging.

c.tjahja@pl.hanze.nl

Abstract | In recent years, the importance of sustaining social innovation initiatives, once initiated, has gained increasing attention and, in particular, the role that design(ers) can play in this process. However, both the academic study and the practice of design and social innovation are currently lacking sufficient insight into how initiatives are sustained outside of experimental or academic settings and rarely move beyond the involvement of designers and/or researchers. The paper shares experiences from practitioners from Asia-Pacific that are operating in the real world, highlighting their precarious working conditions. The significance of building and maintaining healthy social relations in essential in this context, as these enable the weaving of a strong social fabric around the initiatives that will provide necessarily shelter and to endure long after the practitioners' involvement. Therefore, facilitating the creation of meaningful social relations should be the key objective for design, instead of designing artefacts.

KEYWORDS | DESIGN AND SOCIAL INNOVATION, SOCIAL RELATIONS, HONG KONG, THAILAND, MALAYSIA

1. Introduction

Design practitioners, together with other professionals who are operating in the social innovation space, often find themselves in an inherent paradox; their aim is to create long-term social change, whereas their involvement is often short-term, project-based and/or contingent on available funding. The notion that designers can (and should) contribute to the survival of initiatives that they are involved in, has been acknowledged relatively early in academic discourse (Burns et al., 2006; Brown & Wyatt, 2010; Iversen & Dindler, 2014). Ideally, however, it should be the community who ultimately bears the responsibility for sustaining design and social initiatives (Janzer & Weinstein, 2014; Wang et al., 2016; Cairns, 2017). Several promising directions, described further on in this paper, have been suggested to achieve this desired end-state. However, most studies on sustaining design and social innovation describe initiatives which trace their origins to institutional frameworks, often academia or government, and are situated in relatively stable environments. Furthermore, accounts that proceed beyond the involvement of researchers are rare; a notable exception is a study by Hillgren et al. (2016), which follows the Malmö Living Lab over a seven-year time period. Little is known about initiatives that originate and operate 'in the wild', often with limited or no resources at all, as accounts from practitioners are mostly descriptive in nature and do not shed light on how they manage to sustain themselves. In a way, this is not surprising, as design and social innovation is a relatively young discipline, which is still developing (Irwin, 2015).

2. Background of the study

Academic discourse is currently dominated by studies that examine design and social innovation in a European or North American context (Meroni, 2007; Morelli, 2007; Jégou & Manzini, 2008; Murray et al., 2010; DiSalvo et al., 2011; Ilstedt Hjelm & Mårtens, 2011; Westley et al., 2012; Meroni et al., 2013; Di Prete & Mazzarello, 2017; Olivastri, 2017), with the rest of the world considerably less represented. Although a western orientation in design and social innovation research does not necessarily have to be an issue, the assumption that concepts originating from the west can be simply modified and implemented in other, non-western contexts, is problematic (Bala-Miller et al., 2008; Manzini, 2015), as transferring successful ideas and methods from the west into an entirely different context might not be appropriate nor desirable (Brown & Wyatt, 2010). There is a danger of imported solutions and paradigms replacing local knowledge and practices, which might be better suited to tackle issues in their original context and, in addition, can also be used as examples that the west could learn from (Bala-Miller et al., 2008; Akama et al., 2019).

The dominance of the western perspective in academic discourse on design and social innovation can be regarded as part of the broader discussion concerning the decolonisation of knowledge (Mignolo & Tlostanova, 2006; Mignolo, 2007). In particular, the *decolonising design* approach, which respects the relation of ideas, projects and ideas to their particular

contexts and prefers to design relations that recognise differences instead of singular perspectives and "common denominators" (Schultz et al., 2018). Moreover, the centre of design culture, traditionally perceived to be based in the west, should be disconnected from the colonial narrative of modernity and reconnected to *pluriversal* narratives, which assume that multiple centres of design can exist simultaneously (Onafuwa, 2018).

This paper therefore aims to contribute to a more pluriversal body of knowledge on design and social innovation by sharing insights from Hong Kong, Bangkok and Kuala Lumpur. The study is part of a larger PhD research project which aims to determine what constitutes design and social innovation initiatives in the Asia-Pacific region, investigating why projects are initiated, for whom value is created and what role design plays in the process.

3. Perspectives on sustaining design and social innovation

Academic discourse suggests a variety of approaches on how to sustain design and social innovation initiatives. Three major streams, that at times overlap, can be distinguished herein: the first aims to create favourable environments and/or (social) infrastructures to support both current and future initiatives, the second focuses on upscaling and replicating the initiatives themselves and the third aims to preserve the initiatives' underlying ideas and concepts.

Sustaining through creating favourable environments

Enabling (eco)systems, consisting of cultural and social structures, are described by Manzini (2013, 2015) as a requirement for design and social innovation initiatives to be able to flourish and spread. Within these ecosystems, designers can contribute through their skills of visualisation, storytelling and scenario building, and build capacity within the community by for example, making use of toolkits.

Infrastructuring, suggested by Björgvinsson et al. (2012), is another approach aimed at reinforcing long-term commitment. It entails a process of continuously building and expanding a network of stakeholders, while being flexible regarding the allocation of time and resources. Rooted in Scandinavian participatory design, projects in this approach are perceived as *Things*, socio-material assemblies in which both designers and other actors participate. Designers therefore need to consider that after their initial involvement, design Things might continue with other actors and stakeholders. In this context, the term 'infrastructuring' refers to the act of creating an infrastructure that consists of relations that are connected through different times and places.

The enabling systems and infrastructuring approaches have in recent times grown closer, as studies have been examining how design Things can shape the building of future social relations (Light & Akama, 2014) and strengthen social resilience by facilitating collaborative encounters between community members (Cipolla, 2018; Manzini & Thorpe, 2018)

Sustaining through upscaling and replicating initiatives

The advantage of scaling-up initiatives, according to Jégou and Manzini (2008), is that it enables a large of number of people to live sustainably. The scaling-up of design and social innovation initiatives does not entail an increase in size, but utilises creativity, design, entrepreneurship and technological knowledge to enhance the accessibility and effectiveness of initiatives, which in turn facilitates implementation on a larger scale. Similarly, when replicating initiatives, it is not the creative communities themselves, which are highly localised, that are to be replicated. The emphasis should instead be on replicating the service ideas that are deemed suitable for adaptation to new contexts. Furthermore, initiatives should be scaled up and replicated by increasing their numbers (not their size) by connecting them to a larger network. The importance of scale is also underlined by Mulgan (2017), who asserts that it plays a role in linking initiatives to broader programmes. Smart adaption should be given priority over innovation when upscaling, without neglecting the skills needed to adapt social innovations to new contexts.

Sustaining through preservation of concepts, ideas and examples

Upscaling and replicating of initiatives, as described in the previous section, are one way to preserve the concepts and ideas that underpin design and social innovation initiatives. In addition, (design and) social innovation networks, such as DESIS, DESIAP, SIX, Impact Hub and Ashoka can safeguard the knowledge and contacts of the field itself. An accessible and convenient way to both retain and replicate design and social innovation ideas, particularly its methods, are the toolkits, guides and courses offered by various organisations and academics. Examples are IDEO's *Field Guide to Human-Centered Design* (IDEO.org, 2015), frogdesign's *Collective Action Toolkit* (2012) and the *Social Design Methods Menu* by Kimbell and Julier (2012).

The building of strong social relations requires considerable effort, but yields many benefits for the design and social innovation process. As suggested by, for example, (Light & Akama, 2014) in this study, too, social relations were found to strengthen initiatives by providing a foundation from which new ideas can emerge, even when the design component fails or ceases to exist. They can also help create a sense of ownership among the community.

The three main categories of approaches are, however, currently still too theoretical and speculative in nature. A large majority of the cases discussed are limited in scope and/or consist of pilot projects, that tentatively project future scenarios. Toolkits and courses spread knowledge through their dissemination tools and methods, but often do not provide enough insight into contextual factors, which are also not immediately apparent to prospective users. Moreover, examples of real-life initiatives continuing for a long period of time using any of the suggested methods are virtually non-existent.

4. Methodology

The PhD research study, from which this study derives its results, comprised seven months during which Hong Kong, Bangkok and Kuala Lumpur were visited. The researcher spent roughly two months in each city, contacting initiatives, building relationships with those involved and conducting interviews. Case studies, defined by Yin (2018) as an in-depth empirical investigation of a phenomenon within its real world context, were considered as a suitable method to examine how the initiatives operate in their own respective environments. A multiple-case study design was used for this purpose, which entailed the selection of multiple cases in multiple countries, each of which was studied in their own context. Eventually, sixteen initiatives were selected as case studies, five in Hong Kong, six in Thailand and five in Malaysia (see figure 1 for an overview).

HONG KONG		
Initiative	**Initiated by**	**Usage of design**
Goodseed	Government	Capacity building, design thinking, co-creation
DOMAT	Architectural agency, social enterprise	Architecture, product design
Fine Dying (SI.DLab)	Non-profit social design agency	Design thinking, co-creation, empathy, immersion, prototyping, capacity building
Form Society	Independent	Event organising
Play Depot	Independent	Design activities are organised by stakeholders
BANGKOK		
Initiative	**Initiated by**	**Usage of design**
Co-create haroenkrung (TCDC)	Government	Urban renewal, prototyping, visualisation, event organising
Deschooling Games	Independent	Game design, event organising, co-creation
Pom Mahakan	Independent	Design thinking, prototyping, co-creation, community architecture, participatory mapping
Bangkok Chinatown	Architectural agency	Design thinking, prototyping, co-creation

CROSSs	Architectural agency	Participatory design, architecture, prototyping, designing relations
The Rambutan	Independent	Graphic design, activism
KUALA LUMPUR		
Initiative	**Initiated by**	**Usage of design**
Earth Heir	Social enterprise	Product design
3nity Design	Design & branding agency	Branding, graphic design, product design
Green Pocket Park (POW Ideas)	Architectural agency	Architecture, art
Lorong Bandar 13 (Think City)	Government	Urbal renewal, architecture, co-creation, visioning
Water Warriors & Mukim Pasangan (University of Malaya)	Academia	Designing relations

Figure 1. *Overview of the sixteen initiatives that participated in the study.*[1]

The data was collected through semi-structured interviews with stakeholders, which were recorded using an audio recording device. The questions asked during the interview were structured around the *Activity Theory* framework[2], which studies both individuals and their contexts simultaneously by studying the activity that is generated in the process (Engeström, 1999). In addition, other relevant topics or themes identified during the conversation were highlighted in handwritten notes.

Thematic analysis was used to analyse the collected data. A method that is widely used in qualitative research, it can identify, analyse, and report patterns (themes) within data (Braun & Clarke, 2006). The data in this study was approached in an inductive manner, which entails the presumption that the findings are the result of the analyst's interaction with the data, leading to the identification and construction of patterns, themes and categories (Patton, 2015). Reoccurring topics in the interviews were grouped into broader themes and further grouped into three key themes (see figure 2). The findings discussed in this paper focus on the third key theme: sustaining design and social innovation.

[1] A detailed description of the case studies can be found in Tjahja (2019)

[2] For a more in-depth discussion of how Activity Theory was used in the larger PhD research study, please see Tjahja, Yee & Aftab (2017) and Tjahja (2019)

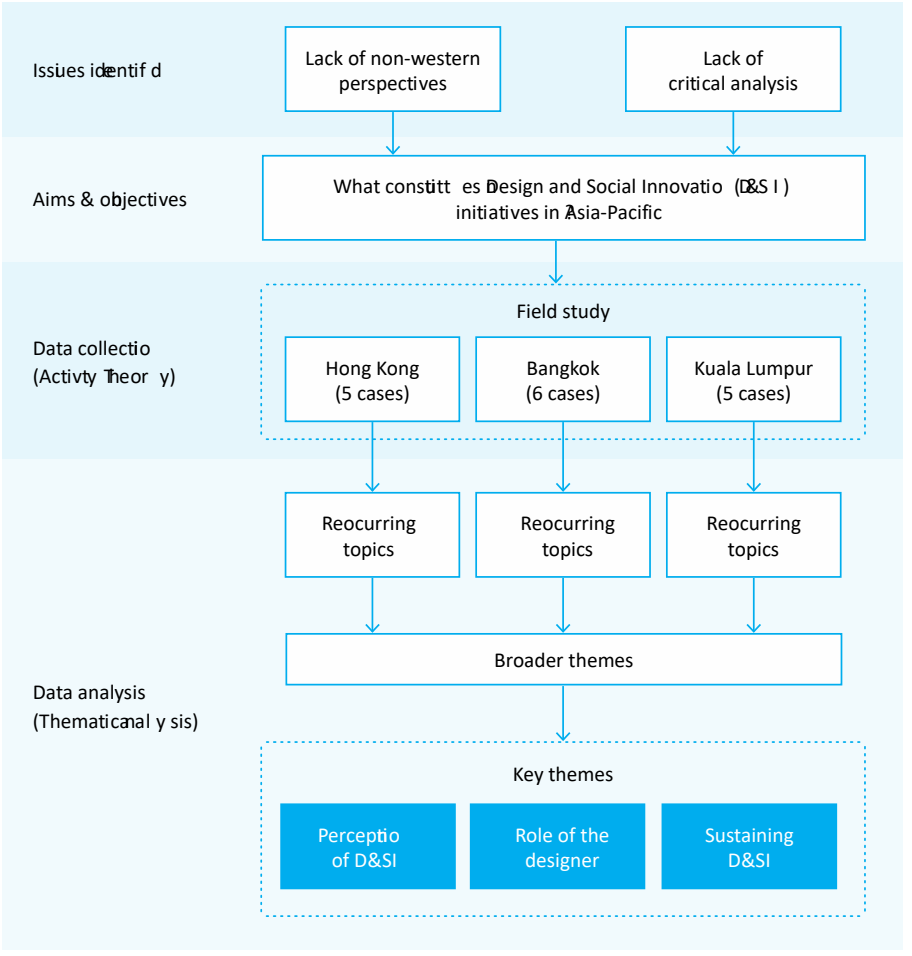

Figure 2. A methodological map of the PhD research study.

5. Findings

The insights gained from the practitioners who participated in the study regarding the continuation of their initiatives can be categorised in four themes: the importance of building and maintaining social relations, issues surrounding the upscaling and replicating of their initiatives, difficulties finding a suitable business model and the lack of public space.

The importance of building and maintaining social relations

Social relations can influence the design and social innovation process in various ways and can have dimensions and modalities that are not always immediately apparent. Practitioners in all three cities reported that the building of (new) social relations was beneficial for their initiatives both during and after the process. Maintaining good social relations with community members and other stakeholders was essential for building both trust and capacity within the community as well as creating a sense of ownership of the initiative, with some respondents noting that the social aspect of their work ultimately was more important than the design aspect. Furthermore, several initiatives managed to create new social ties among the local community, which stakeholders perceived to be a valuable outcome.

In Bangkok and Kuala Lumpur, social relationships are often characterised by a high degree of informality, which helps to expand networks and create new opportunities in the process. Particularly in Bangkok, both the positive and negative effects of social hierarchy were significant, interacting with practitioner's work on multiple levels and in different scenarios (Author et al., 2017). For example, having access to key figures that are situated high in the hierarchical ladder can be of significant benefit in terms of an initiative's progression or provide opportunities, which would have not materialised otherwise.

Issues with upscaling and replicating

Academic discourse perceives the scaling-up and replication of initiatives as an effective way to spread either the initiatives themselves or the ideas that underpin them. None of the bottom-up initiatives in this study, however, have managed to do this successfully. Several of the respondents reported the lack of manpower as a major issue, either within their own initiative or the stakeholders involved. Furthermore, most of the initiatives are just one of many projects that the practitioners work on. Combined with the insecurity of not knowing to what extent they can secure funding for their social activities, making strategic decisions whether to prioritise social or commercial projects or whether to expand their team can be challenging. These precarious conditions in which initiatives oftentimes are forced to operate, make upscaling and replicating a goal that is difficult to attain for most. Even if initiatives do manage to upscale and replicate, the eventual outcome might not be desirable. An example is the case of the Water Warriors initiative, which was scaled-up by its host university. However, the process of institutionalisation introduced concepts such as accountability and bureaucracy, while not sufficiently taking into the social network that the initiative created between the various stakeholders involved. This threatened the initiative's original bottom-up character, leading to a loss of motivation for the practitioners working on the project.

Difficulties finding a suitable business model

Arguably, the most important question that could be asked in the context of sustaining design and social innovation is "who is going to pay for it?". It is therefore striking that this question often remains unanswered. In Hong Kong, for example, both housing and living costs are among the highest in the world. Practitioners therefore often do not have the luxury to carefully plan out their activities, but need to hit the ground running, particularly when it comes to financing their initiatives. Most of the non-government initiatives studied are not subsidised and have to find other ways to support themselves. In the best-case scenario, income from commercial activities is transferred to fund social activities. In some cases, however, such as Form Society and The Rambutan, the practitioners fund their initiatives using their own private savings. Ultimately, none of these scenarios are sustainable in the long run. Moreover, even when an initiative is fortunate enough to receive funding, it cannot be relied on as a stable source of income.

A related issue is the lack of a suitable legal entity for the initiative. In Thailand, for example, it is currently not possible to mix business and social activities within one organisation, which leaves practitioners unable to make use of tax exemptions and provides no ground for the initiative to exist at all. Academics and practitioners therefore have to take into account that legal frameworks can vastly differ per country or territory, potentially limiting an initiative's present and/or future opportunities. For example, the general environment in Hong Kong and Malaysia appears to be more favourable towards social innovation compared to Thailand, making the threshold to engage in design and social innovation significantly lower in the first two countries. This does, however, not necessarily mean that it is practiced less in Thailand.

The lack of public space

In several of the initiatives, such as Co-create Charoenkrung (Bangkok), Play Depot (Hong Kong) and Lorong Bandar 13 (Kuala Lumpur), design interventions were performed that had an impact on public areas. However, in all three cities the availability of public space was an issue. Public space, particularly in Europe, is often assumed to be owned by the (local) government. However, in Bangkok and Kuala Lumpur, most of the spaces that appear to be public, such as parks and riverfronts, are owned by private parties who have no particular interest in participating in social innovation. Since government influence over these companies is limited, their lack of cooperation can disrupt any kind or intervention that affects public areas. In Hong Kong, physical space itself is extremely scarce and one of the city's most urgent issues. The availability of public space is generally not considered to be as a condition for social innovation from the dominant western perspective. This is exemplified by a study conducted by Thammasat University for the Co-create Charoenkrung project, which found that public space as an indicator was, in fact, missing from western models and therefore had to be added to their own co-creation model for creative districts.

6. Discussion

For many initiatives, particularly those stemming from an academic or institutional context, upscaling and /or replicating are often considered the ultimate indicators of success. However, this might not be necessarily be true for initiatives that originate from outside of these frameworks, whose growth is inhibited by the harsh and unforgiven conditions in which they need to operate; they are simply surviving. Even for initiatives which do have a background in academia, such as Water Warriors, the clash between its grassroots philosophy and the university's institutional framework proved to be a serious challenge to its existence, as scaling up the initiative failed to include the social network which was present in its original incarnation. Therefore, it should be reconsidered whether upscaling and replication should be a default progression path for an initiative to take. In some cases, it might be preferable for initiatives to remain small, local, but true to its original intentions and principles.

Private organisations currently have little incentive to engage in social innovation, which can be problematic for initiatives that propose any kind of spatial transformation. More effort needs to be undertaken to better understand how to motivate these organisations to participate in, or at least facilitate, social innovation efforts. However, practitioners also need to accept that some organisations will never be persuaded to participate, which can have significant implications for the scope and scale of proposed interventions. For initiatives it is therefore essential to communicate appropriately with their stakeholders, managing their perceptions and expectations, and setting goals that are realistic in order to avoid disappointment or even disengagement.

A common factor which binds most of the bottom-up initiatives in this study is the precarious state in which they find themselves. In addition to helping local communities, they also need to sustain themselves, which is a constant struggle. Embracing this notion of precariousness by incorporating it in their practice might be one way for practitioners to deal with this. Designers would have to accept the fact that they themselves will most likely not be making a change nor bear witness to it. Their main task then would be to build capacity and transfer ownership to the community within a limited timeframe, which would not be far from the project-based way of working that designers already practice. However, whether such short-term interactions with the community would have sufficient meaning or value is debatable.

If designers should indeed shift their focus to the creation of favourable environments for communities to co-design with one another, a more effective solution might therefore be to create enabling ecosystems for the initiatives themselves as well. By aligning their own goals with those of other stakeholders or actors, practitioners might be able construct an environment where they are supported by those who have an interest in the success of the initiative.

Social relations are forces that can be considered as fundamental to design and social innovation and whose significance we have only recently begun to understand. Their influence can be felt in a variety of ways, particularly when trying to sustain initiatives. For example, upscaling and replicating can fail if the social components are not taken into account. Maintaining healthy social relations with the community, governments and private organisations can help initiatives survive in inhospitable environments. But perhaps most importantly, the social fabric that has been carefully built up for the community by the practitioners has the potential to outlast the initiative itself. The creation of the social relations that constitute it should therefore take priority over any design activity as any designed product, service or intervention would have no meaning or value if the social dimension is absent.

7. Conclusion

The experiences shared by practitioners from Hong Kong, Bangkok and Kuala Lumpur contribute to a more thorough understanding of how design and social innovation initiatives that grow up 'in the wild' manage to sustain themselves. The constant precariousness state of the initiatives, and in some cases the practitioners themselves, is perhaps is what stands out most. Initiatives that are rooted in academia or government could be perceived as ships who have a home port, a safe harbour where they are based and from which they can sail into the open sea. In contrast, initiatives that are 'out there', are ships constantly battling a rough sea, which might not necessarily be hostile, but merely indifferent to their existence.

For design to make a truly meaningful contribution to social innovation, its primary objective should be to enable initiatives to move beyond their exploration and experimental stages towards long-term independent survival. The construction and maintenance of social relations, awareness on the many complex ways how they exert influence the design process and how they can be grown and managed in a more effective way is crucial for the well-being and survival of the initiative in the long run.

Sustainable Deliberation; an Empathetic 'Mantra'

Amita Deshpande*[a], Ranjana Dani[b],

[a]ReCharkha – The EcoSocial Tribe, India
[b]MIT Institute of Design, Pune, India
*amita@recharkha.org

Abstract | In the current scenario, sustainability, as a way of life is being touted as the new 'mantra'! The design thinker is seen to perceive it as a Social Innovation. Identifying the specific issue of Plastic Pollution, 'Refuse and Reduce' are ideals of a bygone era! The volume of plastic waste needs serious deliberation; but, with 'solution-led' plans using design thinking. reCharkha – The EcoSocial Tribe, is the story of looking at this social issue of plastic waste in the face and, identifying realistic solutions. Adopting the ideals of a circular economy, through a policy of 'RE-USE BY UPCYCLING', seems to have worked as a smart solution!
reCharkha's uniquely sensitive approach uses traditional technology, which is sensitive to the environment and also brings about economic well-being and women empowerment. reCharkha's way to revitalize a craft, which focuses on 'Handmade in India' as the current cultural trend, infusing cultural abundance within contemporaneity; that every sensitive millennial wants to be a part of.

KEYWORDS | DESIGN THINKING, UPCYCLE, PROVIDING LIVELIHOODS, WOMEN EMPOWERMENT, REVIVING CULTURAL CRAFT

1. India; A fertile ground for sustainable change

The Indian diaspora lives within unique and varied lifescapes. While some live in villages or rural settings, others live in industrial towns or uptown cities, also known as urban settings; besides 'villagers and urbanites', they could also be categorized as local, global and 'glocal' Indians. Their social and cultural realities are varied, the urban college-educated professionals being more world-wise from their rural counterparts who have little exposure. There is great diversity in lifestyle and language across India and many folks have minimal literacy. They are inherently steeped in tradition; there seems to be a revival of a newfound 'Indianness'* in their perceptions despite of globalization. They are respectful of belonging to a rich heritage of glorious traditions and values inspired by naturopathy and *ayurved* and a fascination and pride for the treasures inherited in the form of Indian crafts. Indian culture, being resilient in nature, is seen to be robust in its value - based social fabric; India is a fertile ground for adaptivity to sustainable development aimed at betterment of society.

As utilized in due context by various designers, 'GLOCAL'15, the term first appeared in 1980s in a publication of the Harvard Business Review, at a 1997 conference on "Globalization and Indigenous Culture"; sociologist Roland Robertson stated that 'glocalization' meant the simultaneity or the co-presence – of both universalizing and particularizing tendencies.

2. Empathy; The core of social change

Design for Social Development* or Service Design* are popular terms used within the field of Social Development; it identifies a cohesive integration of design thinking within a focus on strategic thinking. Being a powerful tool, an 'empathetic design strategy, is seen to improve the chances of success of development projects. It strives for behavioral change through information dissemination, education, or generating awareness. Further, it provides relevance through tangible products or system solutions that engage people to change long-established practices or rigid mindsets.

Proposing suitable solutions for the upliftment of any scenario means revisiting some of the basic premises that we normally take for granted. It requires understanding of a 'world view' that is aligned to a global sensibility, as also, respecting cultural sensitivities of communities that deeply value their roots. Design for Social Change* demands that characteristics of empathy, engagement, responsibility and an overall 'Sustainable Deliberation' become the significant drivers in the professional practice of social development. The role of ethical considerations at national, international and global level, as also interdisciplinary design practice norms need to be taken into consideration. Research of professional models and performance assessment methods need to be applied. Regular participation in ethical debates and analysis of processes prevailing within current environments, are seen to be useful in achieving collective or personal goals.

Any type of development requires some kind of behavior change on the part of all involved stakeholders. In order to effect behavioral change, it is necessary to understand why people do what they do and understand the barriers that may stop positive change in adopting newer relevant practices. An empathetic attitude would be critical to understand peoples' barriers that any change would entail, as perceived by them. A study of ethnography and cultural contexts has proven to be an effective way to understand target audiences. Meaningful and wholesome research is about feeling the 'pulse of a particular audience', listening to their feedback, and responding appropriately. Whether discussing a development project or broader economic reforms — from health, environmental issues, education or grassroot development to private sector development, financial support or judicial reform, the idea is to build consensus by generating a well-informed dialogue among stakeholders. The success or failure of a project can often be affected by the relevance of Design Innovation and how well it engages essential aspects of local, political, social and cultural realities. Reform efforts or development projects have often been successful, when built on a substantial foundation of an 'immersive approach' to Design Thinking.

3. India: a land of varied perceptions

India is called a Developing Nation; indeed there have been some clear indicatives of a focused change in terms of industrial, political, economic and social change. The fairly focused pace of 'development' is rampantly affecting the entire landscape of India in a drastic manner, both Ecologically and Socially. Many of India's cluttered, overpopulated and unkempt cities and towns clearly indicate an insensitive disregard for an eco-system that defines a progressive society. Many heart-rending questions arise regarding the environmental degradation as also the degeneration of the social fabric as is being witnessed in India, especially more so in urban India. These need to be urgently addressed. Are littered roads a part of the smart-city landscape? Does pollution get substantially addressed within the framework of the regulatory civic systems? Are the present conditions and possibility of a chaotic and hazardous future not disturbing the mindsets of the educated and cultured urbanite? The empathetic steps taken to improve this scenario, need to be addressed urgently, as also, the rate of change needs to hasten as a priority.

However, as one goes away from the urban areas to remote areas or then to the newly rediscovered farmhouse living concepts, one can experience a contrasting situation! Here, the relationship between people and their EcoSocial surrounding is still somewhat intact and humane. They seem to respect and worship nature, not necessarily extending a ritualistic tradition, but with keener sensibilities of a mind not invaded by the gory impacts of industrialization gone wayward! A strong social bond within the community, inherently much more at peace with what is around them and within themselves too! These are the real 'Grassroots' of India. That's when one realizes that the inherent culture of India is essentially substantial and resilient in nature!

However, as one goes away from the urban areas to remote rural and tribal areas, one can experience a contrasting situation! Here, the relationship between people and their EcoSocial surrounding is still somewhat intact and humane. They seem to respect and worship nature, not necessarily extending a ritualistic tradition, but with keener sensibilities of a mind not invaded by the gory impacts of industrialization gone wayward! A strong social bond within the community, inherently much more at peace with what is around them and within themselves too! These are the real 'Grassroots' of India. That's when one realizes that the inherent culture of India is essentially substantial and resilient in nature!

Our interdependence on this inherent EcoSocial fabric amplifies India's traditional wisdom, which is being practiced even today; be it Ayurveda and Naturopathy, which uses soil and plants to cure many chronic diseases; be it organic and traditional farming, which optimizes use of water, soil, microbes and other living organisms to produce healthier food; be it conventional housing, which uses local stone, soil and other natural resources to make climate resilient houses well-suited for the diverse geographic and climatic conditions of our country; be it our beautiful and extraordinary handicraft which has always provided a source pride and livelihood to a large population of our country. Precisely, 4.3 million people directly and indirectly are still involved in the craft production; the handloom industry is the second-largest employment provider for the rural population in India, after agriculture.

A drastic degradation of the environment has prompted a realization in today's generation; environmental issues that are causing societal upheaval will not cease or reverse, until social beings change their ways. Practices of the yesteryears could well be an inspiration for a sustainable lifestyle! A deliberate 'move' towards sustainable living, a revival of simple living; possibly prompted by drastic environmental issues that have definitely caused huge concerns, can be observed. Sustainability, as a way of life is being touted as the new 'mantra'…..a lifestyle!!!

Figure 1: Ancient system of medicine 'Ayurveda'; Figure 2: Nature, Climate resilient houses

4. Design: a professional problem solver

Design is seen to have transformational power. Design methods, design attitudes and approaches are being looked upon as tools to create and deliver sustained value. Businesses and brands that are substantial in terms of their commercial footing, are seeing design as the source to build the competitive advantage in terms of innovation, differentiation and sustainability. Socially motivated organisations, in their CSR programs, are increasingly using design thinking as holistic problem solving tool, in terms of exploring how design could make their systems and processes effective.

Design has always been respected to be a problem solving activity; design innovation offers scope to change the world. The design thinker is seen to perceive social innovation with a rare depth when proposing a substantial solution. Design innovation is seen as that which possibly brings relevance, energy and strength and prompts a holistic and realistic solution. The generation of creative concepts provides functional relevance to validate the strength of a purposeful idea.

However, the challenges and opportunities of developing nation like India are different from those of a developed economy. Therefore, even though design is already making inroads into the developing economies, the role of design needs to be contextually envisioned.

From the typical rhetoric, like "Good Design is Good Business" (Watson, 1950) to the more recent one like "Design as a Source of Competitive Advantage" (Martin, 2009), the role of design is no doubt significant globally. Even in India, designers have done a lot of study on this front such as, in their book, Design and Environment: An Introductory manual, Kumar and Vyas, elaborate the concepts of and significance of Design Thinking. Organizations like KPMG are India's design thinking practitioner's workshops. When the Design domain interfaces with Business it generates 'structure and process orientedness'. Whether it is Research, Production or CSR, all could become "templatised" with clear set of objectives generating characteristics of reliability, predictability and scalability.

> "Design has emerged as a high-profile activity, indispensable to quality in sophisticated sectors of manufacture and communication. Yet the original inspiration for bringing design to this land—to lift the quality of life for millions living at the margins of existence in villages and urban slums—remains virtually untouched" (H. Alpay Er, 1997)

Design process contributes to providing a systematic approach to social design and in turn, contributes to improving human well-being and livelihood. The agenda of Social Design is inspired by, among many others' Victor Papanek's * idea that designers and creative professionals have an inherent capability as also the responsibility to cause real change in the world through substantial design. Papanek expands the term of 'Responsible Design' as contributions made through more ecological products made of eco-friendly materials or developing living environment and habitat that is conspired with natural elements. He also remarks on designing for people 'needs' rather than their 'wants'.

Social design thinking also indicates the integration of products and processes as creative capital. Another author that contributes to the development of this definition of social design is Victor Margolin*. He writes in "The Politics of the Artificial" about the "designer's ability to envision and give form on material and immaterial products that can address human problems on broad scale and contribute to social well-being." The restrictive view of social design as charity is insensitive to economic development of a section of society. It needs to be respected as professional contribution to the development of the larger well-being in terms of the potential of the patenting of products and processes that have substantial value. Also, companies like IDEO* have established the significance of human-centeredness approach to generate innovative solutions.

5. Social Design with a realistic vision: the designer, “an Agent of Change”

The growing menace of plastic has been a nightmare within the lifestyle of a so-called modern society. It’s an oft used material which has engulfed the environment amplifying, ‘unashamed utilization of the ugly against adaptation of the wholesome’. When addressing the issue of Plastic Pollution in India, ‘Refuse and Reduce’ are ideals of a bygone era! Plastic came into existence only about 6 decades ago, and its mass production has already generated 8.3 billion metric tonnes of it, mostly as disposable products, thus, 6.3 billion metric tonnes is now plastic waste. Out of this, barely 9% has been recycled. The remaining 91% which has not been recycled is either dumped into layers of landfill or finds its way into water ways and finally into the huge gyres of plastic waste created in our oceans. More than 8 million tonnes of plastic enter the oceans each year, equal to dumping a garbage truck of plastic every minute*. As much as 80 per cent of all litter in our oceans is made of plastic. Thus harming the entire ecosystem, be it marine or terrestrial! Marine debris is harming more than 800 species. 40 per cent of marine mammals and 44 per cent of seabird species are affected by marine debris ingestion. According to some estimates, at the rate we are dumping items such as plastic bottles, bags and cups after a single use, by 2050 oceans will carry more plastic mass than fish, and an estimated 99 per cent of seabirds will have ingested plastic. Plastic waste kills up to 1 million sea birds, 100,000 sea mammals, marine turtles and countless fish each year.

Figures 3 and 4: Typical sites of street dumps and landfills harming stray animals and causing air pollution

Figures 5 and 6: Plastic waste being thrown into rivers and the state of rivers dumped with waste

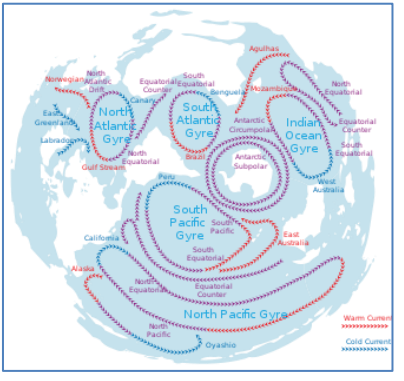

Figure 7 and 8: Plastic impacting marine life and extent of Garbage patches created all over the planet

The volume of plastic pollution and the harm from such waste, needs serious deliberation; with 'solution-led' and workable plans. reCharkha, an Eco-Social Initiative, is the story, among many others, of looking at the social issue of plastic waste in the face, and, identifying realistic solutions driven by sound process of design thinking derived through extensive research.

At reCharkha, a chronic global issue, caused due to the modern, wasteful and unsustainable lifestyle, the need to find inspiration at the grassroots of a substantial traditional systems proved to be a seamless and most natural eco-social solution!

REfuse and Reduce, though definitely the ideal solutions, are impractical and extremely difficult to implement, given that plastic has become such an essential part of the lives in any Indian urban setting! REcycle is another known solution. The currently used techniques of recycling or reprocessing plastic waste, range from incineration, pyrolysis and chemical recycling, are however methods also causing pollution!

reCharkha's first foundation pillar being "EcoSocial Conservation", REuse by UPCYCLING was adopted as the ideal solution. Based on the theory of 'REUSE', reviewed with practical ideals and infused with innovative ideas; it proposes social innovation to uphold the ideals of sustainability for the current scenario in India, delving deep to align with the mindsets and perceptions of the contemporary Indian target audiences. Adopting the ideals of a circular economy through a policy of 'RE-USE BY UPCYCLING', to address the problem statement of 'Stalling the rate of the ever-growing plastic dump', seems to have worked as a smart solution!

Another relevant aspect which reCharkha identified was that of addressing livelihoods in the rural settings which suffered due to severe deficit of livelihood opportunities. Before launching the program, a core team of reCharkha, toured various rural and tribal areas of India extensively, to gauge the situation from closer up. Realization dawned in form of apathetic facts. A majority of these rural dwellers were dependent only on rain-fed agriculture, which typically takes place for 4-6 months every year. For the rest of the year, many had to migrate to towns and cities in search of odd jobs. Because of this, majority of the working men had to live away from their families, as bringing up families in the cities is even more expensive. The younger generation is being driven by circumstance to move away from an agricultural economy, leading to large scale migration of rural youth to urban areas. This is draining away village youth to overpopulated towns and cities, further burdening the urban infrastructure. Most modern skill development and livelihood development programs are seen channelized specifically at rural youth. Their movement towards urban centers saw a waste of this facilitation since it could not be reutilized by the younger or older generations!! Thus, presenting how mis-focussed strides in economic development are shamefully disregarding the issues of livelihood and tearing apart the delicate social fabric. This called for specific addresal of the issues of a typical community.

6. Community development with a holistic, yet individual focus

Community development is subjective, since focused people in consideration; their socio-economical background, their ingrained culture and traditions, their lifestyles as also their typical habits and intricate perceptions are community specific.

Development and culture, as being closely interdependent on each other, are dynamic concepts. A historical survey of its relevance is seen in many a case studies that claim Social Change for typical communities that demand individualistic solutions. Here, the three conventional 'dichotomies' call for discussion in terms of factors that influence a design proposal for change: (a) tradition and modernity, (b) universalism and relativism, and (c) individualism and collectivism. This generates questions like, the right of an individual and also as active agents, participating in generating a holistic solution with an institutional approach; the feasibility of a broader system in terms of both its crafting and delivering a substantial output. The illustration below gives a framework for Design for Social Impact:

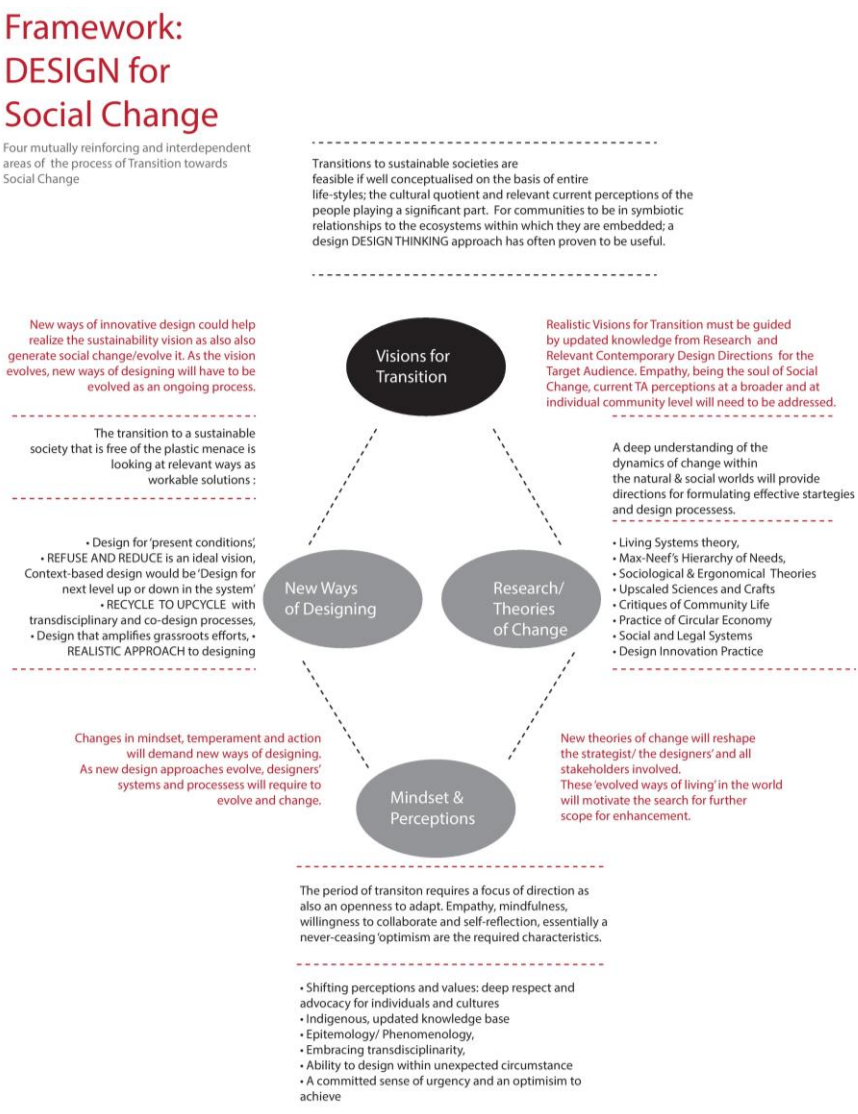

Figure 9: Framework – Design for Social Impact

In 2015, reCharkha launched the first project through the implementation of its second foundation pillar, 'EcoSocial Change', where they focused on a community with potential to be ideal stakeholders, a bunch of quick and eager learners, to contribute to the solving of a huge social issue. A remote village in the western hills of the Union Territory of Dadra Nagar

Haveli was chosen and nurtured to become Agents of Change!! This 100% tribal village, consisting of the Warli tribals, traditionally known for their artistic inclinations of crafting wall paintings, excitedly joined the revolution. They extended their inherent artistic abilities to learn a new craft, Handloom Weaving. Today, 14 young women and men of the village, have mastered the art, and work fulltime towards a huge common goal. Essentially many more local women are hired for many of the activities of this project, which has overall impacted about 20 families of a tribal village. This has generated an unheard phenomenon of 'Women Empowerment' through generating of livelihood for a nascent female section of society. The project promises definite scope for engaging large volume of helping hands, when scaled to benefit a larger target of society.

The UPCYCLING process is very engaging; waste plastic bags and wrappers are collected from waste pickers and enthusiastic hubs of society, from grocery and shopping bags of all microns, wrappers of household items such as detergent packets, diaper packets, food packets (wafers, cookies, biscuits) and many other items that are 'wrapped' to interesting waste such as old VHS and audio cassette tapes are utilized (as depicted in the image below)

Figure 10: Raw material used for Upcycling by reCharkha – The EcoSocial Tribe

These are sanitized and sorted into different colors. The original colors are retained and deliberated upon to generate interesting designs and patterns; (they are not dyed as the colorfulness provides scope for furthering the saleability). The cleaned waste plastic is cut into strips using just a pair of scissors to form plarn, and bundled to be used to weave a beautiful fabric using a traditional spindle (charkha) and handloom. The entire process of weaving fabric is manual and a labor of love as its outcome is a magical expression of unique compositions crafted by deft interactions of the warp and weft system of the weaving process. Here, the third pillar of "EcoSocial Sustainability" comes to light with the revival of a sustainable and culturally rich hand weaving system as the choice to generate plastic fabric from the handloom.

The fabric is tailored into designed products by a team of 18 men and women in Pune; functional yet trendy handbags, totes, purses, laptop/electronic accessories, home décor products and other utility items are manufactured for a conscious buyer. Our Pune workshop consists of 18 women and men. A conscientious team of 32 fulltime employees, and indirectly impacted 20 plus families form the invaluable team which is growing with the scope of this EcoSocial Initiative.

The in the link below, shows the "Why" and "How" of what we do:
https://www.youtube.com/watch?v=g7xkPF2fa18

The fourth and vital foundation pillar of reCharkha, namely "EcoSocial Participation" smartly engages the customers as supporters of the cause by involving them in the collection of plastic waste (from societies, schools and families) volunteering to design market trending products and marketing and selling the products by spreading the message of EcoSocial Development to a larger population! The production and generation of sales for the range of daily-use products has become an EcoSocial Movement; aiming to create a new generation of Conscious Consumers!

Though consumerism is the culprit of the growing problem of plastic waste, to prompt the buying of products made from reused/upcycled/recycled material, seems to be a realistic solution benefitting the environment; thus, reducing those many resources from being freshly extracted from the environment. A typical UPCYCLED-HANDWOVEN BEACH BAG from reCharkha, has upcycled about 45-50 waste plastic bags and wrappers, thus removing them from the waste stream! Simultaneously, resources required to create a new beach bag from virgin polyester (a petroleum product) or even a plant-based resource are avoided! Each Upcycled Handwoven Beach bag from reCharkha, creates 1 to 1.5 man-days of work for the underprivileged in our society as a strategically designed effort of EcoSocial relevance, a proof of resilience in Design thinking and doing!

Figure 11: EcoSocial Conservation

Figure 12: EcoSocial Change

Figure 13: EcoSocial Sustainability

Figure 14: EcoSocial Participation

reCharkha, an EcoSocial Initiative, is the story, among many others, where practical ideals are infused with innovative ideas. Design thinking proposes social innovation to uphold the ideals of sustainability for the current scenario in India. 'Handmade in India', as a much-favoured trend, infuses cultural abundance and contemporaneity. This design solution amply validates the resilient character of a well-designed project and its products.

Its narrative has a uniquely sensitive approach that extends a dynamic concept. It is seen, reviving traditional values and the nuances of an eco-friendly craft; as also lending a personalized involvement by the craftswomen and the prospective consumer. The unique upcycled products make an emphatic statement that abhors undue industrial encroachments on the environment. A major issue was addressed through the initiative to balance the 'migration imbalance' between rural and urban areas. Furthering the concept of women empowerment, it has provided livelihoods to many and emancipation to rural women who are proud members of this Movement for Social Change.

Figure 17 and 18: reCharkha's UPCYCLED-HANDWOVEN Bags and Pouches

Figure 19 and 20: reCharkha's UPCYCLED-HANDWOVEN Home Décor collection

7. Observations: Good Design is about Resilient Systems

At the broader level, it is amply relevant that Innovative Design Strategy, that empathetically involves people and culturally relevant tools, could well be an effective formula to generate social development. At an individual level, the testimony of an involved user who believes in the benefits is proof of the fervour generated by the cause. Design for Social Change validates it resilience in the fulfilling of, the holistic ideals of "Conserving the Environment" and "Enabling EcoSocial Empowerment".

Design Thinking and its optimistic process is seen to push designers ever onward in pursuit of workable solutions through empathetic response to stories of real troubles. Intractable issues may need a more intricate level of immersion at certain levels of the design process. An empathetic strategic designer is capable of attending to the nuances of the social spaces they work in and address 'what' they are driving themselves towards, 'who' and 'what' is shaping a relevant change and 'why'. The sensitively innovative designer is able to interpret the world around them and visualize innovative ideas of 'how' to change society for the better.

Wicked social problems demand a critical and analytical approach to important resources that drive substantial change in providing resilient solutions. The interdisciplinary approach of design prompts deeper immersion into the research activity rather than just borrowing from social sciences and ethnography; specially where ethnic contexts are essentially significant as is in the Indian socioscape. Here concepts such as reflexivity can generate deeper awareness through participation of communities that would best understand how and what they can change! With blurred interdisciplinary boundaries, it becomes important to respect the contributions of each specialist as also develop credible tools to reflect on the nature of the individual's contribution and its possible and actual impacts.

8. Philosophy of Change

In relevance to ambitious development, **"**There is no passion to be found playing small – in settling for a life that is less than the one you are capable of living." – Nelson Mandela

With respect to the empathetic approach to sensitive development "User centricity is the key to Good design solutions" Kumar Vyas

Abstract | Wicked problems are present in societies from the Global North to the Global South such as displacement, dispossession and homelessness. These are indubitably key dimension of present time. The COVID-19 has deepened these problems. Such crisis requires us to consider challenges to scholars and professionals, regardless of knowledge area. Service design and design for social innovation are rooted in social issues and could be tools to address and mitigate these problems. Nonetheless, marginalised communities and dispossession remain at the margins in the service design and design for social innovation literature. From the analysis of two students' projects, we critically examine the significant contributions of service design and social innovation methods and tools in such contexts. The concept of alterity and arts-based methods emerged as a pathway for building a humble perspective for service designers working with wicked problems in the context of marginalisation. The SEEYouth research project will allow us to conduct an in-depth exploration of this perspective and its potential for addressing these problems.

KEYWORDS | SERVICE DESIGN, SOCIAL INNOVATION, COMMUNITIES AT THE MARGINS

1. Introduction

From the Global North to the Global South, countries have been facing perverse social problems, also called wicked problems. Living in precarious conditions of urban poverty and without fundamental human rights, such as access to health services, food, education and employment, marginalised people often face a lack of dignity in their everyday lives. Service design and design for social innovation are rooted in social issues (Miettinen & Valtonen, 2012; Manzini, 2008; Meroni & Sangiorgi, 2011). According to Buchanan (2001, p. 36), 'design is fundamentally grounded in human dignity and human rights'.

Nonetheless, marginalised communities remain at the periphery in both service design and design for social innovation research and literature. A simple search[1] using the Web of Science search engine and the keywords, "marginali*ed" (using asterisk to get both British and American English) and "service design", resulted in only 12 articles. Seven articles were found when the search was performed by replacing "service design" with "social innovation" and "design" + "marginali*ed". Another search using the keywords "margins" and "social innovation", resulted in nine articles; and "margins" and "service design". Replacing marginalised with "poverty" resulted in 16 and 21 articles, respectively, when added to the strings "service design" and "social innovation" and "design".

Some of these papers were written by authors from the DESIS Network research group, which has been working with social issues in the context of social innovation. Authors, such as Carla Cipolla (Brazil) and Satu Miettinen (Finland) and their collaborators have published many articles, mostly presented at conferences, that encompass communities at the margins in Brazil and Africa.

However, recent service design and design literature has highlighted how future professionals in the field should be better trained to tackle social issues that are considered to be wicked problems (e.g. Augsten & Gekeler, 2017; Sepers, 2017). Souleles (2017) has written about the need for empathy, ethnographic and action research to address social problems. That approach is based on collaborative and participatory methods in which the researcher and the participant are viewed as equals (Souleles, 2017).

Thus, this article describes two projects developed by undergraduate students from the University of São Paulo, School of Architecture and Urbanism, to improve the life of a group of *catadores* (recycling material collectors) in the city of São Paulo, Brazil. This article also introduces the "Social Innovation through Participatory Art and Design with Youth at the Margins: Solutions for Engaging and Empowering Youth with Trans-Atlantic Mirroring" (SEEYouth) project where lessons and methods learned from previous experiences of teaching and conducting research with communities at the social margins will continue to be developed.

[1] The search was first performed on 15 January 2020 and then again on 10 December 2020. Data were updated to reflect the results obtained from the second search.

The analysis of these projects will critically examine the significant contributions of service design and social innovation methods and tools in such contexts; it will also discuss the possibility of scaling up local experiences to the context of being at the margins. Furthermore, if that is possible, what structures could support its scalability? (Morelli, 2015). The projects and their potential impact shed light on how to enhance students' awareness of local and global social issues by designing from a humble perspective.

2. Visibility and Dignity to Cope Marginalisation

In this paper, we describe two projects developed by undergraduate students in two courses, Design for Sustainability and Introduction to Service Design, both offered by the Department of Project at University of São Paulo, School of Architecture and Urbanism (Brazil).

The Design for Sustainability course was created and taught by Professor Maria Cecilia Loschiavo dos Santos since 2003; it discusses environmental, economic and social issues related to design in terms of production and consumption. It encompasses site visits to COOPAMARE and design with/for this group (Santos, 2004; Santos et al., 2016). COOPAMARE was formed by a group of homeless people that created a cooperative to collect recycling materials almost 30 years ago. Nowadays, most of the people are no longer living on the streets, and a group of youth refugees from Haiti is also working with them. Some challenges, such as prejudice and poverty, still persist while additional ones have emerged, such as gender discrimination and language issues.

Immersed in the urban context, the culture of the catadores is built from the disposal of items accumulated from industrialised society (Santos, 2014). Students are introduced to the context of the catadores' every day journey, by visiting the cooperative and observing their work in the field (inside the cooperative and on the streets), and engaging in dialogue with the group's members. Based on a collaborative and participatory process, students, professors and catadores widely discussed the existing problems and opportunities to address and resolve them. By knowing the catadores' everyday life and struggles, and their survival strategies, the students have been developing several projects that aim to promote the visibility and dignity of the catadores so they can better cope with their marginalisation.

The Introduction to Service Design course was offered for the first time at the same school in 2019. Feeding was chosen as the main topic. Services related to food are a global issue and several service design strategies can be applied, including providing opportunities to mitigate poverty and alleviate hunger. In this first experience, some of the students deliberately chose to develop feeding services for people at the societal margins as a way to enhance their dignity.

Figure 1. Catadores and their "carroça" cart (right side). Image: Amanda Kubo e Caroline Speridião.

2.1 Improving the Lives of Catadores' through Food Services

Most of what the catadores' experience takes place on the streets, where they collect the material. Problems, such as the lack of both financial and situational conditions (as well as hygiene and cleanliness guidelines for proper food) emerged as one of the problems that the students observed in the catadores' routine. As noted by Santos et al. (2016), many citizens consider catadores to be dirty people, even delinquents. It is common to see restaurant managers prohibiting catadores from entering their establishments and justifying their attitude as a way of not disturbing their clients. Catadores are only allowed to receive surplus food from the restaurant after the lunch period, and to eat outside the establishments, deepening their vulnerability.

To address and resolve the situation of being at the margins in financial and social interactions related to the essential right of eating in the catadores' daily journey, the students proposed a service that involves a wide range of stakeholders (actors) using the Stakeholder Map tool.

Developed by two students, Amanda Kubo and Caroline Speridião, Sustenta! is a system that encompasses service and product design; it is intended to offer opportunities to eat with dignity while promoting socialisation. The system will provide eating spaces and workshops, together with the delivery of a kit, that is aimed to transport food in a cart during the catadores' working hours. According to Kubo and Speridião:

> "The proposal is to carry out the revitalisation of spaces for coexistence within warehouses, points for recycling materials and cooperatives, in addition to organising small workshops aimed at handling food within these spaces. To pursue this solution, we count on donations and much collaboration from volunteers and partners, such as local restaurants, associations, neighbourhoods and NGOs."

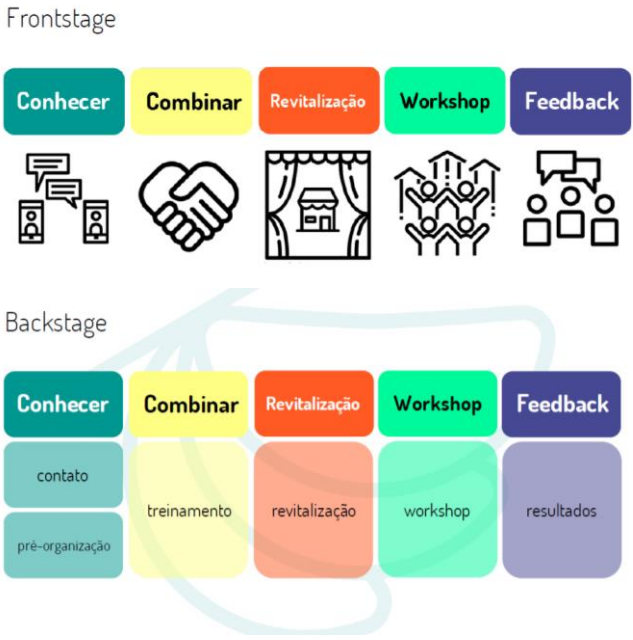

Figure 2. Frontstage and backstage of the Sustenta! service. Image: Amanda Kubo and Caroline Speridião.

2.2 Increasing Knowledge about the Relevance of the Catadores' Work

In the city of São Paulo, every inhabitant produces 352 kg of garbage a year. Only a bit more than 1% of that is recycled, and the problem would be worse without the work of the catadores: they are responsible for gathering more than 90% of the material that is to be recycled. There are more than 30 cooperatives and 15 thousand catadores in the city. Together, they collect around 30 tons of recycling materials per day, thus playing a crucial role in society and in protecting the environment. Nonetheless, their work is still invisible and undervalued, which keeps them at the margins of society. Thus, the students decided to develop an app to increase knowledge about the relevance of the catadores' work, mitigating their invisibility. As one student, Juliana Eiko Hiroki, noted:

> "Coopera, SP! consists of a free educational game for mobile phones (IOS and Android), developed to make the population aware of the importance of the issue of solid waste in cities, of recycling collectors in society and their cooperatives, in addition to the processes involved since collection, separation and reuse of this waste. Taking advantage of the current situation, in which cell phones and their countless applications and games occupy a large part of people's time, the objective of this work is to disseminate on a large scale the importance of recycling collectors, besides to make the population aware of the steps involved in the recycling process."

Figure 3. Coopera, SP! app: through a game, the population of the city could become aware of the recycling process and the relevance of the catadores' work. Image from Juliana Eiko Hiroki.

3. Youth at the Margins

As researchers, we have a shared aim to continue the use and development of the humble inquiry and participatory development in the SEEYouth project. This project will investigate the youth marginalisation that occurs inside groups of homeless people and refugees in São Paulo, Brazil and in Helsinki and Kemi, Finland. Five universities (University of Lapland, University of São Paulo, University of the State of São Paulo, University of Leeds and University of Montreal) received funding from several funding instruments (Academy of Finland (A/Finland), United Kingdom Research and Innovation (UKRI/United Kingdom), Fonds de Recherche du Québec—Société et Culture (FRQSC/Canadá) and Fundação de Amparo à Pesquisa do Estado de São Paulo (FAPESP/Brazil).

The researchers from the four countries have worked on similar projects and have an interest in increasing scientific knowledge about the tools and methods from service design and arts-based-methods applied to tackle poverty and marginalisation.

From the previous Participatory Development with the Youth (PARTY) and Margin to Margin projects, tools, such as The Hero's Journey (Sarantou et al., 2017) and storytelling methods (Miettinen et al., 2016), were designed to increase youths' self-esteem, motivation and awareness. Often self-esteem and motivation are crucial for youth to have the courage to live their life and the desire change, searching for something new. Toward that end, it is important for an individual to see himself/herself not as someone on the margins, but as a powerful person who can find his/her own path.

4. Alterity and Humble Dialogues as Possibilities for Service Design and Social Innovation Teaching and Practice

Collaborative approaches are often used to tackle wicked problems (Roberts, 2000; Suoheimo, 2016, 2019). In wicked problem projects, designers often serve as facilitators of a co-design, participatory process (Prendiville, 2018; Sepers, 2017; White & van Koten, 2016; Suoheimo et al., 2020). As White and Koten (2016, p. 41) noted:

> "In catalyzing social innovation for sustainability, designers need to take a role that is more facilitator than leader; in which they design conditions and processes to stimulate the 'wide reaching social learning' (Vezzoli, 2006) that is required for the radical transition in society."

Participatory approaches are essential in service design projects (Stickdorn et al., 2011). Thus, service design can be a holistic approach of co-designing. As Tsekleves & Cooper (2017, p. 2264) stated:

> "Service design has an essential role to play here by placing the person at the epicentre of the design and development process, leading to a service responsive to the needs of the individual."

This perspective and these methods and tools can also contribute to the idea of how service design works in the background with so many professionals and their fields by facilitating their process of addressing wicked problems. The service designer does not necessarily have the most in-depth knowledge of the field, but his/her knowledge is sufficient to facilitate the experts' processes as they work with other relevant stakeholders. This requires that the service designer immerses himself/herself in the topic by studying it. Indeed, the first phase of Double Diamond (Design Council, 2019) or the Design Thinking process also demands that the service designer obtain knowledge about the problem at hand. However, how can this be achieved in the context of marginalisation?

When dealing with wicked problems and situations related to social and economic marginalisation, service design and social innovation methods and techniques are very useful for observing the context and mapping the stakeholders that could be involved in the solution, as proposed by the students in the Sustenta! project. Nonetheless, we felt that a humbler perspective is mandatory in order to better understand the social vulnerability in contexts of marginalisation. Only empathy, or "putting oneself in someone else shoes" or, in our case, "pulling or pushing a cart of recycling material for one day", is not enough since it is challenging to understand the life of a person who experiences prejudice and invisibility every day. As the Coopera, SP! project critically proposes, the solution could be that we, not the catadores, should change.

Recognising that we do not know how the catadores feel and think, and starting with being open to listening to and getting to know them, seems to be the very first step in the

immersion process. Alterity and the concept of otherness can be more useful than empathy as a preparation.

The second question that emerges is: how can a humble dialogue with the community be initiated and sustained?

Artistic participatory design and participatory service design share many common characteristics in terms of democratising power (Mohan & Stokke, 2000; Baum et al., 2006). Souleles (2017, p. 929) has stated this well:

> "Characteristic of participatory design is that it questions the notion that only experts can become co-designers. It stands in opposition to practices built on hierarchy and control. In fact, participatory design requires that top-down control be relinquished, and end-users become active and equal partners. In this respect, it adopts an egalitarian idea of sharing in the decision-making process."

Participatory methods are used in service design and art-based research to empower people. According to Baum et al. (2006), empowerment **aims to reduce inequalities and power differences between the people involved.** Participatory art and design are methods used to decentralise power in a way that enables local people to determine developments by themselves (Mohan & Stokke, 2000). Thus, local partners and NGOs play an essential role (Mohan & Stokke, 2000). Before this approach, it was assumed that the locals would play a passive role (Mohan & Stokke, 2000). Hickey and Mohan (2004) also wrote about the importance of involving power and politics in order to have efficient outcomes. However, this approach can be challenging because not everyone wants change.

According to Baden and Wimpenny (2014), in the broadest meaning of art-related research, art is used to 'sense, to explore, understand and represent human action and experience' (p. 1). Thus, in a way, art-based research is similar to service design because it is about the experience that emerges. The service designer aims to create an improved experience of a service (Stickdorn et al., 2011). Service designers should present the voice of the customers (which, in the context of this paper, could be understood as a community) in a development process (Stickdorn et al., 2011). According to Baden and Wimpenny (2014), it is difficult to define art-based methods because they can take various forms and contexts. Baden and Wimpenny (2014) also noted that art-related research is practised or has a connection with the social sciences and arts, as well as service design (Suoheimo, 2020; Sarantou et al., 2017).

Thus, the SEEYouth project explores alterity and art-based methods with youth at the margins of society in order to deeply understand both as tools for service designers. Service design and art-based methods go hand-in-hand when dealing with contexts of marginalisation, since the choice for these methods share the same aim which is to use participatory approaches to empower marginalised groups. A more systematic review on both service design methods and art-based methods could be useful for future research as it is not yet a widely researched topic. Now, they seem to be methods that are used in the

SEEYouth project or in other socially-oriented projects. Mirroring the results from the SEEYouth project between Brazil to Finland, and vice-versa, will enhance our comprehension of the possibility of scaling up local experiences.

5. Conclusions

The tools designed solely for wicked problems use collaborative strategies (Suoheimo, 2016, 2019) as well as service design (Suoheimo, 2020). Nonetheless, there is still a lack of research on service design in contexts of marginalisation.

Ultimately, service designers aim to create transformation; social innovation can be described as a process of social change to respond to wicked problems (The Young Foundation, 2012). Wicked problems require an interdisciplinary and holistic view in order to make real change. By working within marginalised communities, students could enhance their awareness of social and global issues.

Nonetheless, students are motivated with a shift in educational practice, which is plural and fraternalistic. They are keen to understand the "spontaneous design" as pointed out by Santos (2000) and Escobar (2018) who argues in his book Designs for the Pluriverse, "Every community practices the design of itself: its organisations, its social relations, its practices, its relation to the environment". (p. 184)

They acknowledge social movements and communities' role in managing their own situations and producing knowledge about their routines. This uncodified knowledge is increasingly demanded by students who recognise and are inspired by the fraternity among these communities' members at the societal margins.

During the COVID-19 pandemic, this feeling of fraternity proved even more vital in large urban centres like São Paulo and Rio de Janeiro, where there are several positive responses to social innovation coming from favelas like Paraisópolis (in São Paulo) and Complexo da Maré (in Rio de Janeiro).

In this scenario, it is essential to recognise the severity and the dimension of global problems, especially those characterised as wicked problems. This perspective requires a humbleness position and recognition of the design(er) restricted contribution, given the magnitude of the problem.

Thus, we call for attention to the need to teach design as a re-directive practice as proposed by Fry (2001), encouraging future designers' agency on imperative societal changes and challenges to build a "sustain-able" world, from a humble perspective, listening and learning to and empowering people at the margins of society. Alterity and arts-based methods seem to be a starting point to promote a humble perspective for service designers working with wicked problems in the context of marginalisation.

*lena@thedesignvillage.org

Abstract | This study is an extension of the author's investigation into alternative, organic and contextual meanings of iconic design in India for her presentation at an international Winter School Program in Europe (2018-19). It argues for a need to expand the scope of current design pedagogies, by celebrating and incorporating indigenous wisdom, through understandings of visual/ spatial strategies of ubiquitous objects along with Euro-centric Modernist ideals which largely form its basis. As chief mentor for courses on 'correlations' for Under Graduate and Post Graduate programs in design at a private university, the author is deeply interested in connecting seemingly unrelated domains, establishing patterns and deriving analogies of semiotics and semantics, to build new directives in design education/practice. The paper is largely intuitive, based on an analytical interpretation of a regional context and strives to seek common ground with Western premises and universal paradigms. It deliberately uses images taken by unknown people.

KEYWORDS | INDIGENOUS, UBIQUITOUS, VALUES, MULTIPLICITY, ADAPTABILITY

1. The context

> "As we live and as we are, simplicity with a capital 'S' is difficult to comprehend now a days. We are no longer truly simple. We no longer live in simple terms or places. Life is a more complex struggle now. It is now valiant to be simple; a courageous thing to even want to be simple. It is a spiritual thing to comprehend what simplicity means." (Wright, 1954)

In these unpredictable times, resources are at a premium- a consequence of the excesses committed in the past half century. More importantly, tolerance is at a premium; geopolitical hegemony, economic polarity and an increasing tendency of allegiance to singular (therefore myopic) ethnic, cultural identities have cumulatively resulted in widespread armed conflict. Every existence is perhaps endangered, in its own way. Survival instinct is on red alert.

2. From habit to ritual to culture

A habit when no longer questioned or contested and instead, treated as inviolate, becomes a ritual and this ritual when practised by an entire population gets termed as a 'culture'. So also, with the culture of resilience.

2.1 Resilience

However, 'resilience'- the ability to spring back from situations that leave adverse impacts and move on, is an innate attribute of every living species, a universal one for human species. Circumstances create change; change (external and oft reversible manifestation) brings transformation (internal and irreversible) which in turn is a function of resilience or the resistance to change. If transformations are expressed as equations of permutations and combinations between 'loss' and 'traction', varied formulae emerge due to the impacts of cultural, political and systemic phenomena acting as catalysts. Thus, resilience and culture are associates in the schema of transformation.

2.2 Culture and resilience-The Indian way

It is impossible to imagine the world's largest democracy without visualising the needs and aspirations of its alarmingly enormous and vastly heterogenous population; without understanding the immense geographical diversity and the consequential social, cultural and religious melange produced; without absorbing the multiplicity of meanings, the spectrum of paradoxes and complexity of challenges that inherently define its demographics. World-wide concerns of energy, depletion of resources, increasing conflicts and the eminent prospect of unsustainable futures, also plague India. Additionally, nearly 70% (*India at a glance*, n.d.) of Indian society, agrarian by nature, is driven by vernacular design which in turn is driven by sustainable, frugal means and is usually expected to fulfil multifarious purposes. The Indian

designer operates in this complex context. India had been a thriving civilization for over 5000 years before being reduced to a nation-state. In the second millennium A.D., it was subject to prolonged plundering under despotism and colonisation. It also has a tendency of being struck by every kind of natural calamity simply because its geography is inclusive of almost every kind of landform on earth. These persistently challenging, natural and man-made circumstances have ensured that resilience started as a 'habit' and eventually metabolised into a 'culture'; the culture of resilience has become second nature to its people.

2.3 Objectification of resilience

"India has always moved ahead with the awareness that the seeds of a solution lie within the problem itself." (Nath, 2015)

As Indians became resilient, they objectified it. By tracing the narratives of an object of daily-use in the heartland of India-the *Charpai* (day-bed/cot) and the *Lota* (pot), the study attempts to demonstrate how ubiquitous objects despite their commonness, have stood their ground on what they mean to people and thus established their own notion of design and resilience. Neither changing contexts, nor the passage of time has been able to alter radically, their functions, aesthetics, semantics and semiotics. It intends to demonstrate how, for the *Charpai,* the *genuis loci* (the spirit of place) and *genius saeculi* (the spirit of time) have practically stood still. Also, the study contends that conversely, the resilience of these objects somehow represents the design culture of resilience of the people of this civilization.

Figure 1. A typical Charpai placed in upright position

2.4 A notion of design in India

As rightly pointed out by Romesh Thapar in 1979, the biggest challenge for India then (and even today)- "To raise so many (people) to recognised levels of healthy and creative living poses problems which have no parallels in lands which have already developed and advanced." (Balaram, 2011). After over half a century of independence, the responsible and responsive Indian designer is still grappling with mediating between the design needs of 'development' and 'affluence'. She also feels the need to contemplate how the influences of a 5000-year-old history can produce narratives through design.
The way of life in the ancient Indian civilisation urged constant oscillation between awareness and introspection; it advocated continuous questioning of personal and social conduct or of modes of social organisation and seeking of provisional answers appropriate to varying contexts. The disruption during the epoch of foreign invasions and colonisation has produced a *Tabula Rasa* for contemporary, educated Indians; for these ways began to be seen as mere stories of the past with little relevance in present times. They also have largely been moulded by modern consciousness. Yet at another level these ways of life are not obsolete but very much in vogue and therefore must be brought to the level of Indian consciousness and could inform contemporary Indian design.

3. Framework of the narrative

3.1 The big picture

The pandemic forced us to insert abrupt, radical and heterodox ways of thinking and living into our already pluralistic society. The 'New Normal' is somewhat an oxymoron; for 'Normal' is about stability, familiarity and predictability (which the times were far from) while 'New' is about change. The study attempts to show how the *Charpai* was 'Normal' yet 'New'. More importantly, it also seeks to question the basic premise of the definition of design; the proposition being: what if the very understanding of 'what design is', emerges from 'what design can do'? In particular as a response to vulnerabilities to disruption of life as embodied by the pandemic. Infact, it would be pertinent to propose that this ubiquitous object actually embodies the attributes of an anti-fragility system.
Additionally, it seeks to position the aesthetics of the *Charpai* through Dr Paul Hekkert's (TU Delft) postulate that the aesthetics of a product emerge from how effectively and meaningfully it performs its intended functions.
Similar to the approach in Andrew Atwood's "Not Interesting: On the Limits of Criticism in Architecture', the study seeks to not focus on the 'interesting' (something that is attention seeking) but rather look at the uninteresting, the banal and the ubiquitous and be more critical and open to new ways of reading built-environment.

3.2 The cultural subset

If we say we must live our brand, our designs must reflect the values we bring to bear.
'Guna' is a Sanskrit word with many contextual meanings. Its most generic and correlative meaning is 'strand'. In another context, it means 'virtue', 'attribute, or 'tendency'. *Guna* also

refers to 'personality' or the 'innate nature' of an individual. Within its broad meaning, it incorporates three sub- components namely *Sattva* (aspect that spells harmony and positivity/goodness), *Rajas* (aspect of confusion/spontaneous passion) and *Tamas* (aspect of negativity/state of inertia and chaos). Present in varied proportions, together they determine an entity's character.

The study will attempt to show how the *Charpai* speaks about the *Guna* of adaptability- the attribute of merging with its context while keeping its identity intact, the *Guna* of its optimistic endurance or sheer persistence, the *Guna* of readily facilitating congeniality and multiple identities (that merge), the *Guna* of being adept at multitasking, the *Guna* of having the courage to initiate new meanings. It will then explain how these eventually add up to a notion of its culture of resilience.

The narrative has been conceptualised to accommodate several positions that lie on a wide spectrum defined by two extreme ends of an attribute; from the 'ephemeral to eternal', from the 'frictional to configural', from the 'primordial to ethereal'.

4. About the *Charpai*

4.1 A brief description

The *Charpai* is a traditional, hand-woven, day-bed, most commonly found in many parts of the Indian subcontinent, Pakistan and Bangladesh; particularly in the alluvial plains and the arid parts of north India. (Punjab, Haryana, Uttar Pradesh, Rajasthan and Gujarat). Also known as '*Khaat', 'Khatiya'* and *'Manji',* in Hindi it is a compound word of *'Char'* meaning 'four' and *'Paya'* meaning 'footed'. A frame of four posts (usually wooden in nature), connected by four horizontal members sports a woven surface; a thick net of fibres made from jute, coir, cotton, leaves of the date palm, strips of cloth and (unfortunately) in contemporary times- plastic ropes. This weave allows for voids in-between the fibres and is climatically suited to aerate in the hot, dry climate. Traditionally, one does not need a mattress to lie on it.

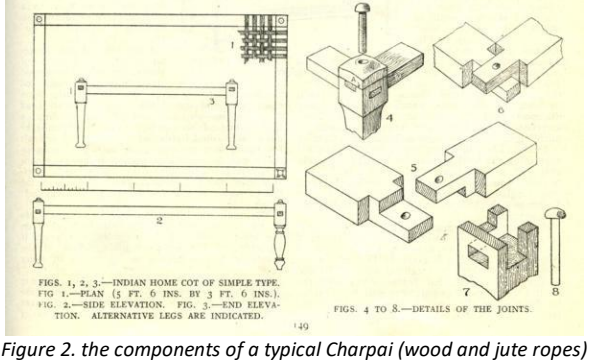

Figure 2. the components of a typical Charpai (wood and jute ropes)

In this seemingly simple 'DIY' design lies a measure of craftsmanship, of dexterity of warps and wefts, of innovation in the vivid patterns, textures and colours. Its making begins with the tying of a '*Jee'* (life knot) at one vertex of the bed. The diagonally-set weave has one end left free for weight adjustments; the linear members are positioned such that they control the sagging of the bed as it ages. Once the life of the surface is over, it can be easily strung at home.

Figure 3. A Charpai being strung or restrung, from c.1900

Figure 4. The diagonal weave gives it the required tautness and flexibility; the voids between weaves provides aeration needed in hot and dry climate

Figure 5A Varied sizes, colours, textures and materials of a contemporary Charpai

Figure 5 B Varied sizes, colours, textures and materials of a contemporary Charpai

4.2 A historical reference

The *Charpai* seems to have been in existence since antiquity; there is no convincing and absolute proof of its origin. It might have been an indigenous object or come in from Greece in the times of Alexander in the 4th. century BC. It finds mention in the chronicles of prolific medieval traveller Ibn Battuta who had this to say, "The beds in India are very light. A single man can carry one and every traveller should have his own bed. When you lie on it you need nothing else to render the bed sufficiently elastic." (Kumar, 2016)
Another important historical mention is the use in Malaysia, by British-recruited Punjabi Sikhs of the police force and night-watchmen of banks and big shops, when both countries were British colonies. A typically nostalgic and vivid memory of Malaysian witnesses of those times has been of burly Sikh guards bringing the light and airy bedsteads, propping it up near their posts, taking short naps while maintaining vigilance through the night and simply carrying it back home on their heads once the shift was over.

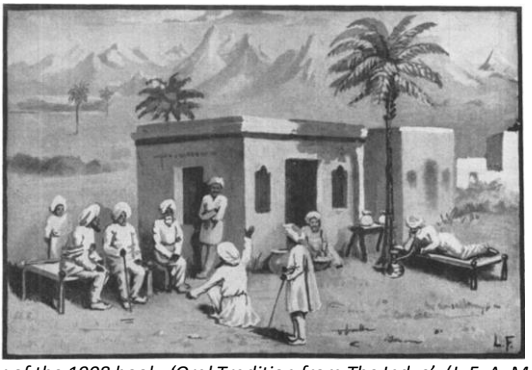

Figure 6. The cover of the 1908 book- 'Oral Tradition from The Indus', (J. F. A. McNair and Thomas Lambert Barlo) features prominently the Charpai

Figure 7. The Serendipity Arts Festival 2018 celebrated the Charpai as being 'Truly Indian'; showing the different weaves and their connotations

5. The analysis

5.1 From ephemeral to eternal

Ephemerality is a function of 'limited' time; a measure of temporality, fleetingness or cursoriness. The *Guna* of being ephemeral lies in the *Charpai's* kaleidoscopic adaptability; in its numerous and varied temporary but specific uses; in its ability to generate transient territoriality and to facilitate 'pop-up' architecture in a diverse set of circumstances.

For the homeless, the first claim towards making any 'space' their 'place' is communicated by fixing the *Charpai* somewhere in the middle-of-anywhere and this resolutely remains so, until eviction happens anytime. Thus, the time and space with the *Charpai* becomes ephemeral.

Figure 8, 9. The Charpai establishing territoriality of a quasi-shelter

Its daily-use pattern seems to follow the sun-path. In the mornings, elders use it to imbibe the 'good solar radiation' over the customary cups of tea. During late mornings, when they are through with a round of household chores, women of neighbourhoods create 'a place' on and around the *Charpai* for intimate conversations and indulgence in communal embroidery or knitting. One cannot underestimate the importance of this much-needed respite for this extremely hard-working section of the society.

Figure 10. Women of neighbourhood communities meet up and use the Charpai to converse; a welcome respite from a hard day's work

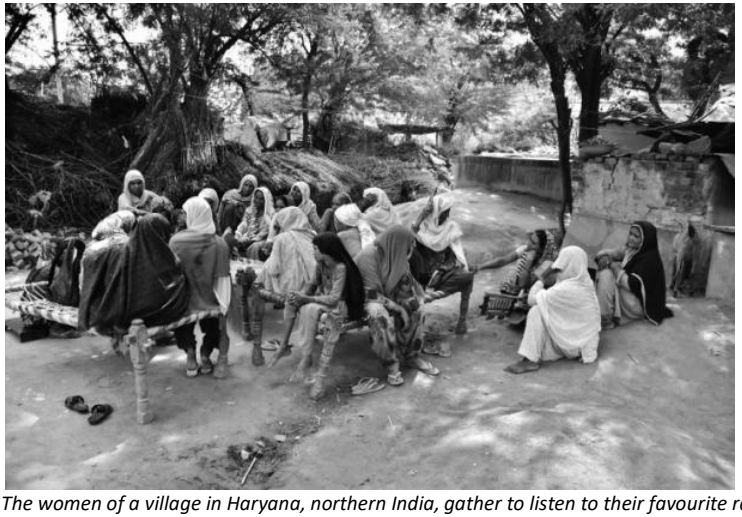

Figure 11. The women of a village in Haryana, northern India, gather to listen to their favourite radio program concerning health, education and empowerment.

By noon, it becomes a vertical or angular screen for elders and children to nap behind or as a 'double-decker-berth' for two generations. Children convert it into a trampoline; women, into a screen for privacy while bathing in not-so-closed spaces. Make-shift cradles with infants are hung on it; Pulses, condiments, wet clothes are sundried on it.

Figure 12.

Figure 13.

Figure 14.

Figure 15.

Figure 16.

Figure 17 a

Figures 10-17a. The multiple uses of the stationary Charpai as a day in the daily life of a villager unfolds

Figure 17 b. 'Khaat' embroidery; the fabric is stretched by tying to two sides of a wooden frame (Khaat or Charpai) using thick cords and embroidered from all sides simultaneously and easily because the fabric is taut. This mechanism is used by all top fashion designers in India.

The portability- the 'CIY-Carry it Yourself' factor, taken for granted in agrarian India, extends its adaptibility. Light enough to be balanced on the head by men and women, it can be transported on foot. Bicycle and motorcycle riders carry it effortlessly, by perching it between the driver and the pillion.

Figure 18.

Figure 19

Figure 20.

Figure 21.

Figures 18-21. Men and women carrying the Charpai easily by balancing it on the head; portability on bicycles and motorcycles which are the modes of transport in Indian villages

Once mobile, it transforms into a palanquin or a stretcher, to ferry the sick to the nearest hospices or people and their meagre belongings to safety, during floods. Probably because it is one object that is available in the vicinity of wells, it is a contraption to rescue children and animals who accidentally fall into them by tethering posts to ropes, turning it upside down and lowering into deep wells. This phenomenon is more commonplace in villages than urban denizens possibly imagine.

Figure 22. A sick person being transported in the most 'efficient' manner to the nearest ambulance; it is typical of remote villages of India

Figure 23. People and belongings moved to safety on a Charpai turned raft, during a flood

Figure 24. A leopard being rescued from a well

Wood and rope; hardy and indigenous materials ensure its longevity. People retain it for periods long enough to strike an emotional bond with it; discarding it does not feature in the scheme of things. This then spells a simple practice of sustainability- relevant in times when a 'throw-away', 'one-time-use' trend-a culture of disposability seems to be in vogue.

For urban denizens, physically disconnected from their roots in the village, the imprints of childhood experiences evoke nostalgia. As a mnemonic device, the *Charpai* becomes eternal-fostering memories that linger much after their yearly visit to their village is over. The realisation of its existence in village-households before the birth of a new generation or the death of a previous generation, is sufficient to nurture a notion of its immortality. Childbirth and the last rites of a deceased take place on it. The phrase '*Khaat Khadi Karna'* translated to literally mean 'placing the day-bed in an upright position' refers to the death of a person.

Figure 25. Often the dead are carried on the Charpai itself for their final journey

Us designers have a dichotomous interpretation of time as an insert in design; we design to express 'Zeitgeist"- the spirit of a time or, strive for it to be timeless. The *Charpai* indeed does both.

5.2 From configural to frictional

The *Guna* of being configural is about building relationships between parts, between parts and the whole, between the whole and the big picture.
The *Charpai* generates space that can be imagined by a set of prepositions- on it/above it/below it/behind it/by the side of it. Because it is ubiquitous, it can be installed in any space or can create it. Either way, it is never separatist but inclusive. Propped up conveniently and innocuously against a wall when not in use, it virtually infuses life into a courtyard by its sheer presence, once put down.

Figure 26. Basking in anonymity, propped up against a wall

During the rituals of the great Indian wedding in north-Indian villages, the bride's trousseau and items of dowry are prominently displayed on it, in the centre of the courtyard, for all villagers to view and bless. Importantly, it is a part of not just the pageantry of this great Indian wedding but of the institution of marriage itself. In a pre-wedding ritual in Haryana, the bride's maternal uncle brings the four posts of a miniaturised version of the *Charpai* and the father-of-the-bride fixes the horizontal members and the woven surface. Alongside, the real-sized one waits with her belongings for the '*Vidai*' (the send-off). She takes both versions to her in-law's place; they serve as a reminder of the values with which she has been brought up and the dignity with which she is expected to conduct herself. Also, the groom probably does not have a room of his own in the house occupied by three generations of a typical extended family. The newly acquired *Charpai* simply gives the couple 'place within space'.

Figure 27. The miniature Charpai symbolically carried by the young bride as part of her dowry

Figure 29. This is how a collection of loaned Charpais would look when a wedding is taking place in a village

Figure 30. The Charpai in democracy; A typical Gram Panchayat / village council in discussion; however, in recent times the authority of a male dominated and oft orthodox group called the Khap Panchayat in certain parts of north India as Haryana is being debated

Figure 31. The Charpai in democracy; A political party asks people to bring their Khaat (Charpai) to a political gathering and terms it 'Khaat Panchayat' as a pun on 'Khap Panchayat'-a traditional village council in these parts of India

Figure 32. A set of Charpais creating a temporarily safe sense of belonging for the homeless and displaced

Figures 33-34. The Charpai perched comfortably in road side eateries and highway joints called 'Dhabas' catering to urban and rural populations

Figure 35. The Charpai at ease in high-end resorts

"Whatever space and time mean; place and occasion mean more. For space in the image of man is place and time in the image of man is occasion." Aldo van Eyck (1960)

It is a common tradition in villages to lend their day-beds to a bride's family hosting a wedding and often reeling under the pressure to match up to expectations of a large visiting population. The hospitality it offers to the groom's side, becomes one of the critical building blocks on which the relationship between the bride and groom, between the families united in marriage and between entire communities and villages gets built. A lot of prestige is at stake here. The loaned *Charpais* become the wedding gift and blessing from the entire village; for she is their daughter and not just the daughter of one particular family. It would be fair to say that communities that celebrate together are likely to resolve conflict better. The literal and allegoric value of the day-bed in this domain cannot be underestimated. It reiterates the exemplification of rites and routines being larger than life itself. (Zumthor, 1998).

At the communal level, the powerful village elders (called the *Panchayat*) traditionally dispense wisdom and justice and upholds its social structure. The spatiality of this collective sitting on a *Charpai* under the shade of a massive Banyan tree, surrounded by villagers, squatting on the floor, all around them, is indelibly impressed in the Indian cognition.

Until a few years ago, people in India-particularly in rural/semi-rural areas, did not have defined rooms; there was no concept of 'my private space'! Spaces and furniture were intrinsically flexible. Today spaces are divided and private; furniture static. The *Charpai* positioned in multiple ways in multiple locations thus has the potential to resurrect the flexibility that is much needed in premium spaces which continue to be India's reality.

A *Charpai* goes where its maker might not still be able to- this paradox is a commentary on the harsh truth that even after three and a half millennia, this is the only extent to which social boundaries of a divisive social structure (the caste system) have managed to get blurred in this civilization. However, in the context of some 30 million crafts-persons in India (*Craft Traditions of India Past, Present and Future; Textbook in Heritage Crafts for Class XII*, 2011) who craft their livelihoods with their hands, the perspective changes. One can imagine the kind of 'big impact' such 'small gestures' can create. These numbers spell good for India- a nation where numbers can be a malaise.

It is completely 'at home' in the imaginary domain of the homeless, in roadside eateries in villages/towns/cities or in the 'middle-of-nowhere' highway stoppages called 'Dhabas', or in luxury homes and high-end resorts. It can physically accommodate an entire quintessentially Indian, extended-family. When a lone person sitting on a personal *Charpai* invites another to sit beside him or her, the gesture makes explicit the position and dignity accorded; it defines a friend or an acquaintance of equal status. Such is the connotation of the simple act of sharing sitting-space on a day-bed. The '*Guna*' of creating harmony and cohesiveness by manoeuvring opposing ideas, lifestyles, constraints and challenges to create integrative solutions is most relevant to contemporary Indian designers, for this is the context in which they are operating. The *Charpai* is a resilient system that provides for basic needs equitably distributed. Social equity builds communities in which people know, respect and care for others and therefore perform better in adversities.

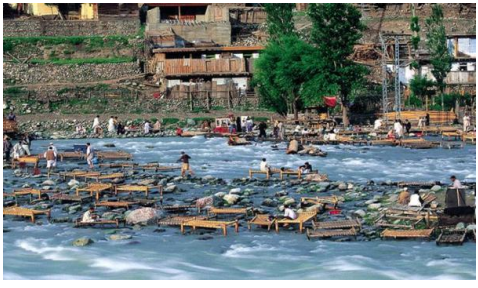

Figure 36

Figure 37

Figure 37. It is literally a legitimate election symbol in both India and Pakistan, speaking of its cognitive value in the minds of a large section of illiterates which is very much a part of the democratic process.

Figure 36. a common sight-scores of Charpai set on waters of the Indus river in Pakistan with people lounging on it throughout the day

It carries a very strong message of being of/for/by the people- the core sentiment of democracy. Its aesthetic value and historical relevance might be mediocre at best; however, by lending itself to social and cultural experiences, by allowing people to curate their own uses and build their own sets of relationships around it, the *Charpai* defines a different 'iconic'.

In times when social and religious conflict are commonplace, this quotidian object is helping blur 'mind-barriers'. It demonstrates how multiple identities need not be antagonistic; they can coexist and make their individual presence felt, appropriate to the context of a collective.

A lightness in friction is manifested physically, in the simultaneous looseness and tautness of the woven surface and its ability to tolerate extra stress. It cannot get more rudimentary, more child-like, than to say that villagers actually peel potatoes using its abrasive fibres.

In a very pertinent 99u talk on 'Design for Friction' Steve Selzer (*Steve Selzer: Designing for Friction—Adobe 99U*, n.d.) rightly comments that if we so completely do away with friction in our lives, eliminate meaningful collisions and confrontations, we are in effect promoting a culture of lethargy, complacency, intolerance and an inability to navigate change.

5.3 From primordial to ethereal

'Primordial' for the *Charpai* would emerge from being non-pedigreed design. Created by ordinary people, used simply as a piece of furniture to sit or sleep, it spells abundance, accessibility in stark contrast with Western museal objects-exclusive and inaccessible, to be viewed in awe, consecrated and therefore dehumanised. The *Charpai* sits in its original, ethnographic field-replete with people and contexts and narratives.

Figure 38. The poorest subsistence farmer uses the posts to plough his field; this is the real ethnographic 'field' of a Charpai

There can be no rationale for something to be termed ethereal. A thing is ethereal because it just is- called *'Tattva'*-the truth, the essence, the 'thatness' of something. Ironically, a recurring and timeless theme in India's metaphysical and visual culture says, 'it is in what is not, is what is. It is called '*Shoonyataa*' - void or empty space, evocative of nothingness. And then there is *'Sunnata'*- silence in a meditative state or as a phenomenological experience.

Together, they create opportunities to introspect individually and collectively. The *Charpai*- wherever, whenever and however facilitates just that.

Figure 39. The ethereal aspect of the Charpai

6. Relevance of this narrative

People-centricity has been the core idea of Martin Heidegger's theory of existentialism or Christian Norberg Schulz's theory of phenomenology (Norberg-Schulz, 1980) or a Dickensian novel. Yet for most Indian designers, a preoccupation with Western models of design pedagogies and practices under influence of Western theories of modernity has meant ignoring the wisdom of indigenous design in design thinking-particularly of its semiotics, of its ideologies of time and space; perhaps for the reason that design became a defined discipline in colonised nations only after they gained independence.

7. The interesting case of the *Lota*

Interestingly however, in India that was not the case. Just after a decade of independence, upon invitation from the Government of India, the American designer couple-Charles and Ray Eames took on the gargantuan responsibility of documenting the problems of design, mapping the impact of Western technology/design and recommending upgradations to the deteriorating quality of consumer goods- a legacy left behind by the British. Their unconventional and visionary perception of design was as a value system, as "an attitude that could discern the strengths and limitations of both tradition and modernity." They argued for an assessment of "the evolving symbols of India" and the need to connect these values and symbols to the problems of environment and shelter.
The *Lota*-a round water pot, typically of clay, polished brass, copper, silver, bronze, stainless steel and even plastic became the fixed symbol of utilitarianism in an evolving pattern of design. They called it "the greatest, most beautiful" object they had seen and admired

during their visit to India. A multipurpose metal vessel whose versions include '*Kalash*' and a wider '*Matka*' is a participant in all walks of Indian life. It is used for collecting/storing/ retrieving/pouring water and keeping it cool, for performing religious rituals- from celebratory to death, practising yoga and primarily to bathe and clean oneself after defaecating. It is used to carry many other liquids, semi-solids and grain. In Gujarat and Rajasthan, called a dowry pot also used for carrying small objects as clothes or jewellery. It provides efficient service with poise and dignity and this is the purpose of all design. Its sculptural form allows it to fit into the palm of the hand and be lifted, the curve of the hip is aligned to the rhythm of walking. The centre of gravity when empty or full is such that several of them can be carried on the head; women even dance gracefully with a series of them. This semiotic role is perceived pan-India. For Muslims, the '*Wudu*' and '*Ghusl*' ritual purification require water, for which a *Lota* is commonly used.

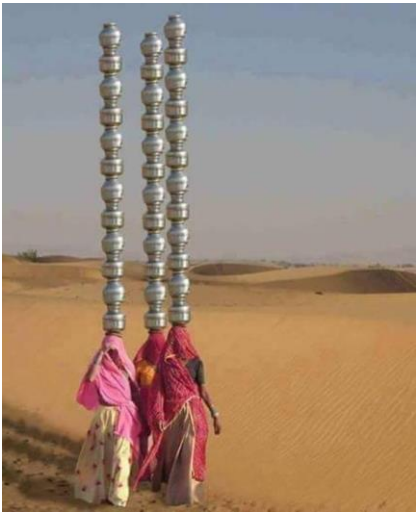

Figure 40. Women balancing several Lotas and walking to and fro, from the distant well on a daily basis

Figure 41. The centre of gravity of a version of the Lota, called the Matka is such that one can perform a rhythmic folk dance complete with face and hand gestures, swirls and continuous feet movement.

Figure 42. Women performing the 'Kuan Poojan'- worshipping the well, on the occasion of the birth of a child

Figure 43

Figure 44

Figure 45

Figure 46

Figure 47

Figure 43. 'Griha Pravesh'- a post wedding ritual in which the new bride enters her husband's home by topping a Lota (also known as a 'Kalash)' full of rice; a symbol of bringing with her Goddess Laksmi- the Goddess of wealth and prosperity
Figure 44. A typical housewarming invite would contain the 'Kalash' as a symbol marking the auspicious event.
Figure 45. A wedding ritual of giving away of the bride by her parents, to the trustworthy groom is called 'Kanyadaan' and is marked by pouring holy water from the 'Kalash'
Figure 46. Celebrations of 'Pongal' a harvesting festival in South India marked by allowing milk and rice to boil over the pot.
Figure 47. A Hindu cremation ritual includes circumambulation with a pot of holy water, which is broken before the pyre is lit

The India Report (Eames & Eames, 1958) was based on the concept of 'Reinventing the *Lota*'; such had been the impact of this object of resilience. The mapping organised into components of aesthetics, anthropometrics and ergonomics, physics, logistics and materiality not only became the basis of design directives and education for the nascent nation, but recognised a new definition of design of the *Lota*.

8.Conclusion

Somewhere along the line, in the past six decades thence, these directives seem to have got lost in translation. Today, if the world has largely acknowledged that design is about "devising courses of actions aimed at changing existing situations into preferred ones" (Simon, 1969) and if wisdom is knowledge accumulated over time, the wisdom of traditional, indigenous design of sub-cultures must be incorporated while addressing the challenges that design intends to make. Conversations revolving around these need to be conducted in India, the global forum needs to be engaged with so it can regain its place in our lives.

Design has always been about being different. What if its value lies in not being different? Rather than what stands out in the crowd, what if the crowd itself is that which stands out? Is it time to challenge the conventional criteria of declaring something as being 'designed' through the nomenclatural lens of formalism-composition, structure and representation? Because *"As we live and as we are, simplicity with a capital 'S' is difficult to comprehend now a days."* (Wright, 1954)

The Materiality of Resilience

Emile De Visscher* [a], Lorenzo Guiducci [a], Iva Rešetar [a]

[a]Humboldt-Universität zu Berlin, Cluster of Excellence 'Matters of Activity. Image Space Material', Unter den Linden 6, 10099 Berlin, Germany
*emile.de.visscher@hu-berlin.de

Abstract |Following a long series of transfers from material behaviour and ecology, the notion of resilience is today a general concept in systems thinking for ecology, cybernetics and information theory. Recent debates around the ubiquitous use of the term necessitate a renewed enquiry into its implications. This article proposes a case-specific, interdisciplinary approach to resilience by reconstructing its initial links to materiality. Through the lens of biological material sciences, architecture and design, our three studies will investigate the materiality of resilience as opposed to isotropy, inertness and durability, revealing how it is embedded in the context. Building up from the material base of resilience, we argue for the agency of resilient materials and technologies in the development and organization of projects and propose connections between the resilience of materials and that of social, political and ecological systems.

KEYWORDS | MATERIALITY, INTERDISCIPLINARY STUDY, BIO MATERIALS, THERMAL ADAPTIVITY, WASTE RECYCLING.

1. Introduction

1.1 The evolution of resilience: the path to dematerialization

The notion of resilience has followed a long trajectory of transfers between various societal and disciplinary contexts. Although already present in writings from Bacon in the 17th century (Hellige, 2018), the notion initially spread during the course of the 18th century in material sciences and applied mechanics. The physicist T. Young, and later the material scientist W. J. M. Rankine, exerted a considerable influence on the physical and mathematical use of the term. Rankine (1858) defined "Resilience or Spring as the quantity of mechanical work required to produce the proof strain," and mathematically linked this notion to the moduli of strength, stiffness, elasticity, and pliability of a material. In the beginning of the 20th century, the term gradually escaped the sole field of materials science and was applied to mechanical components to qualify their capacity to withstand shock.

These approaches to resilience imply a material or system that can absorb a shock load and return to initial state. A major shift in the understanding of resilience came later from psychology and medicine. The decisive impulse to expand this understanding was given by the physiologist W. B. Cannon, who studied self-regulating and protectively stabilizing organisms. Unlike the concept of resilience in materials science, homeostatic systems do not return to their original state, but, through adjustments, produce similar conditions after each loading event (Hellige, 2018). Close to that of resilience, this concept was subsequently adopted by early cybernetics theory.

The further metaphorical shift of resilience and homeostasis came from the field of early animal ecology in the 1930s and 1940s to describe the way populations could adapt to shock, invasion or climatic variation. It was observed that some ecosystems were more adaptive to change than others and that this capability depends strongly on the variability of animal populations and food sources, thereby introducing the key factor of diversity to resilience.

A breakthrough in the concept of resilience came with the work of C. S. Holling, who developed an analytical theory of resilience for systems and economics. His understanding of resilience implied a logic of small scales, of versatile and heterogeneous units that withstand disturbance, based on the assumption that "ecosystems are not modular systems; they owe their resilience above all to their inhomogeneous structures, interdependencies and their network character" (Holling & Goldberg, 1971). But very soon, a major debate broke out between him and his colleague W. Häfele, who used this systemic thinking of resilience as a template for organizing energy production. Holling and his research group generally rejected nuclear energy, large-scale technical monocultures and centralistic system architectures as incompatible with the goal of resilience. Häfele, on the contrary, used the "notion of resilience to describe large energy systems rather than single, weakly interacting small entities" (Sassin and al., 1977). By doing so, he severed the link between resilience and

materiality, turning it into system thinking on a large scale, which might be applied independently to nuclear energy, finances, supply chains or urban planning, as is the case today. It was this decoupling process of resilience from actual materials and units on which it is based that made such appropriation possible. And in many ways, this controversy still prevails today.

1.2 The ubiquitous use of resilience

Since then, resilience, as an operational strategy of risk management, has flourished, progressively asserting itself as "a dominant discourse in discussions of international finance and economic policy, corporate risk analysis, the psychology of trauma, development policy, urban planning, public health and national security" (Walker & Cooper, 2011). Recent studies show how resilience has been deployed in varied ways with "different geographies and temporalities, diverse effects and different kinds of political implications" (Simon & Randalls, 2016). For some, this expansion derives from its inherent "tendency to metabolize all countervailing forces and inoculate itself against critique" (Walker & Cooper, 2011).

Nevertheless, recently critiques have arisen in several fields. A seminal article by Walker and Cooper (2011) has showed that the success of this ecological concept in colonizing multiple arenas of governance is due to its intuitive ideological fit with a neoliberal philosophy of complex adaptive systems: "Abstract and malleable enough to encompass the worlds of high finance, defense and urban infrastructure within a single analytic, the concept of resilience is becoming a pervasive idiom of global governance." Other voices, like that of the historian and media theorist O. Halpern (2017), argue that "combined together, resilience and technology create a form of preemptive infrastructural governance that naturalizes precarity, sacrifice, and violence as a necessary economic value, rather than as a politically derived option." The work of Wakefield and Braun (2014), analyzing resilience as a "*dispositif*" ["construct"] in the sense of Agamben and Foucault, contend that resilience generates governing strategies in which "crisis is no longer that which is to be warded off, eliminated or overcome, but that which must be absorbed, attenuated and survived." In a way, resilience has become a way to "depoliticize" risk and crisis, as well as a powerful tool in maintaining social vulnerability, as the anthropologist Roberto Barrios has successfully shown (2016) by raising the relevant question: "Given this substantial list of critiques, should we abandon the concept of resilience in disaster research and risk reduction?"

The ubiquitous use and contradictory appropriations of the notion of resilience demands a renewed enquiry that would link back to its early materiality. As with all bio-inspired concepts that gradually move away from the sole realm of biology, the risk of simplification and application to any situation is evident, as Holling already warned in the 1970s (Holling & Goldberg, 1971). In this article, we will use our expertise in material case-studies to highlight some essential aspects of the notion. Our aim is to show that resilience can still be a relevant concept for renewed design strategies and socio-economic organizations, if it remains grounded in bottom-up strategies and retains a deep understanding of its materials´ logic.

We reiterate here the need for a case-specific, interdisciplinary approach and for the reconstruction of the early definition of resilience with its implicit links to materiality.

2. Three perspectives on material resilience

Three different disciplinary approaches will help us shed light on the materiality of resilience. The first approach will allow us to deepen understanding of resilience in bio-materials. The second example will show the use of resilient materials in the architectural space, thus redefining its relationship to the environment. Finally, the third study will demonstrate how materials generate specific socio-economical agencies.

2.1 Resilience in bio-materials

In engineering disciplines, the concept of resilience is fairly straightforward: resilience is the ability to store mechanical energy upon loading and returning to its original state afterwards, without energy loss. In the stress-strain plot, which typically describes a material's mechanical behavior, resilience is measured as the area below the linear part of the loading curve. The larger this area, the more resilient the material. Mechanical resilience ought not to be confused with the concept of toughness, which describes the ability to absorb shocks and dissipate the mechanical energy at the cost of damaging the material itself, defined by the area below the stress-strain curve up until failure.

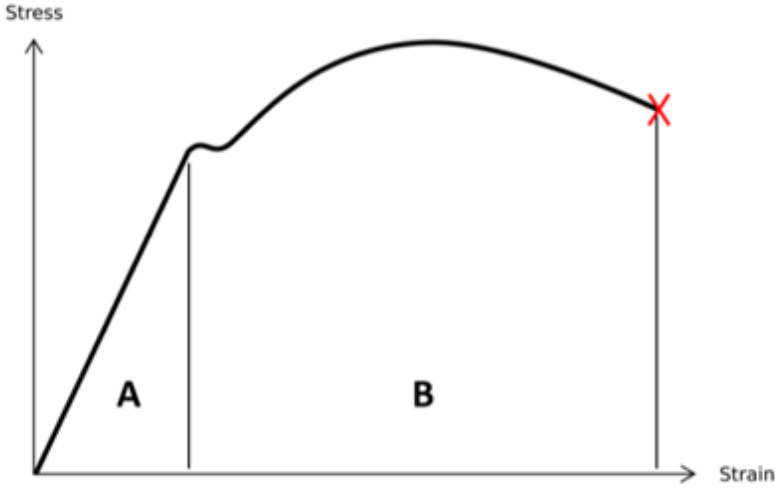

Figure 1. Loading curve of a ductile material: resilience (area A) and toughness (area A+B).

This definition of resilience sketches the main aspects of how resilient materials behave: they respond to external perturbations not simply by resisting them and eventually failing, but rather by accommodating them and "continue performing." Escaping the narrow boundaries of this definition rooted in mechanics jargon, biological materials provide a large repository of examples that can be used to highlight the link between resilience, in a broader sense, and its materiality: in this section, by analyzing some exemplary systems from biological materials, we will introduce some important aspects that clarify this link and serve as abstract principles for the applied test cases presented in the next sections.

Seed dispersal units (such as pine cones) are plant structures that store seeds and spontaneously deform to release them into the environment. Detached from the parent living plant, these structures comprise non-living tissues: therefore, both the sensing and mechanical actuation required for seed dispersal must occur autonomously. In the pine cone, the scales open or close in response to changes in humidity over the day-night cycle. Ice plant seed capsules instead need liquid water to expose the seeds. This is possible thanks to specialized tissues (keels) attached to the inner face of the capsule valves composed of a lignified, diamond-shaped cellular structure filled with highly hygroscopic and cellulose-rich internal layer (CIL).

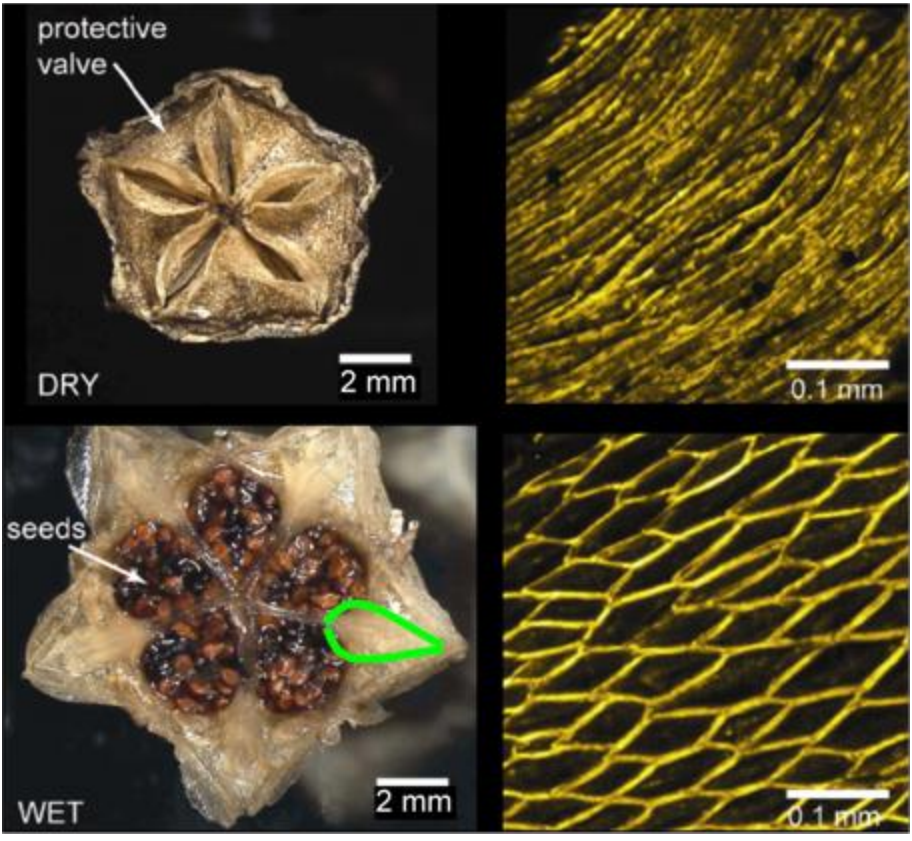

Figure 2. The ice plant seed capsule (left) in the closed dry state (top) and open wet state (bottom), with the keel tissue highlighted in green. A close-up view of the keel tissue (right), in the dry, collapsed state (top) and wet, expanded state (bottom). Adapted from Harrington, 2011.

Upon wetting the CIL swells and increases in volume, whereas the diamond-shaped keel cells convert it into a 400% extension, thus unfolding the capsule valves and exposing the seeds, which can be washed out of their housing in the case of rainfall. One could describe the ice plant seed capsules as resilient, since, as in the engineering definition, they react to an environmental stimulus by temporarily changing state and then reverting to the reference state once the stimulus is removed. Inspired by keel tissue the authors have explored cell shape as a means of controlling mechanical actuation and have formulated design-rules for actuating cellular structures with tailored behavior (Guiducci et al., 2014, 2015, 2016).

Another example closer to the present use of resilience is the plants of the genus *Banksia*. Widespread in Australia, where spontaneous combustion and bushfires occur routinely,

these plants have developed a seed capsule that stores the seeds in special follicles for many years. The long-term integrity of the follicles is provided by a mechanically stable pericarp and waxes with a melting temperature of ~ 50 °C, which are assumed to self-seal cracks, (Huss et. al., 2017). In case of a bushfire the innermost pericarp layer softens and internal stresses can be released, leading to a small opening of the follicle. The embedding of the follicle in the cone, the thickness of the pericarp and a porous separator between the seeds protects the seeds from burning and extensive heat (Huss, 2019). Such bushfires alone are not enough to expose the seeds though: only after repeated episodes of rainfall the follicle opens further and the seeds can be dispersed (Cowling & Lamont, 1985) (thanks to hygroscopic movements not dissimilar from those of the pine cones).

Figure 3. Cones of Banksia attenuata *in their closed (left) and open (right) states, respectively before and after the burning of a bushfire. Image credits: Michaela Eder.*

Only if this specific sequence of events occurs (a long enough bushfire followed by repeated rainfall cycles) can the seeds be dispersed and germination take place. This strategy allows seeds to disperse under improved conditions for germination: abundance of water (due to rainfall) and sunlight (fewer taller plants providing shade), richer soil (due to nutrients set free by fire (Sollins et al., 2007). The example of *Banksia* plants presents strategies that turn catastrophic events and extreme perturbations into an advantage for the organism, which has adapted over the course of evolution to the harsh conditions of its native environment.

The last example presented here is bone. Bone is at the same time a load-bearing material, a living tissue and calcium reservoir. It can heal and remodel. Such diverse functions are obtained through a specific hierarchical material architecture with different structural motifs at different length scales (Reznikov et al., 2014, Winer et al., 1999). Hard mineral particles

integrated within a triple collagen helix form the fibrous ultrastructural level, up until mm-scaled motifs such as osteons or trabeculae that make bone at the same time stiff and tough, two properties that usually conflict. One could think that such bone architecture is the result of a selection for the best possible material distribution; instead the latter derives from evolutionary selected processes (bone healing and remodeling) that make bone a resilient material system.

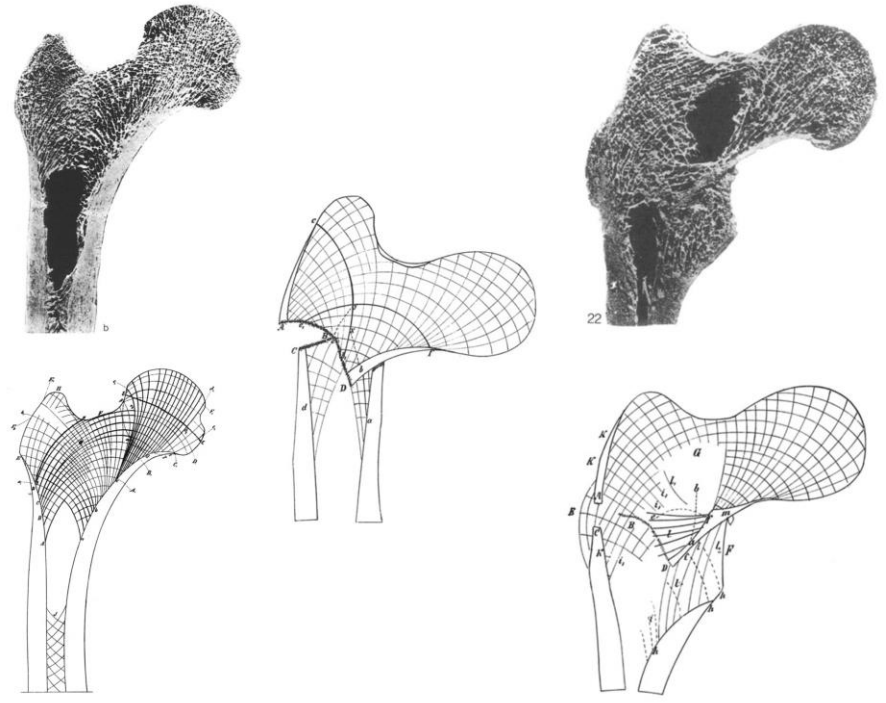

Figure 4. The architecture of trabecular bone in the femur head is aligned to trajectories of maximum axial load (left). Immediately after a displaced fracture, bone's architecture is unchanged (center). After healing bone morphology is partially restored and tissue distribution is adapted to new loading conditions (right). Adapted from Wolf, 1986.

This can be proved by looking at the architecture of a healed fracture with mismatching bone stumps. In this case the resulting bone architecture doesn't simply map the healthy one onto the external boundary of the new bone; instead it changes, adapting to the different loading condition. Since these conditions (the accidental morphology of the wrongly healed bone and the consequent unforeseeable loading) could not be pre-programmed in the genetic code, a different strategy must be operating here.

Mechanobiology shows that such bone remodeling derives from the ability of bone cells to sense the mechanical load in their local environment and resorb or deposit new bone "packets" depending on the actual load level (Fratzl & Weinkamer, 2007). These cells populate an intricate network of canaliculi only a few micrometers in diameter but extending throughout the bone.

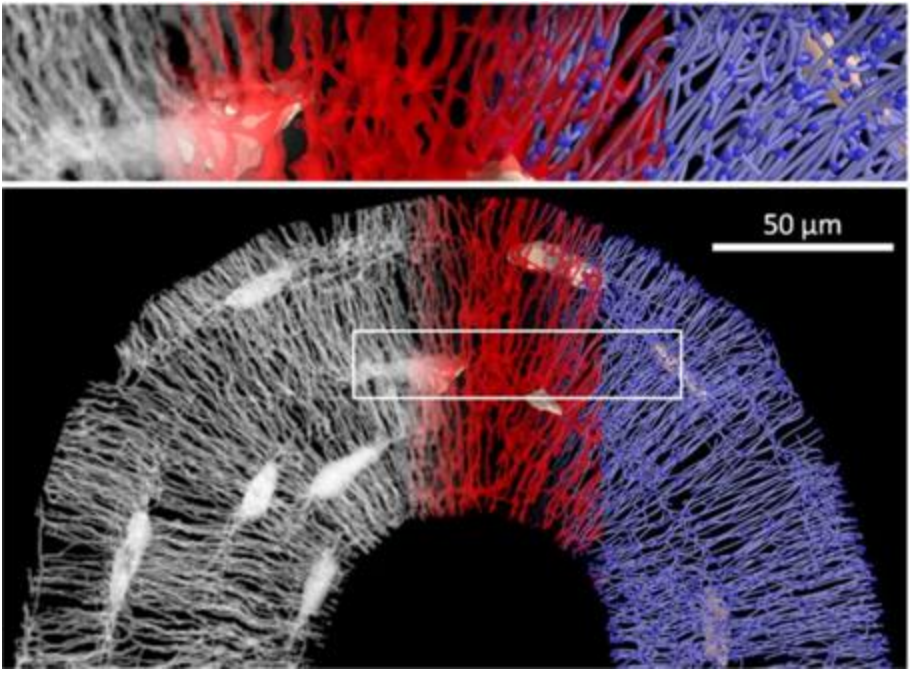

Figure 5. An osteocyte network of an osteon. The osteocytes sit in lacunae and are connected through canaliculi. Composite image from confocal laser scanning microscopy data (gray, left), binarized image (red, middle) and its edge-node mathematical representation (blue, right).

Moreover, by dissolving little amounts of bone minerals at such a large, distributed, cell-mineral interface, these cells are responsible for the homeostasis of calcium levels in blood. Thus, these cells can continuously adapt the bone architecture and mineral content to multiple loading and physiological conditions. Instead of following a fixed "masterplan" in a top-down manner, simple local rules allow for a living material that is structurally stable, constantly rebuilt from the bottom up, adapted to multiple requirements, and, in brief, truly resilient.

2.2 Resilience in architecture: designing material-based temperature modulation

The second case study from architecture examines how growing concerns about climate change and the effects of anthropogenic heat on the built environment have placed the concept of resilience at the heart of discussions about climate control in buildings.

Our dependence on air conditioning — a centralized, energy-intensive technology — is prompting us to rethink not only our normative, technological and energy practices, but also the closely related, underlying material and design concepts. A large part of the success of air conditioning lies in its ability to create a stable, controlled thermal environment. Originally introduced to heat, cool and dehumidify the air in various industries handling sensitive materials such as paper or cellulose-based textiles (Elliott, 1994), air-conditioning systems soon expanded into living and working spaces to ensure hygiene and perceived positive effects on well-being and productivity — as well as new, quantitatively adjustable levels of comfort.

Such interventions in the indoor climate have not only “standardized” the air as a medium but have also had a profound influence on architectural materiality. Ultimately, insulating and sealing the building from the outside to create a controllable and thermally neutral space has become a predominant material strategy for dealing with climatic fluctuations (Addington, 2009). Although recent regulatory efforts have been made to establish stronger links between indoor and outdoor climates in architecture, insulating practices have produced closed systems, which, paradoxically, respond more to the operation of mechanical devices and the general idea of thermal comfort than to the actual climatic context (Moe, 2014).

Following Holling's understanding of the differences between resilience and stability (Holling, 1973), this case study aims to shift attention from the concepts of climate control and quantitative thermal optimum to material-based and climate-dependent temperature modulation. Although Holling's writings moved away from the strictly material view of resilience to formulate a larger theoretical framework for systems behavior, his focus on decentralization and small, local interventions resonates well with design strategies that put climatic environments into a direct correlation rather than prescribing a specific performance. In addition, Holling notes that, should the material system be profoundly affected by external changes, such, as in our case, heat, the constancy and quantitative accuracy of the system becomes less important than the persistence of relationships.

The experimental investigation outlined here positioned between practice-based design and engineering explores the resilience on the basic level of the material through the design example with novel, bio-based phase-change materials (PCMs). By using materials that dynamically exchange energy with the environment; we are able to reinstate architectural materiality in the active shaping of thermal environments. The case study shows how such material entities, although acting locally, require a closer relationship between buildings and

the larger thermodynamic environment to respond to locally available thermal energy and accommodate seasonal and daily climate fluctuations.

Figure 6. Melting process of PCMs leading to heat absorption and temperature drop in the room.

Architectural elements for local cooling based on PCMs have inherently resilient behavior (Fig. 6). Unlike conventional building materials that are designed to withstand environmental forces, PCMs respond to surrounding temperature fluctuations by changing phase and storing thermal energy. The phase transition is triggered at ambient temperature (in this case at 24°C), which enables performance in the human comfort zone. When the surrounding temperature rises, the materials melt and absorb the excess heat; when the temperature drops, the materials solidify again and release the heat stored. In this way, PCMs undergo day-night cycles without degrading (Mehling & Cabeza, 2008) or requiring an additional energy source.

The decisive factor in the design of PCM-based elements is not only to ensure that the melting range of the PCMs corresponds to the daily temperature difference, but also to define the shape and arrangement of their encapsulations, which promotes heat transfer and improves their cooling capacity (Fig. 7). The study shows how the dendritic glass encapsulations, digitally designed and crafted by a lamp-working technique, can serve as a suitable geometrical concept to increase the contact area and contribute to the heat exchange between PCMs and the surroundings. In the experimental testing, this cooling

ceiling prototype facilitated temperature decrease and dampened the thermal loads during the periods of excessive heat.

Figure 7. Experimental prototype of the cooling ceiling based on PCMs.

The capacity of described material systems to absorb heat shock and adapt to changing climatic conditions resembles the resilience of biological materials which themselves are in constant energy exchange with their environment. Design interventions suggest a shift from practices of climate control towards designing open systems that enable collaboration and co-evolution of matter with the wider thermodynamic environment.

2.3 Resilience in design: local production strategies for social reintegration

Within the framework of design, we will explore not only the intrinsic properties of matter, but the interrelationships and co-evolutions of matter with socio-technical networks, in particular waste. What we generally categorize as “waste” does not constitute a uniform class of material. Waste is considered as such because, in its context, it does not conform to financial, technical, social and symbolic modalities that allow it to be considered as a resource (Berque, 2014). In this regard, plastic probably constitutes a major waste issue. Produced in larger quantities each year (Garside, 2019), often in single-use or short-lived objects, oil-based polymer waste degrades very slowly and endangers fauna and flora in many parts of the world. Yet, from a purely technical point of view, thermoplastics should not constitute such a disaster. Indeed, they are relatively easy to sort with simple methods (flotation, folding, flame), the temperatures for melting them are low (between 120 and

250°C), and they allow many useful forms to be obtained (rigid, flexible, films, foams, nonwovens, woven fabrics, etc). So why are plastics such a big ecological problem?

Figure 8. Thermoplastic Injection Molding mass-manufacturing production line.

The reason we examine here concerns the resilience of the technical networks this material relies on. Unlike metals, ceramics, textiles and wood, plastics were born and developed during the 20th century, driven by the chemical industry and large multinational oil companies. All the technical improvements, knowhow, machines and processes for the formation and synthesis of plastics evolved on the industrial scale, with high-precision machinery and process control down to the molecular level. There is almost no plastic craftsmanship, no local scrap specialist, and no knowledge of plastics classes outside industry, universities and research labs. Conversely, wood, metal, textiles and ceramics have existed for millennia, and the tools and knowledge associated with these materials are widely distributed. The large-scale technological system linked to polymers production and recycling lies at the heart of the waste issue of plastic, because it inhibits local sorting and reuse strategies. How can this status quo be reversed? Rather than proposing a technology involving the learning of new skills or a high degree of material stability (like 3D printing), a simpler and adaptable solution must be looked for, one that links up with diffused tactics, in the sense of Michel De Certeau (1984), already established in various territories and traditions.

Figure 9. Waste plastic recycling machine by centrifugal extrusion, 2013.

This was the initial motive behind our project in 2011. A Gaulard, N. Paget, C. Machet and E. De Visscher imagined a machine for transforming thermoplastics by hot centrifugation, using the principle of the cotton candy machine. This process can transform shredded plastic waste into fibers of various sizes and thicknesses, defined by the machine properties and the qualities of the plastic. This minor transformation, a simple elongation of the plastic, drastically alters its bonding possibilities with other techniques. Indeed, the textile arts such as spinning, weaving, felting, sewing, braiding and knitting, are widely distributed techniques, carried out by professionals and amateurs alike, in many artisanal and semi-industrial configurations all over the world. This minor transformation would be able to put plastics in the reach of local actors capable of transforming it into useful everyday objects and small economic gains. Suddenly, waste can become a lever for new distributed economic and socio-technical networks, based on an omnipresent and almost free resource.

To test this hypothesis, we had the chance to set up a workshop based on this technology in the suburbs of Antananarivo, Madagascar. From June 2018 to December 2019, we successively surveyed the context, built a machine locally, established a network of recyclers, selected young Malagasy people in professional reintegration, trained them on the machine and also in entrepreneurship and design, so that in the end they were able to set up a company and operate the machine by themselves. To understand the impact of the project, it should be recalled that Madagascar is the fifth poorest country in the world. The island, very rich in natural resources and renowned for its textile crafts and unique fauna and flora, is nevertheless plundered by endemic corruption, exploitation by large foreign

companies and drastic ecological degradation. This dramatic situation, although generated by several factors, worsened considerably during a major political crisis in 2009. With respect to plastics, though none are produced on the island, massive importation generates huge landfills, clogs roads, rivers and sewers, and poisons animals. On the other hand, the natural resources used by local craftsmen, such as raffia, sisal and natural silk, are of good quality and therefore increasingly sold abroad, depriving the craftsmen of their raw material and thus of their livelihood. It is within this framework that we established our new local recycling workshop. With the help of a local NGO and a Cultural Fund, we have selected ten young Malagasy people coming from precarious conditions to be trained in machinery, design and business management. The project is now active and they are using the waste to create a new fiber for local crafts.

Figure 10. Team of young Malagasy learning to use the machine, 2018.

This project was conceived and designed to be decentralized. The machine is small, transportable, and easy to use, needs very little maintenance, and can be produced locally in a simple mechanical workshop and with a few standard parts. The machine processes significant quantities of diverse plastic waste, which does not even need to be homogenized or filtered. At most, the head requires cleaning, a quick and easy operation. All these properties are exactly the opposite of the usual manufacturing processes for plastic fibers, in particular industrial micro-extrusion, which operates on a very large scale, requires a high degree of precision, does not tolerate plastic variations or impurities, and is therefore only

suitable if associated with constraining and precise sorting and the cleaning and homogenization of waste.

The technologies and materials, their form, properties and functioning generate certain socio-technical arrangements and networks. These are political, in the sense that they reorganize the networks of actors and the ways in which opportunities and problems are perceived collectively. Providing a machine to link and activate local, traditional and distributed technical networks furthers new socially resilient ecologies.

Figure 11. Textile products made from fiberized waste and weaving techniques, 2019.

3. Conclusion

What lessons can be drawn from these three different material perspectives on resilience? And most importantly, how can they improve understanding of the process by which the term has gained general acceptance? The biological material systems provide interesting aspects which can be linked to the two other case studies First of all, the resilient strategies described do not require separation between hardware and software, but are instead integrated systems of material and information pathways. Compared with state-of-the-art manmade devices, such as, for example, a robotic arm, such systems do not rely on predefined scenarios and an extensive energy supply. A further feature concerns the contextual adaptation of these solutions. None of the case studies are applicable to global

systems or to every context; they work within a range of stimuli generated within a specific set of parameters, distributed and redundant. And, most importantly, these material strategies are not dependent on precision and control; instead, they respond to a wide range of changes and accept impurities, variations and peaks.

One surprising common element in all these examples is the fact that none attempt to restore some predefined original state. In many different ways, the systems react to fluctuations and shock but use them to benefit from these situations to ensure a more efficient, long-lasting and small-scale adaptation. Comparing this feature with socio-economical resilience, we could support Barrios's question that probes the idea of stability itself and the inherent problem of resilience in humanitarian sectors: "restoring back to what?" (Barrios, 2017)

The Anthropocene we now live in and the many risks it entails is a call to relink our design strategies to materiality. As the virtual world of the Internet is unthinkable without all the cables and infrastructures it requires to function, resilience cannot be thought without the materials and technologies its logic is based upon. Creating a new large-scale urban planning with concrete, steel and glass will never end up fully resilient, as these inert materials are made to withstand, rather than to work with, change. We argue for the agency of resilient materials and technologies in the development and organization of projects and for connecting the resilience of materials with that of social, political and ecological orders.

About the Authors:
Emile De Visscher is a designer, engineer and materials scientist who explores ways of making with attention to the participatory and public nature of the manufacturing processes. His research focuses on the invention of small-scale production tools, and more recently, on developing new production processes in the field of biomaterials.
Iva Rešetar is an architect working experimentally on environmental design concepts through collaborative interdisciplinary research between natural sciences, humanities and design practices. She investigates the relationship between material and thermal space in architecture and develops integrated methods to incorporate thermodynamic processes into architectural design.
Lorenzo Guiducci is a material scientist, teaching and conducting research at the intersection with design and architecture. He has explored the actuation of the seed capsules of plants and, more generally, cellular solids subjected to internal pressure. His current research interests lie in structure-function relationships in both biological role models and mechanical metamaterials.

Abstract | The issue of sustainability is linked to lasting processes. However form a fashion standpoint the impulse for change affects the life expectancy of products, both from material durability linked to programmed obsolescence and from psychological obsolescence. This research explored how material objects could become a desire for new uses by satisfying new needs while retaining their original meanings and further enhancing their value. The purpose was to connect the world of material relationships with emotions, analyzing sustainability as a broad process of social relationships that generate knowledge and awareness in the consumption and use of garments. The methodology was developed from three contexts that used participatory observation as well as interviews and questionnaires for data collection and analysis. The results provided evidence of greater awareness and reflection on the subject by the participants.

KEYWORDS | FASHION DESIGN, SUSTAINABILITY, EMOTIONAL DURABILITY, SOCIAL PRACTICE, CO-DESIGN

1. Introduction

The concept of durability that is part of product design, development and manufacturing processes and their life cycle becomes especially relevant in the definition of specific design strategies for sustainability (DfX) which are relevant from the area of eco design. In this way, well-designed products and materials have the potential to extend their duration; However, despite the fact that this phenomenon has been accepted and recommended in the last twenty years as an aid to the objectives of sustainability and a brake on planned obsolescence, triggering durability as a design strategy through the longevity of the physically useful product is a reductionist solution that it does not consider. The impulse for change as a constant in fashion directly affects the life expectancy of products through what is known as psychological obsolescence, which underlines the psychosocial nature of fashion. The concept of emotional durability linked to the field of social and sustainable fashion design is not an objective to be achieved but rather a result derived from the use of the product. From this perspective, durability can become a desire for a new type of use to continue satisfying "changing" needs while retaining its exceptional meaning and further enhancing its emotional value. (Fletcher, 2008; Fletcher, 2010; Fletcher and Gross, 2012; Nakano, 2009; Chapman, 2009).

Although there are several research and fashion trials that deal with the concept of emotional durability as part of one of the future paradigms to be taken into account in the field of current sustainable fashion, most studies do not provide real practices on how to problematize these aspects from work and reflection with people (Lee, 2008) in search of a real social commitment, but rather reflect on these aspects and their implications from a theoretical approach. Although some studies are closer to the action of this concept, as is the case of Fletcher, in his Local Wisdom project, he does not examine the field of study with sufficient academic rigor. Its purpose is presented as a social practice (performative) and not of rigorous research where there seems to be no clear structure or use of specific data collection and analysis tools.

In this sense, despite the importance of aspects of emotional durability as a challenger of obsolescence in the field of fashion and given that there is hardly any design research that deals with this area rigorously, our research aims to study the relevance of these aspects through an empirical study of a sample collected over time to expose the results of this study in an open event where the results of several years were shown, new data was collected and a new reflection was reinforced in the relation of pledge-human commitment.

Our goal was to increase the resilience of consumer-product relationships by reflecting on the empathy and attachment of objects by providing a more expansive and holistic scenario of the emotional longevity of garments. Our hypothesis was to demonstrate that from social practices it is possible to re-educate consumers by exploring through the reflection and dialogue with the product the long-term possibilities of this.

2. Theoretical framework

2.1 Sustainability and slow fashion

Fast fashion dominated by just-in-time production and rapid distribution and marketing times have accelerated the growth of consumption driven by programmed obsolescence and changing fashion trends. This fashionable system of using and throwing has caused a destructive need in the consumer where he often buys more than he needs. Consequently, this has led to the accumulation of waste, which in recent years has significantly increased solid waste of textiles and clothing in landfills, from 7% to 30% in five years (Pookulangara and Shephard, 2013) .

More specifically, recent reports by Asirtex inform us that in Spain, the world leader in fast fahion fashion companies, the average consumption during the period (2017_2018) per person was 34 items per year, which is an average of between 10 and 14 kilos of discarded clothes per year, of which only between 1.5 and 2.5 kilos are recovered in recycling containers, leaving a good part of this consumption without recycling and therefore in solid waste condition.

To counteract these effects, the slow fashion movement has emerged strongly opposing, on the one hand, the devastating effects caused by the insatiable demand for fast fashion and, on the other, challenging the current mass production system. Slow fashion seeks to improve the quality and transparency of production and consumption processes by addressing issues related to cultural diversity, identity, symbolic expression and the design of durable products (Nakano, 2009; Fletcher, 2008; Fletcher, 2010; Fletcher and Gross, 2012; Howard, 2004).

Slow fashion can put a brake on the fast fashion industry by rethinking its design, production, distribution and marketing model, impacting the entire product life cycle in a circular, responsible and conscientious way.

Empathy, attachment and narrative generated from human behaviors and relationships with the product are essential to build a sustainable long-term commitment to the product. Such aspects are unfortunately not priority elements in the general study of sustainable design for durability, since they are difficult to work and their conception is neither easy nor effective in the short term. It is more attractive to work the durability of a product in a sustainable key from the technical and functional approaches, which are of greater productive and commercial interest due to the reduction of costs, convenience and attractiveness that they produce quickly and directly. However, these environmental solutions do not provide real long-term solutions, since as Chapman says “the machine of inefficient consumption continues to emerge in a wasteful way, but now it does so with recycled materials instead of virgin materials”(Chapman, 2009, p.29). That is why "The commercial and ecological unrealities of this model must be questioned." Following Chapman's speech "The sustainability crisis is a problem of behavior, and not simply of technology, production and volume." (Chapman, 2009, p. 33)

Sustainable design methodologies should deal more with fundamental issues, such as the meaning and place of products in our lives. New and sustainable products must seek to instill a new meaning and value in a critical area of human effort that, in many ways, has become directionless and superficial. Consequently, the design for sustainability should emerge within a cultural framework rich in criticism, positioning it as a central pioneer of a committed social, economic and environmental change, rather than dealing with providing answers to only technical solutions (Chapman, 2009; Fletcher, 2010)

2.2 Emotional durability vs material durability

According Payne “Once fashion trends advance, the aesthetic value of a garment decreases. It becomes wasteful.” (Payne, 2012, p.205). Clothes are not disposed of because they are worn, but because they are outdated.

According to Binotto and Payne “Fashion in the modern era is based on the logic of perpetual stylistic change and operates within what Entwistle (2009) calls an aesthetic market that fetishes the new” (Binotto and Payne, 2016, p. 8) and consequently condemns the “old” or old-fashioned in the interior of a waste consumption framework.

To alleviate its effects, the concept of emotional durability is opposed to the culture of use and throwing and the psychological obsolescence caused by consumer trends in the fast fashion industry. Material durability challenges the limits of the material culture of waste, achieving results that go beyond the rational considerations of whether or not an object is in good condition. The concept of emotional durability has emotional and empathic implications with the product from the relationship and emotional connection with it, extending the desire for its use from its original meanings, which enhances its value and causes a new need for use and consumption through time.

Norman (2004) argues that a "favorite object" can become a symbol installed from a positive frame of reference consisting of pleasant memories and experiences extensible to one's identity.

In the same perspective, Fletcher (2012) warns us that in order to challenge obsolescence and promote the emotional durability and longevity of products, it is essential to focus our attention on the competences of clothing and on the “art of use” and not so much on the Product as matter. In his Local Wisdom project, he analyzes the care, repair and satisfactory use of clothing from the perspective of the “art of use”.

Other researchers, more recently, focus their attention on the poetic competences of waste by enhancing their plastic beauty to strengthen their social bonds and emotion attachments from the notion of charm as a driver of new relationships and experiences susceptible to affectivity that promote reflections and ethical responses and social commitment (Benett, 2001; Binotto and Payne, 2017; Žižek, 2009)

On the other hand, based on Chapman's considerations (2009) that “possessions are symbols of who we are, what we have been and what we are trying to convert ” (Chapman, 2009, p. 34) and since these allow the incorporation of new meanings to the original meanings, it is

easy to understand that the products that have the most functionality provide important signs and indicators in human relationships.

Thus the design paradigm for durability must be understood and interpreted beyond the longevity of a useful product, technically speaking.

"One of the new and more difficult paradigms of sustainability is precisely to increase the resilience of consumer-product relations, which proposes a more expansive and holistic approach to the design of durability and the experience lived through it" (Chapman 2009, p. 35)

3. Methodology

The research methodology has been mainly qualitative. The techniques used have been based on data collection through participatory action techniques, observations and thoughts aloud. For its development semi-structured interviews, questionnaires and audiovisual records have been used.

The methodological processes of observation, action and interaction in praxis have been carried out by creating scenarios and social practices that have involved different users (e.g., researchers, designers, street people, educators, etc.).

The general line of work has continued the practical procedure developed in our previous investigations. These processes have been worked on in different scenarios: practical/ observational, artistic or communicative /reflexive.

The research has been implemented in a phase called Connections that has been structured in three stages or degrees of involvement an Exhibition, Meeting and Barter of clothing. Each stage had a relevant development and impact for the scope of this research.

From a broader approach, Connections 4 had the main objective of connecting the world of material relationships (clothing) with social relationships and emotions derived from past experiences. The objective was to enhance the competences of clothing, focusing attention on the art of their satisfactory use, either through the accumulation of memories and experiences, or from the capacity of reuse. Specifically, the concept of sustainability in fashion was analyzed as a broad process to generate knowledge and awareness in the consumption and use of garments. The intention was to challenge the system of fast fashion and industrial interests, to curb the psychological obsolescence of the mass consumer, driving through the different stages (exposure, encounter and barter) the emotional durability and longevity of the products.

The work approach was structured in 3 stages of development:

1. Stage Connections 4: Exhibition

This first stage shows; the results of the project materialized and visualized through the exhibition.

Figure 1: Poster designed by the group of research for dissemination and invitation to exhibition/encounter and barter.

Objectives of the exhibition

The main objective of the exhibition was to show the results of the 10 best testimonials (clothing stories) from a sample of more than 50 videos and photographs collected during the three previous editions. The images, texts and videos exposed tell real fashion stories based on their own experiences, based on the art of the satisfactory use of the garments, and /or the feelings and emotions linked to them.

A second objective addressed the issue of creating a history of fashion itself that extends beyond historiographic practices, dating and classification, to narrate fashion through real experiences and anecdotal stories.

General Panorama

In the study on the design of the exhibition, the materialization of the concept and the social impact and potential awareness that the present exhibition may have had in the art space "La Colectiva" in the local society of Xàtiva and its surroundings, has been kept in mind; on the one hand, the strong communicative impact of the selected proposals (photographs and history of clothing, with a strong emotional charge); and on the other, the design of the exhibition space: the organization of the exhibited pieces (size, number, type, impact etc.) the impact of the intangible elements (music etc.), the impact of the tangible elements of accompaniment and ambience scenographic, the design of the infrastructure useful for the proper functioning of electronic and / or visual devices, the place and location of artistic pieces and other useful objects arranged within the communicative and narrative space, and the visitor's journey through the exhibition space and for the rest of the event.

Figure 2:The exposition's inauguration

Procedure

The exhibition that was being prepared during the month of July and September of the year 2018 was inaugurated on October 5 of the 2018/2019 course in the artistic space of the "Colectiva" located in Xàtiva. The exhibition kept its doors open to the public until November 5.

Figure 4: Pictures from the exposition

Figure 3: Pictures from the exposition

Instrumentalization, materials and infrastructure used

The exhibition shows a selection of the best photographs taken during the meeting of connections 2 and 3 of the previous years and a selection of the best narratives both in audio and video format with audiovisual support (Ipad and television).

Each one of the exposed images was linked to a significant phrase that identified and represented it, in addition to a QR code where the visitor could access with his mobile phone to visualize the history of the garment told by the person represented in the photograph.

Figure 5: The exposition's inauguration

The total number of images and stories told were 10 of which 7 were presented in color and in A2 size on a 1 cm thick cardboard holder and 3 were presented in black and white in 100x70 size on a 1 cm cardboard support . The phrases linked to the images were made on

vinyl and were attached to the wall next to the photograph and to a QR code also printed on A5 size vinyl on a 1 cm thick cardboard holder.

Figure 6: Exposition room

Figure 7: Picture's details with their artefacts (Ipads) that tell their emotional stories.

As for the audiovisual stories due to budget limitations and exhibition space, it was decided to exhibit only 3. They were mounted on a loopy audiovisual support on digital tablets that were inside a wooden box hanging on the wall next to each image.

In addition, at the entrance of the exhibition space a television was installed with a video that introduced the exhibition with a brief explanation and showed all the testimonies (fashion stories) collected in the exhibition.

Figure 8: Pictures of all participants

The exhibition space was divided into three: on the one hand there was the exhibition with everything explained, on the other there was the space where the bartering of clothes was carried out, which will be explained in the following section, a third space was destined to the recordings of the stories of the garments and the photographs of the users with them, finally, a third space was enabled where an audiovisual of last year's parade was projected and whose concept was related to the base concept of the event and the present investigation. In this same projection space a snack and information about the project were placed (See the image 9).

Figure 9: The exposition's meeting point

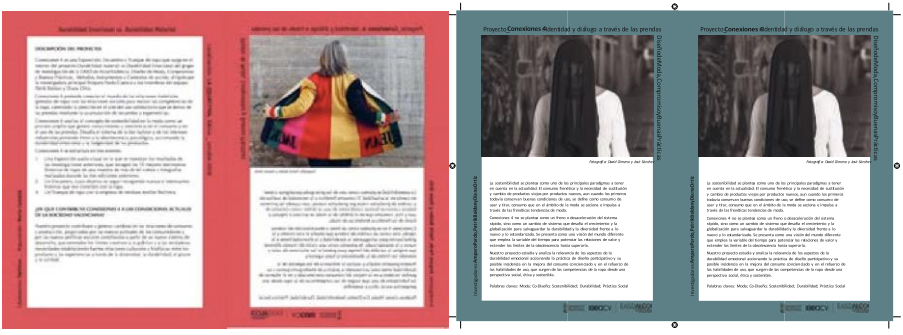

Figure 10: Exposition flyers

2. Stage Connections 4: Encounters

Objectives of the encounter

The main objective of the meeting was to continue collecting stories of clothing or accessories that maintained an emotional bond with its users.

A second objective was to make the task of using and throwing away difficult by activating the self-reflection and self-awareness of the users participating in the meeting through the dialogue with the garments.

General Panorama

In the general study of the concept of emotional durability, compared to the material durability of the garments that is derived from different theories and studies, this meeting aimed to generate the self-awareness that the objects we buy (clothes) can transcend their aspects or material characteristics to the immateriality and intangibility, which makes them unique garments of difficult detachment and makes their removal impossible ennobling them and keeping them as unique and special. Consequently, reflection and awareness about the fact that a poetic look at everyday objects (clothes) can lead us to keep them

paying attention to care, pampering, patchwork, etc., would facilitate the brake on the mass consumption of using and throwing away and challenge the rules of programmed and psychological obsolescence produced by consumer trends. In short, to raise awareness that the simple objects that we buy can become, through dialogue with them, special objects, worthy of keeping and repairing, avoid compulsive consumption and enhance reflective and responsible buying.

Procedure

The meeting was held on October 5, 2018 and its duration was only a few hours.

For the planning of the meeting there was a team of audiovisual and photography professionals, in addition to the support and collaboration of students of the EASD Alcoi school, of the sustainable fashion subject, who were instructed and prepared for the process.

The complete team of professionals and participating students were coordinated by the researchers / professors of this paper, who were in charge; on the one hand, to choose the place, prepare and design the stage of the staging and design the questionnaire / interview directed; on the other, they prepared all the necessary material, made the appropriate HR contacts and organized and coordinated the meeting during its duration.

Instrumentalization, materials and infrastructure used

The instrument designed to gather information at the meeting was a semi-structured interview combined with an ad hoc questionnaire.

The questionnaire only collected demographic and anagraphic data such as age, name, place of residence, profession and marital status, while the semi-structured interview served to explore the subject under study by raising open-ended questions that allowed the participant to reflect on the topic and express himself freely.

The interview was designed based on a focus group of students and fashion teachers.

A pilot questionnaire was previously conducted and tested with a small sample of participants in the EASD of Alcoi. After the various tests and subsequent corrections, not only the interview items were adjusted but also the technical aspects of how to approach and raise this.

The materials used during the recording of the interviews were some purchased by the team of researchers, others borrowed and most of them from the team of researchers and the team of professionals hired to carry out the recordings.

Figure 11: Data recollection from the interviews to participants

Table 1. Main questions

Table Rows [STYLE: _DCs Table]
¿What is you name, age, place of birth?
¿What is your profession?
¿What garment have you brought and what do you want tell us about it ?
¿What emotional bond ties you to it?
¿Where do you store this garment?
¿Do you use it often?
¿What do you think will happen to it ?
¿What would you change this garment for?

The resource inventory was as follows:

Two cameras, two video cards, a laptop, several spotlights and flashes, paper material for the backgrounds and two microphones.

Data Analysis

The qualitative analysis of the data was carried out by means of audio-video transcription and photographs of the subjects endorsing the garment.

Figure 12: Photographies of the participants

3. Stage Connections 4: Exchange

The barter was held on the same day October 5 and its duration lasted for the entire duration of the exhibition. Objectives

The main objective was to make participants aware of the possibilities offered by the exchange of clothes as a brake on programmed obsolescence, which leads us to the practice of continuous wear and tear.

The second objective of the barter was to serve as a claim for the citizens of Xàtiva to approach the event, since given the complexity of the project and the general ignorance of the topic addressed, in the Xativa social group, we needed an element that was attractive. In this case, the possibility of offering an exchange of clothes at zero cost might seem an interesting practice that additionally attracts people to the meeting and the exhibition to involve them in the whole process.

General Panorama

On the basis of an increasing number of studies on sustainable fashion management, textile waste management and fashion activism, this barter was designed which was attended by the Texlimca waste company and the ASIRTEX association, who provided us with all the clothes displayed in the pop up store, previously selected by the barter.

Figure 13: A participant tells the story of his garment

Figure 14: The participant choose the garments for the exchange

Procedure

The barter took place on the same day October 5 and its duration lasted the duration of the exhibition.

Instrumentalization, materials and infrastructure used

The barter was located at the back of the room, in a space designed to keep in tune with the concept of reuse and exchange. One of the walls of the room was organized with boxes of old pallets hung as shelves. In them all the cataloged clothes were placed according to the value previously granted by the researchers.

Figure 15: Photographies of the organization of the garments during the exchange. Table 2. Table of catalogation of the garment

Scale of evaluation from 1 to 5		1	2	3	4	5
1	Current fashion esthetic					
2	Good conservation and cleaning of the fabric					
3	Sofisticated garment					
4	Outer wear in good conservation					
5	Good overall state of the garment					
6	Vintage esthetic					
1€	3€	6€	8€	10€	15€	20€

The organizers of the barter were the same researchers, both were responsible first of all to design the space, organize it, make an inventory of all the garments lent by the company, assess each of the garments based on criteria (See table 2), receive the people / costumers, meet their needs and place the exchanged garments in containers that were specifically designed to insert the exchanged garments.

On the other hand, the principal investigator was the one who took care of selecting the material, before the barter celebration, at the Texlimca company premises. The criteria followed for the selection were described in table 2.

Figure 16: participants during the exchange

4. Results

Although the selected sample was random and could not be controlled with great rigor from the generality of the stages performed, it could be controlled more comprehensively through encounter and barter. As for the Meeting, the number of participants was 15 subjects, and although more participation was expected, the sample was good and showed qualitative data of great validity and reliability for our study; however, Barter participation was much higher reaching the figure of 50 participants.

The first stage of the project, the exhibition of connections, produced results that were shown in an exhibition aimed at the society of Xàtiva, which took place in the art space of the Xàtiva Collective. Although the results in this case are not palpable the repercussions that the visual and narrative impact of the exhibition were fundamental elements to give clarity and knowledge on the subject to the potential visitors participating in the other stages of the project (encounter and barter).

The second stages of the project the connection meeting, In the light of the analysis of the analyzed audio video recordings, three large blocks of qualitative data of validity and reliability were thrown in our exploration.

> The strong empathy of the participants towards the chosen garments, in a very personal dialogue relationship, since they all gave effective and clear answers to the questions posed. All the participants had a relevant story to tell about their garment, they maintained an emotional bond with it, they kept it in a special place or with special attention, they used it on special occasions because they considered it special, and they would not change it for anything, leaving it mostly as an inheritance to someone special.
>
> The narrative, powerful and discursive capacity, thrown from the interviews analyzed, it was possible to create a fashion story from testimonies about stories of experiences and emotions lived with the clothes, since all the participants had something important to tell about their favorite or special clothes.

> The strong attachment relationship that the users maintained with their garments evidenced the importance of the longevity (emotional durability) of the garment since the assumption of a new use and a new meaning.

In the third and last stage of the research, from the analysis of data made from the inventory made before and after bartering on a bank of 60 garments supplied by the company Texlimca, it was estimated that 80% of the garments were exchanged for others supplied by the participants who attended the event.

5. Discussion and Conclusions

This research has had special relevance in the strong involvement that the participating society has had in the exhibition, in the barter and in the meeting, a fact that has had a positive impact on the achievement of the objectives set and the consequent ad hoc validation of the hypothesis raised in this studio. From the extension of the theoretical notion of the concept of emotional longevity of garments, theorized by different scholars of the field (e.g., Fletcher, 2012; Chapman, 2009; Norman, 2004; etc.) to the scope of participatory social reality, explored by other relevant researchers, (e.g., Lee, 2008; etc.)very satisfactory and relevant knowledge has been generated about the theoretical-practical field on which to continue advancing and improving towards a idea of a more responsible, committed and participatory fashion consumption. The different scenarios worked on in this research have served as the basis for exploring the field of emotional durability of fashion products, their longevity, their skills, their poetics, their strengths and how to extrapolate all these concepts to commercial realities that challenge massive consumption in favor of a more holistic and committed consumption based on the shame of buying. In the first part of this research, the concept of emotional durability was explored from the emotional connection that a product (article of clothing) can have in our lives from the relationships we maintain with them, their meanings and the place they occupy in our lives. This exploration was carried out through an exhibition where a selection of photographs of people wearing a symbol garment was shown, accompanied by an audio video testimony and QR code, which narrated the affective richness of the garment-user relationship, demonstrating its powerful emotional longevity and their inability to get rid of it. An overview of the results achieved in this exhibition made visitors aware of the strengthening of relationships with the objects that we acquire and the creation of their own unique fashion stories. These results allowed not only to strengthen the vision of a more committed consumption but also to contribute to the literature proposed in the investigation of the emotional durability of objects (e.g., Chapman, 2009; Fletcher, 2012; Binotto and Payne, 2017; Benett, 2011; Žižek, 2009). In the second part of this research, perhaps one of the most relevant to the fulfillment of the hypothesis of our study demonstrated, once again and through the compilation of new ad hoc testimonies, the existence and potential of the emotional components that can emerge of the garment-user relationship. This confirmed that the affective bond and falling in love with the object, beyond its material skills and/or use, is possible, which turns the garment into almost a relic, and builds with it its own and unique history of the fashion that transcends the historiographic boundaries of clinical and impersonal dating and classification traditionally used to tell the story of fashion.

In general, these findings contribute, on the one hand and directly to Norman's (2004) theories about how a “favorite object” can become a symbol installed in a positive frame of reference made up of memories and pleasant experiences that can be extended to one's own identity; and on the other, to the more specific arguments of Chapman (2009) on how a possession can become a symbol of ourselves, being able to incorporate new meanings added to the already original ones that exceed its material usage skills. In the third part of this research, which was carried out through a clothing exchange, we were able to confirm how the material and usability competencies of a product also take on special relevance when they are exposed in an attractive way and within a culturally rich frame, as was the case in this research. In this sense, although the initial approach to barter was to serve as a

claim for the rest of the activities, we were able to demonstrate by the interest and the amount of garments exchanged that the waste loses its condition of waste when it is exposed in an attractive way, emphasizing, if possible , its flaws (i.e., stains, worn, broken etc.) in order to enhance the plastic beauty of these. This enhances its capacity for transformation even more: from waste to “bargain” garment, unique or vintage fashion. In addition, these results reinforce the considerations of (Benett, 2011; Binotto and Payne,; Žižek, 2009) offering a real and commercial vision of their theoretical arguments by reaffirming that the poetic competences of the residue from the notion of charm that can be derived from the The same, they can strengthen the relationship with the user by promoting new relationships and experiences with him, promoting reflections and ethical responses of social commitment and responsible consumption.

In general terms, the theoretical and practical implications of this research have led to joint reflection by researchers and participants, raising new questions of scope on how to strengthen future relationships with the products we buy, sell and / or design, promoting and valuing skills more affective and poetic competences of garments turned into residue from their methodological implications of design and development to the commercial realities of pre and post sale. If we can establish empathic relationships with the objects (garments) we buy, before even acquiring them, we can build a commitment to emotional durability with them. Inviting users to participate in the design processes (pre-design) or perhaps in the (post-design) to mend, custumize and/or remanufacture the garments already acquired or in use, will not only increase their skills but also all the emotional relationships that are built through those active experiences with the garments.

Our challenge for the future is to promote the shame of buying to buy by strengthening and extending the material, poetic and emotional longevity of the products we buy or those that we no longer want by committing ourselves to waste. Our challenge is to enhance relationships of empathy with products and make our own fashion history based on the experiences lived with the garments we acquire, this form of consumption being the key to building a sustainable commitment with the planet with future generations.

This research has allowed us, through a random sample, to get a good reading of the field of work at a general level. Therefore, it is expected that the reiteration of this study from the increase in the size of the sample and its extension to other populations will allow us to collect more data and thereby expand our expectations.

In conclusion, with all that has been discussed and starting from the main objective, it was shown that from social practices it is possible to re-educate consumers by exploring through reflection and dialogue with the product its long-lasting possibilities in favor of greater consideration and extension of the potentially durable aspects that can influence the design for the sustainability of the products.

The potential of Theory of Change to visually model the underlying logic behind service design projects

Abstract | Theory of Change emerged in the past decades as an approach to better plan, drive and evaluate community initiatives and philanthropic projects, and has since been used more widely to support a variety of innovation processes. Within design practice and design research, however, Theory of Change remains underused and underexplored. This paper intends to focus on two applications of Theory of Change, mostly in light of its potential to visually model and communicate the underlying logic in service design projects. Particularly, the paper will examine how these two different visual representations of Theory of Change had contrasting purposes and, therefore, experimented with varied ways of displaying the key assumptions, activities, outputs and outcomes of the two projects by, for example, operating on visual elements such as scale, texture, colour, transparency, layers, patterns, grids and modularity.

KEYWORDS | VISUAL MODELING, SOCIAL INNOVATION, THEORY OF CHANGE, VISUAL ANALYSIS

1. Introduction

Especially when dealing with social innovation processes, service design requires a strong degree of collective sense-making and strategizing for the vision of the designers to be realised (Simeone, 2019; Simeone, 2020; Morelli et al., 2020). Theory of Change emerged in the 1990s as an approach to better plan, drive and evaluate community initiatives and philanthropic projects (Stein & Valters, 2012) and has since been used more widely to support a variety of social innovation processes (Brest, 2010). Theory of Change is a holistic tool to understand processes, where one identifies the current situation (in terms of needs and opportunities), the intended future result (expected or hoped for outcomes), and what needs to happen to move from one situation to the other to reach one's goals (Rogers, 2014). In other words, a Theory of Change is concerned with how and why an initiative works (Weiss, 1995).

What distinguishes Theory of Change from other tools is (a) its joint focus on collaborative design and on the surfacing underlying organisational assumptions and (b) its use of figures (often labelled 'Theory of Change maps') as a means of socialising the vision behind the intervention. Given these attributes, design research has shown some interest for Theory of Change, mostly in relation to how it can support design projects in complex contexts of intervention (Alter, Whitham, Dawes, & Cooper, 2019), including social innovation (Tonkinwise, 2015). However, to date, the construct of the Theory of Change remains understudied in design research and under-applied in design practice (Jones, 2015). This paper intends to offer a contribution in this direction by examining two applications of Theory of Change: (1) a UK Government funded project to scope the possibility for the nationwide roll-out of smart meters and (2) a European Commission funded project oriented toward offering a supporting service for all those city actors interested in using design to develop urban and social innovation projects. These two projects produced very different maps – i.e. visual representations - of Theory of Change. The specific focus of the paper will be to study how these two representations helped articulate the underlying logic of the two projects. These visual representations had contrasting purposes and, therefore, experimented with varied ways of displaying the key assumptions, activities, outputs and outcomes of the two projects by, for example, operating on visual elements such as scale, texture, colour, transparency, layers, patterns, grids and modularity. As suggested by some experts in the use of Theory of Change (Davies, 2018), there is a great need to more closely examine how a deliberate use of varied visual elements can improve the expressive capacities of the tool.

The contribution offered by the paper is, therefore, twofold. First, the paper intends to study how Theory of Change can help identify the underlying logic behind service design projects. Second, the paper aims at more closely exploring how different visual representations of Theory of Change can provide a greater level of granularity in modelling and communicating such logic. In a broader perspective and in relation to theoretical and practical implications,

the paper will also examine how Theory of Change can support the work of design researchers, educators and practitioners.

2. Theoretical and methodological framework

2.1 Theory of Change in design research

In the past decades, design has greatly expanded its scope (Manzini, 2015). Its potential to address, frame and reframe complex and wicked problems has been widely recognized across fields as varied as design research (Buchanan, 1992), business studies (Martin, 2009) and innovation management (Dorst, 2015). Theory of Change can support design projects that deal with contexts of interventions that are more and more volatile, uncertain, complex and ambiguous (Jones, 2015; Bennet and Lemoine, 2014). Particularly, researchers have noted how the granular representations provided by Theory of Change can help understand the functioning of sociotechnical systems (Norman and Stappers, 2015; Jones, 2015). Indeed, Theory of Change can work especially well when design is considered as an activity that is not limited to the manipulation of materials but is extended to a conversation with a social context (Simeone et al., 2019). This implies a critical evaluation of the state of things and a creative process to imagine how to change them through an activity of problem-solving and (collaborative) sense-making (Manzini, 2019).

Within design research, Theory of Change has been used to look into various aspects, from user engagement processes (Alter et al., 2019), all the way up to theory of agency (Mom, 2007) and design practice (Wahlin and Kahn, 2015). However, some design scholars noted that Theory of Change remains underused in design (Tonkinwise, 2015). One particular area in which design scholarship could usefully contribute to the wider development of Theory of Change is the design of the products of the process: Theory of Change maps. Whilst scholars such as Davies (2018) have explored drawbacks in how Theory of Change maps represent programmes visually, an alternative visual vocabulary using design principles remains lacking in literature on Theory of Change.

2.2 Theory of Change as a way to map and communicate in service design projects

Theory of Change mapping involves identifying anticipated causal pathways through which an intervention leads to a set of outcomes, and the articulation of the assumptions (or underlying theories) of how the hoped-for change will come about (Darby, Liddel, Hills and Drabble, 2015). In other words, a Theory of Change explains how an intervention (a project, a programme, a policy, a strategy) is understood to contribute to a chain of results that produce the intended or actual impacts (Ling, 2012). Theory of Change ensures that co-production is central by bringing together key stakeholders and lets them collaborate through continuous conversations, eventually facilitated within workshops (Alter et al.,

2019). Theory of Change, therefore, allows who is managing, designing or facilitating the intervention to capture a wide range of voices, to observe dynamics and, in general, to operate successfully in those situations in which there is a degree of uncertainty and confusion on how to proceed and over the final outcome to be reached (Jackson, 2013). As such, the fine-grained mapping of all the key components of a project provided by the Theory of Change can be a powerful tool to identify the underlying logic and assumptions in complex interventions (Davies, 2018). Service design - with its focus on the functioning of complex ecosystems and on journeys dynamically co-created by various stakeholders (Meroni & Sangiorgi, 2011; Stickdorn et al., 2018) - provides an ideal ground for Theory of Change to be applied.

Theory of Change is not a purely intellectual exercise: Theories of Change maps "can only be useful if they are designed to serve a clear purpose, and once designed, the organization adheres to that purpose" (Hunter, 2006, p. 194). The main purpose of a Theory of Change is to make sense of the initiative that is being designed within a specific organisational setting and in contexts in which multiple stakeholders interact (Anderson, 2004; Weiss, 1995). In these situations, the underlying logic of an intervention is not always clearly articulated but at times, it emerges from the interaction of diverse stakeholders and their dynamics of sense-making, which might be pulling the project toward different directions (Mirabeau & Maguire, 2014). When applied to these contexts, Theory of Change can also be helpful to share and clearly communicate the underlying logic of an intervention to these varied stakeholders; Theory of Change can act as a form of storytelling, as "an art of weaving, of constructing, the product of intimate knowledge" (Gabriel, 2000, p. 1). Making sense of an initiative is a social phenomenon, so that much of the work to build a Theory of Change is crafting together a narrative from disparate perspectives. In order for this sense-making to achieve its purpose, the main result (the 'Theory of Change map') needs to be effective in communicating a coherent narrative (Davies, 2018).

Much of the success in the application of the Theory of Change depends on the very design of the Theory of Change map. To date, little has been written academically or otherwise on the design features of Theory of Change maps and the lexicon is largely underdeveloped. Boxes are filled with text descriptions of 'events', and arrows connect them, representing expected causal connections between these events (Davies, 2018). Maps are most often arranged from left to right under the categories 'context', 'activities', 'outputs', 'outcomes' and 'impacts'. The use of design elements is minimal. This leads to maps that are unable to effectively display the underlying logic in a clear narrative, even when these are understood by the consultant drawing the maps.

This paper intends to address this gap by examining how the visual dimension of Theory of Change can offer a particularly fruitful avenue to identify and communicate the underlying logic of complex interventions, including those large-scale service design projects that see interplay of varied stakeholders.

2.3 A case study approach

This study adopts a case study approach (Eisenhardt, 1989; Eisenhardt & Graebner, 2007), which has proven to be particularly fruitful while analysing a variety of phenomena within real-life contexts (Berg, 1968; Breslin & Buchanan, 2008), and scholars examined the relevance and the limitations of this approach (Dasgupta, 2015). Particularly, this paper follows a research approach that selects two cases - Smart Metering Early Learning Project and Designscapes - since they offered contrasting situations and approaches (Yin, 2009).

The authors of the paper directly participated in the design and implementation of these two projects, quite significantly relying upon the application of Theory of Change. This internal positioning gave the authors the opportunity to collect data and insights, mostly through direct and participant observation based on ethnographically-inspired methods (Czarniawska, 2012) but also carrying out surveys and interviews (about 250 participants, including other team members and representatives of partnering organizations). Within the context of this paper, this material has been selectively examined to distil insights on how Theory of Change was visualized and used to identify key logic pathways behind the two projects. The visual analysis of the two different applications of Theory of Change has been conducted using dimensions (e.g., scale, texture, colour, hierarchy, layers, patterns, spatial distribution) highlighted in visual design literature (Lupton and Cole Philips, 2008).

3. Representing Theory of Change

3.1 Case 1: Smart Metering Early Learning Project

The context

The roll-out of smart electricity and gas meters to households and small businesses in Great Britain by the Department for Energy and Climate Change (DECC) began in 2011 with the Foundation Stage. During the Foundation Stage, the Government and delivery partners aimed to learn from early activity about how consumer engagement can best be achieved, and feed lessons into planning for the next stage. This project summarised and analysed evidence from a range of sources, including three new DECC research projects, into how GB householders engage with smart metering, carried out with cooperation from energy suppliers; GB and international evidence on smart metering and energy feedback; and some evidence from non-energy domains such as public health, where applicable to understanding behaviour change processes (Darby et al., 2015). This project used Theory of Change as a way of structuring and undertaking the analysis. Theory-based evaluation systematically develops and tests theories related to links between policy delivery and outcomes, and is particularly useful for evaluating complex interventions involving many actors.

The visuals

The Theory of Change maps were created following analysis into evaluations of similar services, theories of behaviour change, interviews with key stakeholders and two Theory of Change workshops. Figure 1 below is an example of horizontal layout for a future service design related to smart meters. In this project, as a prospective programme, the most important aspect for the stakeholders to understand was the causal logic and the connections between different activities. In addition, the planned roll-out of the programme was highly complex, with many interdependencies between partner organisations, some of whom appeared unlikely to be fully motivated to join the programme. Given this, the map focused on the implementation and planning by exploring different scenarios and assumptions relating to varying engagement from the key stakeholders. The map below is a scenario requested by the client where smart meters would be rolled out alongside household level electricity micro-generation.

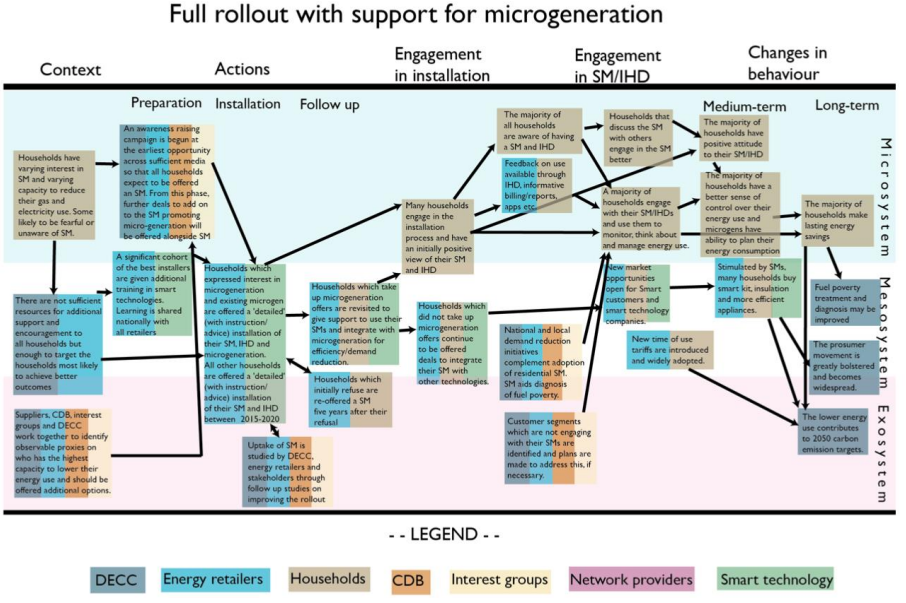

Fig. 1 Theory of Change map from the Smart Metering Early Learning Project

In this map, issues and context for the programme were arrayed to the left and connected to the actions. Actions are broken into preparation, initial action and follow-up action as suited to the programme. The colour-coded boxes help to show which part of the system needs to be engaged at each stage and where benefits would accrue. As a complex national-level programme, the rows are layered from micro to macro as a way of making sense of the programme activities and the interactions between the strategic level and household implementation.

3.2 Case 2: Designscapes

The context

Designscapes is an EU-funded project oriented toward fostering design-driven innovation in European cities and beyond. The project intends to leverage the capacity of cities to harbour ecosystems (Peltoniemi & Vuori, 2004), in which private companies, NGOs, city administrations and citizens can work together on innovation projects and processes. Designscapes intends to build on the generative potential of these environments by implementing a service that (1) selects a number of promising ideas and projects from various European cities, (2) provides them with some direct funding and (3) supports them with mentoring and coaching activities on how to use design approaches and methods. The idea is that Designscapes could accompany local stakeholders through a 'change journey', in which they fully realize the potential of design to support their innovation projects and processes. Service design was, therefore, a key approach used to model and implement this change journey and to understand how the service provided by Designscapes could support it.

The visuals

The figure below was the second Theory of Change map, the first being highly technical and not clearly distinguishing the key stages of the programme. Because the previous Theory of Change map did not present an easily understandable picture of its critical features, it remained unclear how the stages of the programme would work in practice and the critical points along the pathway. Figure 2 shows an alternative, streamlined way of constructing Theory of Change maps, with less detail whilst retaining the overall meaning. Mayne and Johnson suggest that in some cases simplification of a Theory of Change may be needed because "for many interventions, displaying all of the elements of their [Theory of Change] in a single diagram can be cumbersome, resulting in a too complex diagram of arrows and boxes" (Mayne and Johnson, 2015, p. 415).

Figure 2 focuses on the assumptions and risks between each causal link. The greatest amount of text concerns assumptions, which highlight the intrinsic frailty of a programme and the number of internal/external conditions that need to be attended to in order to achieve outcomes. The lack of detail in the 10 central boxes means the map has limited utility as a signpost for implementing the strategy. Instead, the sparse writing emphasises the intended pathways the project may progress along and the critical dependencies between each step.

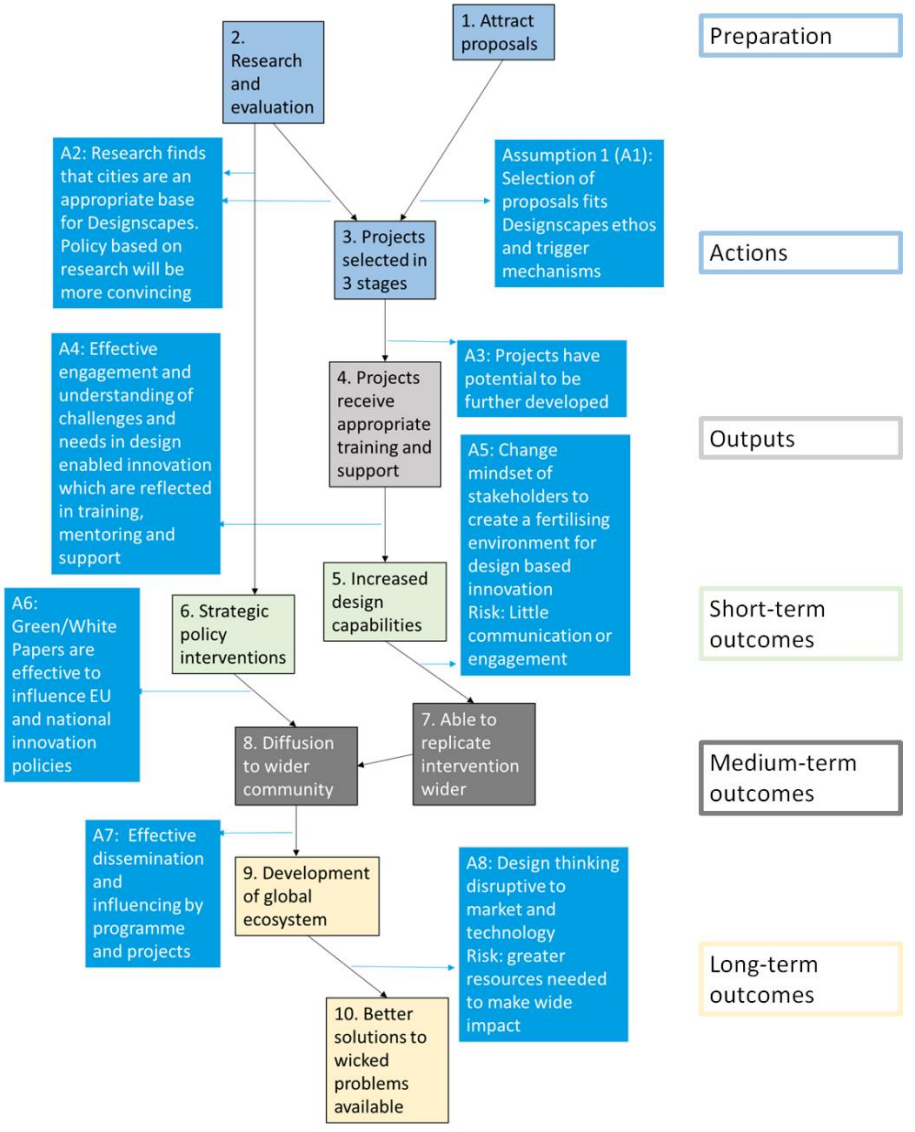

Fig. 2 Theory of Change map from Designscapes

4. Discussion

The two cases examined in this paper show that visual mapping may have substantially different instantiations and this in turn, can have different implications on how Theory of Change can be used to address action and generate meaningful change. Rather than being designed by a single person, these maps can also emerge from negotiation and collective sense-making processes that might involve different project stakeholders. Indeed, the tool can be used as a way to engage stakeholders in granular conversations about key aspects of a project: its broad vision, its goals and its strategy to meet these goals. The use of this tool does not require professional visualisation capabilities from those in charge of producing or contributing to a Theory of Change map; however, the following considerations could clarify the characteristics of different visual choices and highlight their potentials and shortcomings.

4.1 Visual analysis

Figure 1 was intended to (a) display the responsibilities of different partners, (b) emphasise the complexity of the system design and (c) raise awareness of the difficulties and considerations that would be involved. Conversely, Figure 2 was designed as a way of making the Designscapes programme more understandable to project insiders and highlight the key risks and links in the service design. Given this, table 1 examines some key visual aspects of the two different representations of the Theory of Change.

Table 1. Key visual aspects of the two different representations of the Theory of Change

Visual aspect	How it is implemented in the Smart Metering Early Learning Project (Fig. 1)	How it is implemented in Designscapes (Fig. 2)
Directionality	Theory of Change is here represented as ramified and multidirectional. Rather than proposing a single linear pathway, this Theory of Change - with its spatially distributed connections - proposes a sort of map that can be navigated in different ways	The Theory of Change is here implemented as a vertical and somewhat linear progression
Temporal dimension	Multiple concurrent causal links, with elements connected by multidirectional arrows, which also trace loops. Steps are not only progressive but they can also be simultaneous	Predefined sequence of steps, few of them in parallel
Spatial distribution	Theory of Change is plotted against a grid composed of three rows (levels) and five columns. However, the visual elements of the Theory of Change are also positioned in between rows and columns and categories. The grid is quite permeable. The high density of connections and	Even though, at times, concurrent steps are horizontally displayed (e.g. step 7 and step 8), a vertical linearity still remains the key

	ramifications among the elements of this Theory of Change is another striking aspect	aspect in terms of spatial distribution
Use of colour	A kaleidoscope of colours is used to signal different levels (microsytem, mesosystem and exosystem) and the interaction of various stakeholders for each activity	Colours are used to distinguish the assumptions from the steps and the steps among each other, roughly in line with the usual steps in a Theory of Change

4.2 Potential and shortcomings of these visual representations to identify and represent underlying logics of service design interventions

Table 2 summarizes the underlying logic behind the two projects.

Table 2. Underlying logic of both projects

Underlying logic of the Smart Metering Early Learning Project (Fig. 1)	Underlying logic of Designscapes (Fig. 2)
Key change mechanisms are pinpointed as a series of key actions, which are strictly connected to a multistakeholder engagement process and which lead to some hoped-for changes in behaviour. The whole underlying logic behind this intervention is articulated across three levels (microsystem, mesosystem, exosystem)	A stripped-to-the-core sequence of steps is envisioned to reach the goal of Designscapes. The logic of this sequence rests on some key assumptions, also visualized in the Theory of Change. The sequence is the final representation of the key change mechanisms behind the project

Figure 2 proposes a streamlined version of the Theory of Change. In this visual representation, Theory of Change is stripped to its very core. On the one hand, this representation illustrates the key mechanisms that can ignite and support change in the Designscapes project and in its attempt to support city innovation across Europe. On the other, this representation strongly simplifies the logic behind the Designscapes design intervention and, in its attempt to reduce complexity and aid communication, takes out detail that might have a significant impact.

The ramified and multidirectional quality of Figure 1 seems to capture better the complexity of a social intervention like the one behind the Smart Metering Early Learning Project. Rather than reducing complexity, this figure fully elaborates it. The downside, as directly experienced by some of the authors of this paper, is that this type of visual representations can be difficult to interpret and understand if one is not used to working with Theory of Change. The richer use of design elements is likely to be beneficial to those who are

motivated to understand the map yet the complexity may deter less engaged stakeholders from interpreting the details.

It is interesting to connect these two representations to some wider reflections on how to plan and implement broad social changes like the ones tackled by Designscapes and Smart Metering Early Learning. From a viewpoint crossing various design disciplines, Friend and Hickling argued that key mechanisms behind large and complex urban and social interventions cannot be simply defined at the beginning of a project and through a top-down process, but rather they should emerge from "a continuous process: a process of choosing strategically through time" (Friend and Hickling 2012, p. 1). Their point is that long-term plans are actualized by day-to-day decisions and both plans and decisions are affected by pressure of urgency, competition for resources, turbulence and complexity in the world, cognitive and emotional overload, uncertainty and confusion, interorganizational and organizational conflict and all this can lead to "vacillation and inconsistency in the making of day-to-day decisions" (Friend and Hickling 2012, p. 4). To navigate this complexity, progress can take the form of choosing strategically over time: "intervening, or negotiating with others, […] taking decisions, […] investigations but also clarification of values and cultivation of working relationships with other decision-makers" (Friend and Hickling 2012, p. 4). Against these theoretical reflections, the two visual representations of Theory of Change are positioned quite differently. Figure 2 (Designscapes) aims at reducing uncertainty and simplifying complexity. It targets a more focused scope and adopts a more decisive approach in identifying clear key change mechanisms. As such, it can also be better understood by the various stakeholders who take part in the project and that are rarely all well versed in the theoretical and practical aspects of Theory of Change. Conversely, Figure 1 aims at accommodating uncertainty, elaborating complexity. It aims at a broader and synoptic scope and adopts a more exploratory approach, in which key change mechanisms are not so immediately highlighted and potentially also depend on the different pathways that such ramified visual representation of Theory of Change allows for. As such, Figure 1 remains more difficult to understand and interpret and is not immediately actionable as Figure 2.

5. Representing Theory of Change

The paper highlighted how the way in which the Theory of Change is visually represented can help render differently the underlying logic of service design projects. Within the broad community of theorists and practitioners working with Theory of Change, there is a great need to better understand how the deliberate use of varied visual elements while representing Theory of Change can improve the potential of this approach to pinpoint, represent and communicate key change mechanisms (Davies, 2018). As such, this paper shows how various visual aspects in two different representations of Theory of Change can help not only to identify key change mechanisms but also to position the whole underlying logic of the intervention in relation to two polarities: (1) choosing linearity, certainty and comprehensiveness or (2) embracing multidirectionality and complexity. Being aware that

Theory of Change allows for such a level of granularity can, hopefully, also encourage design researchers and practitioners to more closely look into the potential of Theory of Change as a method to identify and communicate the underlying logic of their service designs.

We acknowledge that the use of a limited number of cases can constrain the generalizability of the research implications. In addition, we are aware that we need to dig deeper into existing theoretical frameworks and constructs elaborated in visual studies and semiotics to provide a more solid grounding to our research. In its current, early stage, this paper also does not properly analyse how Theory of Change can be integrated with some specific methods, tools or processes of service design or how the two maps we examined emerged from the interactions and the negotiations among different stakeholders. We see this study as our first attempt to explore visual representations at the intersection of service design and Theory of Change. This is an area that could potentially be of great interest within design research and beyond.

About the Authors:

Luca Simeone is Associate Professor and a member of the Service Design Lab at Aalborg University. He is interested in the strategic, organisational, economic and financial dimensions of design and on how design can support entrepreneurship, innovation and managerial processes.

David Drabble is a Senior Researcher/Consultant at the Tavistock Institute of Human Relations. His work focuses on evaluating innovative and disruptive interventions, primarily on EU-wide projects. David has a specialised role in data presentation, analysis, and digital technologies.

Kerstin Junge is a Principal Researcher / Consultant at the Tavistock Institute of Human Relations in London. Her work focuses on researching and evaluating social innovations, often at large scale, using socio-technical approaches to solve complex challenges.

Nicola Morelli is Professor at Aalborg University, Copenhagen. He collaborates to the Master of Service Systems Design and to several research projects exploring the intersection of service design with social innovation, citizens' participation and design-enabled innovation in the urban context.

The SDGs framework as strategic lever for design education.

*s.maccagnani@ied.it

Abstract | Design and the creative economy have a responsibility in the realization of the UN Sustainable Development Goals, they are a powerful engine for the engagement of the general public, a vehicle for progressive values and a lever for the acknowledgement of the importance of culture and diversity. Culture is not a Goal within the framework of the SDGs, but has been embedded within the 2030 Agenda as a contributor to all of the goals. Design education needs an inner reflection on how it can translate the values of the SDGs into practical and ordinary actions, going beyond the curricula to embrace whole-institution and holistic life-cycle approaches whereby learning transcends the boundaries of formal training to extend to flexible community-based settings and informal everyday environments. The research sets the scenario of design education in connection to the SDGs, exploring the interdependent and interconnected system of relations of the creative economy.

KEYWORDS | SDGS, CREATIVE ECONOMY, DESIGN EDUCATION, SUSTAINABLE DEVELOPMENT

1. Introduction

Following a decision taken in 2012 at Rio+20 Conference on Sustainable Development, the Heads of State and Government participating in the UN Sustainable Development Summit in September 2015 unanimously adopted the document Transforming Our World: 2030 Agenda for Sustainable Development and 17 associated Sustainable Development Goals (SDGs). The decision has set the framework for "a supremely ambitious and transformational vision [...] of unprecedented scope and significance" (U.N. Desa, 2016).

The SDGs have raised the ambition, compared to the Millennium Development Goals (MDGs), and unveiled critical factors in the pursuit of sustainable development:

> "The SDGs need the identification of new critical pathways to sustainability. [...] The task is phenomenally complex [it] will; therefore, need the unprecedented mobilization of global knowledge operating across many sectors and regions. [...] Global problem-solving networks for sustainable development will; therefore become crucial new institutions in the years ahead. [...] The pathways to sustainable development will not be identified through a top-down approach, but through a highly energized era of networked problem solving that engages the world's universities, businesses, non-governmental organisations, governments, and especially young people, who should become the experts and leaders of a new and profoundly challenging era." (Sachs, 2012)

Sachs does not directly mention design; nonetheless, some of the arguments recall designers' domains, such as the identification of new critical pathways, the mobilisation of global knowledge sectors and disciplines, and highly energised problem-solving. No reference to the word design can be found in the 2030 Agenda either. Creative innovation, especially in the private business, is however, considered a crucial driver: "We call upon all businesses to apply their creativity and innovation to solving sustainable development challenges." (U.N. Desa, 2016)

Finally, Sachs' appeal to universities and to "young people, who should become the experts and leaders of a new and profoundly challenging era" position Design Education (DE), at the forefront of SDGs implementation.

The paper explores how DE disciplines and methods can be reconciled with the SDGs addressing four main issues:

1. How interconnected the SDGs framework is with design, culture, and the creative economy?
2. How are the SDGs entering design culture and creative economy practices?
3. How can the SDGs be reconciled with current thinking and actions of Higher Education (HE) and Design Education (DE) Institutions?
4. How is DE evolving to engage actively with the SDGs framework?

2. The overlooked connection of SDGs to design, culture, and creative economy. A review

2.1 The SDGs as a "Design Brief"

The design community reacted quickly to the publication of the SDGs. In November 2015, the Forward Thinking conference in Oslo focused on how to translate the SDGs into a useful framework for design and the Oslo Manifesto, "which asks designers to consider these honourable goals whenever they initiate a project, design a product, or accept a commission." (DMI Review staff, 2018), was published. The Manifesto defines the SDGs as "a Design Brief for the 21st Century" and states that "designers, architects, and creative professionals of the world have been handed a special and enormous responsibility, given to them by the 193 Heads of State. They must imagine and bring to life the design elements of a new, sustainable world — quickly." (The Oslo Manifesto, 2015)

A further challenge emerges in the Manifesto. Besides committing to responsibility, designers must go through "a process of life-long learning about what designs do, or do not, contribute to [...] the 2030 Agenda" (The Oslo Manifesto, 2015). A doubt is raised about the capacity of the design profession to understand what design can contribute to the SDGs. It recalls the idea that "Good design in itself does not necessarily produce sustainability outcomes" (Young, 2010). Designing for the SDGs implies addressing two entangled domains: the adoption of sustainable values and ethics in design practice, and the development of new design methods.

2.2 Culture, the creative economy, and the SDGs

The discussion about the connection between culture and sustainable development dates back to the early '70s (UNESCO, 1972) and the acknowledgment of its role in the promotion of sustainable development to the early '80s (UNESCO, 1982). The debate revamped with the 2030 Agenda when UNESCO urged that "a specific Goal focused on culture be included as part of the post-2015 UN development agenda, to be based on heritage, diversity, creativity and the transmission of knowledge." (UNESCO, 2013)

The 2030 Agenda document did not include the UNESCO suggestion. Culture was not listed within the 17 Goals. It is instead mentioned in one Target (11.4) dedicated to heritage under the Urban Goal (SDG11), and cultural issues are cited in other Goals: Quality Education (SDG4); Sustainable Economic Growth (SDG8); Sustainable Consumption and Production (SDG12); and Peaceful and Inclusive Societies (SDG16). The Future We Want Includes Culture campaign[1] criticized the exclusion, maintaining that the UN document "falls short of a full

[1] www.culture2015goal.net

understanding and affirmation of the importance of culture to sustainable development." (The Future We Want Includes Culture, 2015)

Indeed, the impact of culture and creative economy in the pursuit of the SDGs remains mostly implicit. In the Agenda, the word culture is only used with reference to the protection of "cultural difference," and no mention of creativity and creative economy is made. The exclusion of culture from the 17 SDGs has generated vagueness of operational references to culture in the SDGs, and the need for more systematic and operationalized understanding of the precise role and impact of culture and cultural industries on sustainable development (Hosagrahar, 2017).

The consideration of the monetary value of the cultural sectors by the UK Government policies in 1998 and 2000 (DCMS, 1998, 2000) led to a shift in terminology from cultural to creative industries and made the need for a better understanding urgent. Indeed, the reference to culture in SDGs 4, 8, 11, 12 and 16 paves the way to an extensive range of policies and programs encompassing both the culture's "significant non-monetary value that contributes to inclusive social development, to dialogue and understanding between peoples and generates merit to people-centred value." (SDG Fund, 2017) and its role as "one of the most rapidly growing sectors of the world economy, [...] a profoundly transformative one in terms of income generation, job creation, and export earnings." (SDG Fund, 2017)

Finally, further to the non-monetary and monetary value, a third impact of culture and creativity to sustainable development comes from the advertising, marketing, and innovative communications professionals "tremendous power to shape opinions" as UN Secretary-General Ban Ki-moon said when he called on advertising and creative communication professionals to create the "biggest-ever campaign for humanity" and to transform a complex and abstract agenda into "a personal and emotional story about how we can build a better world" (SDG Knowledge Hub, 2016). Despite this call to action, there are no specific guidelines or a blueprint yet about criteria for effective communication of the 2030 Agenda and the SDGs to all stakeholders (Mulholland, 2019).

3. SDGs and design education

> "The renewed attention to the purpose and relevance of education for human development and economic, social, and environmental sustainability is a defining feature of the SDG4 - Education 2030 Agenda. This is embedded in its holistic and humanistic vision, which contributes to a new model of development." (Education 2030: Incheon Declaration and Framework for Action, 2016)

Two years into the adoption of the 2030 Agenda, the Brussels Declaration (Global Education Meeting 2018) further acknowledged the centrality of education, training, life-long learning, higher education (HE) and research as key driving forces for sustainable development. Notably, in addition to being a specific goal and having direct implications on interlinked

SDGs, education is weaved through all of the goals and plays a structuring role in the "promotion of values of respect of life, dignity and cultural diversity" (Global Education Meeting 2018).

Within this context, HE has a privileged role in the process of building a culture for and of sustainable development and, in turn, a strong responsibility in the achievement of the 2030 Agenda. "Universities, with their broad remit around the creation and dissemination of knowledge and their unique position within society, have a critical role to play in the achievement of the SDGs. Arguably none of the SDGs will be achieved without this sector" (SDSN Australia/Pacific, 2017).

To reinforce the role of HE and consolidate the implementation of practices that collaboratively, rather than compartmentally, address the SDGs framework, a whole-institution approach will ensure cohesion and determine an appropriate basis for prioritising actions. In doing so, the SDGs targets can be addressing within and beyond the scope of the curricula - comprising research, leadership, governance and operations - engaging and activating the broader ecosystems of which academia is a part of. A transformational mind-shift in the acquisition, enhancement and application of interconnected knowledge, skills, values and attitudes, for an evolving world with ever-changing challenges. In other words, new models are for "learning throughout life to support the achievement of the SDGs" (Osman et al., 2017). Supplementing formal learning with community-based non-formal settings and informal daily life activities.

Governments, Ministries of Education and other bodies involved in education, training, and lifelong learning have developed umbrella initiatives or strategic action plans from the get-go of the adoption of the 2030 Agenda. Pending the assessment of results to date of such initiatives, the rising popularity of sustainable development is unquestionable.

The significance of the 2030 Agenda reinforced the discussion on sustainable development in terms of HE and DE, evidence to this should be given to the Kyoto Design Declaration of 2008. The Kyoto Declaration committed all members of the International Association of Universities and Colleges of Art, Design, and Media (Cumulus) "to share the global responsibility for building sustainable, human-centred, creative societies." The SDG Accord launched in 2017 by the Environmental Association for Universities and Colleges, and the growing number of dedicated national and international academic conferences, events, awards and networks have built upon the Kyoto declaration base.

In addition, the interest of the international ranking systems should also be noted - starting from the example of Times Higher Education (THE) University Impact Rankings that has introduced global performance tables assessing universities against the UN's Sustainable Development Goals on four main areas: teaching, research, outreach and stewardship (Ross,

2019) and that of UI Green-Metric World University Rankings that focuses on the condition and policies of universities in relation to Green Campus and Sustainability[2].

According to Irina Bokova (2012), former Director-General of UNESCO, "Education is the most powerful path to sustainability. Economic and technological solutions, political regulations, or financial incentives are not enough. We need a fundamental shift in the way we think and act."

Interdependence, growing of access and exposure to information, progress in globalization, and technology, to name but a few, "require creative and self-organized action because the complexity of the situation surpasses basic problem-solving processes" (UNESCO, 2017).

The concept is reinforced by the World Bank (2019) that identifies three types of primary skills for the evolving world: "advanced cognitive skills such as complex problem-solving, socio-behavioural skills such as teamwork, and skill combinations that are predictive of adaptability such as reasoning and self-efficacy." The World Bank report adds that the "combination of specific cognitive skills (critical thinking and problem-solving) and socio-behavioural skills (creativity and curiosity) is transferable across jobs" (World Bank, 2019). The relevance and cross-cutting nature of system thinking, critical thinking, collaboration, strategic innovation and anticipatory competencies are essential to deal with the increasing complexity and uncertainty and advance towards the implementation of sustainable development. (UNESCO, 2017)

The processes to achieve the interconnected and interdependent goals SDGs is linked to creativity and so much that

> "Creative intelligence has become a new form of cultural literacy which harnesses the power to create, connect, and inspire. Creativity and artistic expressions provide energy and inspiration as well as empowerment. Design is a key dimension of creativity and a major component of culture. Increasingly, design has become a channel to achieve transformation and integration of scientific and technological achievements, including infrastructure development and digitised manufacturing and production." (d'Orville, 2019)

A striking example of the use of design for innovation across sectors is the rise in the popularity of design thinking. An approach that could be said has now become "customary," fostering the appropriation of its methods and tools by other sectors and practitioners [3]. Jon Kolko (2015) states that:

> "Design thinking, first used to make physical objects, is increasingly being applied to complex, intangible issues, such as how a customer experiences a service. Regardless of the context, design thinkers tend to use physical models, also known as design

[2] Without entering into the merits or mechanisms of such systems.

[3] E.g. design today is taught in business schools, including London School of Economics, Harvard, Bocconi and INSEAD.

> artefacts, to explore, define, and communicate. Those models [...] add a fluid dimension to the exploration of complexity, allowing for nonlinear thought when tackling nonlinear problems."

Addressing the more recent development of design in response to the critical issues of sustainability Ceschin & Gaziulusoy evidence particularly design for social innovation, systemic design and design for system innovations and transitions approach. Notwithstanding the problems that still need to be resolved in terms of broad-scale implementation and effectiveness, it can be said that Design for Sustainability (DfS) has:

> "Progressively expanded from single products to complex systems. [...] the first approaches have been focusing predominantly on the technical aspects of sustainability, the following ones have recognised the crucial importance of the role of users, resilience of communities, and more in general of the various actors and dynamics in socio-technical systems. Similarly, the sustainability focus of the various approaches has gradually expanded. The earlier approaches [...] deal with the environmental aspects of sustainability. Moving on, aspects such as labour conditions, poverty alleviation, integration of weak and marginalised people, social cohesion, democratic empowerment of citizens and in the general quality of life, have been increasingly integrated [...]" (Ceschin & Gaziulusoy, 2016).

Skene & Malcolm (2019) put forward the concept that design has the power to sustain and to destroy. Schmidt and Donnert (as cited in Spangenberg et al., 2010) warn that: "Everything was fine in the ancient past. Nature produced no embarrassing shapes and colours; humans were busy struggling for survival and had no time to decorate their first wedges with scrolls. Everything was fine because in the ancient past there were no designers."

This warning reminds us that there can be good and bad design in terms of sustainability and that design in a vacuum is more likely to work against a sustainable planet. Setting design within an ecological context has the potential to provide transformative outcomes for society and the environment (Spirm, 2014). The authors go on to say:

> "Nurturing a systemic lens that is not simply human-centric can influence the direction of a project, resulting in a solution based on mutualism. The SDGs should matter to designers on many levels. [...], for the design student, it surely must be a priority to be familiar with the SDGs and be comfortable integrating them within the design process at both perceptual (Lakoff & Johnson,1999) and conceptual (Bernstein et al., 2010) levels."

4. SDGS framework adoption in practices, cases and examples

4.1 SDGs framework adoption in the creative economy

The SDGs framework has gained a primary role in non-financial business reporting. An influential initiative is the incorporation of SDGs in the last release of the GRI (Global

Reporting Initiative) standard, the most widespread in industry and service sectors. The majority (72%) of the companies surveyed by PWC (2018) mention the SDGs in their non-financial reporting. The share is even higher in the Technology, Telecom and Media group of industries (78%), in Energy and Utilities (78%) and Retail and consumer goods (74%). The research analysed the case of three sectors: Fashion, Food and Telecom that are a significant "landing place" for design students.

Fashion. Two large companies were analysed: Hugo Boss and Luxottica. Both have firmly integrated the SDGs as part of sustainability reporting, identifying SDGs as the "inspiration" of the company' sustainability strategy. Priority SDGs are selected in both cases. Further to product&processes related SDGs, the priority list also includes SDG 3 (Health), 4 (Quality Education), 5 (Gender Equality, Innovation & Infrastructure), 10 (Reduced Inequalities), 16 (Peace), 17 (Partnership), with specific targets. The connections with design range from product, to packaging, to R&S and consumer experience and satisfaction.

Food. One large and one medium-sized company were analysed: Ferrero and Illy Caffé that show a divergent approach to the SDGs as part of sustainability reporting. On the one hand, Ferrero, following a tight GRI standard scheme, sees the SDGs as a classification framework for the company's sustainability actions; on the other hand, for Illy Caffé, the SDGs are a source of inspiration to design company strategy. The different attitude is reflected in the SDGs prioritization model, with Ferrero considering all the SDGs and Illy Caffé making a tighter selection (9 goals) and, based on the CSR report analysis only, gives a different perspective on relationships between design and SDGs, more related to Corporate Identity and problem-solving with Illy Caffé; more traditional with Ferrero.

Telecom. Two leaders in the industry have been analysed: TIM the largest telecom provider in Italy and WIND-3, the third provider of mobile services in Italy. The two companies show a divergent approach to SDGs as part of sustainability reporting, TIM follows a GRI standard scheme, SDGs are a framework for the company' sustainability actions. WIND takes a different route, providing a report dedicated to SDGs that details the SDGs challenges for the sector with an emphasis on the new competencies for a SDGs-oriented scenario that ranks at the first place Complex Problem Solving, at the second Critical Thinking and the third Creativity, all tightly interwoven with design. On the one hand, TIM's approach is focused and accountable; on the other WIND's witnesses the need for a rethinking of companies' targets and competences.

4.2 SDGs framework adoption in HE

Sustainability has found its way into HE and DE; in some disciplines, sustainability was even perceived as a critique to the foundation of the education framework. Nonetheless, while the adoption of the globally recognized SDGs framework can facilitate HE to fulfil its social missions and core functions (Hsieh, 2020) in the advancement of sustainability and sustainable development, the actual and practical adoption of the SDGs framework in HE

and DE remains scattered and has yet to receive an encompassing review. A few examples of the directions put forward above in section 3 can be picked and highlighted.

An example of whole institution approach that uses the SDGs framework as driver for HE activities comes from the **University of Bologna (UNIBO)**. The UNIBO has integrated the SDGs into its mission and strategy since 2016, and adopted a set of metrics to monitor, evaluate, and document progress and impact cross-referencing each SDG against the teaching, research, third mission and institution sphere of the university. A dedicated UNIBO website collects and makes available information and reports on the results of activities with specific reference to the SDGs framework. The website interfaces with two more focused sites, one of the sustainable multi-campus project and one on the virtual coordination structure for cooperation development and engagement initiatives.

The role of DE in transformational mind-shift towards sustainable development that leverages on design culture as initiator and facilitator of awareness building and active engagement finds expression in the **Global Goals Jam (GGJ)** launched by the Digital Society School of the Amsterdam University of Applied Science and the UNDP. The GGJ is a two-day event during which diverse teams of people from all walks-of-life engage with the SDGs through design methods and tools. Key elements of the initiative are interdisciplinarity led by design, grounding the SDGs through a tangible local perspective, sharing of knowledge and experience between GGJ stakeholders, broadening awareness on sustainable development and the value of individual and collective action.

The University of Bergen (UiB) shows how the SDGs can provide a guidance to review and favour the evolution of sustainability culture and sustainable techniques in the study programs. The SDGs Bergen Initiative is built on four primary activities, amongst which the working group Utdanning (Education) 2030. The objective is to integrate within university education SDG-oriented tasks. An internal report has set recommendations on sustainable development and sustainability integration in research, education, and training across the institution, considering multi-disciplinarity and sustainability-focused study programs. Moreover, UiB offers SDG-specific courses within its undergraduate and research school programming. The direct engagement of students in SDG-related activities is highlighted as a critical component of the initiative.

The Impact Through Design. Sustainable Development Goals and Societal Challenges project addresses the issue of applied research in DE, with the objective of defining a systemic proposal for social impact through design, with a focus on the achievement of the SDGs. The project, co-produced by SocialFare and Elisava, gave way to an international Open Talk Series, events, working tables and discussion forums, providing multi-layered and transnational perspectives on the impact design can have on society and the 2030 Agenda.

5. Conclusions

The 2030 Agenda fosters the recognition of design, culture, and the creative economy's direct impact on the SDGs and their role as drivers for sustainable development, engines for the engagement of the general public, and vehicles for progressive values. Contextually, a self-reflection has begun about the changes that the 2030 Agenda vision is triggering in design disciplines. Nevertheless, the relationship between design, culture and creative economy and the SDGs is still far from being fully understood.

The industry examples show how the linkages between SDGs, design, and creative competencies, while on the rise of sector agendas, are still in a rethinking stage, with varying implementation models. The coexistence in the industry case studies of the SDGs as inspiration for problem-solving, complexity management and technical implementation of sustainable solutions solicits the reflection about the necessary coexistence of advanced cognitive skills and technical skills in design education.

Also, the SDGs emphasis on the need to protect "cultural difference" reminds us that design has always been linked to and enriched by local cultural heritage including the arts, the industrial and the crafts territorial fabric, and questions the appropriateness of a single "world design approach" to sustainable development.

DE needs to reason simultaneously in terms of whole-institution (the "design school"), holistic life-cycle approaches, and on the disciplinary boundaries (or non-boundaries) of academia and practice even beyond formal training.

The relationship between design education and the SDGs must be consolidated, yet no systemic analysis at local or global level has been found to validate their interconnection, neither in design curricula nor in a holistic whole-institution approach. Over time the meaning of design - the significance and relevance of the word itself - has expanded, and so have the disciplines it embodies; just consider the expansion beyond product, fashion, and graphic design and the developments that have not yet been foreseen. To this effect, when referring to DE in HE and its interpretations as "design school," a broad concept comprehensive of diverse disciplines, such as fashion, visual and digital arts, diverse applied models must be acknowledged.

The 2030 Agenda vision reinforces the shift toward a holistic approach, questioning the self-preferentiality that design schools and the design community have been found, at times, to indulge in. DE reflections on the SDGs are principally connected to methodologies for innovation, and thus curricula, with limited whole-institution processes observed instead in virtuous multi-disciplinary HE institutions.

6. Future research directions

To broaden and deepen understanding of how the SDGs can be reconciled with thinking and actions in design education, a multi-stakeholder approach should be pursued. The active involvement of companies, universities, design schools, creative professionals, and young people in a co-creating effort to identify tools capable of enhancing knowledge and synergies being an essential element of action.

Starting from the belief that sustainability is a transdisciplinary dimension, future research should:

1. focus on the evolution of design curricula, taking into consideration the dichotomy between sustainability-specific programs and cross-cutting content;
2. explore how transdisciplinarity reflects on traditional disciplines that are still linked to the industrial system;
3. develop life-cycle approaches to learning and innovation;
4. analyse how to improve the integration of the SDGs in the strategy of DE and the development strategy of the creative economy.

The Tree and The Room: Co-Designing DIY WiFi Networks with Emergent Local Metaphors

Michael Smyth*[a], Ingi Helgason [a], Lauren Lapidge[b], Katalin Hausel[b]

[b]UnMonastery, UK
*m.smyth@napier.ac.uk

Abstract | The use of metaphor for communicating conceptual models of interactive systems has a well-documented history in Interaction Design. Although metaphors can primarily be understood as linguistic devices, designers incorporate them into the design process in order to make abstract ideas more concrete and tractable. In this paper we present two case studies where resident researchers worked with Greek village communities to explore potential uses of a "do-it-yourself" WiFi networking technology platform. Built using simple, low-cost Raspberry Pi computer hardware and specially developed, open-source software, this toolkit has the potential to enable hyper-local applications and services to be developed and maintained within a host community. During the co-design process, locally specific, spatial metaphors emerged - the tree and the room - that proved useful for collective sense-making. In this paper, we argue for the importance of foregrounding and supporting emergent design metaphors that are contextually meaningful within the local situation.

KEYWORDS | PARTICIPATORY DESIGN, CO-DESIGN, METAPHOR, WIFI NETWORKING

1. Introduction

This paper describes a pair of related design case studies that were undertaken during residential Test Labs situated in two villages in different areas of northern Greece; Kokkinopilos on Mount Olympus to the east, and Tsepelovo in the Zagori national park region, further to the west. These case studies are presented as examples where emergent, contextually specific and spatially oriented metaphors were influential in the progress and development of the installations. The paper begins with a description of the broader research programme and the motivations behind the case studies, and then presents a review of the literature addressing the use of metaphor in design. The two case studies are described, and the paper concludes with reflection and discussion of the ways that metaphors were influential in each case study process. This discussion then concludes with a summary of "implications for design", specifically some recommendations for approaching "in-the-wild", co-design projects with an awareness of the potential of metaphor as a design resource.

2. DIY WiFi networks "in the wild"

The two case studies presented in this paper were carried out as part of a larger research project called MAZI that was investigating the creation of grassroots WiFi communication networks, including the software applications and local services that can be built around them. Central to the aims of the project is the dissemination of low-cost, easily accessible "Do-It-Yourself" (DIY) networking technologies that enable participatory experimentation and co-design within local communities. The vision is that these technologies could support collective action and creativity, enhancing the possibilities for social life.

This approach to Do-It-Yourself community networking technology combines low-cost hardware with open source software applications. Within the research project, wireless networks were built using Raspberry Pi computers incorporating suites of specially adapted applications available to the user via a browser on their own laptop, mobile device or smartphone (figure 1).

Figure 1: an early version of the WiFi network zone in an outdoor location, including the Raspberry Pi computer and battery.

The toolkit itself is designed to be expandable in the future in order to incorporate a range of open source applications to meet demand, and there are online collaborative resources, including a presence on the GitHub software development platform, to support this ongoing development. At the time of writing, the toolkit includes applications for collaborative note taking and editing, photo and file sharing, website building, and creating polls and surveys.

This approach is not intended as a way to replace the more conventional and widespread Internet infrastructure, rather it is intended to be complementary. An appropriate analogy here might compare industrial scale agriculture to organic urban gardens. They each have different purposes and operate at different scales, but both can have a place within the wider ecosystem of food production. There is growing evidence of interest in developing local community networks, both in response to the perception of possible downsides of global scale networks, and also due to their potential as tools for community engagement, hyper-local knowledge sharing and supporting social cohesion (Davies & Gaved, 2017). The research undertaken within this project is exploring how DIY WiFi network technologies can be adopted by citizens as part of a move towards the "right to the hybrid city" (Antoniadis & Apostol, 2014). This idea that '"doing things locally" is an element of the Internet's future, not its past' (Antoniadis, 2018) is central to this approach. The overall aims of the research project are to make this technology better understood and more easily deployed, and to design and develop a freely available software and hardware toolkit. In this way, the toolkit can enable citizens and communities to build their own local WiFi networks for facilitating hybrid virtual and physical social interactions.

The case studies presented in this paper used early versions of the toolkit "in the wild", exposing the working prototypes and collections of applications to people in real-world situations within communities that represent the intended end users. This approach to design research draws from the anthropologically informed methods popularized by Suchman (1987) and others, and it places importance on understanding new technology interventions within everyday life, rather than working away from the setting, within the

researchers' own usability and user experience (UX) design labs. The term "in-the-wild" here refers to "carrying out *in-situ* development and engagement, sampling experiences, and probing people in their homes and on the streets." (Rogers & Marshall, 2017)

The insights and knowledge gained during this process were fed back to the technical developers of the toolkit, located in a research institution.

3. Metaphors in Design

In everyday language practice metaphors are widely used and their function is well understood. On the surface, the metaphor is a seemingly simple concept, although a comprehensive definition can be rather difficult to pin down. According to Lakoff and Johnson (2003), a metaphor is more than a linguistic or literary device used to express "one kind of thing in terms of another". Linguistic metaphors work, they claim, because the way that humans actually think about abstract concepts - the cognitive process - is largely metaphorical. As Underhill (2018) claims; "metaphor is fundamental to conceptual thought".

Metaphors are useful, possibly even essential, in order to communicate ideas between people, and this process is helpful precisely because people tend to think in a metaphorical way often without even being fully aware of this process. As stated by Lakoff and Johnson (2003), "metaphor is pervasive in everyday life, not just in language but in thought and action".

The metaphors we use to describe the world form and shape our understanding of it. As physical beings, our primary experience of the world is phenomenological, that is to say it relates to how we experience - first hand and in a sensory way - the physical things that surround us (Merleau-Ponty, 1962). Although phenomenology as an academic discipline is concerned with the study of subjective conscious experience it is clear that, from a practical perspective as humans, how we each experience the world is sufficiently similar that metaphors are useful and natural tactics to structure and communicate ideas and concepts. Lakoff and Johnson (2003) consider that the primary function of metaphor is understanding, building on the work of Richards (1936) who characterised metaphors as comprising of a tenor and a vehicle, where tenor is the underlying idea of principal subject and vehicle is the secondary subject which provides a figurative description of the tenor. For example, the ship (tenor) parted the waves like a plough (vehicle). The work reported in this paper has a particular focus on conversations that take place early in the design process. Typically, "design dialogues" at this stage are ill formed and fragmented as participants seek clarity both as individuals and as a group. The use of metaphor is an important conceptual tool where the tenor is intended to provide a domain specific anchor for participants, while vehicle definitions should come from sources that are commonly shared and accessible.

Bridging concepts can be useful for supporting shared understandings during the design process. They are similar to Schön's idea of generative metaphors which he characterises as

the carrying over of frames or perspectives from one domain to another (Schön, 1979). In design situations, Cross (1996) considers the role of language in forming bridges between problems and solutions, rather than leaping straight to a creative solution. To illustrate this point, during a study of a group trying to design a device for carrying a hiker's backpack on a mountain bike, Cross (1996) reported the impact of a single phrase, in this case "tray", and how it influenced the remainder of the design process. The concept of a tray acted as a bridge that lead to the revealing of novel solutions. This example resonates with the ideas around the role of language and its influence on the design process during the case studies that will be discussed in this paper.

The work of Frank and von Sommaruga Howard (2010) further explores the role of dialogue in design and they emphasise the importance of creating a conversation between designer and client that is both open-ended but that critically also allows for the possibility of new knowledge to be generated. While the focus of their research is primarily designer to client or designer to designer conversations, the aspirations are just as relevant to co-design practice where these roles could be represented by different stakeholders and actors, for example end-users, design researchers and organisational representatives. The dialogue that emerges from such interactions takes the form of a shared enquiry, where language and artefacts promote a way of thinking and reflection by a group, and the individuals that comprise the group. When discussing the importance of language during design meetings, Frank and von Sommaruga Howard argue that "language does not just accompany design, it is a constituent of design." Language is a part of the "doing" (designing) and the thing "done" (the designed work) (Dong, 2007).

4 . The Test Labs and the case studies

The lead partners in the two case studies were part of a non-profit organization, unMonastery described as "a social clinic for the future". The organization carries out place-based social innovations, aimed at addressing the interlinked needs of empty space, unemployment and depleting social services by embedding committed, skilled individuals within communities that could benefit from their presence.

In the paper we use the term "Test Labs" to refer to the residencies within each village. This is the term used by the resident researchers themselves to refer to their projects. The term "case studies" has a narrower scope and refers specifically to the design instances or examples discussed in more detail in this paper.

4.1 Interdisciplinarity "insider" researchers

For clarity, in this paper, we use the term "researchers" as an inclusive term to refer to the people who were resident in the case study Test Labs, and we also use the term to refer to members of the other organisations who were part of the wider collaborative project, some

of whom visited the Test Labs and were involved in the work in a more indirect way. The resident researchers sometimes described themselves as “insider researchers”, immersing themselves into the life of the village during their residencies. This approach resonates strongly with the research “in-the-wild” approach mentioned in Section 2 earlier in this paper.

4.2 The case studies

The two related case studies presented here were carried out in villages in northern Greece, each in a distinct area of the country, Kokkinopilos and Tsepelovo in the Zagori national park region. The Kokkinopilos case study took place over three visits of around two to four weeks each, while the Tsepelovo case study, the last in the timeline, comprised of one longer residential visit of nearly three months. In addition, researchers carried out various scoping and preparatory visits before the Test Labs were established and the design case studies took place.

4.3 Background and preparatory work

The Test Lab in Kokkinopilos was the first to be established and was selected after initial scoping visits revealed particular issues regarding the lack of internet access. Later visits identified a suitable vacant building in the village to house the Test Lab. This location became the primary focus for the lab in these early stages. However, a secondary location was also considered in the west side of the Greek mainland, centring around the town of Ioannina.

5. Case study 1: Kokkinopilos village

Kokkinopilos is a small mountain village, part of the Elassona municipality in the mainland of Greece, sited high on the slopes of the Olympus mountain range (figure 2a). Although this mountain region is popular with summer tourists, particularly the coastal side, Kokkinopilos is situated on the inland slopes of the mountain range, is less well known and can be difficult to access. The population is in the low hundreds, but the numbers fluctuate widely according to the seasons, with a very reduced population of mainly older people in residence during the winter months.

Figures 2 (a) Kokkinopilos village and (b) disused school building

In the early months of the Test Lab in 2016, a small, but constantly changing team made several visits to the village of Kokkinopilos engaging in relationship building and collaborative planning activities, often taking place in the social environment of one of the local tavernas. The primary aim at this stage was to build a trusting relationship which could become the ground for mutually beneficial collaboration. The unMonastery researchers expressed a wish to use the disused village school building (figure 2b) as an experimental co-living, co-working Test Lab. In exchange for the use of the building, an offer was made to do something for the village. This way of presenting the group not as *problem-solvers*, but as *a group with a need* was important to set the tone of the negotiations.

These taverna conversations revealed some desires among the villagers around the development of tourism within the area, without losing the particular atmosphere and serenity of the place. Specifically, mapping of the cultural sites was discussed, including the archaeology, the churches and water springs, and also to collect stories. These requirements came from expressions of the need to; increase the economic sustainability of the area, to enable the village to evolve for the future, and to capture existing knowledge. These perceived needs were a response to the concerns about the impact of the younger generations moving away to urban areas and the seasonal variations in agricultural life. Very specifically and concretely, the villagers asked for a website for the village, both in Greek and English.

5.1 The emergence of the Room metaphor: from digital to analogue

One of the concepts that was chosen to be developed was an archive of local knowledge to be kept in the village and accessed by visitors via the local WiFi network. This would be hosted on a MAZI zone built on Raspberry Pi computers supplied by the researchers.

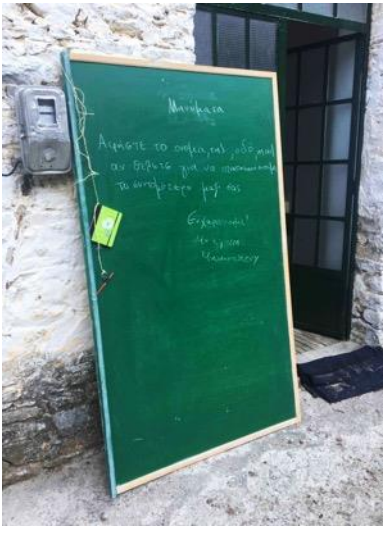
Some of the resident researchers were particularly inspired by the approach of pretotyping; the stage that sits between abstract ideas and "proper prototypes" (Savoia, 2011). The pretotyping approach has the aim of informing *what* to build rather than focusing on *how* to build it. It focuses on testing ideas by building simple versions or mockups to test their acceptance by the intended user group. Pretotypes are intended to be even simpler, and used earlier in the design process, than the more familiar low-fidelity prototypes, and rather than being used to explore functionality or features, they have the single aim of investigating whether the concept should be built at all. The pretotyping approach was appealing in the highly exploratory context of the village Test Lab, and it informed the discussion between researchers.

This enabled the researchers and villagers to continue to collect material and have conversations about what to make available on the internet and what to keep on the local network. One of the classrooms in the schoolhouse was transformed into a walk-in analogue "network zone". This became a place for people to contribute and to collate thoughts and knowledge; a physical archive in the form of a room.

The creation of a physical, tangible space helped the team to see their progress, and also helped the villagers to grasp what exactly they were working on. The whole collection of collated content was easily visible when entering and walking through the room, and items could be touched and handled, added to and annotated.

Each aspect of the content categories intended to be incorporated into the networked WiFi zone hosted on the Raspberry Pis was translated into an analogue version – a hand-made map (figures 3 a & b) was made to mark points of interest that were shared with the researchers. Notes and lists were made and filed under the appropriate heading on the wall. Recipes, water sources, stories, history – everything had its place. A printer was bought (which was donated to the village at the end of the residency) and photos were printed in order to start planning the website for the village. An analogue Guestbook (figure 4) was set up – a green board with chalk and a small book with pen, for messages. Scrapbooks were made and passed around so that villagers could easily contribute.

Figures 3 a & b: The map of the village



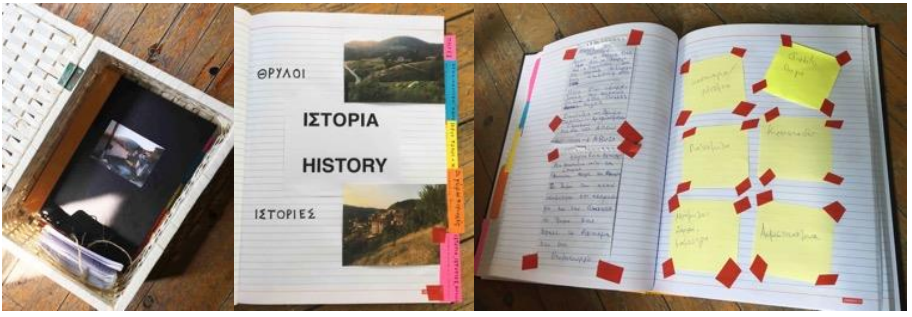


Figure 4: The analogue Guestbook

This analogue way of working continued for a couple of weeks, and it seemed to be positively received. The collections included; stories, history, water sources, recipes, artefacts (photos of), sacred locations, local idioms, Mount Olympus information, and local, medicinal plants. A local WiFi zone was created as a demonstrator through which the villagers could view the material that was proposed to include on the online website to be uploaded to the Internet.

At the end of the project, notes and photos were collated into a scrapbook and left for the village, along with files and photos on memory sticks (figures 5 a, b & c).

Figures 5 a, b & c: The scrapbooks

6. Case Study 2: Zagori Region and Tsepelovo village

The second Test Lab took place in Tsepelovo village, one of the Zagori region villages in the Pindus mountains of northwestern Greece. The nearest large town is Ioannina where people from the surrounding villages often migrate to, and even further to the capital, Athens. The surrounding mountainous villages are mostly populated by an older generation but in recent years there has been a noticeable desire for younger people to move to the villages mostly due to the beautiful natural surroundings they offer.

A building (figure 6a), in Tsepelovo village (figure 6b), owned by the Athens School of Fine Arts, was chosen as the residential hub of the Zagori region Test Lab. The building is mostly used in the summer months, and the Test Lab took place over a period of around two months duration late in the year (October to December) in 2017.

Figures 6: (a) The Zagori Test Lab building and (b) Tsepelovo village

6.1 Identifying needs

During the early scoping visits to the Zagori region, researchers identified a number of areas of action specifically in the mountainous regions. They discovered a desire to: build a community network; develop alternative tourism; archive local traditions and stories; create alternative forms of education; raise awareness of environmental concerns; and search for local resource sharing tools, including agricultural resources.

6.2 The Tree metaphor: the Platanos Provocation

Similar to the Kokkinopilos case study, one of the aims of the Test Lab was to develop a technological instance, installation or provocation in the village that would demonstrate the capabilities and possibilities of the DIY WiFi networking toolkit. Rather than bringing individual project examples to the village situation from outside, it was deemed important that the concept would be arrived at collaboratively with people living locally. From discussions during workshops, the idea of the "Platanos" emerged as an idea to raise awareness in the village of what was happening in the Test Lab building, and to try out the technology in-situ.

The plane tree, or platanos (figure 7a) in Greek is a permanent feature of many village squares, called the "plateia", in mainland Greece. The squares often include the village church and a water spring, and so the shade of the platanos provides a focal point for gatherings. People say that if the platanos could speak it could tell you everything about the village. It was decided to build a network zone around this concept in the main square of Tsepelovo, based around one of the applications of the toolkit, the Guestbook application.

Figures 7 (a) The Platanos in Tsepelovo village square and (b) the gathering in the village square

Early in the Test Lab residency a major village weekend event presented a good opportunity to interact with the extended community within the platanos square. This was the

commemoration of the Greek entry into the second world war and was acknowledged with a large gathering in the village square of residents and those who live elsewhere but who still consider the village to be their home (figure 7b).

The Platanos installation presented a Guestbook so that visitors could leave the Platanos tree a message during the gathering so that others could log in and see it. The installation was programmed and uploaded to the Raspberry Pi computing kit by the researchers during a process of collaborative learning about the technical aspects of the toolkit itself. Although the Guestbook was chosen to be fairly simple to understand and interact with, there were some deeper ideas influencing the overall concept, including ideas around collective decision making and decentralised democracy. Villagers could upload an image and type a short text message using their own mobile devices (figure 8). The presence of the installation network zone was promoted with posters around the village, and during the event itself the researchers were present, talking to the villagers, explaining the installation and encouraging the posting of messages to the Platanos tree. Some of the researchers were logged in as the Platanos tree's own profile, answering messages in the voice of the tree. The impression gained during the event was that people did enjoy the experience and the provocative nature of the concept opened up opportunities for discussions between the villagers and the researchers.

Figure 8: connecting to the Platanos Tree Guestbook

7. Discussion

The two case studies described in the paper illustrate the importance for the design process of identifying emergent, spatial, contextually relevant metaphors in the framing and communication of an early design concept. This was particularly important in this co-design project because of the situated, “in-the-wild” nature of the work. During a combination of collaboration, collective discourse and practical workshops in each of the Test Labs, the tangible metaphors emerged, and were further developed. These metaphors supported the identification of understandings and insights around the possibilities of the DIY WiFi networking technology. This shifted the emphasis somewhat away from early identification of concrete technological solutions, opening up wider discussions.

The visual, physical and spatial language of the two ideas, the room from Kokkinopilos and the tree from Tsepelovo, were demonstrated to be effective at communicating the affordances and conceptual models of the technology. Using the terminology of Richards (1936) as discussed in section 3, a metaphor is comprised of a tenor and vehicle pairing. In these studies, in each case the DIY WiFi network was the tenor, and the room and tree were the vehicles that described the purposes of the networks in terms that were meaningful in each local situation. Critically, these vehicles emerged from the co-design process and were grounded in the spatial context of each setting.

The room metaphor was developed as a creative response to a multi-layered situation and it provided a physical representation of the virtual DIY Network that was being developed – a hybrid network. The school room was a space that was familiar to the villagers, many of whom had been pupils there in previous years, and this encouraged a richer discussion about the nature and format of the village resources. The tree metaphor was more explicitly related to the everyday life of the village. The Platanos provides a canopy that enables the villagers to congregate and socialise. By creating a network that let villagers leave messages for the tree, and that gave a voice to the tree itself, the prototype built on the local myth that the Platanos knows all the secrets of the village.

To conclude, we propose two key lessons learnt from these case studies:

- Useful metaphors can emerge from the specific context: they should be grounded in the language of the local situation in order to enable shared meaning to occur. Designers and researchers should be alert to possibilities residing within the situation and must be sensitive about observing and listening to what the wider context could be communicating.

- The use of metaphors can support shared meaning through the framing of a need or problem, but they do not necessarily lead directly to solutions, their strength can lie in their power to provoke and to support discussion.

Towards 'regenerative interior design': exploring a student project

Giovanna Di Monte-Milner[a]

[a]University of Derby
giovannadimonte@gmail.com

Abstract | Interior designers should design for regenerative systems in order to achieve advanced sustainability, beyond the current 'neutral' sustainable design approach. A broader and more positive regenerative design and development approach supports building social and natural capital within the new ecological paradigm. The interior design discipline has made little contribution to this agenda. This paper thus explores interior design strategies, which relate to regenerative design strategies, through a student project proactively implemented within the Interior Design department at the University of Derby, in an existing 3rd year module. A qualitative research design is used to analyse and code students' proposals, using a constructivist, grounded theory approach. The results present 'regenerative interior design strategies'. These varying strategies are used throughout the project, of which the most *grounded* tap into various social and environmental sustainability benefits. This can inform teaching about sustainability in interior design for a new ecological paradigm.

KEYWORDS | REGENERATIVE INTERIOR DESIGN, SUSTAINABLE INTERIOR DESIGN, INTERIOR DESIGN

1. Introduction

Interior design, as a built environment profession partly responsible for depleting the earth's resources, has the potential to also improve the environment. Within a new emerging ecological paradigm, an overarching concept of 'sustainability' includes using regenerative approaches, and an advanced hierarchical structure of benefits. While 'sustainable interior design' is well documented and researched, contributions to the regenerative design agenda are thin in both education and industry. This research aims to uncover some potential applications of regenerative strategies in an interior design project. The paper explains a proactive teaching strategy wherein the topic of regenerative design was introduced within a student interior design project called *VISION/MAQUETTE* (V/M) at the University of Derby, in an existing 3rd year module, in the 2019/2020 academic year. The objective of this paper is to explore interior design student strategies that link to regenerative strategies. This can provide insight into the ways in which the discipline can improve education about sustainability, and to improve its environmental efforts beyond the current neutral, tool-focused efforts.

After the introduction in the first section, the second section discusses sustainability, interior design strategies, the pro-active teaching strategy and student project. The third section presents the research design and method, followed by a fourth section that presents results and a discussion.

2. Background and review of literature

2.1 Sustainability in the new ecological paradigm

The new emerging ecological worldview is evolutionary, and comprised of living systems (Hes & Du Plessis, 2015). However, sustainability, as an overarching aspiration (Cole, 2012), is not being achieved with the current state of sustainable design, given its skewed sense of measurability and management. Non-integrative and flawed in its focus on the awarding of points, a new paradigm is needed that supports the advancement of the concept of sustainability.

Firstly, sustainability (see Figure 1) has a hierarchical structure that requires three, nested key ingredients (Fischer, et al, 2007), in place of the triple bottom line. As Fischer et al state:

> "Societies cannot exist without a functioning life-support system, and economies can only flourish within a functioning social system with effective institutions and governance structures." (2007, p.622)

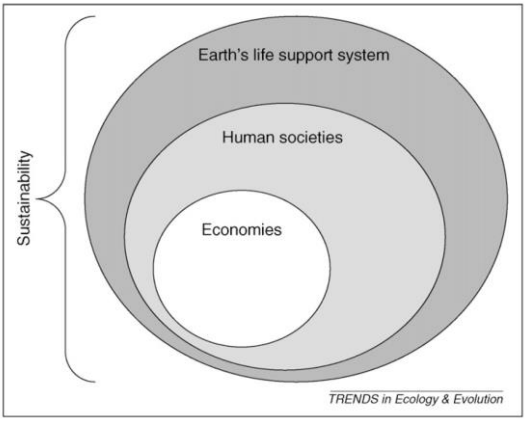

Figure 1. Three nested key ingredients to achieve sustainability (Fischer, et al, 2007, p.622).

Secondly, sustainability that acknowledges the importance of the environment necessitates a regenerating system. In such a system, positive development and regenerative design are key.

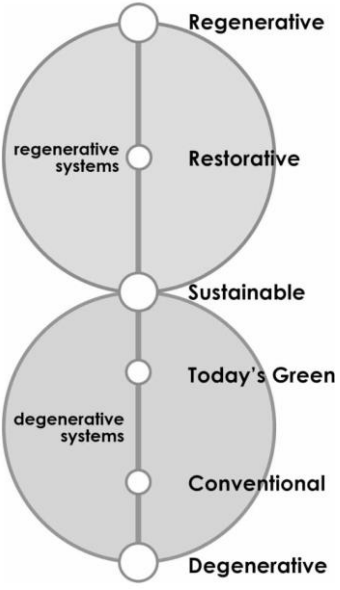

Figure 2. Degenerative and regenerative systems (Plaut, et al, 2012, p.114).

Positive development involves designing "…not just with, or like, nature, but for nature" (Hes & Du Plessis, 2015, p.93) and to "…leave nature better than it was before human settlement" (ibid, p.107). The "…caveat that the outcome should be net positive: more nature, more opportunity and more options" (Hes & Du Plessis, 2015, p.107).

Regenerative design, originally coined as designing regenerating landscapes, refers to a regenerative design and development methodology created by Regenesis (a professional interdisciplinary design team). Like positive development, regenerative design requires positive contributions that increase what existed before human development (Hes & Du Plessis, 2015). It is, however, broader than positive development, surpassing it in its aims for a "reconnection of human aspirations and activities with the evolution of natural systems – essentially co-evolution" (Mang & Reed, 2012, p.26). The concept of sustainability is impossible without regeneration: Figure 2 presents all these design approaches and the need for a regenerating system (Plaut, et al, 2012).

Interior design has long supported the need for energy conservation (Wahl and Baxter, 2008; Theodorson, 2014, p.37). However, links to positive development and regenerative design are less evident in this discipline, yet are clearly necessary, as it is an established profession that contributes greatly to the built environment, as well as to the degradation thereof.

2.2 Typical interior designer strategies

Interior designers have a specific role: to protect public "health, safety, and welfare" (Martin and Guerin, 2005, p.1; IFI, 2011). They make use of various tools and modes of production (Königk, 2010). Interior designers also design with and for human environmental needs, interior construction, codes and regulations, design, products and materials, professional practice, and communication (Martin and Guerin, 2005, p.52). Drawing from my own experience as an interior designer in industry, and from various sources (Kang 2007; Ballast 2010), interior designers in practice are expected to carry out a variety of tasks for a variety of projects. Some of these everyday interior designer practices (in the design stage alone) include: observing, interviewing, briefing, conceptualising, analysing, measuring, documenting, budgeting, using elements and principles of design, communicating, specifying materials, finishes and furnishings, evaluating products and details, drafting technical drawings, constructing models (digital or physical), understanding and applying building regulations, understanding building systems and services.

As the interior designers role continues to grow more complex (Guerin and Martin, 2004; Guerin and Martin, 2010), and require collaboration (Van Marrewijk, 2014; Theodorson, 2014), the discipline should look toward expanding its expertise, especially in the realm of protecting and benefiting the environment.

2.3 A pro-active teaching strategy and student project

An existing, 3rd year interior design module (6ID501 – Design: investigation and identity) supports a year-long major project which requires students to transform an existing space within a building of significance. The module had no explicit outcomes related to sustainability. This offered an opportunity to encourage students to design with more relevant social and environmental concerns, and less 'superficial' typologies for their major project. Therefore, an introductory project, called *VISION/MAQUETTE* (V/M), was inserted into the curriculum. The V/M project is influenced by my previous holistic teaching strategy (Di Monte-Milner, 2017) used at a previous institution.

This V/M project began with a questionnaire, issued to students in pre-project stage, to gauge their knowledge of the ecological paradigm, sustainability, and regenerative design. Thereafter, students were briefed, as part of a pre-design stage, to design a regenerative, spatial intervention (scaled model), as a bite-sized 'taster' of their upcoming, year-long major project. The intervention needed to: address a social and/or environmental issue; be placed within an inactive/underutilised space within their chosen site; be creative, and engaging; and use a regenerative design approach. It also needed to make use of multimodal forms of communication, to help present a popular and universally-accessible message or slogan. Students were then informed by myself and a supporting associate lecturer (whom I prepared), about the new, holistic ecological paradigm, and regenerative systems. Information was delivered via lectures, discussions, videos, and student-led group presentations. The design stage followed with one-on-one discussions in studio between student and facilitator, and a model-building, laser-cutting session in a workshop. Students submitted a digital presentation. In the final critique, each student presented a final scaled-model of their regenerative intervention.

3. Research design and methods

Situated in the constructivist paradigm, the study uses a qualitative research design, and is ontologically interpretive and epistemologically subjective. I present my own and the associate lecturer's research bias and self-reflection as facilitator. I have also had interest in the topic since embarking on a PhD in 2013. The aim is not to provide absolute truth, but valid truth. A constructivist, grounded theory (CGT) approach was used for content analysis, and coding was done inductively using NVivo™ software (computer-assisted qualitative data analysis software – CAQDAS). A non-linear approach was taken throughout coding so as to avoid forcing data into preconceived codes or categories (Charmaz, 2016).

3.1 The Data

The contextual data is comprised of documents related to the work of 12 students. Some students who took part are from one of the University's international partnering institutions

(HTBLVA Spengergasse). In order to comply, an ethical clearance procedure was followed, to adhere to the EU General Data Protection Regulation (GDPR). The data was gathered throughout the timeline of the V/M project, and is available upon request. Some of the data was prepared by myself, which is thus not raw data. The document types (termed by Charmaz, 2016) include:

- Elicited documents (8):
    - Questionnaires,
    - Questionnaire results (A) (only question 10 and 18 were coded).
- Diverse documents (12):
    - Studio discussions (B) recorded and scanned by author,
    - Final digital presentations (C) submitted online by students,
    - Photographs of the final submitted models (D), taken by the author,
    - Lecturers feedback (E) recorded and scanned,
    - Peer feedback (F) recorded and scanned.

Adding data that has multiple viewpoints is important in CGT to avoid forcing the data. Therefore, peer feedback (F) was also included as data to be coded.

Figure 3. Photographs of a selection of students' final models that were coded (Data D). Photos by author.

3.2 The research time line

The research process did not follow a pre-determined timeline or structure; instead, it inductively evolved as may happen in CGT (Charmaz, 2016).

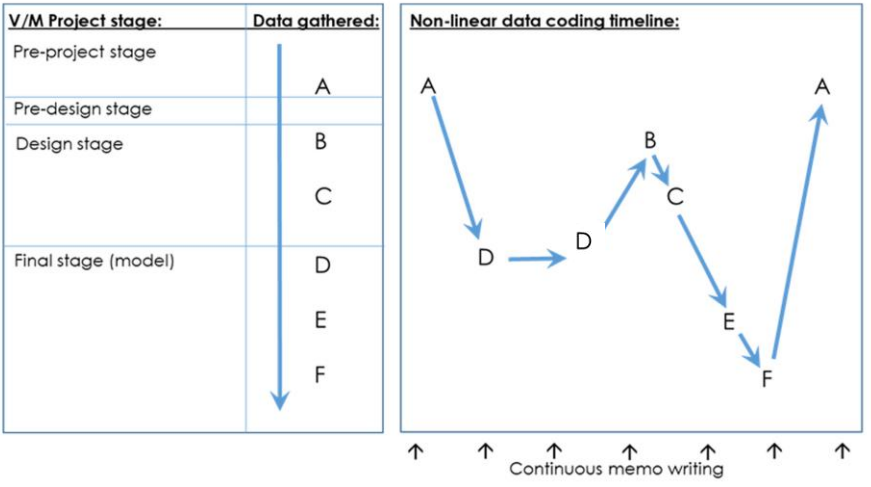

Figure 4. A timeline presenting both the events within the V/M project as well as the research programme (by author).

Although I acknowledge that my coding began with guiding interests (the lens of regenerative approaches based on previous literature I have read), these offered only some ideas for coding. Figure 4 illustrates that the process of coding was non-linear, and data was not coded in the order that it was gathered. Coding was instead iterative and cyclical (some data being coded twice at different stages of the timeline), ensuring that the data was not forced into pre-existing ideas from the literature.

A research journal (available upon request) includes a series of informal memos written throughout the project, which served as a method to clarify and generate codes and categories. These memos include eleven coding memos, three operational memos, and five analytical memos (which were also created in a non-linear order).

The coding method emerged as 'eclectic first-cycle coding' later on in the coding process, even though it never began as such. It initiated with coding of data A as a reflective exercise (to avoid coding into pre-existing categories). Initial coding of data D followed whereby I coded 'everything for everything' to avoid pre-existing ideas. Next, upon reflection, 'process coding' became more suitable for then coding data D, B, C, E, F, and A again. Process coding is coding using gerunds or action words (Saldana, 2016). The research objective was to determine design strategies/actions, so coding with gerunds seemed more appropriate.

Charmaz (2016) supports coding for actions using gerunds in CGT. Parent and child codes were used to make it easier to sort codes as they grew in number. Next, main categories emerged (e.g. wellbeing, senses and community were merged into one) and were raised to the level of focussed codes. Here, the main concerns became apparent. Finally, categories were discussed in terms of existing literature.

3.3 Delimitations

It is important to recognise that the students had already chosen their site and 'new use' for their major project before the academic year began. Introducing V/M in the beginning of the module was important, because, and as Bogenstätter states, decisions in "early design phases determine up to 80% of the environmental pollution" (2000, p.376).

The information about regenerative design that was delivered to students was based on a selected number of sources I had previously researched that were relevant to the topic. Students also co-creatively presented information to each other that they themselves found.

Some boundaries for the coding process were created. The quantities of the NVivo™ region percentages were not taken into account in this qualitative study when coding the photographs/images. No text was coded, and instead coding of regions was done due to the various types of sources that needed to be coded. Repeated references to the codes revealed 'groundedness', not frequency. It was also important to ignore repeated codes for field notes I had taken myself. Only repeats in the data compiled and presented by students were coded.

4. Results and discussion

In this section, the codes and categories are explained, and are followed by the resulting 'regenerative interior design strategies' used by the students (at different stages of the V/M project).

4.2 The codes

At first, I attempted to code any interior design strategy that I could see in the data (not just what I thought could be a 'regenerative interior design strategy'). For example, I coded what I saw in the data: *waste management*, or a *drawn gathering space*, or an *energy-generating element*. The amount of codes (representing strategies) grew considerably. It therefore became essential to group these codes (as child codes) within higher-order parent codes to make sense of the data. It then became appropriate that these parent codes reflect the stages of the V/M project:

- *Assuming* (a parent code in the pre-project phase);
    - Example of a child code: *waste management*.

- *Intending* (a parent code in the design stage)
    - Example of a child code: *gathering space*.
- *Designing* (a parent code in the final stage i.e. model).
    - Example of a child code: *energy-generating element.*

It is important to note that *intending* was further separated into *intending: initial* (data B) and *intending: final* (data C). This is because some codes represent students' design intentions, and not what they actually implemented in their final models.

It became obvious that child codes needed to reflect actions and so codes were renamed to gerunds, for e.g. *designing for waste management; designing a gathering space; designing with energy-generating elements*. The action/gerund *designing* used for all the child codes are a culmination of typical designers' tasks like specifying, drawing, analysing, technically resolving etc. These were presented earlier in the paper and emerged from my own industry experience and literature presented by Kang (2007) and Ballast (2010).

4.3 Emergent main categories

The action-type child-codes then totalled 178, and are available upon request. Those that were similar or significant were then raised (merged and renamed where necessary) into a total of 7 main categories (i.e. main strategies). Five of the seven main strategies fell in the parent *Assuming*; six in the parent *Intending*; and six in the parent *Designing*. Other unrelated strategies that were insignificant fell off.

The table below presents the five most significant of the main strategies, which I term 'regenerative interior design strategies'. They appear in bold, and in order of groundedness, in the table below. It is clear that different design strategies appear more grounded in some stages of the project than in others.

Table 1. Resulting main 'regenerative interior design strategies' in order of groundedness, with those most significant in bold.

V/M Project stage:	Data / Diverse documents:	Parent codes:	Main categories/strategies (out of many merged child-codes):
Pre-project stage	Data A	*Assuming*	***Designing for nett positive flora and nature***
			Designing to add value to existing
			NA unsure or not answered
			Designing to recycle reuse reduce
			Designing for and with communities
Pre-design stage	*N/A*	*N/A*	*N/A*
Design stage	Data B&C	*Intending: initial*	***Designing for and with communities***
		intending: final	***Designing to add value to existing***

			Designing for nett positive flora and nature
			Designing typologies
			Designing to recycle reuse reduce
			Designing with a regenerative design tool
Final stage	Data D, E, F	*Designing*	***Designing for and with communities***
			Designing to add value to existing
			Designing for nett positive flora and nature
			Designing to recycle reuse reduce
			Designing typologies
			Designing with a regenerative design tool

4.4 Discussion

This research uncovers a possibility of seven 'regenerative interior design strategies'. The five most significantly grounded of these are explained in order of significance below. It is important to note that the term '*designing'* is repeatedly used in the category and child code names. I use the term in this study to represent only some of Kang (2007) and Ballast's (2010) designer tasks, because it was a student project, and not an industry-related project. *Designing*, therefore, includes the act of researching, drawing, documenting, specifying, communicating etc.

Regenerative interior design strategy 1: Designing for and with communities

This main strategy is a consolidation of two strategies: *designing for wellbeing*, and *designing for and with communities*. Examples include designing for: the senses, spirituality, education, healing, mental health, physical wellbeing, a human-nature-connection, health and safety, comfort, interconnections, equity, accessibility, own voice, tolerance, respect, social activities, multi-cultures, future generations, local skills and art, and giving back to the community.

This category thus, in sum, is about designing for social benefits (see Figure 5), and is the most grounded of all five strategies. This supports the notion that interior designers "…shape spaces that shape the human experience" (IFI 2011). These strategies not only support design that is *for* society, but design *with* society. We know from research that for interior design to become regenerative, designers should focus on human issues (Sorrento quotes Ellison in her article, 2012, p.41; Pliess, 2011; Theodorson, 2014, p.37), because the occupants are emerging as key players responsible for the performance of buildings (Theodorson, 2014, p.42). Regenerative design also values the 'who' of a place through

design that can "continue to engage with the stakeholders long after the designers and builders have left" (Hes & Du Plessis, 2015, p.119). Because this main strategy further aims for designing to revive and re-value the community's skills and stories, it also promotes the regenerative ideal of designing for 'story of place'. The strategy of interconnecting people to a natural setting or 'place' also promotes co-evolutionary ideas. After all:

> "[h]umans are part of nature and as such have a contributive role to play in the health and evolution of the living systems of which they are part, continually participating as nature and developing the potential of both the system and its inhabitants." (Hes & Du Plessis, 2015, p.112)

Regenerative interior design strategy 2: Designing to add value to existing

This second most significant strategy represents: restoring, repurposing, improving the existing, adding uniqueness, or celebrating an existing building's uniqueness and character. Even though the major project already required students to reuse an existing building prior to this project, these strategies appeared to offer more than simply designing to reuse the existing.

In reviewing theory of regenerative design, this category can also link to 'story of place'. Revaluing existing stories about the place, and valuing uniqueness by improving a space, can help shape "relationships between people, the place in which they reside, [and] past and future generations" (Hes & Du Plessis, 2015, p.119). Understanding the existing site, evoking ownership of the site and ongoing learning and co-evolution of people and their place are important concepts in regenerative design. Although this category seems to respond mostly to the economic sphere of advanced sustainability modelling (see Figure 5), the added focus on stories means that the category straddles social and economic benefit.

Regenerative interior design strategy 3: Designing for nett positive, flora and nature

This strategy, initially called *designing for and with flora*, later merged with *designing inspired by nature,* as students referenced biomimicry and biophilic design. The strategy then also seemed to represent the use of energy-generating design, which reflects the nett positive contribution to natural resources synonymous with regenerative design.

A current trend in interior design is to add restorative natural settings in interiors to benefit occupants psychologically (Bringslimark, 2011, p.484. Interiors that use natural elements as positive distractions promote wellness (Ulrich, 1991, p.107), since "people particularly like to see natural contents" (Ulrich, 1993 in Bringslimark, 2011, p.470). This category can be positioned in the environmental sphere of improved sustainability (see Figure 5), while also benefitting society. This is most interesting, as it suggests the potential for interior design to not be solely for economic and social benefit, but for the environment that both of these exist within as well.

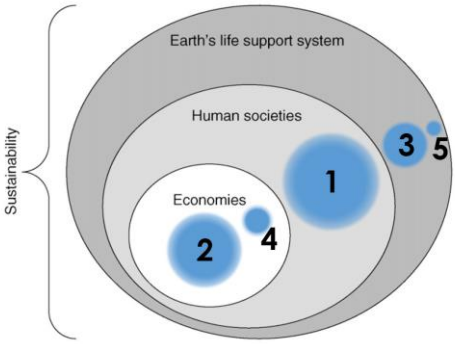

Figure 5. The proposed 'regenerative interior design strategies' (1-5) within an advanced model of sustainability (Fischer, et al, 2007, p.622, adapted by author).

Regenerative interior design strategy 4: Designing mixed typologies

This strategy – of designing for mixed typologies and spaces (like consumer, creation, consultation, educational, and commercial spaces) – did not seem to fit with any other aforementioned strategy. At first, it did not appear to be a regenerative design strategy, however, a design may have economic benefits if it includes a rich variety of spaces for an array of functions that benefit multiple users' needs. It adds on-going viability, which is an important element of designing for 'place as core' in regenerative design (Hes & Du Plessis, 2015, p.117). In contrast, design of unsuccessful or one-dimensional typologies will lead to more unused space and a wasted chance to generate any nett positive social or natural resources.

Regenerative interior design strategy 5: Designing to recycle, reuse, and reduce

This strategy includes using upcycled furniture, reusing waste, charity bins, recycled materials, waste and water management, and designing for multi-functional use. This mode of design aims to efficiently use and manage available materials and resources and benefits the environment in a similar way to the third strategy. If these two are then linked, this joined strategy would become the third most important category. This means interior designers can contribute to the environment even more than initially envisioned. Figure 5 presents this concept.

It is important to conclude that interior design students design with different strategies and at different stages of the project. They showed a better inclination to design for the environment at the beginning of the project, while designing for social benefit was most significant in the middle and end of the project.

4.5 Future recommendations

While the results obtained are useful, the number of participants was small, so the project can be repeated for further insight (a repeated project is already underway). These few student projects nonetheless offer some potential for developing 'regenerative interior design strategies' that can enable regenerative systems. This set of examples can be used to inform interior design students in future, and to promote the idea of designing for and with the environment throughout a project. It could further be beneficial to code these students' final projects at the end of the academic year, in order to see the extent to which they continued to use regenerative approaches. This could reveal further strategies, or uncover those that were never implemented in the end at all.
The project, however small, did include a mix of local and international partnering students. It could be interesting to study the differences in strategies used among these different cultures. A more collaborative student project could also have revealed even richer regenerative design strategies, and would have further supported Williams's (2012) idea that transdisciplinary approaches are key to designing regenerative places. As Williams notes, regenerative design has education and training challenges (2012), so this project can inform the way in which educators package whole/living systems thinking into existing curricula.

4.6 Limitations

This class was made up of a small number of students and participants, however the project was repeated in 2020 and is already being researched to offer further insight, because with this small data set, design strategies and responses cannot be generalised. These students have also not yet been fully employed as practising interior designers, so their design strategies are limited at this stage.
Students were also only shown specific information, which I am familiar with (having read about the topic since 2013), and the only nett positive regenerative design examples I was able to present to them were urban, landscape, architecture and product design examples. This could have influenced their own design strategies.
Furthermore, many students in the class are German-speaking, so although complicated jargon used in questionnaires and presentations was explained, at times concepts could have been misinterpreted. Regenerative design also presents some confusion in that it is a complex issue with no fixed steps to follow (Tainter, 2012).

5. Conclusions

Interior design needs to respond to the ecological paradigm of an advanced notion of sustainability by adopting regenerative approaches. Sustainable design is facing criticism. There is also little literature suggesting potentials for 'regenerative interior design'. A proactive, introductory V/M student project, inserted into an existing curriculum, uncovers some interior design strategies that can be used to design for regenerative systems (which is

finally proposed in this research as 'regenerative interior design strategies'). It also shows that students' strategies changed at different stages throughout the project. It also showed that there were five most grounded strategies, the most significant having social benefit. Some strategies did offer environmental benefit, suggesting that interior design can in fact also benefit the environment. These environment-focussed strategies were more significant at the beginning of the project however, and can offer insight into how the discipline can better teach and design for and with the environment, within the ecological paradigm. After the introduction in the first section, the second section presented sustainability in the ecological paradigm, followed by typical interior designer strategies, and the pro-active teaching strategy (where the student project was then described). The third section explained the research design and method, followed by a fourth section that presented results and a concluding discussion.

Abstract | Nowadays customers expectations has changed and consumers have become much more conscious, demanding and always looking for transparent and traceable services and products. World fashion market is changing too, thanks to younger customers who share their experiences and needs through social networks and digital platforms: this developed a new critical approach to companies behavior, who are now asked to respond of their social and environmental responsibility. Unfortunately, despite their distribution, many of these platforms are not easily accessible. In this context, textile industry is one of the most articulated ones, appearing mixed and heterogeneous especially because of the presence of many companies and actors working in one of the longest supply chain of the manufacturing industry. Those reflections conducted to the design of a platform: Trace, that will provide clarity and guarantee the quality of Italian products throughout the supply chain.

KEYWORDS | ETHICAL FASHION, TEXTILE SUSTAINABILITY, TRACEABILITY, SUPPLY CHAIN, DESIGN MANAGEMENT

1. Introduction: the Prato textile district

Companies agglomeration in districts represents the primary vehicle of Italian manufacture international opening (Becattini 1998; Brusco, Paba 1997; Fortis 1998) also in the fashion sector. The Italian Fashion System is composed indeed of an archipelago of specialized territorial areas; this represents a unique wealth for industrial development opportunities.
It is possible to identify the textile-clothing sector in Italy in a strong fragmentation: there are local systems specialized in textile manufacturing activities, others in clothing, others in both. Companies operating in these local systems work together with mechanisms of exchange, generation, and reproduction of intangible resources such as knowledge or trust. (Becattini,2003; Becattini, 2015; Dei Ottati, 2005).
This research is rooted in the Prato textile district, which is composed of several companies dedicated to the processing and production of textile fibers. The Prato textile district has been assumed as an archetypal exemplification of Marshallian Industrial Districts' processes (Becattini, 2004). This is a particularly articulated reality in which different sectors coexist, including actors supporting the whole supply chain. All the peculiarities that qualify leading companies in the district seem to be as crucial as diversified in operating methods, technologies used, reference markets, and above all, the organization of the supply chain. Moreover, the presence of numerous actors makes this sector heterogeneous with one of the most extended and elaborate production chains.
Thus, the integrated and coordinated management in a supply chain represents a primary tool to ensure a winning service and to gain a competitive advantage through collaborative conduct and transparency, especially in an evolving market like fashion, with ever-higher levels of uncertainty and unpredictability.
This research was conducted according to two parallel axes: one leading to the historical link with the environmental sustainability of the district was carried out within the Datini archive located in Prato. The second is based on a field analysis within a sample of companies.
The analysis revealed that the coordination of the supply chain was often underestimated due to the lack of information shared between downstream and upstream companies. Moreover, the multiplication of competitive pressure requires companies to explore new areas for improvement within the individual company. The risk management shared between producer/distributor and shopkeeper resulted in being decided unequal.
Besides, the intense transformations undergone in the whole fashion sector is worth mentioning: it is possible to notice the growth of different consumption model generated by the social change. Examples can be found in growing attention to pollution and global warming issues lead by numerous campaigns such as "Fashion revolution" or the Greenpeace campaign "Detox my Fashion". The latter includes 80 worldwide companies committed in reduction of their environmental impact and use of chemicals in production processes. It is also noteworthy that among these 80 companies participating in the Detox campaign, 34 are in the Prato area, bringing out a deep-rooted awareness of the sustainability of the Prato textile district.
For decades we have witnessed the delocalization of production (mainly oriented towards the Asian continent), impacting significantly on the planet in terms of pollution and emissions. Many studies have focused on the social and environmental impact of the fashion and textile industry, (Boston Consulting Group, 2017, Claudio, L., 2007; Birtwistle, Moore, 2007), showing that the impactors elements are manifold and not exclusively linked to the production of raw materials.

Moreover, the fashion consumer nowadays is demanding, connoisseur, selective, and his/her buying habits are based on personal evaluation of the product, and therefore, challenging to permeate. As it happened with the customer-product, the relationship between client and brand is currently based on reputation and feedback, making the old fidelization methods ineffective.
This contribution has the aim to explore strategies for safeguarding and enhancing the Prato textile industry, through the proposal of a new model of traceability for products and processes. The aim is to trace and systemize all information regarding the supply chain: from raw materials to production and distribution processes. The result would reveal itself inviolably through a platform based on Blockchain technology.
Hence, this contribution intends to investigate transparency and traceability in the textile industry, with a specific reference to the Prato district. The output of this reflection is TRACE: the proposal of a traceability platform that aims to provide clarity to the customer, as well as guarantee the quality of Italian textile products throughout the supply chain.

2. Emerging scenarios: ethical fashion

Sustainability in the fashion system is an extended field of study that has evolved from a vision centered on purely ecological aspects to a global meaning concerned about how social and economic dimensions of supply chain can impact on the territory (MacArthur, 2013).
In the past few decades, the fashion industry has been one of the main driving forces for global development (Maloney, 2015). The scenario is changing; sustainability and responsibility issues have become central in the debates on the future fashion industry, mostly thanks to the change of a fundamental actor in the supply chain: the consumer (Choy et al., 2012).

2.1 Ethical fashion

Multiple realities compose the concept of environmental sustainability in the textile-clothing system. Sustainability concept is rooted in the longevity of the product and the possibility of a second life through the recycling of the fibers (Ricchetti, Frisa, 2011) as well as social impact of production processes. There are, therefore, multiple aspects that can be considered cornerstones of this theme, all strongly connected.
Information and communication technologies (ICT) nowadays drive industry competition, tending to reshape the nature of manufacturing and manufactured goods (Porter & Heppelmann, 2014). Moreover, information technology opportunities have led the consumers to become increasingly aware, demanding, and looking for transparent and traceable services and products.
Companies have perceived these changes in consumer behavior as a request to exhibit their social and environmental responsibility transparently (Brown, 2010). Hence, the "prevailing ideological system" (Fabris,1995) changes and significant new opportunities are emerging for design culture.
Sustainable fashion is a growing need, especially facing the critical issues that have emerged in the fashion industry in the last decades. The term Eco-Fashion means a virtuous circle that includes all the steps: the design of a more durable product, the choice of materials, production, and distribution of products, trying to achieve the minimum possible environmental impact.

Eco-Fashion has an excellent media response, is a communicative force for a new life approach that allows ideas for sustainable strategic design. The increasing presence of Eco Fashion collections on the market shows a growing awareness. It seems to be strategic and oriented towards more solutions made of transparency, traceability, certification, communication as a function of a possible recycling facilitation.
A sustainable system is not simple at all; one of the ways may concern the reduction of the consumption of primary resources (raw materials, energy) and the reuse as well as the recycling of materials. In other words, the goal is to be able to adopt an economic system whose mission is to reduce the waste generated during all phases of the product. Approaching sustainable management in the fashion sector inevitably means including the entire textile supply chain.
"The difficulty (in the fashion industry) is to see how all the suppliers of the individual components can be ethically secured and accounted for, together with the labor used to manufacture the garment, its transport from factory to retail outlet, and ultimately the garment's aftercare and disposal "(Beard, 2008).

2.1 Ethical consumer

Changes in consumer behavior actively contributed to the centrality of sustainability and responsibility themes in the fashion industry.
The new consumer is an active part of marketing strategies, compared to the past it is no longer faithful to a single brand, it is more selective and demanding and often changes consumption styles (Rinaldi, Testa, 2013).
Digital technologies are the main contributors to this change in dynamics. "In the digital age, people are used to commenting, documenting, and sharing their experiences online. Therefore, loyalty is also and above all, determined by advocacy, or by the willingness to recommend a brand to other people" (Kotler, Stigliano, 2018).
The current consumer, therefore, is an increasingly fluid figure, has multiple identities, and escapes traditional segmentation attempts. He is autonomous, informed, prudent.
Francesco Morace speaks of Consum-Author (Morace, 2016) as a subject who becomes the protagonist and "author" of his existence and his own consumer choices. It is a hybrid figure that wants to be involved and informed on both the genesis and the traceability of the product he/she buys. This phenomenon has led to an increasingly strong binding between being and buying, taking the path of critical and participatory consumption. As Francesco Morace (2011) wrote: "sustainability can be an element of differentiation and advantage of a product, but over the next 20 years being 'sustainable' will be a necessary feature that every product will have to incorporate in order to access the market ".
Thus, social and environmental issues are crucial, especially for young consumers, who through their purchasing habits by promoting brands aligned with their values. Nine out of ten consumers of generation Z believe that companies have the responsibility to address social and environmental issues (Cone Communication, 2017).
Being recognized individually and receiving an offer designed according to specific tastes and needs are fundamental prerequisites for establishing a lasting relationship between people and companies. In order for this bond to be established, it is necessary for companies to put customer-centered innovation processes into practice, one of the design capabilities of "Leading Business by Design" (Micheli, 2014). The company acquires value as much as the consumer participate in the corporate culture.

Consumers have created a more respectful buying habit. Specifically, the increasing amount of available information modifies the models of value creation. In this scenario, a designer can be a "creativity manager", assuming a vital role in the project of all product lifecycles, as well as in need to generate, or in some cases support, the conscious criticism of the contemporary user in this fashion sector.

4.Transparency and traceability

Transparency and traceability are now acknowledged as necessary to measure social and environmental sustainability in the supply chain of the fashion sector.
"Being transparent" in the entire supply chain is the result of work done on traceability and certification, guaranteeing ethical standards, respect for social criteria relating to workers' rights and respect for environmental criteria (water supply, energy recovery, polluting emissions into the atmosphere, production and management of waste, management of dangerous substances and materials).
the widely accepted definition of traceability is from the International Organization for Standardization (ISO), with the added key component of a sustainability focus:
Traceability: The ability to identify and trace the history, distribution, location, and application of products, parts, and materials, to ensure the reliability of sustainability claims, in the areas of human rights, labor (including health and safety), the environment and anti-corruption.
Being able to implement a traceability system means being able to map the operational and production flows, from the extraction of raw materials to the production of semi-finished products and parts up to the production of final products, retail, and possibly the use and reuse, in line with a circular economy.
Using this approach means involving all the players in the production network and educating them towards transparency; provide information that allows for a standard, transparent, and accessible understanding.
Educating the different actors of the supply chain means for companies to develop adequate design management capabilities connected to five factors: awareness, planning, resources, skills, and process (Kootstra 2009).
The theme of traceability is undoubtedly not a brand new topic, dealt with for years in the study areas linked to the dynamics of logistics and business management. Nowadays, the communicative aspects of traceability systems grow in importance as they represent an additional point of contact with the consumer.
A series of opportunities for design are grafted, also thanks to the technological advancement and, in particular, the most recent opportunities potentially offered by the blockchain.
Recent studies on the application of blockchain technology in the agrifood sector show that open-source, decentralized, distributed database for storing transaction information (Francisco, Swanson 2018) can ensure the accuracy of this information, such as product quality, safety, and labeling.
In the context of sustainability, traceability is a tool to ensure and verify the sustainability declarations associated with goods and products, guaranteeing good practices and respect for people and the environment along the entire supply chain.

5. Trace: the design of a traceability platform

Trace has the aim of providing transparency and traceability within the supply chain. The entire project was experimented in the Prato district, which represents "an exemplary history of Italy's districts" (Becattini, 2000)
Based on blockchain technology, this platform addresses its offer both to companies, suppliers of yarn/fabric, and to the consumer who will purchase the final product. The application of this technology within the textile supply chain becomes a strategic tool, suitable for enhancing the industry itself, optimizing production processes, and reassuring the consumer about the operations conducted by companies.
Moreover, blockchain technology ensures the integrity of the data when it is exchanged in a transition, allowing the elimination of intermediaries and simplifying the relationship between brand and consumer. In order for a transaction to take place, all the nodes (participants) must agree on the correctness of the data transferred.
Once the transaction is validated and inserted into the Trace platform, it remain unviolable and visible to all the network. This solution can guarantee reliability and security of the transferred data transparency (as every data is visible to all the actors of the network), thanks to the distributed database that allows establishing a new concept of trust.
The blockchain can guarantee a "digital" architecture capable of connecting and guaranteeing the exchange between the various players in the supply chain, stimulating them for collaboration.
Trace follows the product in every supply chain process, and thanks to the help of new technologies, information is collected quickly and intuitively. Each item in the production chain will be equipped with a "digital passport": labels, like a membrane, are applied to each piece of fabric. Labels are made of MINERVA PHA, a high-performance biodegradable biopolymer, in which a chip is inserted to assimilates step by step the information regarding the different processes.
All actors involved in the supply chain can view and approve the status of the article. In the final stages of production, the chip is extracted and inserted inside the tag that accompanies the garment in the stores.
The consumer, willing to know the origin of the garment, can trace the history of the product thanks to the chip and intuitively know exclusive content about it.
Ensuring a system based on traceability, thanks to blockchain technology, contributes to the enhancement and protection of a Made in Italy product. Collaborating in the creation of conditions of transparency and environmental protection, as well as increasing consumer confidence.
The opportunities of this platform have, above all, an ethical and social value. The conscience of the place is an intermediate step to regain social responsibility and can reopen the way for a vision of society that goes beyond the market.
Trace is based on a clear concept: production is a social fact and, therefore, a manifestation of cooperation between subjects. Thanks to Trace, Prato's textile product can have a new

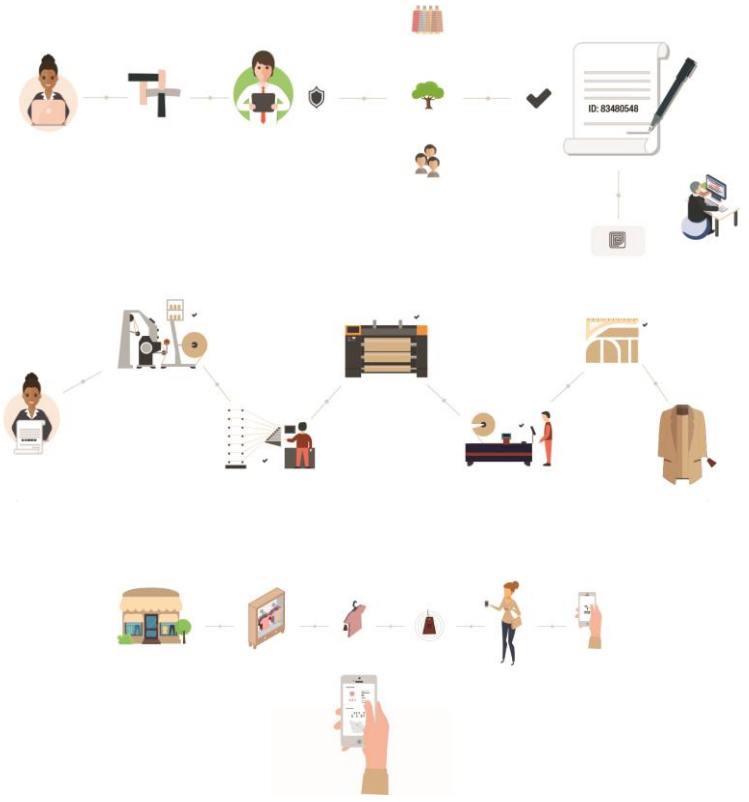

Figure 1. The TRACE process from both producers and consumers point of view.

strategic value that will allow it to diversify for international markets, where social responsibility offers a competitive advantage.
It is essential to make known products characterized by the imprint of a district that has undergone many transformations, strongly linked to tradition with a look at innovation and resource management. Social responsibility as a value but also as an identity. Trace allows to shed light on these issues and make all the information accessible to the final consumer.
Thanks to the design culture combined with opportunities led by recent technologies, tangible and intangible values are intertwined in Italian production, offering a new vision that communicates through a different perspective.

6.Conclusions

The fashion sector has one of the most complex supply chains, with collections that follow one another continuously imposing tight rhythms of development and lead times.
The structure of the Italian supply chain in the fashion sector is complete, with companies operating upstream producing semi-finished products for the subsequent phases (spinning and weaving) and companies downstream that market the finished product.
The sudden change in the market leads companies to choose a sustainable direction but in an ever shorter time. The adoption of an adequate Supply Chain Management tool that allows synchronizing all the operations of supply, production, distribution, and sale ensures optimal performance and savings in time and costs by promoting product quality.
The multiplication of competitive pressure obliges companies today to seek new areas for improvement within the individual company. There are very few companies in Prato that deal with the entire production process, ranging from fiber selection to marketing. On the other hand, there are many industrial companies that cooperate for the return to the end customer of a qualitatively valid product.
In this scenario, there is also an intensification of competition, which is associated with less accessibility not only to financial resources but also to raw materials, and these conditions have increased the competitive centrality of human capital, technological innovation, and efficiency in the use of resources. Moreover, the impact of the crisis has made it necessary to contain those phenomena - increasingly less sustainable - through social inclusion policies, the fight against poverty, respect for human rights, work, and the environment.
It is therefore possible to claim that the process of globalization and the economic and financial crisis have contributed to the growing idea that survival and future development presuppose balance and compatibility between three fundamental aspects: the achievement of financial results, social implications, and environmental impacts.
Companies are key players in the concrete implementation of this development model, which finds its synthesis in the concept of sustainability.
Hence, it is possible to elevate sustainability to a business paradigm, which includes the Triple Bottom Line model (Elkington, 2013): achieve Profit by respecting the environment (Planet) and People.
TRACE, in line with ethical and environmental values, represents a strategic tool, ideal for managing communication between the various players in the supply chain, guaranteeing information security and respect for production.

Abstract | Based on the bleak trajectory of the near and far future due to climate change, this paper outlines some of the assumptions that makes relevant actions so hard to implement. We suggest a framework that enables us to radically rethink sustainability as well as both human and design agency. Based on a simple "Walk-the-Talk" model, potential actions are mapped for both (i) established and (ii) more alternative approaches. The former being the one espoused in today's discourse, while the latter seems to get surprisingly little support. By describing three concrete product concepts we illustrate how by shifting focus to more alternative approaches, we can precisely address the challenges that more traditional approaches have obviously failed to address. In order to find relevant leverage points for both design and required systems change, the paper finally discusses why the traditional approaches still are so dominant in our quest to address climate change.

KEYWORDS | CLIMATE CHANGE, DESIGN, DEVELOPMENT, LONG-TERM SUSTAINABILITY, SYSTEMS CHANGE

1. Background

Design has for quite some time been concerned about the changes needed in how we humans design, build and organize our sociocultural and techno-economic environment. An important insight from long-term sustainable systems is that they are typically characterized by cooperation and diversity. For many centuries, however, the western cultural sphere, with its initial European epicenter, has worked in the complete opposite direction. The hallmarks of this direction have been expansion, exploitation, competition and domination. It can be argued that it is primarily facilitated and accelerated by the global implementation of an economic and industrial 'monoculture' with infinite exponential growth as its primary and essential strategy for survival, which in turn is predicated on continually plundering the life-sustaining biosphere. This monoculture is contrary to everything we know about resilient and long-term sustainable systems. In this 'race to the bottom', the natural world is swept out of the way, as a mere externality.

Modern human civilisation has now arrived at an evolutionary cliff—towards a literal "hothouse" Earth (Steffen et al., 2018), stripping the life carrying capacity of the natural world (Ceballos et al., 2017; Díaz et al., 2019). It has been argued that it is a feature of our existing economic system tied to infinite growth which has historically *cheapened* the natural world in order to dominate and exploit it (Patel & Moore, 2017). However, in order to discuss the situation and its implications we first need to get some fundamental assumptions in place.

1.1 Rethinking Sustainability and Development

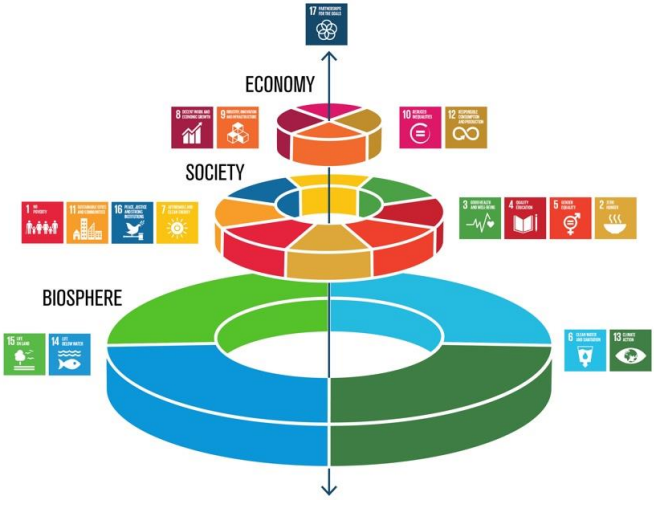
Sustainability as a concept has been frequently used, and probably also misused, since at least the late eighties when UN's Commission on Environment and Development (WCED) published 'Our Common Future' (WCED, 1987). A unique insight of the report was how it understood the environmental crisis as an interlinking of seemingly disparate systemic crises that could not be addressed in isolation. In particular, it had highlighted sustainability's relation to development, as it was explicitly written in both the commission's name and in their oft-quoted definition of *sustainable development*:

> "Sustainable Development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs."

Generally speaking, sustainability can be described as the ability to 'exist constantly', while today it more specifically refers to the capacity for the biosphere and human civilization to coexist. One tension becomes highlighted when 'sustainability' is linked to 'development', as what is perceived as development today just as well could be unsustainable. If true, should one still try to sustain that development? It has even been argued that 'sustainable development' is an oxymoron as the development paradigm is possibly inherently unsustainable (Brown, 2015), which of course depends on what is meant by 'development'. With the hindsight of more than 30 years since the UN published their report, it is therefore

important to ask if it is development, as we know it today, or should we rather refer to a more 'terrestrial' (Latour, 2018) or 'regenerative' (Wahl, 2016) notion of the concept. Regardless, it is becoming increasingly obvious that what we today call 'development' is destroying the life sustaining biosphere, while both increasing the gulf between the few very rich and the many poor (Hickel, 2017) *and* exponentially increasing the extraction of resources and emissions (Martenson, 2011; Raworth, 2017).

The UN's attempts in the early 21st century to resolve this inherent tension between sustainability and development resulted in 15 years (2000-2015) of Millennium Development Goals (MDGs), but as an exercise, it nearly ended in complete failure (Hickel, 2018). Eventually, after some statistical maneuvers, which included moving the baseline year for measurement from 2000 to 1990, it was claimed that the goals had been more or less reached (Ibid.). Following this, 17 Sustainable Development Goals (SDGs) were announced, to be achieved within 15 years from 2016 to 2030. While it is still too early to know the exact outcomes of these goals, there seems to be consensus emerging on the *very* bleak prospects for our planetary future (Díaz et al., 2019; Wadhams, 2017). Especially as the SDGs still set the goal for economic growth (SDG 8), as a condition to solve the crises, which for many is the primary driver of the crises (Brown, 2015; García-Olivares & Solé, 2015; Hickel & Kallis, 2020). In figure 1, Rockström & Sukhdev (2016) sketch out how the SDGs link up to the 'biosphere' and 'human civilization', illustrated as 'society' and its 'economy', respectively.



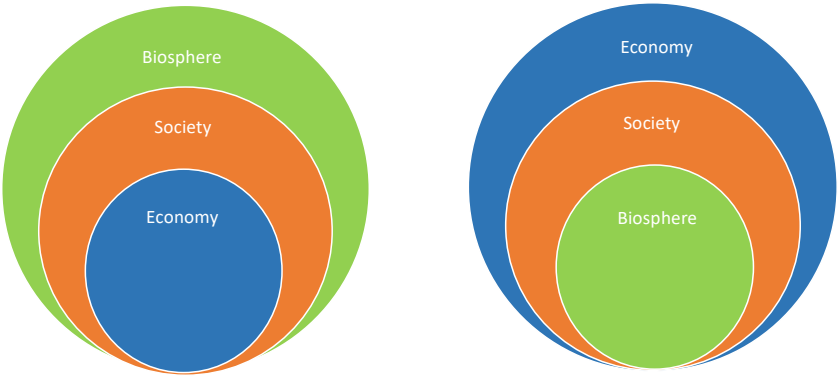


Figure 1. Rethinking and reconnecting the 17 UN SDGs with food. Credit: Stockholm Resilience Centre (Rockström & Sukhdev, 2016)

1.2 Rethinking Human Agency

The discourse surrounding both sustainability and sustainable development tends to be highly politically charged (Fry, 2011; Giddens, 2011; Latour, 2018). Much of that goes beyond the scope of this paper. However, we believe that figure 1 above at least needs to be clarified by adding the actual relation between the three levels at hand.

Below figure 2a illustrates how the entirety of our human civilization is a mere subset of the biosphere; completely dependent on and 'nested' within the Biosphere, what is typically termed as a 'nested system' (Capra & Jakobsen, 2017). This implies that the larger system of the Biosphere does not have the same kind of dependence to us humans. As long as we don't mess up the Biosphere, it's remarkably resilient. However, there is a limit to what it can take and many of these limits might already be on the brink (Steffen et al., 2018).

a) A Nested System relying on the laws of nature

b) A Nested System relying on the laws of economics

Figure 2(a,b) The nested systems model modified from Temesgen et al. (2019)

The biosphere, bound by the laws of nature, offers the bedrock from which society emerges and from within society, the economy emerges. Contrastingly, our present civilization seems to follow a completely reversed nested order as illustrated in figure 2b, implying that the 'laws of economics' set the limits to what can be done in the system. So arguably, in spite of the *talk* about what's required to restore and renew what human society has damaged, we seem to *act* as figure 2b illustrates, i.e., the complete opposite to figure 2a and by that challenging the laws of nature in favor of economically feasible solutions. Or as Naomi Klein puts it:

> "What the climate needs to avoid collapse is a contraction in humanity's use of resources; what our economic model demands to avoid collapse is unfettered expansion. Only one of these sets of rules can be changed, and it's not the laws of nature." (Klein, 2014, p. 21)

1.3 Rethinking design's agency

Design has been criticised for being a mere instrument for developing the consumerist 'wants' for sustaining economic growth, which the present system seems to depend on far more than the 'humans' that designers are told to be focusing on. Giving a "perception of designers as creative, capitalist nerds delivering sexy looking things" (Fry, 2009, p. 120).

The full enormity of the climate and ecological crises has brought us, a small international research group in design, to confront and deliberate on our role as designers as we look to change this bleak trajectory that is leading us towards the complete collapse of our life sustaining biosphere. How then do we as designers explore, develop and use our disciplinary tools and mindsets to address issues related to climate breakdown and comprehend the radical changes that are essential within nearly all levels of our society? Instead of looking from within a human centred point of view, in this paper, we will take a step out of most typical frames by asking what we, as the human species, need to do to better fit into the larger system of the biosphere that we both threaten and depend on. In this paper we'll therefore discuss what is required to *'walk the talk'* towards a more long-term sustainable trajectory.

2. The Walk the Talk Model

As discussed by Amsale Temesgen et al. (2019) it makes an immense difference whether we restrict our options and goals to be feasible within the present economical paradigm or not. In this paper we'll explore if this distinction can be generally useful in order to discuss the multitude of approaches available today, how 'densely they tend to be populated' in present day discourse and the leverage points (Meadows, 1999) to change the present system to a more 'long term' sustainable one. We'll do so by first establishing a rather simplified map illustrating the 'tension field' at play.

We call it the 'Walk the Talk Model', which first maps out different kinds of possible responses to global warming based on our actions and claims (i.e. walk and talk, respectively). In addition, it also makes a distinction between those that try to respond within the present mainstream system versus those who try to find solutions outside it. We follow it up by describing three illustrative cases relating to energy production. The model illustrated in figure 3 below shows how we do, or do not, *walk our talk in relation to climate change* (CC). Exactly how the different approaches are allocated on this, admittedly simplified map is a bit arbitrary and should only be understood as illustrations of what could be there. Illustrated by the tone of grey in the background, we argue that the lower right triangle currently dominates the present-day discourse.

The lower left quadrant is populated by those that neither walk nor talk in relation to CC. Lower right quadrant is populated by those that rather talk than walk, while the upper left is the opposite, consisting of the ones walking without talking about it; i.e. those communities

that just live and thrive in a sustainable manner. All these three quadrants relate in different ways to the approaches populating the upper right quadrant. The upper right quadrant, is also where both the tension and the contrast between the attempts to solve the crises *within vs. outside* the present system becomes most obvious.

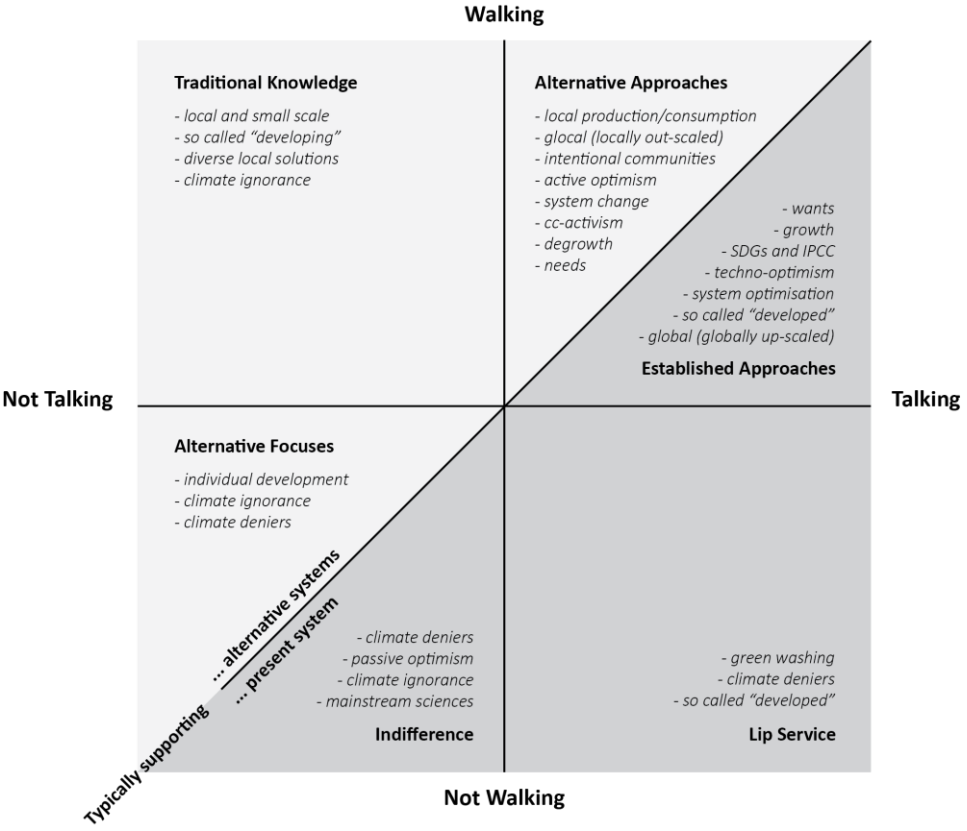

Figure 3. The walk the talk model. Credit: Authors

If one considers figure 3, an explicit tension emerges between the 'alternative systems' of the upper left quadrants and the established present system of the lower right triangle. If one assumes an '80-20' distribution, we note that while *most* of the world's population resides in the upper left triangle, they are continually impoverished yet much of the resources and energy are being consumed by those in the lower right triangle, by a privileged few. When we zoom in on the upper right quadrant of "walking-talking", this tension becomes even more apparent when talking about energy and resources allocated for climate action today. Essentially, we seem to avoid solutions that might disrupt our

present economic order, focussing much less on alternative 'Societal Transformation Scenarios' (STS) which might be especially relevant today for staying below 1.5°C (Kuhnhenn, et.al., 2020). We will expand on this tension further, explored through three cases that highlight the kind of additional solutions we might be able to create if we could dare to *walk* outside the hegemonic box of our present, growth-dependent economic system. What might happen if for a while we freed ourselves from the economic feasibility of the short term and screen new ideas and more thoroughly explore the long-term alternative approaches above the diagonal line in figure 3?

3. Three Illustrative Cases

The three cases, in 3.1 – 3.3 illustrate the tensions in how to address the daunting challenges we face today. The narrative today tells us that renewable energy is growing much faster and even becoming cheaper than the traditional fossil fuel sources used today (Gore, 2016). However, on scrutinizing figure 4 below, at least 3 problems of that story emerge:

1. In order to make the narrative compelling, it needs to compare relative growth instead of absolute growth. The present story becomes invalid if one compares the more important absolute growth.
2. In contrast to case 3.1, the narrative completely forgets that during the last few decades we have emitted more CO_2 than the whole of humanity, had ever done before that (Wallace-Wells, 2019). Due to the Climate system's inertia most of this CO_2 is still in the pipeline without revealing its final consequences today.
3. In contrast to case 3.2 and 3.3 the present narrative assumes that we can produce the required equipment for 'renewable' energy production, without using even more fossil fuels and minerals.

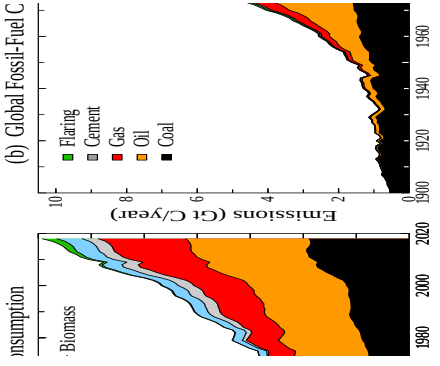

Figure 4 (a,b). Global Energy consumption and fossil fuel emissions. Credit: Hansen, (2020)

We will therefore discuss three different cases developed within design master program at AHO that can all be juxtaposed as 'alternatives' to the way we produce and use energy today. The design concepts themselves are all feasible in principle but haven't been able to scale *up* on the market yet. The first case is indeed used in certain niche markets, but far from what's required to unleash its CO_2-negative potential. The two other cases, are speculative concepts based on basic science, but as such get less attention than one would expect if one considered the urgency to *replace* and not add to the already extracted fossil minerals and fuels. The three cases are all divided in two subsections: 'How things are', which roughly represents the lower-right triangle of our 'Walk-the-Talk' model (figure 3). While the second subtitle, 'How things could be' goes on to illustrate possible alternatives that rather might appear in the upper-left triangle of the same model.

3.1 Reversed Carbon Emissions

How things are: from soil to atmosphere

Since the advent of industrial revolution, we have organized our societies and developed technologies, products and their production capacity around a seeming abundance of fossil fuels like oil, gas and coal. The social, technical and economic systems we live in today are typically so dependent on these resources, extracted from the deep soils of our globe, that the comparison to a severe drug addiction easily come to one's mind (Raworth, 2017). But just as with any other drug's immediate and addictive comforts, it also comes with severe negative, long-term consequences. One can argue that the most serious one, with numerous negative and cascading effects, is that it takes fossil carbon from the earth and in the process emits vast amounts of CO_2 that cause both global warming and acidification of the oceans.

How things could be: from atmosphere to soil

The pioneering book, *Biochar for Environmental Management, by* Lehmann & Joseph (2009) proposes reversing carbon emissions by utilizing Biochar. Since then, biochar has been discussed as a way of sequestering carbon from the atmosphere and by doing so *reversing* some of the devastating flow of carbon our society has produced (Bates, 2010). The idea is simple. Instead of burning biomass in air to ash, one burns it without oxygen into coal (as one fraction) and energy (as another). Thus, one ends up with both energy and carbon (or biochar), where the latter can be put back into the soil and make it more fertile. By this process the highly stable biochar, becomes a long-term carbon sink by circumventing biomass carbon emissions to the atmosphere. While promising, enthusiasm for biochar was initially hampered by the sobering fact that, as illustrated in figure 4, the sheer scales of carbon emissions are so immense. In fact, the accumulated carbon emissions turn out to be much more than what could be considered directly economically feasible to be useful for our soil. However, more recently Albert Bates and Kathleen Draper argue in their book *Burn-using fire to cool the earth* (2019) that this dilemma potentially can be resolved by utilizing carbon's inherent versatility and ability to replace fossil oil, not only as a fuel, but in all kind of designed products typically needed in our everyday life. They coin the process 'Carbon Cascading' as it can be used in series of different applications before it eventually ends up in

the soil again. Figure 5(a,b) illustrates a very simple concept for application of biochar where an energy loop is maintained by only using the gas produced from the feedstock to cook food and letting the remaining carbon go back to the soil thus enhancing its fertility. Furthermore, with a *cascading* approach one could let the Biochar produced pass several stages of other productive uses before it eventually ends up in the soil.

3.2 Redistributed manufacturing

How things are: Centralized mass production
If biochar forms a closed loop of energy flow within a socio-technical system, then this might also drive the production model in a more generally sustainable direction. Although the centralized mass production model has become a mainstream economic development strategy and has contributed to the creation of economic wealth in many countries, this development has also brought us a series of negative effects, including the vulnerability and inflexibility of the system, resource exhaustion and environmental degradation, the barrier between consumers and producers, etc (Biggs et al., 2010; Johansson et al., 2005).

How things could be: from consumer to prosumer
Arguably, we probably need a more resilient and flexible distributed production model to drive the system from mere optimization to the kind of changes really required. This means that material extraction, manufacturing and other involved processes probably need to change too. Pure consumers could ultimately become more of “prosumers”, producing their own goods and services (Kotler, 1986). Instead of relying on infrastructure separated by thousands of kilometers, people could receive a greater proportion of both long-term sustainable products in general and even required energy from their own community or

home. The 3D-printer 'biomA' is a solution that aims to facilitate exactly that. It uses algae to 'grow' batteries (Figure 6a,b). This concept speculates about an alternative solution to lithium batteries by combining algae with chitosan biopolymer instead of the extracting minerals for batteries to accelerate the global transition to more long-term, sustainable and distributed energy production. Within such a distributed production network, all users are considered a localized open manufacturing node, or 'terminal', in a network with so called 'prosumers'. The 'prosumer' gets involved in both the production and the consumption of resources, goods, and services on which they depend. The node can therefore more efficiently reflect the scale and context of local needs, conditions and resources. In addition, the networking between multiple nodes can still enable sharing of the information, resources and knowledge required to reflect changes in the demand from individuals to communities, regions and countries. Or in other words, the main driver of the process might eventually move from the needs of our present system to more essential needs for both the user and the biosphere we depend on.

3.3 Renewed Energy production

How things are: Non-renewable, renewable energy

The share of, so called, 'renewables' in the global energy supply has never been higher (Figure 4a). However, it is being added over and above the already existing energy sources and not so much *replacing* the fossil fuels as promised but further *increasing* capacities for energy consumption. This compounds into a 'race to the bottom' where technology enables ever *newer* capacities for extraction and consumption in addition to what already exists (York, 2017). Despite offering some growth in the short run, it is estimated that these 'renewables' are on course to deplete global reserves of crucial resources such as copper, lithium and other rare-earth minerals given the inherently unsustainable rates of consumption today (García-Olivares & Solé, 2015). It seems that we are caught within a "double bind" where trying to reduce emissions through the present economic system could

end up creating even more emissions if we don't drastically reduce and rethink "civilizational wealth" (Garrett, 2012) as well as "green growth" (Hickel & Kallis, 2020).

How things could be: long-term renewable energy

Given what we know, distributed and scaled *out* nodes of global renewable energy infrastructure might need to be *decoupled* from existing "extractivism" and sourced, manufactured and powered renewably. Speculative Solar, in figure 7, is an alternative, 3D printed optical solar cell that harvests solar energy using optical structures coated with graphene solar inks from sequestered atmospheric carbon. The 3D printed optical structures coated with graphene propose to capture a larger spectrum of visible and infrared solar energy, vastly increasing energy efficiency and effectiveness within the same footprint. In combination with reduced energy consumption, these cells could potentially transform cities to become net generators of energy instead of net consumers, all within the existing frames of today's infrastructure. Designed for modularity and complexity, these solar cells are predicated on adapting to localised production and consumption for community needs rather than market needs, i.e., for scaling *out* rather than scaling up. If one were to carry forward the principles of distributed manufacturing, replacing fossil energy and combine with graphene made from sequestered sources, it might be possible to build a 'virtuous cascade' of renewable energy replacing and regenerating itself through other, locally produced, renewable production systems.

4. Discussion

In this paper we have tried to question some contemporary discourses, which typically seem to be 'marinated' with assumptions that are often taken for granted regarding sustainability and how to best combat climate change. Comparing some established and alternative approaches reveals to us that even the best of the more established sustainability interventions only does *less* damage yet receive *most* of the world's resources and

investment, but on the whole, leaves the damaging engine of infinite growth unchallenged. On the other hand, the kind of alternative solutions we briefly illustrate in our three product cases (3.1 – 3.3) could as a contrast, not only potentially *replace* existing technology, but even reverse some of the damage already taking place. However, these mostly remain relegated to the margins today, revealing the tensions as described in figure 2(a,b) and figure 3.

The upward trends of global energy consumption and CO_2 emissions (Figure 4) make it fairly evident that in the foreseeable future, it will not be possible to replace *all* fossil-based energy we use today with *truly* renewable alternatives. However, we are still asking ourselves why isn't more being done to start the seemingly most logical development trajectory to address this dilemma; i.e. (i) to develop solutions that facilitate a way of living that require radically *less* energy and (ii) to make sure that the energy sources really are long-term renewable. One quite obvious answer is that these alternative product approaches do not make 'economic sense' when the focus is on economic hegemony where cheap fossil fuels are preferred over renewables, scaling *up* over scaling *out*, centralised production and consumption over localised prosumers. One might also contemplate if there is an even more powerful, albeit also more hidden, reason behind this. Might it just be that the alternatives we sketched, being inherently small scale and local, also are too disruptive for a system that is built on gigantic, globally up-scaled solutions? Is it that these alternative approaches, in essence call for a fundamental rethink that challenge the established approaches of the 'laws of economics' (Figure 2b), where the biosphere is *not* a mere 'resource' waiting to be exploited for economic growth?

In this paper we have tried to illustrate how design's agency could be expanded to explore alternative climate solutions at the local level, in ways that could potentially help build resilience and be better suited to addressing the environmental and social crises due to climate change without resorting to the same historical vicious cycles of domination and exploitation of the natural world.

However, underpinned by our own frustration, we have also tried to understand why this is not an easy route to take. Even though many realize that human society might be at stake, we don't seem to address this serious challenge in the required way. One may ask why we don't do what is obviously needed to be done to rein in the worst possible outcomes of a system we still seem to support. Where are these leverage points of change in this system that we as designers might be best suited to address and, to get the required impact, how do we best mediate the work we do? However, in those efforts we probably also need to pay attention to Fredric Jameson's famous words:

> "Someone once said that it is easier to imagine the end of the world than to imagine the end of capitalism."

Water infrastructure as leverage for resilient cities: a multi-scalar design perspective on urban flooding

Sophie Leemans*[a], Erik Van Daele[b]

[a] Ph.D. Candidate arch., KU Leuven Department of Architecture
[b] prof. dr. arch., KU Leuven Department of Architecture
*sophie.leemans@kuleuven.be

Abstract | Global and complex collective challenges such as climate change and its impact on weather patterns require answers across scales and disciplines. Exact spatial impacts are difficult to predict and demand resilient design solutions which incorporate a broad range of weather scenarios. However, due to a number of reasons, governments have repeatedly opted for the construction of large-scale engineered infrastructures that focus on a water defence strategy. Therefore, this paper aims to offer a multi-scalar perspective on urban flooding by illustrating the potential of local water infrastructure as a changemaker. It builds further on design-driven research of a flood permitting urban condition, illustrated by a case study at neighbourhood scale. A network of multiple urban design interventions is structured according to four strategies to deal with water: infiltrate, connect, buffer and protect. Findings explore the possibilities of expanding this designerly approach to other environments and challenges for a resilient urban configuration.

KEYWORDS | RESILIENCE, FLOODING, SUSTAINABLE URBAN DEVELOPMENT, URBAN DESIGN, MULTI-SCALAR APPROACH

1. Introduction

The presence of water has always been a determining factor to the settlement and expansion of urbanisation. Traditionally, cities emerged alongside rivers or coastal areas to have direct access to water as a basic need to inhabit and cultivate the territory, and to connect the agglomeration to the rest of the world e.g., think of the late-medieval water trade networks of the Hanseatic League in Europe. This clarifies the intense inhabitation of river deltas globally: they accommodate 500 million people while representing only 5% of the worldwide land area (Kuenzer & Renaud, 2012, p. 8).

The relation between water and urbanisation is not only one of synergy, but also one of conflict. Coasts and riverbanks were often naturally reshaped by temporary floods before humankind started mutating these natural flooding areas. Many natural flooding processes were disrupted over time due to extensive dredging operations and the construction of large-scale controlling infrastructure such as dikes and locks. These human interventions display an attitude of maximal resistance to the natural dynamics of water. The Dutch coastal works (Delta Works) are a prime example of a water defence strategy, while at the same time enabling Dutch companies to develop very specific technologies and methods which lead to economic benefits.

However, due to rapid urbanisation over the past centuries and its ecological impact, urban agglomerations are increasingly confronted with the complexity of water-related challenges (Flanders Environment Agency, 2020a, 2020b; Ritchie & Roser, 2018). Pressure on engineered structures such as dikes is increasing and there is a need to formulate sustainable alternatives in response to increasingly extreme weather patterns, consistent lowering of the groundwater level, sea level rise, and so on.

This paper builds further upon the master thesis project “Adaptive architecture and flood permitting cities. Urban flooding as incentive for incremental change.” (Leemans, 2019) and the eponymous paper presented at the 2020 SPACE International Conference on Sustainable Architecture Planning and Urban Design (Leemans, Van Daele, & Gheysen, 2020). The publications include a case study of the Brederode neighbourhood in Antwerp to explore how urban design on the intermediate scale (i.e., the scale between the architectural intervention and the urban plan) can influence a sustainable evolution of cities that are facing the threat of urban flooding. It is a research by design that imagines new urban configurations based on different water management strategies. As an addition to this research, this paper aims to reframe and position the case study of Brederode within the larger discourse such as infrastructural urbanism, multi-scalar infrastructural design and systemic design.

It begins by describing a number of concrete current collective challenges related to water on a larger scale (global and regional). The following section provides a rather theoretical background in order to frame these collective challenges as an opportunity to reshape urban areas. Subsequently, the paper provides a short overview of the design strategies and

infrastructural interventions proposed in the case study of Brederode. The paper concludes by putting the case study in relation with the theoretical reflections.

2. Water-related collective challenges

2.1 Global and transnational structures and challenges

The research by design discussed in this paper mainly focuses on collective challenges related to water that dense urban areas are facing nowadays. Many of these challenges are related to the impact of climate change, an issue that transcends borders of countries and cities. Therefore, it is important to shortly frame it in a larger and historical context. The greenhouse effect was first identified in the 19th century, indicating a global warming. It became clear that human activities were polluting and changing the earth's climate (Flanders Environment Agency, 2020a). In 1988 the Intergovernmental Panel on Climate Change (IPCC) was established to provide policymakers with regular evaluation reports on the state of knowledge about climate change. Other global initiatives are the 2030 Agenda for Sustainable Development with 17 Sustainable Development Goals, adopted by all United Nations members in 2015 and the yearly UN conferences (COP) to assess progress on climate change. These overarching initiatives have both the advantage and disadvantage of operating on a global scale.

Figure 1. In 1958, director Frank Capra explains the basics of climate change in a TV broadcast, warning for its catastrophic consequences. He points out that the melting of the ice caps could result in an inland sea in the Mississippi valley, leaving large urban areas permanently flooded. (Capra, 1958)

Challenges related to climate change are often seen as too big and impossible to solve, especially on an individual level. However, the consequences are a common issue and responsibility and therefore a collective challenge. This implies a mentality shift on all levels,

from nation leaders and policy makers to 'common' citizens. The perception and impact of projects on local level therefore is not to be underestimated and essential to complement the large-scale level decisions such as policy-making and legislation.

Increasing flooding in urban areas is a direct result of climate change. In most parts of Northwestern Europe, it is expressed by a rise in sea level on the one hand, caused by volume change of a water mass at changing temperatures, exchange of water mass with melting land ice and changing storage of water on land; and more extreme weather conditions on the other hand, in the form of wet winters with intense storms in combination with dry summers. Recent research shows that if we do not cut carbon pollution we could reach a 4°C warming with a sea level rise of nearly 2 meters this century (Strauss, Kulp, & Levermann, 2016). Since we already warmed the planet more than 1°C, we will inevitably experience serious consequences regarding flooding.

River deltas are usually highly fertile and thus some of the most densely populated areas. Because of their delicate position in relation to the sea as front lines, river delta cities will experience the effects of sea level rise and extreme weather conditions first and foremost. As a result, both the frequency and intensity of flooding will increase. This offers particular urban design challenges: areas will be exposed to water permanently and/or during specific moments.

The Rhine–Meuse–Scheldt delta covers 25,347 km^2, making it the largest risk zones for flooding in Europe and therefore a relevant case (Tockner, Uehlinger, & Robinson, 2009). The delta covers large parts of both The Netherlands and Belgium. Both countries are the two most vulnerable European countries for flooding caused by the rising sea levels: more than 85% of the coastal area lies below 5 meters of the sea level. In Flanders, about 15% of the surface, both the coastal zone and Scheldt polders, is situated less than 5 meters above the average sea level (Flanders Environment Agency, 2018). In addition to the threat of a rising sea level, a changing pattern of precipitation also increases flooding risk. Two types can be distinguished: on the one hand watercourses which flood as a result of persistent rain, and on the other water runoff in case of intense rain showers. This paper will mainly focus on the latter phenomenon, as it is directly related to urban design in terms of built density and soil sealing.

In general, the limited predictability of extreme extreme weather events such as severe rainfall and storms requires flexible infrastructural design. Instead of resisting the natural dynamics of water, a flood-permitting policy with specific interventions on multiple scales could offer a long-term sustainable strategy.

2.2 Regional challenges: Flanders' special spatial context

Flanders, and by larger extent an area reaching from Rotterdam (The Netherlands) to Lille (France) is characterised by a dispersed spatial structure (Gheysen & Van Daele, 2016). This is the result of a number of polycentric network structures (some natural, others manmade)

such as water, mobility and energy. This diffuse urban pattern has enabled interesting relational configurations and qualitative living conditions, but is at the same time facing, amongst others, water-related challenges.

An important contributing factor to flooding risks and the distorted dialogue between urbanisation and the natural territory is the continuous increase of hard surfaces or soil sealing. Based on data from 2015 it is estimated that 16% of the total area in Flanders is covered with non-permeable material, consisting mainly of buildings, roads and car parks (Statistics Flanders, 2019). Additionally, a doctoral study showed a possible increase of the built environment to 30 – 50% by 2050 (Poelmans, 2010). The degree of soil sealing is the highest in and around the largest cities (e.g. Antwerp and Ghent) and in areas characterised by spatial dispersion (e.g. the Kortrijk region). Where the soil is sealed off, rain water cannot infiltrate into the soil and consequently runs off and is disposed to the sewer system. Historically, rainfall was distributed evenly throughout the year, which induced the set-up of a refined network of drainage in order to keep the land dry for economic purposes of agriculture and building construction. However, due to changing rainfall patterns, the drainage system is no longer adapted to the current needs.

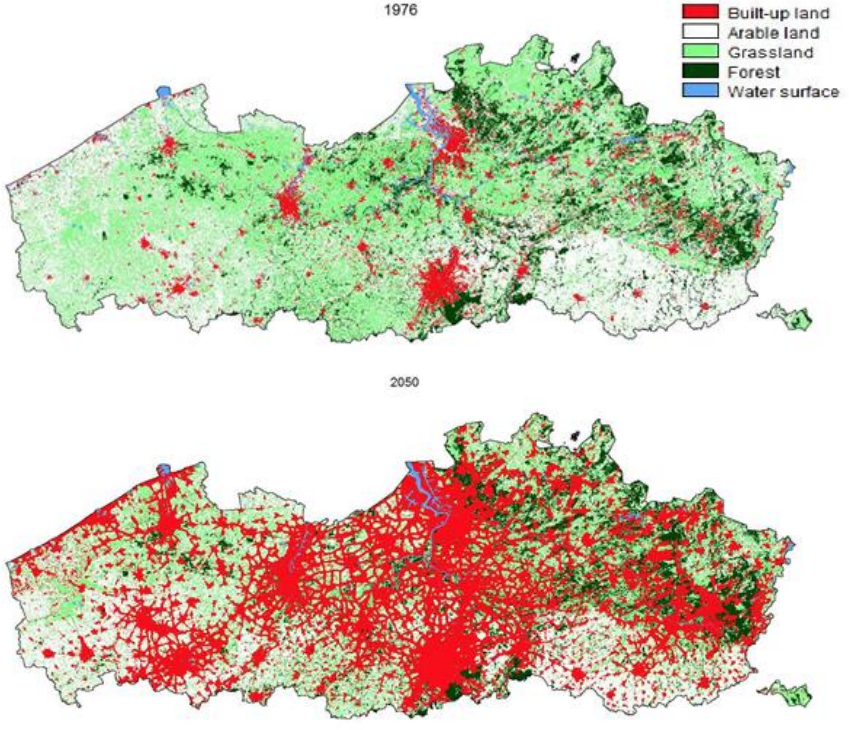

Figure 2. Land use in 1976 and 2050 is case of "business-as-usual" scenario: built surface could increase from from 7,2% in 1976 and 18% in 2000 to 41,5% in 2050. (Poelmans, 2010)

Additionally, decrees about water management in Flanders are quite recent, the first one dating from 2003. As a result of ambiguity on flood sensitivity, over decades new buildings were erected in water-sick and potential flooding zones. The Flemish Environment Agency estimated that as a result, currently approximately 36.000 to 56.000 buildings are located in flooding areas (Panorama, 2013). The combination of poor water management and increasing flooding risk induces a moment of crisis. It is clear that in particular in Flanders, a tipping point has been reached (Dehaene, 2018). The rural substrate is no longer capable of absorbing the ongoing urbanisation in a sustainable way. This leads to numerous unwanted effects of which several related to water management (e.g. flooding, drougths, ecological decrease). It is this urgency of transformation that requires us to rethink and adapt water-related infrastructure to be able to incorporate multiple future scenarios.

3. Infrastructure as an entry to address collective challenges

The architectural design and public spaces are generally considered crucial factors to urban areas. Infrastructure then is considered to be the supporting, if not carrying network that belongs to the separate discipline of the engineer, as at the same time technical infrastructure has become increasingly complex, too. However, this schismatic attitude has led to some extent to the concealment of infrastructure in urban design, as an invisible handyman working behind the scenes of a theatre that has become the city. Consider the term *illusielandschap* [illusion landscape] as an example, pointing at the hiding away of centralised energy production, far away from its consumption (Vervloesem, De Bruyn, Mabilde, & Dehaene, 2018, p. 37): the city as a vampire-like metabolism.

At the same time, issues related to infrastructure often appear to be a symptom of a malfunctioning larger system (e.g., traffic congestions in the dispersed territory of Flanders are not necessarily a sign of insufficient road infrastructure, but rather point at the unsustainable way living and working is organised; or flooding as part of a natural dynamic system). Therefore, intervening on the form (e.g., widening a road; or constructing a dike) instead of the underlying processes results in symptomatic problem-solving, rather than addressing structural change (Allen, 2003). Additionally, it is the “combination of local realities, conditions, and regional forces forged together to interact” which results in “more intelligent […] interventions” (Berger, 2009, p. 15). Therefore, this paper points at the importance of a multi-scalar approach of local (water-related) infrastructure as a link to address large-scale, complex issues such as climate change and to consider it as an assignment of the urban designer. A similar approach of multi-scalar infrastructural design can be found in the projects proposed for New York’s waterfront in the Rising Currents exhibition (Bergdoll, 2011).

Structural interventions on infrastructure networks are rather rare and often a matter of labour-intensive and technical work (e.g., the construction of a new highway or widening of a canal). However, it is at these moments in time that an opportunity for the urban designer

arises to intervene (Hauck, 2011) and go beyond technical symptomatic problem-solving, and to integrate the socio-spatial impact of the infrastructure with the urban fabric. In the particular example of local, water-related infrastructure, flood-permitting structures in cities such as basins and gutters in residential environments could contribute to incrementally transforming the way that water is dealt with in cities today and therefore inducing a mentality shift.

In order to highlight the impact of infrastructure as leverage for reshape urban areas, the historical example of the Great Stink is particularly interesting. In the middle of the 19th century, London faced a hygienic crisis which gave rise to an urgency that raised it to the level of an urban problem and therefore a collective challenge. This issue of severe pollution led to the construction of collector drains underground, and consequently introduced a new series of public spaces such as parks aboveground. It is this collective added value which illustrates the potential of infrastructural interventions to bridge the gap between engineering and urban design.

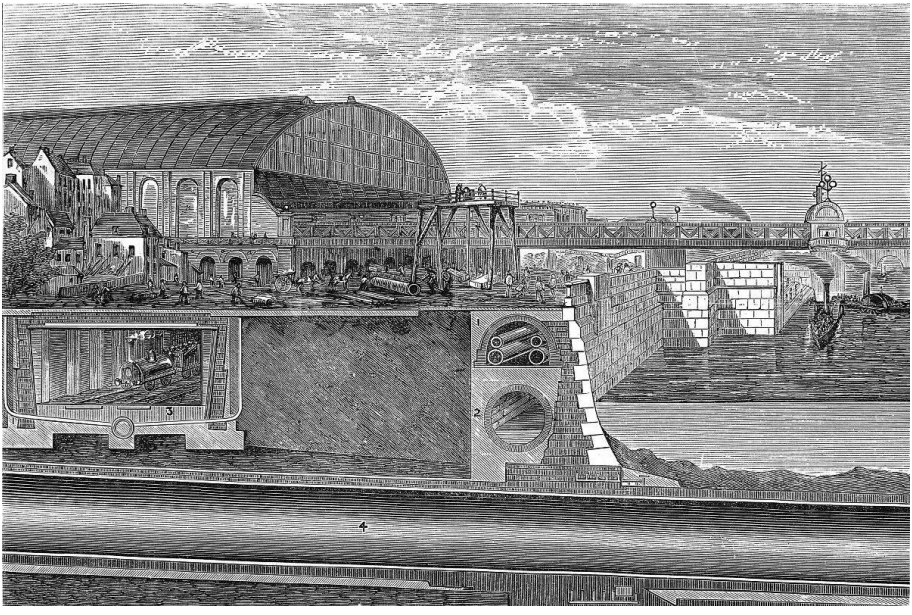

Figure 3. Section of the Thames Embankment displaying amongst others newly constructed sewage collectors. Source: Sir Joseph Bazalgette, Illustrated London News, Vol 67/1, 1867, p. 632 © Science Museum/Science & Society Picture Library.

Today, the era of large-scale, top-down, mono-functional, capital-intensive infrastructure is over (Orff, 2010). Therefore, there is a need for new approaches to deal with complex issues such as urban flooding, in order to combine infrastructural intervention with socio-ecological

added values. As a designerly exercise, this paper includes a case study of the Brederode neighbourhood in Antwerp, Belgium.

4. Local challenges: the case study of Brederode

4.1 The city of Antwerp and water: happily, ever after?

As indicated before, the proportion of hard surface in Flanders is problematic, and the degree of soil sealing in and around Antwerp is remarkably high. In order to get a clearer idea of the design challenges related to urban flooding, it is necessary to study extreme scenarios as they display the problems to face in a condensed way.

Due to limited predictability regarding future urban flooding, a city such as Antwerp requires to improve its resilience to water. Both the city itself and the federal government are already making efforts to do this. In the regional context, the Sigma Plan was set up as the result of a severe flooding in Ruisbroek in 1976. However, in programs such as the Sigma Plan (similar to the Dutch Delta Works), the incentive is mostly based on a defence strategy: a resistance to river flooding though the construction of walls, dikes or the reinforcement of quays (with the exception of few rural large-scale flooding zones). Despite the fact that it might seem to be an effective knock-on solution to flooding, in reality it disrupts the natural flooding process (Temmerman & Kirwan, 2015). A more sustainable approach would be to start from a flood-permitting incentive instead.

Data provided by the Flemish Environment agency display several high-risk zones in the city of Antwerp. The Brederode neighbourhood was selected as an exemplary case study, being located within the dense urban fabric of the city centre. The challenge is to rethink neighbourhoods such as Brederode in a way that they become resilient for increasing extreme weather scenarios. With its 0,72 km^2 and 11.722 inhabitants, Brederode is a relatively densely populated neighbourhood in the city of Antwerp (City of Antwerp, 2019). Additionally, it has little open public space available and at the same time houses many public facilities such as schools, care facilities, local shops and restaurants (Secchi & Viganò, 2009). The neighbourhood is somewhat isolated because of its infrastructural borders: the river Scheldt in the west, the Leien (an inner urban ring road) in the north and the motorway junction of the Antwerp Ring in the south.

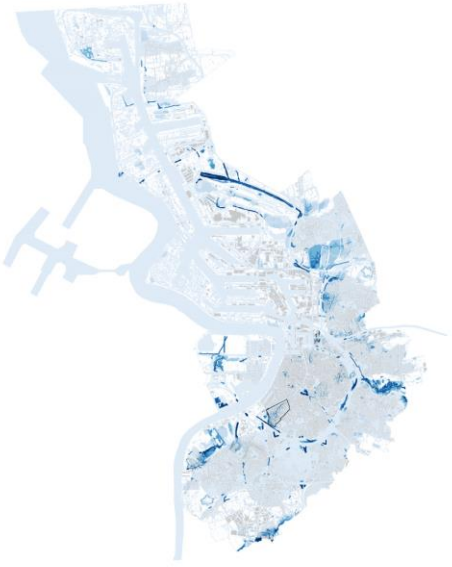

Figure 4. The water depth in the event of a flood with a probability of once every 1000 years in the city of Antwerp, Belgium including an indication of the Brederode neighbourhood. Source: Flemish Environment Agency. Elaboration: Leemans, 2019

4.2 Establishing a network of interventions on the intermediate scale

Neighbourhoods integrated in the dense urban fabric such as Brederode don't have open space available for large-scale infrastructural interventions. The architectural and urban context requires solutions at a smaller scale, and consequently, design-driven research resulted in a network of interlinked urban design interventions on the intermediate scale. This is the scale between the architectural intervention and the urban plan, moreover "the scale of the streetscape" (Scheerlinck, 2018). The proposed network finds its existence in the partial occupation both in in space and time of so-called niche space (e.g. basements, streets, empty lots) connected to each other through resilient structures. These interventions carry the function of links in a network to be switched on or off depending on the weather conditions. The proposal does not (only) aims to prepare the area for emergency scenarios, but above all aims to explore and highlight the positive effects of providing space for water. The implementation of these interventions generate possibilities for collective spaces by and for the inhabitants.

This case study research should not be considered as a solution, but rather as an resilient approach to urban flooding and an attitude of intervention to incorporate multiple scenarios. The interventions should therefore, to a certain extent be adaptive through space

and time. Complementary, it creates valuable space found within the existing urban fabric through double use.

Figure 5. (left) Water depth in event of a 1000-year flood in Brederode. Source: Flemish Environment Agency. Elaboration: Leemans, 2019 (right) Implementation of an adaptive water network of interventions on the intermediate scale. Source: Leemans, 2019

Four strategies of dealing with water have been tested. The most favourable way is to infiltrate as local as possible; the second preferred strategy is to transport the water to infiltration locations; the third strategy is to buffer certain amounts of water for drier periods; and the final option is to protect the weakest areas which could not be included in the previously mentioned system.

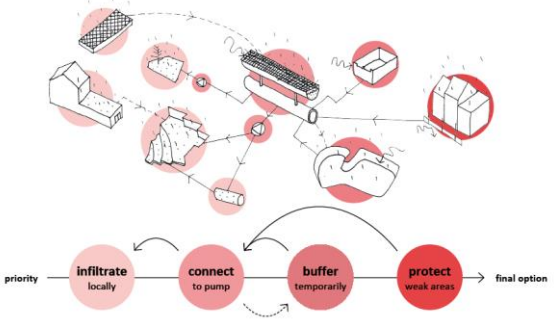

Figure 6. Systemic scheme of the proposed network structured according to four water strategies, each corresponding to different design interventions. Source: Leemans, 2019

4.3 Spatial translation of water management strategies

The following section contains a representative selection of urban design interventions in the proposed water network. The first intervention is linked to the infiltration strategy. Instead of collecting rainwater in sewage and transporting it elsewhere, here, it is collected in the inner space of a building block. It consists of an artificial landscape bordered by a retention wall of three metres high and two metres deep with openings and a levelled infiltration basin in the middle.

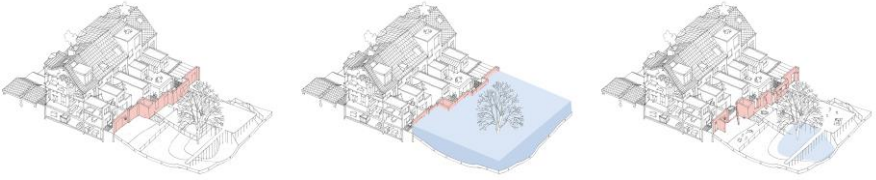

Figure 7. A section of the building block, displaying the retention wall bordering the infiltration basin. Source: Leemans, 2019

The second intervention is the construction of a multifunctional pump house at the border of the infiltration basin complemented by an aboveground network of open gutters as primary water cleaning and an underground network of pressure pipes running through the surrounding streets.

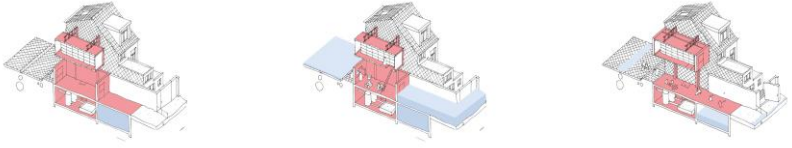

Figure 8. A pump house connects a network of open gutters and pressure pipes with an infiltration basin. Source: Leemans, 2019

The third intervention consist of a series of buffer zones to collect and retain larger volumes of water to bridge dry periods and reduce the impact of intense rainfall. The buffer zones are designed in such a way they are considered an added value to the neighbourhood in wet and dry situations. They can be located in public or private spaces, occupying small squares, (parts of) dead end streets, parts of non-through traffic streets, residual public space and so on.

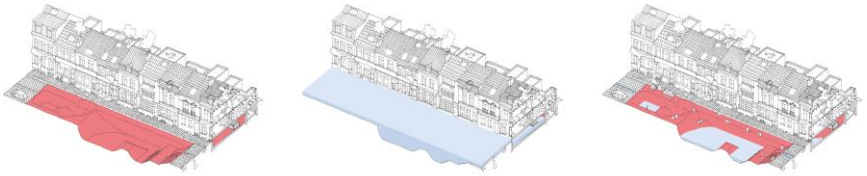

Figure 9. Buffer zones can take on different functions depending on the water volume they hold. Source: Leemans, 2019

The fourth intervention is aimed towards zones that cannot be incorporated in any of the previous strategies. It is a protective structure consisting of steel columns and hollow structured concrete slabs in between. These are invisible at street level as they fit in a trench between the road and the pavement. In case of severe rainfall and overflow of the existing sewage system, the cavity in between the concrete slab and the trench is filled up with water and subsequently pushes the hollow concrete slab upwards according to the Archimedes' principle. Therefore, the space in between the colonnade is filled up with water but the sidewalk and the buildings behind remain dry.

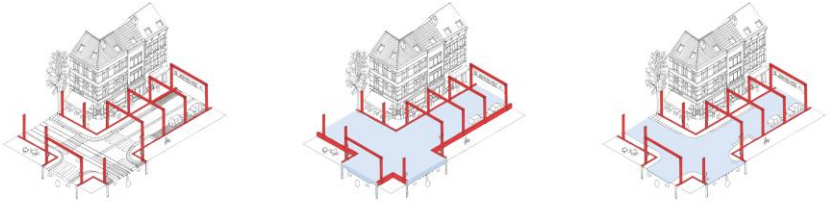

Figure 10. A protective linear structure prevents buildings from being flooded during severe rainfall. Source: Leemans, 2019

5. Conclusion

The present study evaluated the potential of water-related infrastructural interventions on the intermediate scale for future resilience while positioning it in a wider discourse of urban design such as infrastructural urbanism, multi-scalar infrastructural design and systemic design. It is crucial to recognise the importance of these small-scale interventions as changemakers to complement large-scale (physical and political or legislative) structures in order to induce mentality shifts.

Two findings from the study in this paper deserve further comment as they could be expanded to non-water-related infrastructure networks. First, infrastructure could to some extent, as a collective layer and carrying network become leverage to reshape urban

environments towards a more sustainable future. Second, therefore these infrastructural interventions should go beyond technical problem-solving and aspire to generate added socio-ecological values. Interestingly, this paper has shown that the rare event of infrastructural adaptations could be considered an opportunity for the urban designer to intervene in the underlying infrastructural networks.

A possible practical approach for infrastructural design emerges from this study: the drawing on the intermediate scale as a research tool because it is capable of exposing and addressing large-scale issues (e.g., urban flooding as a result of climate change) and at the same time revealing possibilities in local conditions and rendering possible realities (e.g., basements of town houses as temporary water buffers). Particularly the axonometric drawing on the intermediate scale is capable of transcending administrative borders such as plot boundaries and displaying interventions in a clear, concise and comprehensive way.

Despite these interesting insights, the following limitation of the study should be acknowledged. The design-driven researched focused on a case study that represented a dense urban fabric as found in several compact cities in Flanders. However, as previous studies have shown, critical contributing factors to flooding such as soil sealing are not only very high in and around compact cities, but also in the dispersed spatial condition distinctively found in areas such as South-West Flanders. Additionally, the research described in this paper mainly focused on the collective challenge of (urban) flooding.

Therefore, future research would benefit from on the one hand focusing on the urban condition of dispersion and on the other including a clearly articulated collection of future infrastructural challenges. In that way, a collection of comprehensive design strategies could be formulated in order to establish a more sustainable and resilient urbanisation of the Flemish territory.

About the Authors:

Sophie Leemans graduated summa cum laude from KU Leuven with a Master's in Architecture. She worked at the architecture and urban planning practice TSPA in Berlin and is now doing a PhD on the potential of spatial networks in dispersed territories.

Erik Van Daele is lecturer and studio master at KU Leuven, Belgium. He received a master's in architecture, theory and history and urbanism. Till 2014 he was associate in uapS. His design research focus is on disturbances, imperfection, and appropriation.

Maarten Gheysen is an architect, urban designer, and Doctor in Architecture. He combines both academia (KU Leuven) and practice for 20 years. He has an interest in public spaces in dispersed territories, local government and policymaking.

Abstract | This paper tells the experience of a social enterprise in the middle of the Andes in Salasaka Ecuador that is changing passive observation into action with kindness and passion. Andes Materials challenges traditional romantic perspectives surrounding indigenous textile artisans in social sciences and critical theory. In addition, we analyze how market forces in our country have destroyed or reshaped our traditional knowledge and cultural links. Finally, we propose our case to use new social and economic scenarios as an alternative to the traditional fashion industry where human stories are not part of garment creation.

KEYWORDS | FASHION, HANDMADE, ARTISANS, ECUADOR, TEXTILE HISTORY

1.The Past

When thinking about artisans, TIME comes to mind. We think about them as mystic people, piers of our grandparents, surrounded by nostalgic scenarios filled with dust and vintage tools that no longer exist. Our current industrial world has accelerated the way many productive techniques are lost. In the Northern Andes, indigenous cultures and their local techniques did not match the timing of outside industrial processes of the 20th Century. Since the 60s, Latin America has been convinced that machine-made was synonymous with being modern and that traditional handmade crafts and goods were for second-class citizens. Latin America has had a continuous imbalance, importing more manufactured goods than it exports, leaving no space for the development of new products. In this context, we have not had the chance to improve traditional knowledge and thereby develop a Product Design Industry.

For our purposes, we want to talk about textile production. The Andes have had a long and creative history surrounding textiles. The oldest fabrics found can be dated back 6000 years and were used mostly as power symbols between religious and political elites. During the pre-colonial era of the Incas, clothing making evolved into FASHION with a sophisticated level of design, utilizing a huge variety of techniques, types of cloth and even accessories. The remains of these pieces show a refined control of the back-strap loom weaving: plain, tapestry and scroll fabrics were stitched together to create larger pieces. Fabrics were decorated with sophisticated embroidering details (Pillsbury, 2002), and many used pioneering techniques such as the triple and quadruple weaving. The use of very thin and dense yarn was remarkable with 250 to 500 wefts per inch on average (Lechtman, 1993).

The dyeing industry was very dynamic. It created a very broad catalogue of plant-based colours. Carmine red and violet became treasured because of the production of carmine, a pigment obtained from a cactus parasite known as cochineal. This insect was cultivated along the dry fields of the empire and became an important tribute in medieval Andean economies (Phipps, 2010). Its active components are very easy to cast inside the keratin and cellulose fibers of cotton and camelids creating thread, yarn and fabric with very bright tones.

Violet has been a highly valued color during history mostly because of the lack of a diversity of natural sources for the pigment. Lichen, blue azurite or lapis lazuli were used to produce tones closer to blue and the expensive murex, a sea snail found in the Mediterranean made royal purple possible (Phipps, 2010). The complexity of obtaining these tones made this color a luxury for the clergy and monarchy. With the discovery of cochineal by colonizers, a new industry was established in the Americas with big plantations of *Nopalea* and *Opuntia* cacti and this parasite spread across the dry areas of Mexico and South America (Gade, 1979).

During the colony, European fashion pushed away many of the previous fashion trends and industry leaving space only for techniques that could be replicated for the European vogue.

The introduction of the pedal loom made it possible to extend the length of fabrics but decreased the richness of the weft detailing. The introduction of Merino sheep in the sixteenth century (Phipps, 2010) set aside the fine alpaca fiber to create thicker and more protective fabrics.

During the Republic, the new nations kept alive many colonial production systems such as mercantilist textile mills (*obrajes*), workshops dedicated to textile production for the benefit of the Crown (Korovkin, 1998) and later the new republic feudal industry. At these places, indigenous communities became part of the inventory and were kept in slavery thanks to an endless credit system and no right to own property (Chandler, 1982). Each *obraje* was specialized in specific products and therefore the use of pre-colonial and colonial techniques that suited the demand. This knowledge went beyond production and was acquired by these groups to produce their clothing. For example, in Northern Ecuador groups such as the Otavalo were able to replicate the English cashmere: the women from Zuleta have admirable blouses decorated with exquisite embroidery and lace. In the south, the people of Salasaka produce wool felt for their ponchos that are used in rituals of manhood.

2.Resilience

During the colonial and republic eras, there was a contact component that shaped textile knowledge: trade. The production of textiles is very labour-intensive and therefore extremely connected to demand. Without its monetary or symbolic value, fewer people work on, learn or improve techniques. In the case of the town of Salasaka in Ecuador, this dynamic drastically changed during the 20th century thanks to new industrial processes, access to education, Mission Andina and the economic crisis at the beginning of the 21st Century.

In the 50s and 60s, the introduction of aniline erased most of the dyeing noesis thanks to stronger mordants and quicker processes in contrast to traditional techniques such as the cochineal that could take up to 3 days. One of the biggest losses during this time was the quality of ovine fiber because of the reduction of flocks linked to a lack of shepherds. Children were culturally accountable and when they started going to school, they learned to shepherd in the abstract as opposed to the original “learning by doing**”** (Tang 2016) model. This led to a decline in the genetic quality of sheep. Currently, the flocks have reduced to 2 to 4 animals per family, which retained production for domestic consumption with sporadic purchases of wool from other communities or even factories. With the changes in dyeing and sheep raising knowledge of the production chain, which used to happen internally in every family, broke into pieces.

In 1954, Misión Andina came into the equation with a mandate to “promote the development of indigenous communities introducing innovative technologies and new productive, organizational and trading approaches” (Bretón, 2000). The organization, in partnership with the Ecuadorean government, established education programs for

craftsmen. In the case of Salasaka, designers such as the Ecuadorean Hugo Galarza and American Charles McGee worked with local loom weavers to create new patterns for tapestry after understanding and improving some techniques (Burbano, 2020); and Dutch artist Jan Schroeder taught interlocking tapestry to communities in the mountains (Ucrós, 2015). According to designer and researcher Iván Burbano, the new items created by this initiative could not find a market to be sold; the group founded the store Tosca Originales (1) as an effort to generate income. Sadly, this store as other initiatives promoted by Misión Andina came to an end after economic, administrative and other scandals related to the neo-colonial views of that time. This failure was significant because once again, the artisans did not connect with the final buyers. However, the town of Salasaka kept the knowledge and started producing tapestry that was later sold by the nation of Otavalo. An example of this work is a fish pattern that is still around. Mentioned before, the Otavalos are an ethnic group located in the north of the country that is excellent international traders.

Thanks to the success of their cultural exportation, the Otavalos started traveling around the world playing traditional music. These shows were and are still common on many streets around the world. This artistic business is always displayed next to crafts manufactured in Ecuador. Salasaka supplied most of the tapestry for many decades until demand motivated the Otavalos to switch to a local maquila production. This change was exacerbated by the 2000s economic crisis and dollarization. The exorbitant inflation and conversion made tapestry a no profitable activity for Salasaka (Masaquiza, 2017). According to local artisans, labour and materials took most of the costs with insignificant and sometimes negative revenue.

During this time, Ecuadoreans were forced to migrate mostly to Europe and North America. Salasaka found a peculiar spot: The Galapagos Islands. With a registered population of 600 people and an estimated 400 illegal inhabitants by 2011 (El Telégrafo) and 600 legal inhabitants by 2018 (El Universo), Salasakans found jobs in construction, home caring, transportation, and tourism. This last activity represents a steady demand for tapestry with Galapagos fauna patterns woven on the continent and taken to the islands by travellers who go back and forth between the two places. During their time in Salasaka, they work on the loom and sell those products to thousands of tourists at extremely convenient prices.

Trading has shaped the textile heritage for Salasaka. Cultural changes in the last century have affected the core of the production chain, decreasing the quality or even erasing many techniques. However, the demand for goods and the local textile consumption have kept many techniques alive, all of them divided across the same geographical area.

3.Today

By 2020, the process of wool production into textile goods can be synthesized into 3 big categories:

Table 1. Summary of processes involved into yarn, thread and fabric making at Salasaka.

	1st process	2nd process	3rd process	4th process	5th process
Sheep Raising	Breading	Veterinary care	Wool Shearing		
Wool Processing	Washing	Cleaning	Carding	Hand Spinning	Wool ball and skeins
Dyeing	Plants	Cochineal			
Pedal Loom Weaving	Hurdida	Loom Weaving			

Sheep rising happens inside many families in Salasaka. They mostly own two to four animals, always including a female sheep, which is appreciated because of its reproductive capacity. The animals rotate wherever good grass is located and they are tied to a rope to keep them in the area. The fur is sheared one time per year and these fleeces are used to make clothing for the family such as ponchos, bayetas (shawls) and anacos (skirts) that are worn for *Día de Muertos* in November.

Sheep face two big problems: a lack of veterinary care and cattle theft. In the first case, the animals suffer from parasites such as ticks and amoebas and other conditions; sadly, their owners lack the knowledge to treat them properly that decreases their quality of life and health. Salasaka is also a victim of cattle theft; people avoid visible areas and rotate the animals constantly. However, most of the events happen at night and people feel hopeless for the help of the authorities.

Figure 1. Families in Salasaka own few sheep and the lack of care decreases the quality of life and health of the animals.

The fleeces are used for domestic consumption and they are processed inside each family. It starts by washing the dirty wool, which is very labour-intensive. Each fleece requires a lot of water from the river or water channel. The preferred soap for washing and whitening is *Deja*, an industrial detergent. The washed wool is hand-clean to eliminate any impurity, which facilitates the carding process. With the use of two combs, the wool is lengthwise aligned.

The carded wool is soft and ready to be hand spun. This technique is mostly done by women who carry a *carrizo* stick with a bundle of carded wool at one end At any free moment, women take these fibers and gracefully twist them to interlace the fur into fine thread or yarn. Each person has a specific and unique speed; pressure and consistency, which makes each, thread a fingerprint. Depending on the future use of the thread and yarn they became balls or skeins.

When required the thread can be dyed. The preferred colours in Salasaka are black for *ponchos* and *anacos;* and purple, dark green and pink for *bayetas*. The pigments available are artificial anilines, which are cheap and easy to use. For the wealthiest families, women appreciate carmine bayetas dyed with cochineal.

Figure 2. Manuel Masaquiza is waiving a media vara, the standard size of a bayeta. Traditionally, families own a pedal loom and use it to prepare clothing for domestic use.

Finally, the wool thread and yarn are prepared on the loom to later become fabric. The first step is the *hurdida* that is the preparation of the warp (lengthwise thread) on the loom that requires the finest consistency of material. After this three-day process, the artisan will start weaving the *trama* or weft (width wise thread), which can be plain color or designed. For traditional clothing, simple or lineal patterns are popular. In the case of tapestry, the designs have a broader variety of iconography, mostly animal and plant.

4.Design in Capital

While Salasaka has kept its textile knowledge divided between its inhabitants, the dynamics of the mestizo cities are different. In this context, in the capital of Quito, the inhabitants have western stories surrounding their clothing: they buy them from a store. Before the nineties, seamstresses and tailors were in charge of making people's clothing. With the boom of fast fashion, more and cheaper items are filling the demand for clothing leaving the old trades at the edge. More affordable fabrics such as industrial acrylic and cotton are now the preferred by the middle class.

In this context, textile design has had to find a space in the contemporary globalized world with a pioneering generation of designers/makers leading the change. They have understood the necessity of looking back at the origins: to the fibres and fabrics and who made them. These professionals come from high educational backgrounds; products of significant changes in the country's education system: The 2010s crisis in Argentina and the use of the American dollar as Ecuadorean currency made Argentinian art and design schools affordable for families to send their children abroad. On the other hand, scholarship programs sponsored by the local government allowed many students to study in the United States and Europe. All these people came back with knowledge and skills developed for industrialized countries.

Coming back home was a big challenge for these people since everything they learned was developed for another context: places where the industry and design have shaped the culture of creating. Fashion, product, and graphic designers brought back sustainability as part of their work, but faced the need to develop enterprises and not just creative projects.

Many designers started this path with sustainability as their main value. Designers are recycling and up cycling materials such as the case of Remu Apparel that reuses denim for their jackets or Allpamamas that give a second life to house fabrics. However, upcycling and recycling have limits for creative processes. Designing a collection requires specific, customized and new fabrics and this search have become a significant barrier. The manufactures of thread, yarn and fabric couldn't compete with fast fashion and stopped

producing locally. With a weak industry, the efforts to improve technology or even develop it never happened and sustainable textile supplies became almost non-existent.

In this context, the challenge of creating a sustainable collection is difficult as Remu Apparel tells on their commercial website:

> "…we realized the material we used for lining our jackets, while beautiful, was not made of sustainable materials in line with our production objectives. We were sourcing the lining for our jackets from local artisanal markets where the lining was labeled as alpaca or wool, but in reality it was made of acrylic fibers. We stopped production immediately and started looking for new direct suppliers to partner with." (Remu Apparel, 2020)

Figure 3. Remu Apparel decided to stop using acrylic fabrics. The linen of this jacket is made by Andes Materials.

The experience of Remu Apparel is shared between many who have taken a step back in order to start looking locally. In the context of Ecuador, that means looking for the indigenous artisans like those in the town of Otavalo. Sadly their traditional Plaza de Los Ponchos, stores and workshops (now factories) no longer prioritize sustainability. Acrylic became the first option for low effort, bright folkloric colors, and big productions. The initiative Allpamamas searched for the fabric in other communities of the country and found artisans such as Carmen Orellana in Bucay, Azuay province, who weaves a textile known as Makana made with silk and cotton with geometrical patterns. This enterprise also works with Matico, the last workshop dedicated to traditional loom weaving located in Peguche, Imbabura province (Allpamamas, 2020). Nevertheless, these companies have the demand for more fabrics thanks to their yearly collections, work and efforts. Creating the supplies is not their business.

5.The Opportunity

Ecuadorean Fashion brands are growing locally and internationally; they all need sustainable supplies with a traceable origin.

Salasaka's traditional ecological knowledge (TEK) related to textiles does not work around the dynamics of fast fashion. It actually hurts the local products that are made non-competitive due to a lack of reliance on modern procedures and technologies (Tang, 2016). At this specific moment in time, it is important to embrace the knowledge kept in oral traditions and creates the conditions to improve Salasaka's textile TEK. This is the beginning of Andes Materials.

This scenario turns out to be an opportunity for the researchers (us). The town of Salasaka hosts all textile processes from sheep to textile creation. Sadly, recipes and secrets have died off with the original artisans or got lost because they became literally useless for their families. We cannot shame them. If they couldn't sell what it took them so long to make, why would they keep on doing it?

Moreover, we realized the competitive advantage of having all the pieces of the value chain happening locally, which is a rare phenomenon in a post-industrial world. Usually, raw materials are located far away from the people who transform them into supplies and finally, the garments. This advantage helps us provide information of the whole process: From sheep to supply, everything happens in Salasaka.

We started improving the quality of the local fibber. In order to get results, we sample the fur of 46 animals and test different visual characteristics of the wool including color, length, density, breaking point, resistance, and crispness. As an average, the thickness of the local fiber is 24.13 um. which makes the wool medium quality (Rodriguez 2017). In order to improve the quality of the fiber, it needs to be thinner which will help decrease itching, and

make the wool softer and more resistant.

Figure 4. Wool samples were taken from 46 animals to test the quality of the local fiber. Sadly, the average quality was not the best which led us to design a strategy to improve the quality of the breed.

The veterinary recommendation was improving the genetic quality through reproduction. We identified a Uruguayan breed with amazing fiber qualities: 4M. The males rotate between families to fertilize female local sheep which facilitates the birth of new lambs and sometimes twins twice per year. This process is giving us better animals but not enough wool. As a solution, we have found and bought 4M wool from flocks in other indigenous communities in Chimborazo and Cotopaxi provinces, where people did not have a fair buyer.

Figure 5. The new generation of lambs are visible bigger and healthier than their parents.

Other recommendations of the study included food, medicine and veterinary care. This was approached in a practical manner: classes where people learned how to identify and treat common diseases. With an established calendar and constant supplies, the animals have improved their quality of life including the new generation.

Figure 6. Zoila is learning from the veterinarian Karla Rodriguez how to provide a vitamin shoot to her animals.

Shearing was improved as well, from scissor cutting, which used to hurt the skin of the animal, to mechanical shears with hair clippers that keep an adequate fur length to keep the animal warm. Because our products and processes are limited, we take time to shear each animal reducing the stress. When the fleece is ready to be washed, we use detergents free of phosphates. The clean and fragrant fleeces are now ready to be cleaned by hand and any impurities are discarded. The clean wool is ready for carding where fibbers are aligned and softened.

With good wool, we get an amazing thread by applying an ancestral technique. Traditionally made by women, hand spinning is the way of making thread and yarn. Women carry a *carrizo* reed with a bundle of carded wool at the end. The previously carded wool is transformed by twisting the fibers into a continuous fine line.

Figure 7. María and Francisca at the workshop of Andes Materials hand-spinning wool into thread.

The yarn and thread are ready to be sold as balls or prepared for the next astonishing phase: pedal loom weaving. With the feedback of fashion designers, we determined standard sizes to fit design and sewing needs. Our offer is versatile enough for patterning and products that use big pieces of fabric such as yoga rugs and linens.

Another significant upgrade is natural dyes, techniques that were lost in the minds of the grandparents of the present grandparent. We are using local plants and cochineal on written recipes that are a combination of oral tradition and modern improvements. Old recipes have lost ingredients such as the sneaky *Piedra Morocho* that was used to make black. Dyeing with cochineal used to take days with an excessive use of this precious insect. We have

reduced waste and standardize procedures and portions.

Figure 8. Part of the work on creating dyeing recipes includes looking for new recipes and adapting them to local plants.

The standardization provides us data about raw materials and processes. We now know how much resources are needed for every product we include in our portfolio. We have optimized our production dynamics to respect nature and set a comfortable working environment for people: our workshop is a place where people have the physical and motivation tools to revitalize their heritage.

Figure 9. The workshop of Andes Materials used to be a school that stopped working in the 90s. From the ceiling to the walls, the space has been upgraded to fit machinery and furniture.

Order, recipes and standardization are facilitating fair pay to our artisans in a timely manner. We have set prices with enough revenue to reinvest in the company and make a profit after investing time and resources to design a proper website and constant audio-visual material for promotion. We sell branded yarn and thread to stores, plastic artists, and other enthusiasts. Our more profitable product is fabric; with minimum orders of 10m, we are at a point where we can customize orders, experiment with patterns and materials. Salasaka and its textile knowledge are back on the market.

6.We are Equal

The experience of Andes Materials is part of our hearts; we connect Salasaka's textile knowledge to the new world of sustainable fashion without reliance on the bygone themes of nostalgia and romanticism. Since the beginning, we (the researchers from the mestizo world) decided to establish equality as our main value and go against the social and academic status quo. The indigenous communities of the Andes have been under-appreciated as "the other ''; their culture has been simplified as folklore by a "modern world culture characterized by constant change and whose forms were, as a result, ephemeral" (Diarmuid, 2014).

Figure 10. The Team of Andes Materials.

The dynamic is related to a narrative of observation and classification, not by the cultural actors themselves, but by the academic world. The world has looked at the indigenous people as classified objects, which reminds us of the taxonomic interest characteristic of colonialist Spain, at a time when the influence of the Swedish naturalist Carlos Linnaeus spread throughout Europe (Katzew, 2004)**,** giving rise to famous expeditions whose aim was to catalogue everything that was possessed. The new business world cannot follow the traditional ways of seeing the other.

We believe social entrepreneurship creates the conditions to improve local economies and therefore culture. Our portfolio and services provide construction materials for fashion designers, which allows them the freedom to create products without worry about where their materials are coming from. Our portfolio allows us to generate new conditions for the economic stability of family life in the Salasaka community.

The now obsolete critical theory of academia has been replaced with action. We do not theorize; we believe social entrepreneurship is changing our future.

Working with the United Nations Sustainable Development Goals in Design Education

Silje Alberthe Kamille Friis[a*]

[a]Royal Danish Academy – Architecture, Design, Conservation
*sifr@kglakademi.dk

Abstract | This paper investigates how design schools within the fine arts can teach students to create sustainable transformation when working with the United Nations Sustainable Development Goals (UNSDG). The question is examined through a case at the Royal Danish Academy where third semester students engage in a project-based design thinking course focusing on how to increase biodiversity in Denmark. Data consists of the course material and 48 student team projects. The projects are organized in terms of the areas of design intervention and are applied to analyze how well the design methodology and course serve the objective. Findings illustrate that the applied design thinking approach is supportive to creating transformation at the scale of the UNSDGs, however, the student projects generally lack critical reflection on the correlation between challenge and solution and an assessment of the potential impact of the design proposal. Adjustments and new suggestions are offered for future courses.

KEYWORDS | DESIGN THINKING; UNITED NATIONS SUSTAINABLE DEVELOPMENT GOALS; BIODIVERSITY; ASSESSMENT; FINE ARTS DESIGN EDUCATION

1. Introduction

At the Royal Danish Academy (RDA) the United Nations Sustainable Development Goals (UNSDG) are included in the school's strategy. Consequently, students must address one of the goals in their BA and MA graduation projects, just as many research projects, the admission test and several design courses include working with the UNSDGs. The objective is twofold. The academy wishes to contribute to a more balanced and sustainable world by investigating and showing how design can contribute to the realization of the goals and to spur a new era of growth within Danish design (The RDA News site, 2016).

The present paper investigates how design education within the fine arts can teach students how to create sustainable transformation. 'Sustainable transformation' can be defined as creating change for future generations to be able to meet their needs, like we, living in the present, can meet our needs (Brundtland, 1987).

The backdrop is the planetary imbalance as expressed in the UNSDGs. Human beings are at the epicenter of the crisis: the human population growth, our ability and will to dominate, our unsustainable use of resources, and our general inability to change our ways before it is too late (Fry, 2012). We are producing results that nobody wants (Scharmer & Kaufer, 2013; Heller, 2018). Already in 1985, Papanek expressed his concerns about the role that design plays on the environment by creating incentives for increased consumption (Papanek, 1985; Csechin & Gaziulusoy, 2016). However, design professionals, educators and researchers have generally been slow to change our ways of thinking and acting in relation to environmental issues. There is much to learn about how design can contribute to creating sustainment.

The study is based on a case in which third semester students from 8 design disciplines participate in a six-week design thinking course working with the question of how to increase biodiversity in Denmark, mainly the UNSDGs #15 Life on Land and #16 Life Below Water (Sustainable Development Goals, 2015). Design thinking provides the underlying theoretical foundation for the approaches to be experienced in practice by the students. Data consists of the course material, e.g. course objectives, program and course layout, and 48 student team projects. The projects are analyzed and organized in terms of how they contribute to increasing biodiversity, leading to three areas of design intervention. Next follows the analysis of what can be learned from looking more closely at the student projects and how this reflects on the design thinking methodology and the course as means to teach students how to tackle large–scale, complex challenges.

2. Design Thinking

The theoretical foundation of the course is based on 'design thinking', a methodology for creative, collaborative, complex problem solving (Brown, 2008; Dorst, 2015; Liedtka, 2016; Thienen, Meinel & Nicolai, 2014). Design thinking was initially investigated as a particular cognitive ability among professional designers, the 'designerly ways of knowing' (Johansson-

Sköldberg, Woodilla & Çetinkaya, 2013). During the 1980s, a different discourse was introduced by practitioners and researchers within fields such as Design, Business Management, and IT, 'design thinking' now a strategy and a toolbox for addressing complex, ill-defined, interdependent challenges, transporting the designers' ways of working to new areas and disciplines (Johansson-Sköldberg et al., 2013). The present case is in line with the latter discourse, defining design thinking as a systematic, collaborative, future-oriented and iterative process enabling the inclusion of perspectives across disciplines, life worlds and allegiances such as knowledge, beliefs and social positions when creatively addressing open, complex, and dynamic challenges.

Central to the process is the framing and reframing of problems in parallel, applying abductive thinking to suggest potential ways of looking at a problem and generate novel solutions (Dorst, 2011). An integral part of design thinking is sketching, prototyping and other types of visualization to iteratively explore and experiment with new opportunities. The visualizations serve as vehicles for communication with oneself and others. It's a way of making external versions of experiences and ideas, and of testing possibilities (Coughlan, Suri Fulton & Canales, 2007). On a planet where disagreement and conflicts are prominent among humans, design thinking appears well-suited to working with the UNSDGs due to its focus on including diverse, sometimes conflicting perspectives in co-creative work (Thienen et al., 2014).

There is a wealth of visual design thinking models, providing participants with a shared process language and supporting the separation of content from process. Typically, the process is iterative and runs in loops between different activities such as a 'research' to investigate challenges, opportunities, underlying conflicts and paradoxes; 'ideation' – to imagine new possibilities and concepts, and 'implementation' – to refine, adjust and realize the designed solution (Friis, 2016).

3. The 6C Model

The design thinking course introduces students to a variety of design thinking and innovation theories while applying the 6C Model (Figure 1) (Friis, 2016) as a foundation for the layout of the course.

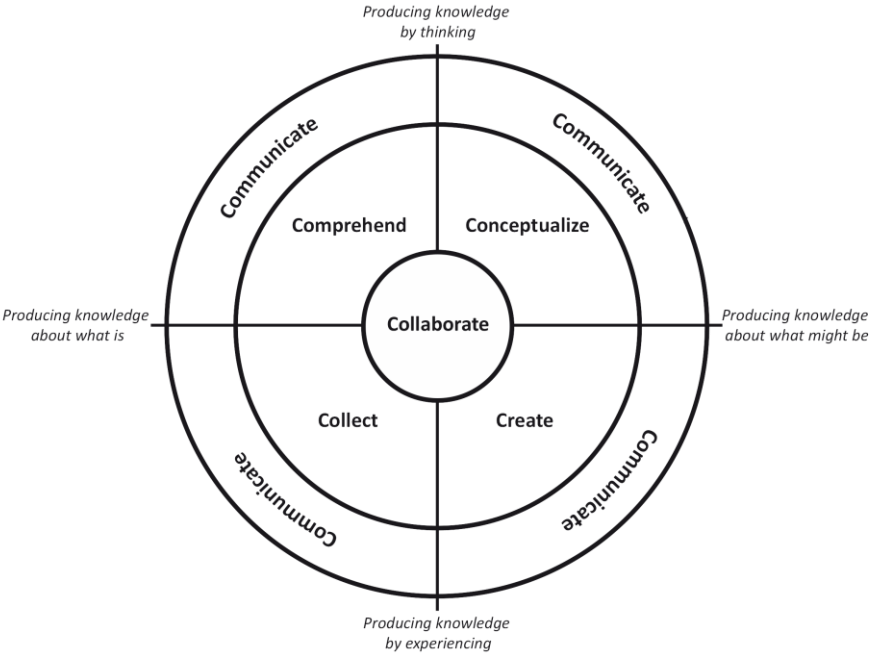

Figure 1. The 6C Model illustrates different approaches to knowledge production in a design thinking process, (Friis, 2016).

The 6C Model describes types of knowledge production in design thinking, e.g. how designers iteratively explore existing situations and possible futures by moving between experience–based and mental processes. The model is accompanied by a deck of 89 method cards, which offers a number of approaches within each of the model's six categories, which are 'Collaborate', 'Collect', 'Comprehend', 'Conceptualize', 'Create', and 'Communicate' (Figure 2).

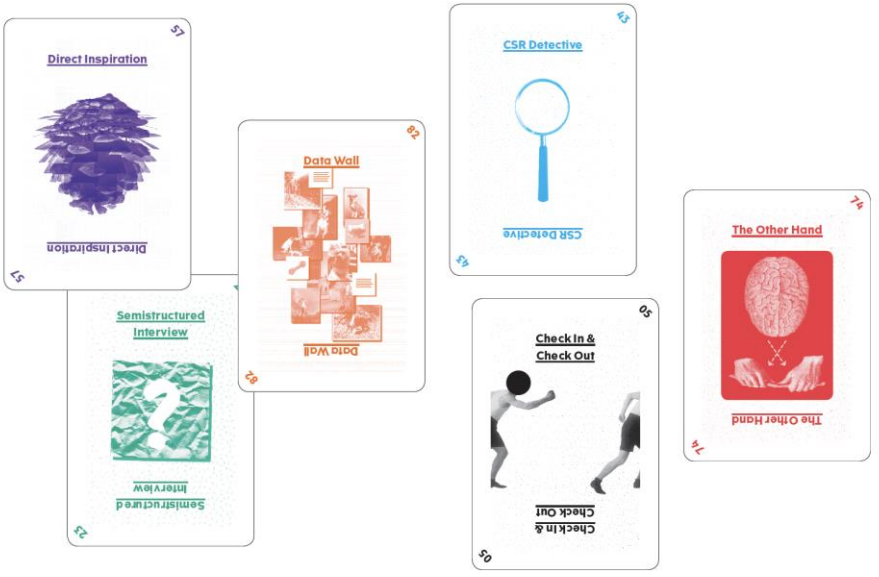

Figure 2. The Co–Creation Cards. Examples of a method card from each of the six color–coded categories, (Friis, 2015).

4. The Course Layout

The aim of the course is to teach the students design thinking and collaboration methods. The course, which has run for two years in 2017 and 2018, is experience and project based. Students work in teams of 4–5 students across design disciplines, which are fashion–, furniture–, game–, graphic–, spatial– and textile design.

At the outset of the course, external stakeholders come to the school to present a challenge. Six weeks later, they are presented with the students' projects and provide feedback on the identified challenges and proposals. The arrangement serves to underline realism and motivate the students to leave the studio and include real stakeholders in the process. In 2017 the UN City Copenhagen and the Danish Society for Nature Conservation (DN) were partners, posing the challenge 'How might we increase biodiversity in Denmark?' In 2018 there were three stakeholders, each posing a sub–challenge to the overall UNSDGs. DN asked 'How might we create space for large, wild animals?' A journalist at the Danish newspaper Information asked 'How might we provide space for bees and other pollinators in the city?' An independent biological consultant asked 'How might we create wilder private gardens?' Students could choose between the three options. Subsequently, a teacher formed the teams.

The categories and accompanying methods from the 6C model are introduced subsequently during the first 3 weeks, allowing students to experience approaches from each category by applying and experimenting with the methods. The 6C model isn't linear, one can start a design process in any of the 6 categories. The sequential approach is a pragmatic decision to avoid information–overload at the outset, and ensure students experience approaches within each of the categories.

Figure 3 provides an overview of the process in the present course which begins with 'Collaborate' for team members to get acquainted with the types of competences, preferences, and skills available in the team, and to adjust expectations in terms of levels of ambition and intentions. The 'Communication' methods are introduced early, since students need to communicate their process and produce material for their final presentation from the outset. Then follows the introduction to approaches and underlying theories in the Collect phase where students identify stakeholders, conduct interviews and experience different types of data production about the situation. In the Comprehend phase, students analyze data and identify insights and challenges. In the Conceptualize phase, they develop and evaluate possible solutions to one or several challenges. In the Create phase, students are introduced to prototyping techniques to further explore and test ideas. In the final week, they present their process, data, challenge and solution in the format of a 3 minutes long film.

5. Empirical Data

The investigation is based on 48 student projects: In 2017 145 students were working on 29 projects. In 2018 there were 90 students working on 19 projects. The data consist of a 1–2 pages project description and a 3 minutes film from each of the teams.

Each project has been reviewed in order to record the challenge identified by the team, the designed solution and how the students think that the solution contributes to increasing biodiversity. Subsequently the projects have been clustered based on the intended effect, dividing them under three headers: a. Changing people's understanding, attitude, and behavior towards biodiversity, b. Creating physical space for biodiversity, and c. Cleaning up or preventing the pollution of nature – leading to better conditions for the ecosystems (Figure 4).

Areas of Design Intervention	Changing People's Understanding, Attitude and Behavior	Creating Physical Space for Biodiversity	Cleaning Up or Preventing Pollution of Nature
Design Projects	*Communication design:* campaigns (the majority with seed bags), folders, films, art installations, exhibitions, cook books, Go Cards, children's books with activities, websites *Interaction design:* board– and digital games, neighborhood competition games, websites, apps, plant calendar, interactive art exhibitions, pop-up events, nature school/lab, online fora and movements for action and information *Product design:* seed packs, plant sticks, shirts	*Landscape design:* floating island biotopes/island and bog modules on city lakes and in canals *Spatial design:* redesigning city spaces to include greenery, green parks in metro stations and along railways *Product design:* Green outdoor furniture for public squares and residential courtyards, drainpipes with greenery, planting box with toolkit for kindergartens, biodegradable planting modules *Service design:* personalized forest certificate, new burial rituals and –site *Multi–stakeholder business model:* marine sanctuary	*Service design:* coffee store concept for recycling, local distribution system for permaculture goods *Multi-stakeholder business model:* plantation of seaweed reefs

Figure 4. Three areas of design intervention to increase biodiversity (Friis, 2020).

The division of the projects cannot be considered complete. Firstly, there are types of projects that the students haven't considered, for instance design to handle invasive species (which might cause depletion of other species). Secondly, the projects can be further divided, e.g. transforming human understanding and human behavior can be related, but are separate objectives. Thirdly, most projects fit under two headers, for instance the design of

an informative book for children (changing understanding) with pages that can be planted (providing new habitat). Each project has been placed under the header where the students foresee the greatest impact. In the following, the areas of intervention are exemplified by student projects.

5.1 Changing People's Understanding, Attitude and Behavior

Twenty–five student projects focus on changing people's understanding, attitude, and behavior towards biodiversity, many based on the assumption that if humans are informed about the state of biodiversity and provided with suggestions for action, change will happen. This is exemplified in the following excerpt from a project description: '"Let it grow', [is] a game for grown-ups who can understand the more complex aspects of the issues concerning biodiversity and will potentially soon be in a situation where they can implement this new knowledge". Another project, 'Ferox World', intends to open the minds and hearts of children to wolves through a digital edutainment game. While large predators such as wolves have been found to significantly increase biodiversity within ecosystems, their presence is contested by many people who fear the animal. The design team discovered how peoples' perception is primarily based on myths rather than facts and decided to inform the young generations through the playful activity of developing biodiverse ecosystems in a Danish environment (Figure 5).

Figure 5. Ferox World. Illustration by design students Olsgaard, Bednarcikova, Andersen, and Kramer, 2018.

5.2 Creating Space for Biodiversity

Twenty projects focus on providing new habitat for wildland and wildlife, for instance by establishing new wilderness islands in Copenhagen's canals or lakes, by creating drainpipes with greenery or by distributing seeds for people to increase the number of pollinating flowers in Copenhagen. The project 'Grøn' (Green) focuses on one of the busiest and most polluted spaces in Copenhagen, Nørreport Station. 250.000 people pass by every day. The students decided to increase the vegetation on the roof surfaces to provide nourishment for pollinating insects and make it visible from the street (Figure 6). In addition, greenery is expanded to the ground level by creating furniture with spaces for plants and flowers, e.g.

benches, poster stands, and columns and a visual campaign disseminating seed bags and information about the importance of wild nature.

Figure 6. Grøn. Illustration by design students Stibolt, Sloth, Gammelgaard, and Holmegaard, 2018.

5.3 Cleaning Up or Preventing Pollution of Nature

Three projects focus on preventing pollution or cleaning up ecosystems, for instance through a new transport system for distributing permaculture goods and design to expand seaweed plantations in the waters surrounding Copenhagen where biodiversity suffers due to low oxygen levels (hypoxia). Seaweed can reduce environmental hypoxia while it is also edible and nourishing to humans. Hence, the team decided to increase the demands for seaweed among Danish households by designing a series of traditional dishes with seaweed, for instance 'Burning Love' (mashed potatoes with bacon and onions) and 'Fish and Chips'. The final proposal 'Weed this Together' (Figure 7) is a multi–stakeholder collaboration between the municipality of Copenhagen, Copenhagen restaurants, and the upstart company 'Nordic Seaweed'. In addition, the team offers the layout for a campaign and a website to promote seaweed to Danish families.

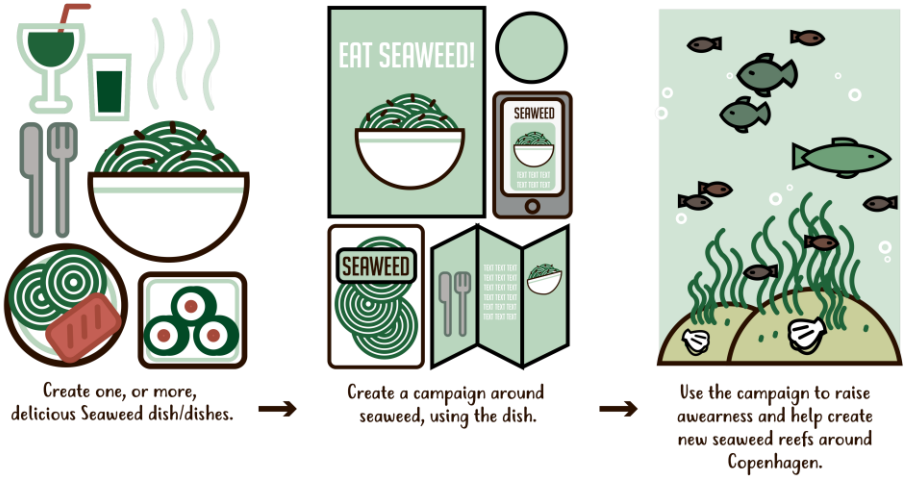

Figure 7. Weed this Together. Illustration by design students Abildhauge, Morille, Nørgaard, Sindler, and Øster, 2017.

6. Analysis

In the following, the student projects and the course design behind the students' results are examined to throw light on how well the design course succeeds in teaching students how to tackle the large–scale challenges expressed in the UNSDGS.

6.1 From Abstract Challenges to Concrete Solutions

In general, the students are able to familiarize themselves with a new and complex topic through the application of design methods. Within six weeks, they identify relevant challenges and come up with novel project proposals. Some proposals represent incremental innovation, for instance board games to teach particular target groups about the significance of biodiversity. Other projects exemplify radical innovation, breaking away from present solutions, for instance the NJORD Turbine Sanctuary for sea mammals, established as a multi–stakeholder collaboration between the turbine manufacturer, the municipality, and an NGO where students provide new designs for the creation of turbine pillars supportive to biological diversity under water. This means that students are able to move between the abstract, higher level of unframed challenges, as presented by the problem owners, to the plain of concrete challenges and solutions. In addition, most teams succeed in telling the story of how they worked their way forward – the methods and approaches applied, the insights gained, and the final proposal, providing a window to the process for others and themselves to comment on, learn, and reflect. The students are thus able to visualize, not only the result but the road travelled and the insights and decision–

making points along the way. These are important skillsets that designers can bring to the table when working with large–scale complex challenges.

6.2 The Connection Between Challenge and Solution

While promising that the majority of student teams identify a relevant challenge and create a design proposal, the relationship between the two is rarely investigated in depth. Will street art change private garden owners' perception of bees and gardening practices? Will offering a personalized forest certificate in return for a donation succeed in attracting 'buyers' and thus save forest? Will a coffee store concept with a reusable cup and a return system be a viable alternative to single-use coffee cups and lead to less pollution of nature? In some instances, the intuitive answer is a 'no', in others a 'yes' or 'maybe', however, the answer is not based on a clear process for evaluating the connection between the two.

Looking at the design thinking course, teachers must find ways to more systematically guide student teams to critically evaluate and question the relationship between the identified challenge and the proposed solution during supervisions and presentations. For instance, by applying the categories of the 6C Model as a visual mapping– and dialogue tool, posting and comparing the types of information and challenges from the existing situation (Collect and Comprehend) to the proposed solutions (Conceptualize and Create). During this process, which should take place early, before design students become too attached to particular ideas (Coughlan et al., 2007) the students and teachers can take on the roles of different stakeholders and critically reflect on the correlation between challenge, solution, stakeholders, context etc. to (re)formulate solutions and challenges.

Also, students should be provided with approaches for early testing of the challenge–solution–outcome correlation in practice, for instance through prototyping. Coughlan et al. (2007) describe how prototypes support learning faster by shifting the creative process from discussion to creative action and by failing early through many rough models that can enable the inclusion of multiple stakeholders such as future users, experts etc. This early type of iterative approach would probably energize the students and their process, as it would be more active and playful. It implicates that the sequential layout of the course – starting with collecting information, moving on to comprehending the challenges before moving into conceptualizing opportunities and creating new proposal – be changed and organized in shorter, iterative loops in line with the tandem framing and reframing of problems and solutions as suggested by Dorst (2015b). It's likely to provide students with insights that can confirm and disconfirm assumptions and thus support the making of credible ties between the challenge and the design proposal. For instance, in the case of Grøn, the student team could have made rough mock-ups of pieces of green, urban furniture, a poster, and seed bags, to observe and interview people passing by Nørreport, discerning the effect that the different elements have on them, leading to new insights and adjustments.

6.3 The Expected Impact and Negative Side–effects

Another insight surfaces when analyzing the student projects: The expected impact of the design proposals (including the negative side effects) is not deliberately assessed or discussed. For instance, what's the expected effect of a set of biodegradable modules with soil and seeds, making it easy for garden owners to provide bees with nourishment –and what might be the negative side effects? Will the solution lead to an increase in biodiversity or does it, in itself, represent a challenge to biodiversity? Is what we create worth what we destroy? (Fry, 2014). We don't know. This is not the design students' fault. Investigating the expected impact, positive and negative, is not explicitly addressed during the course.

One could argue that embracing uncertainty and taking risks is part of design thinking. Says Kolko: "Transformative innovation is inherently risky. It involves inferences and leaps of faith; if something hasn't been done before, there's no way to guarantee its outcome" (Kolko, 2014, p.7). While this is an important argument and part and parcel of creative endeavor, critically assessing the impact of a proposal is central when working with the UNSDGs. Otherwise, we risk repeating the sins of the past by designing solutions – and teaching students to design solutions – that will only make the situation worse by wasting energy and resources on fruitless or harmful efforts.

As it happens, the 6C Model and the Co–Creation Cards provide approaches for evaluating proposals, for instance in the methods 'CSR Detective', 'The Whole House', and the 'Success Criteria Grid' (Friis, 2015), but they are not enforced and likely not adequate for supporting the wide variety of estimates that working with the UNSDGs require – going beyond the present case, the 17 goals address issues in relation to poverty, health, gender equality, clean water and sanitation etc. And subordinated the overall goals are a vast array of problems and opportunities. Alas, a first step is to increase the focus on assessment in the learning objectives, in lectures, and during supervision. The following are suggestions, for how this might be done.

6.4 Knowledge and Perspectives from Stakeholders

Since the student projects address many different challenges, individual considerations are needed regarding what is to be assessed and measured, how, with whom and to which end. In all likelihood, assessments will require the skillsets of different disciplines and different stakeholders at different points during the design process. For instance, a team working with the creation of wild gardens in apartment housing will at the outset need to include the knowledge and perspectives of e.g. architects from the municipality's planning division, biologists, and the inhabitants. Once the team has a solution proposal, in one case a novel type of drainpipe with bowls for growing flowers and housing insects, new knowledge and perspectives from other stakeholders must be included e.g. residential housing architects, landscape architects, engineers, producers of drainpipes, biologists, potential users etc. At each stage of the design process, from initial investigations over concept models to high–fidelity working models, the team must identify the stakeholders able to help them critically

evaluate the possible impact on biodiversity in Copenhagen, the consequences to the inhabitants, the city, and the side-effects of the product, for instance in terms of production, maintenance and recycling. Thus, stakeholders must be included, not only at the start of the process, during the 'Collect' phase (Figure 2), also in the later phases when challenges and solutions are developed.

6.5 The Assessment Tool

To bring attention and focus to the assessment process, it might be helpful to include tangible tools such as The Assessment Tool by Lykke Bloch Kjær at Laboratory for Sustainable Disruptions, Design School Kolding (Kjær & Friis, 2016) which is based on the work by John Elkington (Elkington in Kjær & Friis, 2016). The tool consists of a large circular map (Figure 7) on which participants place the idea to be assessed in terms of its social (people), financial (profit) and environmental (planet) consequences.

Figure 8. The Assessment Tool by Lykke Bloch Kjær, Design School Kolding, (Friis and Kjær, 2016).

Participants ask 'what's the best imaginable consequences?', 'what's the worst imaginable consequences?' – and 'what is missing from the idea to achieve the best possible impact?' The tool provides the students with an experience and understanding of the importance of deliberately assessing and discussing the possible consequences and facilitates dialogue and collaboration, for instance by including real and role-played stakeholders.

6.6 Cross–Institutional Collaboration

A final, more comprehensive approach is to establish cross-institutional collaborations with other universities, e.g. anthropology–, biology–, business–, engineering–, and psychology students. This would increase the complexity of the process, however, also provide teams with a broader set of skills to apply diversified measurements, careful reflection, and the access to networks within different knowledge domains, raising the likelihood of different perspectives and experts being included throughout the process.

7. Conclusion

Six weeks is a short time period to teach design students how to create sustainable transformation at the level of the UNSDGs in practice. It is thus gratifying to see that many things in the present course appear to work well. Provided with a shared, visual design thinking model and accompanying methods for collaborating, communicating and producing knowledge about the present and future situation, the third semester design students generally succeed in familiarizing themselves with what is to many new and complex territory, identifying a relevant challenge and design proposal and narrating the story of their design process.

With this said, further examination of the student projects in conjunction with the course layout reveals the need for additions and adjustments, more specifically in terms of students learning to critically reflect on the correlation between the identified challenge and the design proposal and making assessments of the estimated future consequences of the design proposal. Assessments and measurements are typically not areas that have received much attention within design thinking. The paper provides suggestions for ways to more systematically include methods for assessment in future courses, for instance making space for trying out prototypes with stakeholders, including different stakeholders throughout the process and applying visual models to critically compare and discuss the relationship between the identified challenge and the design proposal.

Working with the UNSDGs in practice in design education is a big mouthful. However, even though everything is not in place we shouldn't wait. The way forward includes doing many different things in the short term and learning from it.

Alternative narratives data visualization archive

María de los Ángeles Briones Rojas*[a], Michele Mauri[a]

[a]Department of Design, Politecnico di Milano – DensityDesign
*corresponding author: marinade.briones@polimi.it

Abstract Nowadays non-expert groups use data to collaboratively create alternative narratives that challenge those imposed by power institutions. Data visualization is an adversarial tool for bottom-up counter communication. This paper offers reflections on bottom-up practices around the creation of alternative narratives that use data visualization. It is based on the preliminary results of a research project that aims to create an online archive of digital projects dealing with data visualization for alternative narratives. The collection of projects allows for an overview of the diversity of actors involved, the issues addressed, the aesthetic characteristics of the visualizations, and the characteristics of the data practices and sources. The re-appropriation of digital languages, platforms, and formats emerge together with diverse visualization techniques as new proposals to counteract information hegemony. While most projects follow the open-source ethic, greater openness in working with data for alternative narratives from bottom-up needs to be promoted.

KEYWORDS | DATA VISUALIZATION, ALTERNATIVE NARRATIVES, ARCHIVE, DATA ACTIVISM

1. Introduction

This paper provides a reflection on bottom-up practices of data-driven alternative narrative. It draws on the preliminary results of a research project aimed at creating an archive of online projects dealing with data visualization for alternative narratives. Data-driven alternative narratives shape the facts that take place in a story not told by the dominant power, with the aim of making visible and evident issues for the audience to reflect over and continue questioning it (Briones, 2019). The archive is proposed as a way of approaching three relevant aspects in the context of data design: 1) promote critical thinking by designers and "consumers" (Tufte, 2006) of data visualizations; 2) raise knowledge and awareness about the type of projects and who mobilizes them, the issues they address, and the ways in which they work with the data; 3) promote the use of data for activism in the design and related communities, serving as a source of inspiration and dissemination. The archive provides an overview of the state of data visualizations used for alternative narratives, revealing aesthetic aspects characteristic of this type of data-driven counter-narratives that are different from other types of data-driven narratives. Presented in the context of a master's degree course in communication design, the archive is an educational and reference-consulting tool for students.

1.1 Emerging technologies and bottom-up data practices with visualizations

The digital sphere has profoundly changed the way people access and share information. In the last 15 years, the production of data has been exponentially increasing. Emerging technologies present new opportunities as well as new challenges. The informational power relationship of governments and corporations that provide homogeneous and opaque methods of access, manipulation, and communication of data, and the increasing cost entailed in personal data (i.e. surveillance and profiling) are two of the many reasons why it is critical to decentralize the ability to produce data-driven narratives. Modes of access and tools to manipulate data have brought marginalized actors to collaboratively create alternative narratives to those delivered by dominant power structures. Non-profit organizations and activist groups increasingly base their campaigns on data, using visualization as an agency tool for change.

Within the network society (Castells, 1997) citizens are now abler than ever to access information and know how public institutions exercise their power. Skepticism towards the dominant power has been installed as a verifiable possibility. On the other hand, individuals and networked communities are seeking to counteract online mainstream information channels, creating new sources and tools of information, often generating alternative channels (e.g. Mastodon platform (https://mastodon.social/about), OpenPod (https://openpod.abbiamoundominio.org/). These practices resonate with the concept of technopolitics, which refers to "the articulation between the strategic use of communication technologies for action and collective organization" (Toret, 2015, p. 51). Bottom-up techno-political practices show how the use of technologies and data is promoting social change,

opening spaces for the creation of new narratives. This article understands that data visualization is a tool and a techno-political bottom-up practice when framing alternative narratives.

The repertoires of action in the uses of data are increasingly amplified due to the access to tools for extraction, analysis and communication of data to lay people; and are "constituted from a group of people articulated together through a diverse set of social and technical means" (Sack, 2011) self-organizing and gathering hybrid profiles that produce new visions of the world. The many online tools for data extraction, manipulation, analysis, and visualization allow one to work with data from the beginning to its communication. Working with data is no longer only for data experts but for a mixture of profiles from different disciplines and skills. The diversity of perspectives and situated knowledge of those who are working with data as a techno-political bottom-up practice is precisely one of the richest bases of the process and result of data visualizations for alternative narratives and that dissociates them from traditional data visualizations.

Although the expertise needed to work with data is no longer the domain of experts alone, there is still a great lack of data literacy among individuals in the datafied society. Designers who work with data visualization, among other profiles such as hackers, are data intermediaries (Baack, 2015) who do the work of bringing data closer to people's experiences (Mauri & al, 2019). In this sense, the communication designer who works with data assumes an active and political role in the information society.

The appropriation and détournement of digital tools and platforms is another aspect of data practices around alternative narratives. As referred to in section 3 of this article, it is remarkable how several of the projects collected in the archive show a disruptive approach to reusing visual and interactive resources to present data visualizations in alternative narratives.

1.2 Data activism and adversarial design

Data activism is a type of activism that takes a critical approach to practices around data and technologies (extraction, production, collection, analysis, communication among others) for challenging existing power relations seeking for social change.

> “It involves a series of practices at the intersection of the social and the technological dimension of human action, with two aims: either resisting massive data collection or actively pursuing the exploitation of available data for social change.” (Milan and Gutiérrez, 2015, p. 122).

Data activism builds on the work of subcultures that precede it, taking main inspiration from hacker ethics and open-source movement that has emphasized the use of data in activism by opening, sharing and modifying them, generating knowledge to seek social change (ibid.). One of the main objectives of data activism is to remove individuals from passivity in the face of data. In this way, data activism will seek to inform how the mechanisms by which

power institutions control individual's data. It will also seek to open up knowledge about technical and ethical practices with data, promoting training instances.
Data activism finds a close relationship with communication design with data through design activism and in particular with adversarial design. Design activism is described as

> "design thinking, imagination and practice applied knowingly or unknowingly to create a counter-narrative aimed at generating and balancing positive social, institutional, environmental and/or economic change" (Fuad-Luke, 2009, p 27).

On the other hand, adversarial design is a type of political design whose emphasis lies on the agonizing qualities by provoking conditions of disagreement and confrontation.

> "adversarial design does the work of agonism means that designed objects can function to prompt recognition of political issues and relations, express dissensus, and enable contestational claims and arguments" (DiSalvo, 2012, p 12).

Design activism directly seeks to empower people to take action in the ongoing processes of social change, while adversarial design seeks to be a proxy for this action. In other words, it is the understanding of conflict that mobilizes action, not the action itself.
Although both concepts point to the active and critical action of individuals seeking to promote change in relationships with dominant power, a closer relationship is identified between adversarial design and data activism. The latter seeks to challenge hegemonic power by pushing society to be actively critical of data and technology and their implications. The above concepts resonate with the role of data visualization as a decisive adversarial tool (DiSalvo, 2012) for data activism. Translating data into visual representations for alternative narratives is an activist practice that requires a critical approach to data to make a political position evident and coherent.

2. The alternative narratives visualization archive

The Alternative Narratives Visualization Archive is an open, ongoing, and collaborative archive that collects and maintains over time digital online projects which use data visualization as a tool to support alternative narratives to the ones from dominant power. The archive aims to raise knowledge and gather the design expertise on the relevant task of portraying evidence to not visible or alternative social issues that aren't been told by the main power institutions. It seeks to encourage the creation of other narratives to those that dominate and to promote discussion of existing ones. At the same time, the archive aims to bring to the fore discussion and awareness on the political role of designers when designing with data. Three main tasks that the archive performs in terms of knowledge construction around data-driven alternative narratives are: the need to create new ways of telling alternative narratives; the bottom-up approach of data to people's experiences around social issues; and the preservation in time of the cases collected.

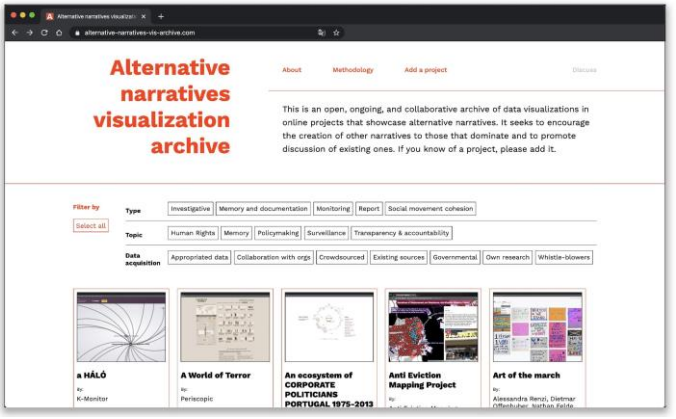

Figure 1. Home page screenshot of the online archive.

Narration is part of human self-creation. To create alternative realities, it is necessary to tell stories that subvert the imposed ones and that above all represent the multiple possible worlds. The projects collected through the archive are examples of how these narratives can be addressed through data bringing new ways of engaging with social issues, and at the same time bringing data closer to people's experience. The archive is intended to be a source of inspiration for those seeking to imagine ways of telling alternative narratives with data. On the other hand, many of the projects collected online are outdated and have been lost over time. The archive seeks to preserve the fragile digital material for future research.

The archive currently boasts a collection of 65 projects, most of which are still online. Each project is categorised according to the way in which the data was acquired, the topic covered, and the type of project based on the purpose of each project. The definition of these categories was based on the project's information generally provided in the "about" or "methodology" section. However, this information is not always present in the projects of the collection, making necessary deeper research on the actors behind and over the situated context of each topic.

The archive is part of an academic research being presented in various didactic experiences in the context of a master's degree course in communication design at the university. During the course experience students are asked to design alternative data-based narratives, designing communication artifacts that invite the public to reflect over social issues. Throughout the research and design process, students consult the archive and use the collection of cases as references for their projects. In this way, the archive turns out to be a tool that inspires the students' project work, while promoting a critical look at the relationship of the themes of the archive projects and the work with data. Therefore, the archive is a didactic tool for the teacher who makes the spectrum of the projects known, and

for the students who consult it looking for references. The filters proposed in the archive conduct the consultation promoting a critical look at the work with data that each project circumscribes.

The archive has also been presented to diverse activists in informal and non-academic contexts, receiving recognition particularly in two respects: 1) exposing the potential that exists in the work between communication designers and activists; 2) and showing a variety of designerly means - which are not always easily imaginable by activists - when envisioning the possibilities of communicating with data. However, it remains to be systematically observed how the archive is an inspirational tool for activists.

Some ways to observe the success or appropriateness of the archive approach might be through interviews with activists who use the data in communications projects. Also, follow up on collaborative work between designers and activists who create alternative data-driven narratives by observing how they consult the archive and practice critical approaches to working with data such as those in the archive.

3. An overview of data-driven alternatives narratives with visualizations

Data-based narratives that use visualizations are the result of a series of practices mediated by various data structures and which need closer observation. To this end, we provide an overview of the projects based on the information that was possible to collect. Following a feminist approach to data visualization (D'Ignazio & Klein, 2016), the project collection is analyzed in four aspects: Who are the people behind the projects? What are the themes they propose? What kind of data sources and data structures do they work with? What are the aesthetic practices that they try to engage audiences with through the data? These questions are more concerned with practices associated with bottom-up production than with data or visualization itself.

3.1 Actors and topics addressed

The collected cases include projects that have to do with social objectives that seek to engage audiences through the communication of alternative visions of the world using data in digital platforms. All projects were developed by independent and mainly bottom-up organizations such as self-organized citizen groups, NGOs, independent civil society organizations, researchers. They are non-profit, not private or business sector-oriented. Each project focuses on a particular topic. Topics were manually classified by defining a macro topic and related sub-topics. The five major topics are: Policymaking, Transparency and accountability, Human rights, Memory and archives, and Surveillance. The following diagram maps according to your topics, subtopics as well as representing the number and type of organization involved in each project. observed how the subtopics overlap and cross

one topic with another. This classification seeks to give more entry points to the reading of the projects and how they represent conflicts.

3.2 Data sources and data practices

Assuming that the visualization of data for alternative narratives should promote a critical reflection on the data, it is relevant to observe what practices are embedded in the "social context where data are produced, consumed and circulated" (Gutiérrez & Milan, 2019). Of course, not all practices are visible in the visualizations, but it is possible to deduce the origin of the data (from official sources, collectively elaborated, among others) or the publication of the methodology and the database used.

The archive emphasizes observing how visualization projects for alternative narratives work with the data. There are several questions that can be asked, from do they contain a methodology section that explains how you worked with the data? Do we know who created that data and how? This classification deals with understanding and showing how the data was acquired in each project. Based on the Mirén Gutiérrez classification published in his research Data Activism and Social Change (2018), the following categorization is proposed:

- **Appropriate data:** it's about grabbing existing data from other platforms from which there is no access. Scraping is one of the most used techniques.
- **Own research:** from research results that can be measured in data. For this, they use all the creativity in using and creating forms of measurements and measuring devices such as self-built sensors, homemade photo balloons, etc.
- **Existing sources:** produce new analysis from available, but unrelated and unexplored, datasets.
- **Collaboration with other organizations:** collectives, foundations, organizations among others.
- **Crowdsourced:** generate the means to crowdsource citizen-contributed data.
- **Whistle-blowers:** organizations or individuals are recipients of data via whistle-blowers such as leaks.
- **Governmental data but not public:** data delivered directly by an entity such as the government to a particular organization for restricted purposes.

Many of the projects state principles such as transparency and accountability, disclosure of power relations, or the right to open information. It is striking, however, that the vast majority of cases do not put much of these principles into practice through their own data visualizations by means that they don't release the databases used in the visualizations, among other practices. From this can be inferred:

- The weak relationship of open data culture linked to data visualizations.
- The incoherence in the discourse of institutions that use data visualization to subvert the opacity of information by institutions of power.

- The deliberate will not to share data due to other reasons not explicit in the projects.

All three are fairly generic conclusions but they provide first lines of action to foster a critical data culture. The archive aims to contribute from design to a more critical and knowledgeable data culture, so it points its efforts to the first of these stated observations. How design can you contribute to a more critical data culture?

4. Aesthetic practices of alternative data visualizations

Working with data for alternative narratives brings with its aesthetic practices that reformulate the way data is visualized by moving away from the traditional way. A new paradigm aesthetic that seeks to promote questions not only from the final output of the visualization but also from how they are constructed. They expose not only the conflict but also the ways in which the conflict is perceived by disrupting visual components of digital interfaces to propose a new reading in their use and meaning.

Visualizations follow an aesthetic of digital disruption through the re-appropriation and détournement of graphic elements (e.g. use of the pixel), digital languages (e.g. emojis, links, gifs), and re-use of platforms for other purposes (e.g. use of Twitter to create a bots that reproduce a database). These new expressions and ways of counting on data move away from traditional graphical visualizations, proposing more elements that involve the audience with the narratives.

The projects in the collection present a well-defined point of view in relation to the subject matter, which is not always contrary but inquisitive to the hegemonic narratives. There is no intention of being neutral in the way the data-based narrative is approached. The vast majority of the actors behind these projects lucidly assume that the data are not neutral, and neither is their representation. In other words, working with data from its interpretation, representation and communication intentionally moves away from a pure neutral aesthetic that advocates efficiency and parsimony linked to statistical graph design. Visualizations in alternative narratives do not follow Tufte's proposal that 'the design of statistical graphics is a universal matter [...] like mathematics' (Tufte, 2001, p. 10). Instead of proposing a purely analytical representation, they integrate other aspects to narration and representation such as the emotional and playful dimensions. These variables are materialized in the use of visual variables in addition to interactive variables (animation, activation of filters, etc.).

The aesthetic practices of disruption that are observed also integrate an open approach to the representation of uncertainty, to the unfinished, and to the disclosure of how the visualization components. It approaches the aesthetics of imperfection (Saito, 2011), by declaring the appropriation and articulation of meanings, languages and visual tools. These

characteristics that are observed from the visual aesthetics of digital projects are often confirmed by the methodological statement of the projects.

Several of the visualizations in the collection assume hybrid aesthetic characteristics that combine different components: in part it is possible to find characteristics of analytical visualization, in part it is possible to find characteristics linked to an aesthetic of artistic information design, as well as components that come from other areas such as oral history and data journalism.

The projects presented below exemplify the aesthetic practices of appropriation and détournement, disclosure and the unfinished, and uncertainty and imperfection by means of narratives.

4.1 Appropriation and détournement of the digital as a means of new languages

Alternative narrative that proposes the use of digital platforms or the lexicon of a digital platform, to give it a twist and say something completely unexpected. With this kind of narrative there is a double meaning: the alternative story, and what the medium that is being re-proposed means. The contrast of the two is what enhances the irony and the subversion of this type of narrative.

This type of alternative narrative brings together socio-political and techno-political elements. As mentioned above, the re-appropriation and re-proposal of digital tools are practices that have been carried out in social movements in recent years. They are also directly related to the principles of open-source culture and tactical media.

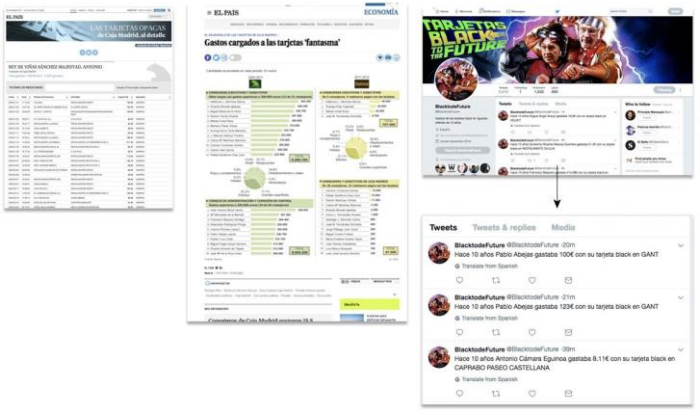

Figure 2. Tarjetas Black to de Future: A Twitter bot that tells micro stories of the executives of Caja Madrid-Bankia through the expenses made with Black cards 10 years ago. Each tweet

is a story. Instead of doing charts or aggregating data they use an existing platform (familiarity) for publishing the unduly expenses of the politicians.

Within the context of Spanish 15M, a leak was revealed with information of embezzlement and public money by Spanish politicians. The leak was a large database detailing which politician spent how much, where and when. Montera34 developed a Twitter bot (@BlacktotheFuture) which tweets every time one of the directors spent money using the black cards 10 years ago. People who follow the account could receive a Twitter notification of one of these stories. The project's aim is to reveal the cheekiness use of black-not transparent money by the authorities through a "in a day like today, 10 years ago" narrative which helps people to realize the lifestyle and irresponsibility of their actions. Dosing the contents of the leak in a time frequency frame that the audience could associate to everyday life actions, increases the sensibility of the crime. The choice of Twitter as the medium increased the "everyday life" perception of a crime that happened 10 years ago as something normal. Instead of analyzing aggregate data, Montera34 chose a different approach to data: small data in doses to reveal the silent crime (small data for mini-narrative in a one tweet dimension).

4.2 Disclosure and the unfinished

"El caso Ayotzinapa" is a project by Forensic Architecture, Equipo Argentino de Antropología Forense, and Centro Prodh. They reconstruct spaces of conflict using the residual evidence of the intense destruction produced by explosions, bullet holes in walls, images captured with closed-circuit TV cameras, amateur and professional photographs and videos, audio recordings and the architecture of the city among other things as pieces of evidence. Their work follows a forensic aesthetics and methodology using a "raw" visual language leaving the same modelling tools with which they reconstruct their research. There is an evident intention not to make up or perfect the technical elements used, making the process of creating the visualization transparent.

Figure 3. Screenshots from the "Plataforma Ayotzinapa" exploration interface. Data and evidence was positioned in time and space. The interface allows the user to navigate through time filtering by victims, security forces, government workers, alleged organized crime members, among others. There are also filters to highlight actions, objects and scenes. Retrieved from www.plataforma-ayotzinapa.org in June 2019.

As a result, narratives present an alternative to those constructed by the dominant power structures using data. "Plataforma Ayotzinapa" like other Forensic Architecture projects, is first and foremost a tool that takes a side in the conflict itself, meaning that its political stance includes the redistribution of power by giving knowledge back to individuals who previously were relegated to just being spectators. Once the spectator gains knowledge they become the audience, taking a position on the matters exposed. The visual models that reconstruct and reshape the data are the political tools that turn the spectators into the audience.

4.3 Uncertainty and imperfection

"U.S. gun deaths" in 2010-2013 is a project led by Periscope in which depicts a database of victims in the United States dead by gun accidents. In orange their lifelines are represented and in grey the hypothesis about how long they would have lived. Visualization is not intended to be an analytical representation, nor does it hope to demonstrate a pattern in the victims' deaths. It proposes to visualize with uncertainty how many years of life were lost by the victims, reinforcing the emotional aspect of what the data represent.

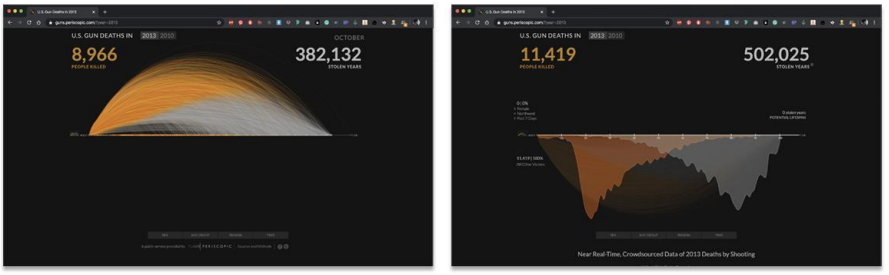

Figure 4. Details from screenshot of the "U.S. gun deaths in 2010-2013" project by Periscope. The visualization shows a hypothetical timeline for the bullet victims. The line is a hypothetical that reinforces the years of life lost. Retrieved from https://guns.periscopic.com/ in June 2019.

5. Conclusions

The paper presents the archive as a way of presenting the state of the art of bottom-up practices of data-driven alternative narratives, raising knowledge and awareness about the type of projects, actors who mobilize them, the issues they address, and the ways in which they work with the data. It seeks to serve as a source of inspiration and dissemination for designers and activists by promoting critical thinking over data when it comes to design data-driven alternative narratives. The archive reveals aesthetic practices, characteristic of this type of data-driven counter-narratives that are different from other types of data-driven narratives.

The paper also highlights how alternative data-based narratives dissociate themselves from traditional analytical data visualizations, proposing new ways of storytelling. Based on cases from the archive collection, it shows how data practices from below are promoting new aesthetic practices that address unconventional aspects in data visualization design. The representation of what is uncertain, of the hypotheses propose new readings to the data bringing them closer to people's experiences, incorporating emotional components to them. Appropriation practices are also an invitation to rethink what is or is not a data visualization that allows audiences to become involved with the phenomena represented. Finally, the design of an uncanny aesthetic emphasizes content and process rather than layers of makeup that hinder understanding in the construction logics of visualizations.

Therefore, it is urgent to start creating a data culture that is conscious of the politics that surround data. It is essential that as data users we start being aware and more critical of the top-down structures that manage, control and collect huge amounts of data and information from the datafied society. Bottom-up structures (individuals, collectives, civil organizations) need to begin to shape knowledge and take control of the implications of data. It is also

important to encourage the alternative use of data, questioning the modus operandi of things, creating spaces of confrontation that promote the active participation of individuals in democracy.

Becoming Lost and Found in Translation

Dr Mark Ingham[a]
[a]University of the Arts London
m.ingham@lcc.arts.ac.uk

Abstract | Becoming Lost and Found in Translation is a participatory co-designed research project involving university art and design students and staff investigating how acts of translation can enhance learning and critical thinking. Using our collaboratively constructed design school manifesto as a starting point it has been translated into over 45 languages that are spoken at our university. This paper outlines the initial findings of this project and how it can be used to think about ideas of meta cognition in learning, transitions from one state to another, liberating and decolonising curricula and how translation itself advances thinking in design education.

KEYWORDS | TRANSLATION, COLONIALISM, LANGUAGE, COLLABORATION, META-COGNITION

1. Becoming introductions (Diventando presentazioni)

> "The question arises, therefore, how far the difference can and must extend - how large? how small? - in order to remain within the limits of the concept, neither becoming lost within nor escaping beyond it." (Deleuze, 1994 pp. 29-30)

Salman Rushdie (1991) asserts, "It is normally supposed that something always gets lost in translation; I cling, obstinately, to the notion that something can also be gained." Lost and Found in Translation is a project run by students and staff from our university, that has used our co-constructed design school manifesto as its starting point to investigate what it means to learn, to translate and be in transition (p. 16).

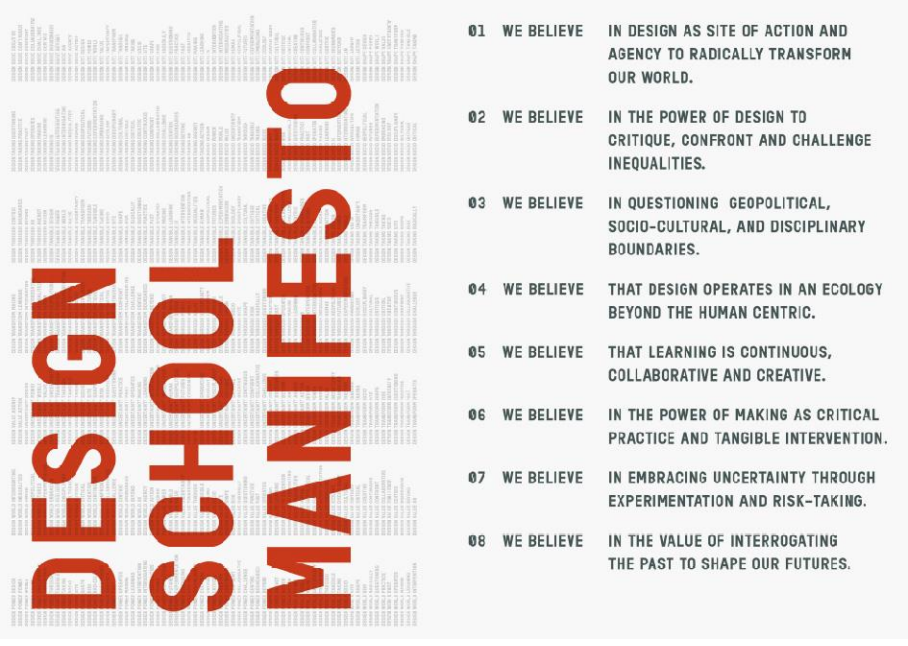

Figure 1. Design School Manifesto, London College of Communication, UAL. (2018)

This paper deals with the origins and continuing evolution, and becoming (Semetsky 2006), of the Lost and Found in Translation project as active participatory co-designed research. It will focus on ideas of critical thinking, meta-cognition and inclusivity and how all student's voices and thinking should be heard and acknowledged in the production of new work about inclusion and social justice. (Bhagat & O'Neill 2011, Freire 1990, Richards & Finnigan 2015).

The project stems from a university funded teaching scholarship I initiated, called “Thinking Design”, which aimed to investigate ideas of meta-cognition in university art and design education. This is outlined in section 2, *Becoming meta-cognitive*, which argues that when acts of thinking are contemplated by the learner then a greater understanding of the processes of learning can be achieved (Livingston, 2003), (Hargrove, 2011), (Ingham, 2012)

In section 3, *Becoming translators in transition*, I describe the development of the project from my initial conversations with students about why our design school’s manifesto was only displayed in English. They pointed out that over 35% of our student cohort are speakers of languages other than English. These new students were in transition from one state; Further Education, undergraduate studies, other parts of the UK or from multiple other countries, to our university, a place they mostly only knew by reputation (Field & Morgan-Klein, 2010), (Land, 2014). This moment of crossing a threshold and to find a place to belong, became central to is project and is developed further in this section (Sabri, 2014).

Section 4, *Becoming pedagogies a concluding becoming*, maps ideas of meta-cognition, translation and transition onto how they could enhance our transformative teaching and learning practice and thinking at out university. From a lecturer translating academic design briefs, so it becomes something that is productive for the student’s learning, to the student making the brief into a physical from, material, writing, or even another idea. This section acts as a conclusion to this paper.

2. Becoming meta-cognitive (메타인지되기)

> “On the one hand, it is apparent that acts of recognition exist and occupy a large part of our daily life: this is a table, this is an apple, this the piece of wax, […] But who can believe that the destiny of thought is at stake in these acts, and that when we recognise, we are thinking?” (Deleuze, 1997 p. 135).

2.1 Beginnings (Początki)

> “…continual beginning afresh.” (Dewey 1916/ p. 417)

One of the precendents of the Lost and Found in Translation project was a two year University funded pedagogical enquiry during my “Thinking Design” Teaching Scholarship. My research aim was to look at the possible value of metacognition in university design and design studies education. I wanted to go beyond the contestable ideas of ‘learning styles’ (Curry 1990), and look more deeply in to the ways we, as educators, can think about and use meta-cognitive ideas of learning, to help our leaners learn better.

For the purposes of the enquiry metacognition referred to “…higher order thinking, which involves active control over the cognitive processes engaged in learning.’”(Livingston, 2003, p. 2). It theoretically investigated ways we can help students, at all levels of knowledge acquisition, to understand how they think about their learning. As Ryan Hargrove (2011)

suggests, “The area of metacognition can be the scaffolding for future problem solving, as the goal remains to enable designers to utilize creative design thinking/processes with optimum efficiency.” (p. 9)

This enquiry had a number of theoretical frames (Bal, 2002). One being a philosophical approach, using key concepts, as discussed by Gilles Deleuze (1997) in Chapter 3, *The Image of Thought,* of his 1968 book Difference and Repetition. This illuminating and complex philosophical tract has been used successfully by some of my PhD, postgraduate and undergraduate students when they have started to question their own thoughts about the way they think about their research. By questioning what we think thinking is, or philosophical has been thought of as thinking, these students, after an often-fraught initial conceptual wrestling match, gained a much better understanding that we cannot base thinking on the concept that just because, “*Everybody knows, no one can deny”.* (Deleuze 1997 p. 130).

2.1 Images of Dinosaurs (Imagens de Dinossauros)

> “The thought which is born in thought, the act of thinking which is neither given by innateness nor presupposed by reminiscence but engendered in its genitality, is a thought without image. But what is such a thought, and how does it operate in the world?” (Deleuze, 1997, p. 167)

One example of this philosophical meta-cognitive strategy was used by Abigail Buchan, a final year Graphic Design undergraduate student, who wanted to explore the representation of dinosaurs. She investigated how we can know what dinosaurs appeared to be like and how past illustrations of them have influenced our thinking about what they might or might not have looked like. Dinosaurs do not look like the ones in Crystal Palace Park or even Jurassic Park, she argued, but they create enduring images that a hard diverge from.

She developed the concepts explored in her written thesis into a practice-based investigation for the ‘Dissertation Transformation Exhibition’ displayed in our college galleries. Abigail set up a wall with the simple instruction, *draw me a dinosaur,* (figure. 2) (Buchan, 2015).

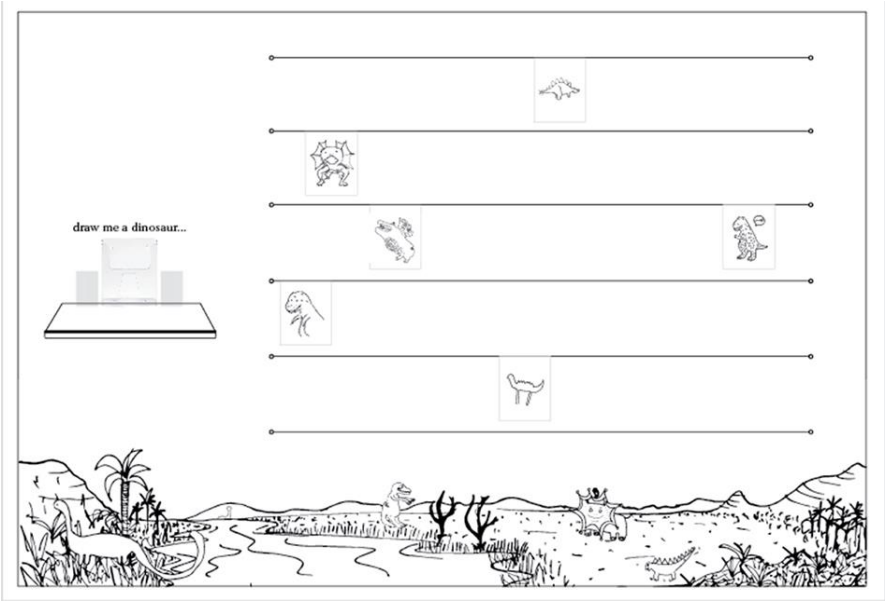

Figure 2. Abigail Buchan's. ''draw me a dinosaur…'. Wall drawing in the 'Dissertation Transformation Exhibition' at London College of Communication, UAL. (Buchan, 2015)

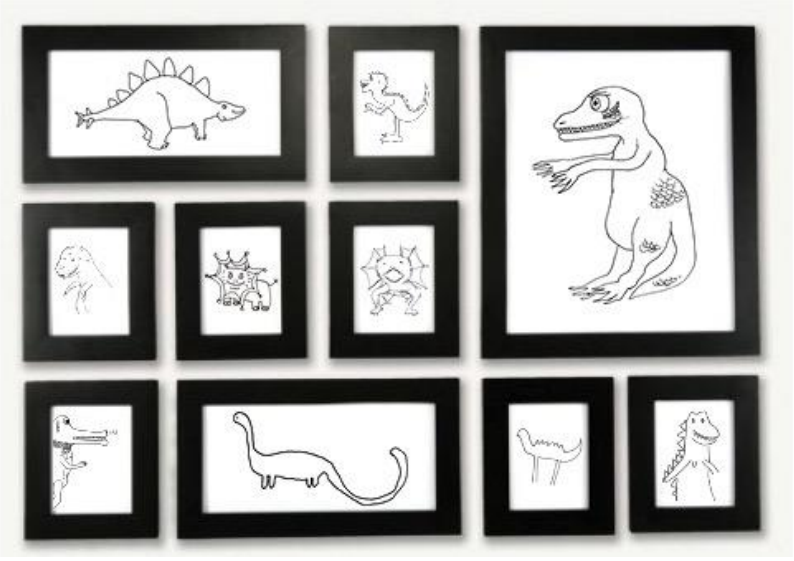

Figure 3. 'draw me a dinosaur…'. Drawings of dinosaurs from the 'Dissertation Transformation Exhibition' at London College of Communication, UAL. (Buchan, 2015)

This practice-based research demonstrated that when we start to think about something, as seemingly simple as what a dinosaur might have looked like, and then be asked to translate this into an image, we often rely on what we already think we know about the object we are trying to translate. The act of translation in this case involved a fun element, but the participants did start to realise that it was not as easy as they first thought and their thinking about what to draw was based on previous encounters with images of dinosaurs.

Figure 4. 'draw me a dinosaur…'. Participant's drawings of dinosaurs during the 'Dissertation Transformation Exhibition' at London College of Communication, UAL. 'draw me a dinosaur…'. (Buchan, 2015)

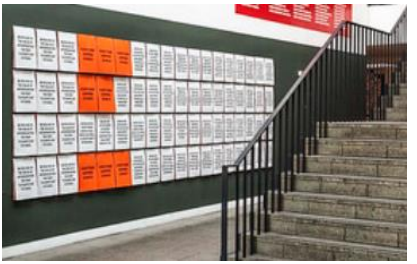
These moments of metacognition were seen even more acutely when students were asked to translate our design manifesto. Often the initial response was, yes that will be quick and easy, to slowly recognising that the process would take longer and involve more thought and often dialogue with others. Participants went from states of eagerness to ones of contemplation and even mediation, to help and try to make the translations as accurate as possible. It made them aware of the deeper meanings of the manifesto and made them aware of their own learning processes.

3. Becoming translators in transition (Convirtiéndose traductores en transición)

> "…if there is language, it is fundamentally between those who do not speak the same tongue. Language is made for that, for translation, not for communication." (Deleuze & Guattari, 2005, p. 430)

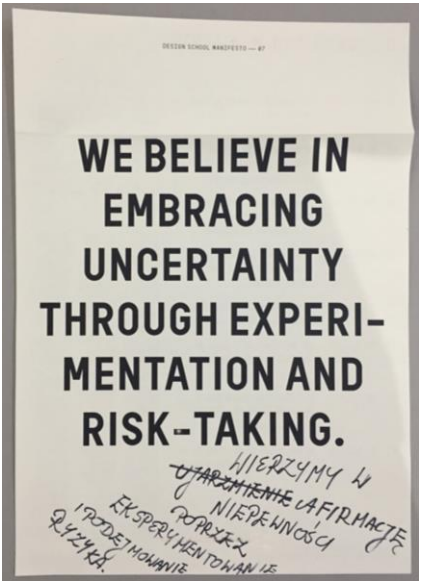
Following on from the theoretical research carried out during the 'Thinking Design' project and after I had taken a teaching and learning sabbatical, I returned to our university and decided to become more nomadic in my thinking and teaching (Semetsky, 2008). I decided not to have an office but work in spaces that were free or were the most appropriate for the circumstances I found myself in. Wanting to reconnect with as many colleagues and students as possible as quickly as possible, this seemed to be and ideal way of being openly visible and available (Ingham, 2019).

3.1 Becoming nomadic (खानाबदोश बनना)



> "The nomadic – smooth – space is an open territory, providing emancipatory potential to those who are situated in this space in contrast to striated, or gridded, space…" (Semetsky, 2008, p. vii-viii)

The department I work for presents work during the London Design Festival each year and was holding its annual public programme exhibition when I returned to work. A number of tables and chairs had been set up in one of the galleries as a space for workshops to be held. I decided to inhabit this space and use it as an 'office'. For LDF18 and our public programme I ran a project called 'Mapping Strange Assemblages' (2018) which involved a number of students and alumni carrying out performative research as gallery guides, and where,



> "…"probe-heads"; […] (becoming) cutting edges of deterritorialization (that) become operative and lines of deterritorialization positive and absolute, forming strange new becomings, new polyvocalities." (Deleuze & Guattari, 2005. p. 191)

Working in the galleries enabled me to be an integral part of these interventions. This had a number of very productive consequences. One being that I became a 'guide' to lost new students who could not find their classrooms or where intrigued by the exhibition. One topic of conversation that reoccurred was our LCC Design School manifesto (2018) displayed at the entrance to the ground floor galleries (Figure 6). The students on the whole where very taken with it and we started to discuss ideas of belonging and language. One question cropped about why it was only in English as there were a large proportion of students for who it was not their first language.

Figures 5 & 6. Manifesto having been translated and displayed at London College of Communication, UAL. (2019) based on how it was displayed in LDF18 at LCC. (2018)

Figures 6 & 7. The Design School Manifesto starting to be translated and altered. London College of Communication, UAL. (2018)

As the idea of translation had always been at the heart of the 'Thinking Design' Scholarship project I decided to do an email call out to students and staff to ask them if they would help translate the manifesto into another language. This was sent out on the first day of the new academic year 2018/19. Within two days we had over 40 responses and the manifesto had been translated into 25 different languages. The feedback was remarkable. The students said the exercise made them feel they belonged to the school and had been given an immediate investment in its ethos and future. The idea of translation was also taken into the

formal lessons of the students by colleagues in the department. (Freeman, Anderman, and Jensen 2007).

> "…this is just to let you know that DBS students loved Manifesto translation exercise. They found all sort of ways to do it: the English speaking students used child's voice, school French or street language and the students who have English as the second language worked on interpretation of the sentences as they quickly figured that it cannot be literal. I used the difficulty around the translation to explain how we write in a different voice than how we speak and how academic writing is developed similarly (they are submitting their first assignment next week so this was a timely exercise). It will also allowed me to situate them within this institution and speak about the community of practice – lovely." (Milic, 2018)

3.2 Becoming visible (变得可见)

> "To hear each other (the sound of different voices), to listen to one another, is an exercise in recognition. It also ensures that no student remains invisible…" (hooks, 1994, p. 41)

Below is a sample of responses given by the students when they sent in their translations to me. These and the face-to-face conversations I had with numerous students made me aware of the importance of visibly showing new students that they are welcomed at their new university (Freeman, Anderman & Jensen, 2007). Translating the manifesto helped with enabling the students to feel actively connected to the department and started to help them to feel they belonged in and with the college. It also shows that it had made them think deeply about acts of translation (Field & Morgan-Klein, 2010).

- "I have translated the rest of the "We Believe" into Chinese and make some changes on the manifesto I translated last week. They are not perfect, but I hope it helps." (Helen 2018)
- "I've translated to Portuguese (from Portugal, not Brazilian...). I am not 100% sure about one of the sentences, I wrote in the doc which one it was and why the uncertainty. Hope it helps!" (Benedita 2018)
- "Please find attached the Arabic translation of the Design School Manifesto. I see it as a work-in-progress as I feel like interpretation of text is always subjective. Please keep me posted on any communication regarding the working design group. I'm still very interested in being part of it." (Yasmeen 2018)
- "…please find the translated table, there are some phrases that don't fully satisfy me, I might need another Italian person to compare the translations. It's very hard to translate while trying to keep it consistent and readable." (Pietro)
- "I translated it into Polish. I did it to my best knowledge and qualification but I am not a translator so I hope it's all correct and carries the meaning :)" (Dominika)

We now have over 40 different languages translations, translated by 60 students and staff at our university. We have started to translate the manifesto into Sign Languages and Braille. The student group, Lost and Found in Translators (LaFiTers), are recording these translations into sound and video works to be put on social media platforms like Instagram. These recordings (Audio Lost In Translations, 2019), have developed into students talking about their own cultures and ideas of serotypes (Osborne, 2007).

3.3 Becoming collaborative (Stát se Spolupráce)

> "Something in the world forces us to think. This something is an object not of recognition but of a fundamental encounter.' (Deleuze, 1997, p 139)

From this initial flurry of activity, a group of students and staff at our university was formed (the LaFiTers). We decided our terms of reference were to explore ideas of; social inclusion (Cameron, 1992), social justice, (Smyth, 2011), culture shock and belonging (Burke & McManus, 2009) and transitions (Sabri, 2014). These would be through ideas of what it means to translate something from one state to another and to be in transition.

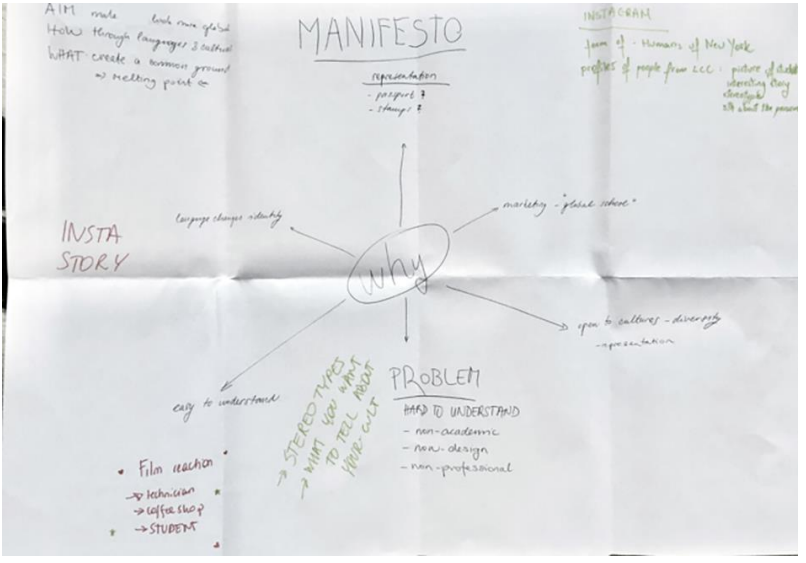


Figure 8. Drawing by the LaFiTs group showing how the Manifesto could be translated and developed. London College of Communication, UAL. (2018)

The students in the group have creatively and gainfully fused written, oral, visual languages, to create new kinds of thinking about the manifesto, with and for our multicultural students

at our university (Healey, Flint and Harrington, 2014). From our first meeting the students came up with a set of initial ideas,

> "… to film or to record students and other people that are involved in the school. The results would be then put as an Instagram story on the university account. This medium reaches a great amount of people that are somehow involved with the school." (LaFiTers, 2018)

3.4 Becoming critical (Att bli kritisk)

> "The point is rather to elaborate the theoretical, critical, and textual means by which translation can be studied and practiced as a locus of difference, instead of the homogeneity that widely characterizes it today." (Venuti, 2004, p. 42)

Inclusivity and critical thinking are central to this project as its aim was to give a sense of belonging and ownership to the students at our university (Freire, 1990, hooks, 1993). After the initial translations were completed, criticisms emerged and were voiced by the students in the group. There were a number of critiques of the manifesto, the students saw that it was about design, "...but as one of its principles is communication, some of the sentences were not clear and hard to understand." (LiFiTers). They saw is as not being democratic, as it was made by tutors. Their solution was for the content of their audio/visual recordings to come from asking questions about the manifesto, to criticise it, to ask people to translate them on the spot, ask them about their culture, stereotypes. (Cowden & Singh, 2013)

3.3 Becoming inclusive (Incghọ nsonye)

> "I share as much as possible the need for critical thinkers to engage multiple locations, to address diverse standpoints, to allow us to gather knowledge fully and inclusively." (hooks, 1994, p. 91)

They decided that they liked the act of recording and came up with the following ideas. To make a podcast that would consist in recording conversations. The recordings would be conducted by the people leading the projects. They would then take the material and find different topics within the conversation and make theme-based podcasts (Ibid). They came up with these set of questions and prompts.

- Does your language change your identity: who are you in English compared to you mother language?
- Any stereotypes? Ask people to tell what they think about x culture and then show to someone from the actual culture and see how they react and respond.
- What do you want to tell about your culture?
- What does the manifesto mean to you?
- Say "Hello how are you" in your language?
- Do you have an accent within your language, how complex is it?

- Ask someone to translate it – write down as you hear it – let someone else read it out loud.

> "[A] few conversations about the manifestos were recorded to see what the effects would be and what kinds of answers we would have. 'It turned out to be interesting while interviewing someone the surrounding friends wanted to be involved in the debate.'" (LaFiTers, 2019)

One aim of this project was about the transition for our new students into the diverse communities at our university. To then help create a sense of belonging for all our students at all stages of their engagement with the institution. This includes all students who may feel 'othered' when entering Higher Education, whether that is to do with race, gender, sexual orientation, transgender, religion/belief or any other protected characteristics and including class (Equality Act, 2010). As Janey Hagger, Karen Scopa and Christabel Harley state in their chapter 'The Art of Smooth Transition' (Cited in Bhagat & O'Neil, 2011 p. 126).

> "…the transition into the culture of HE was challenging for many, in the crucial first stages of study. The challenges experienced by students could be identified as those related to adjusting to the HE culture(s) and environment, (such as), Integration issues for mature students, Introduction to diverse languages and cultures, Awareness of different social and educational backgrounds." (Ibid)

Design School Manifesto We believe in design as site of action and agency to radically transform our world. 我們相信設計能為世界帶來革命性的改變。 We believe in the power of design to critique, confront and challenge inequalities. 我們相信創作能批判、對抗、質疑不公。 We believe in questioning geopolitical, socio-cultural, and disciplinary boundaries. 我們嘗試衝破地緣政治、社會文化和單一學科的界限。 We believe that design operates in an ecology beyond the human centric. 我們相信設計不只是以人為本。 We believe that learning is continuous, collaborative and creative. 我們推動終生學習、共同學習、創新學習。 We believe in the power of making as critical practice and tangible intervention. 我們相信創作能引起批判性討論和產生有效的干預。 We believe in embracing uncertainty through experimentation and risk-taking. 我們從實驗和冒險中擁抱未知。 We believe in the value of interrogating the past to shape our futures. 我們相信審視過往，能塑造未來。

Figures 9 & 10. One of the first translations by Helen + her complete version. London College of Communication, UAL. (2018).

At this stage the project made us aware that the more students are involved in the conception and production of objects like our manifesto the more a sense of belonging starts to happen (Freeman, Anderman & Jensen, 2007). We also noticed that the very act of translation, which is a daily part of a lot of our student's lives, became legitimised in a world that was communicated predominately in English. It became away to opening out the discussions about what the manifesto was trying to mean and how it could be reinterpreted through translation to be clearer and even more meaningful.

4. Becoming pedagogies (Farîĝante pedagogioj) a concluding becoming.

> "We learn nothing from those who say: 'Do as I do'. Our only teachers are those who tell us to 'do with me' and are able to emit signs to be developed in heterogeneity rather than propose gestures for us to reproduce." (Deleuze, 1994 p. 23).

Pedagogy according to Gilles Deleuze (1997) amongst others, is not something that is "done to one" or "is done by one to others,". It is something that one participates in, it should be a mode of co-construction, teaching and learning become fused, one is opened up to the future, and one is better able to question knowledge construction as such (Cole, 2016). This project continues to be collaborative, cooperative and contestable. Its aim is to create new concepts and new ways of thinking about inclusion and diversity. (Steventon, Cureton, and & Clouder, 2016). From this project a number of key concepts have created 'lines of flight' and made us think differently about the creation of such objects like our manifesto.

Figure 11. Participatory installation, Translation table(s) in the 'Education in Progress Exhibition,' Smith (2019) at LCC UAL, performed by Ingham et al. (2019)

4.1 Becoming language (تصبح لغة)

> “Intralingual translation interprets linguistic signs by means of other signs of the same language (Derrida, 1985, p. 173).

We interrogated the use of the English language as a part of an ongoing colonisation of the world by its seemingly increasing domination of world languages (Cameron 1992, Phillipson 1992, Rihane 2018). Alison Crump (2014) argues for “...an emerging theoretical and analytical framework…” called LangCrit, or Critical Language and Race Theory. Crump “..urges language studies scholars, both within the field of English language teaching and beyond, to continue to look for ways in which race, racism, and radicalisation intersect with issues of language, belonging, and identity.” (Crump, 2014:1)

The Lost and Found in Translation project has opened up the idea that English itself is a colonising force. The project feeds into and supports the liberating and decolonising curricula project at our university (Panesar, Patel, & Jethnani, 2018). It continues to interrogate ideas of cultural Imperialism and linguistic imperialism. Robert Phillipson professor of international language studies, defines English linguistic imperialism as,

> “…the dominance of English... asserted and maintained by the establishment and continuous reconstitution of structural and cultural inequalities between English and other languages.” (Phillipson, 1992:36).

English is often referred to as a global "lingua franca", but Phillipson argues that when its dominance leads to a linguicide, it can be more aptly titled a “lingua frankensteinia.’ (Ibid).

This project has put into question the dominance of English in UK art and design academic institutions. The paradox of English being a ‘common ground’ and common meeting place for all our students and at the same being a barrier to learning for some has not been lost on the students. It has put into focus the way language is privileged in some academic discourses and disciplines, yet is often not taught or discussed at any productive or significant level. Our hope is that this project has started to forefront the use of translation as a way of creating a better sense of belong for our students and to help in the way they learn. Our recent postgraduate show’s publicity included, for the first time, translations of a welcoming message from the university (LCC PG Shows, 2019).

> “Translations can be creative. New pure regimes of signs are formed through transformation and translation.” (Deleuze & Guattari, 2005. p. 136)

This project has continued with two public expositions. One being in the exhibition Education in Progress (2019) (Figure. 11) and the other in the London Design Festival 2019. These both produced new translations and renewed interest in the project from incoming and continuing students, who have started to create visual translations of the manifesto (Figure. 11). Funding was received to, conceive, codesign and coproduce with students and a translation expert, Dr Emily Salines, an interactive work book that would include all the translations so far. This notebook with blank pages for further translations would have given

to all incoming students at the beginning of the 2020/19 academic year, September 2020. Due to the UK Lockdown this project has been turned into and online interactive project using the Instagram *bla.bla.bla.translation*, in conjunction with a Padlet site Becoming Lost and Found in Translation at: https://bit.ly/2Sgx8Fi

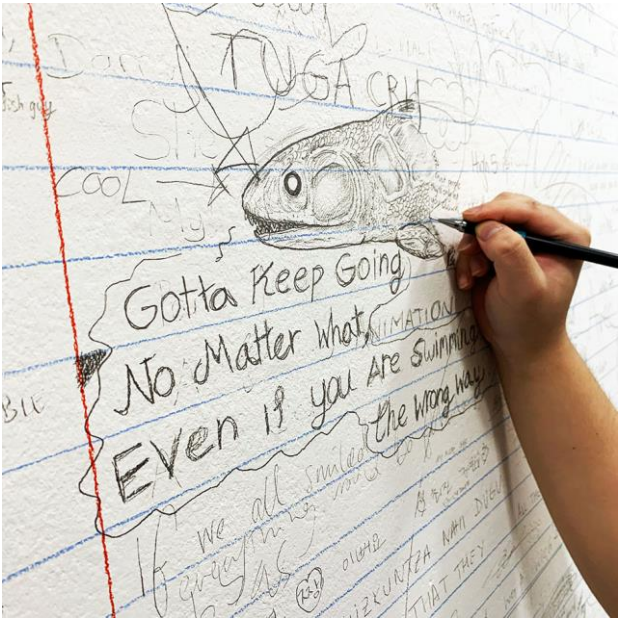

Figure 12. Design School Manifesto being translated and redrawn on walls in a corridor at London College of Communication UAL during the London Design Festival created by Ingham et al. (2019a)

I believe that as Athelstan Suresh Canagarajah (1999), a Tamil-born Sri Lankan linguist, argues "The way forward is to promote the 'pluralistic identities and hybrid discourses' desired by (our) communities." (p. 173). The power of language, both as a way of building shared communities, and as a colonising force will be explored more deeply in further iterations of this project. As in when bell hooks (1994, p.172) encourages her students to use the vernacular in her classes and to give students the space to translate form their own language, this project questions the ideologies of translation. It aims to deterritorialize translation's flows (Deleuze & Guattari, 2005) so that the power of dominant languages to become colonising forces is contested, challenged and resisted. We want to create a resistance against the standard, to resist the major (ibid) and to become liberated in translation.

About the Authors:

Mark Ingham: I am a Reader in Critical and Nomadic Pedagogies and a UAL Senior Teaching Scholar. My research forms entangled encounters with: images of thought and memory, rhizomatic and meta-cognitive learning theories, fuzzy narratives and virtual and physical liminal teaching spaces.

Acknowledgements: Dr Nicky Ryan, Dr Pratap Rughani, and Jason Copley for their unwavering=ng and continuing support for this project. I have received funding form the LCC Teaching and Learning Innovation Fund and UAL's Teaching and Learning Fund, without which this project would not have been as successful. The students of the Lost and Found in Translation group (The LaFiTers), especially Lola and Dominika, and the students involved in the Becoming Lost and Found in Translation project (The BLaFiTers), Ana and Marta, who have produced an interactive Instagram bla.bla.bla.transaltion. Without these and the hundreds of other students involved in this project along with the myriad of LCC and UAL staff this project would not have been possible. Special thanks go to Dr Emily Salines who has driven the ideas of what translation is and can be. Finally, without Susan Papas, my proof reader, who patiently untangles my sentences and corrects my dyslexic spellings, texts like this one would be no more than gobbledegook and gibberish.

CULTURE (OF) REVOLUTION. Critical Thinking in fashion design education – New learning approaches for a systemic change in the fashion industry

Carolin Ermer[*a], Julia Schwarzkopf[b]

[ab]University of Applied Sciences (HTW) Berlin
[*]carolin.ermer@htw-berlin.de

Abstract | While sustainability related issues are more pressing today than ever before, the global fashion industry is still one of the most resource hungry and harming industries for people and planet (Fashion Revolution, 2019). Designers' work starts at the very beginning of the supply chain of products (Tischner & Charter, 2001) hence fashion design can have an enormous impact on sustainability in all stages in the lifecycle of clothes. Simultaneously, there is also an opportunity for designers to reinterpret the understanding of design and thus create a more sustainable and holistic approach (Ehrenfeld, 2016). However, in fashion design curricula in higher education in Germany, this is not visible. Therefore, a new set of competencies for sustainable thinking and acting, like Critical Thinking, is needed for fashion designers to be also incorporated in their education. Only then there is the potential to transform the fashion industry towards a systemic change.

KEYWORDS | CRITICAL THINKING, FASHION DESIGN EDUCATION, INTERDISCIPLINARY LEARNING, SUSTAINABLE DEVELOPMENT GOALS (SDGS), SYSTEMIC CHANGE

1. Introduction

Sustainability related issues are more pressing today than ever before. We are exploiting resources of any kind beyond earth's carrying capacity. And even if we will only use renewable energy and recycle all our resources in the future, we will face an increased use of resources yet alone due to the forecasted increase in global population. Therefor the United Nations have proclaimed 17 Sustainable Development Goals (SDGs) to be delivered within a "decade of action" also calling for action from businesses (United Nations 2019).

The fashion industry is one of the most resource hungry and polluting industries on the planet (Global Fashion Agenda, 2017; Obregon, 2012). It overwhelmingly promotes and "feeds an ever-accelerating consumption culture predicated upon a TAKE > MAKE >WASTE model" (Ellen Mac Arthur Foundation, 2020). Like other industries, it is far away from being a circular industry (Circularity Gap, 2020). When aiming to make a contribution to the SDGs by the fashion industry, besides the often-criticized supply chain, this also relates to the ways fashion items are designed and produced. In the fashion industry, designers are working at the beginning of the lifecycle of a garment, hence they have a great impact on the garment-related sustainability issues, including the respective supply chain (Fletcher, 2014; Charter & Tischner, 2001). As Tham (2008) succinctly puts it:

> "Making good decisions already at the design stage makes cleaning up further along the line redundant." (Tham, 2008, p. 27)

According to Charter and Tischner (2001), at least 80% of a product's subsequent social and environmental impacts are determined at the design stage. Fashion designers therefore can have an impact in every single step along the fashion and textile supply chain (Fletcher, 2014; Tham, 2008). Simultaneously, there is also an opportunity for designers to reinterpret the understanding of design and thus create a more sustainable approach (Ehrenfeld, 2016). Based on the current situation in the fashion industry with all its so-called "wicked problems" (Tulder, 2018), it is important to start at the origin of these problems in familiarizing future fashion designers with the possibilities of sustainable action within their studies and future careers. Fashion design education today must use its transformative role to move from a focus on aesthetics, optics and haptics demanded by individual target groups and the industry (Faerm, 2012) to include aspects of sustainability and responsibility (Edelkoort, 2016; Tham & Fletcher, 2019), digitalization and automation (Freyer, Noel & Rucki, 2008). Within this approach a new set of skills and competencies is needed not only of fashion designers but in education for fashion design. This discussion is also been developing on a global scale recently (Union of Concerned Researchers of Fashion, 2020). Whereas in Germany design research and design education research are relatively new fields of study (Joost et al., 2016; Jonas et al., 2016) and research in fashion design education is almost not visible in these movements (Banz, 2016).

The aim of this research is to derive a didactical proposal of learning approaches for an interdisciplinary course concept for sustainable fashion design to be developed for the

University of Applied Sciences in Berlin (HTW), Germany. Since the 2000s key competencies are discussed intensely in social sciences as a required framework for monitoring and assessing learners´ development (Arnold, 2008; de Haan, 2007) as well as in human resource development for measuring competencies for job profiles (Rosenstiel et al. 2017; Erpenbeck & Sauter, 2011). Competencies are abilities "to successfully meet complex demands in a particular context through the mobilization of psychosocial prerequisites (including cognitive and non-cognitive aspects)" (OECD, 2005, p. 4). Within this, various concepts of key competency frameworks for sustainability (de Haan, 2007; Wieck, Withycombe & Redman, 2011; Riekmann, 2018) have been proposed over the last years. Key competencies are defined as overlying competencies with a broader focus, and not only for a specific context (Rychen & Salganik, 2005). Therefore, learning approaches within this proposal are based on key competencies for sustainable development referring to competency frameworks for Higher Education for Sustainable Development (HESD) (Wieck, Withycombe & Redman, 2011; Rychen & Salganik, 2005). In every framework Critical Thinking has an established and broad role. It is understood within different definitions, as a basic competency or even a key competency, and at the same time as a valid overlying teaching and learning approach for all learning movements (Chatfield, 2017; Wieck, Withycombe & Redman, 2011; Moon, 2008). Hence, a focus of the envisaged didactical proposal will be on the successful implementation of Critical Thinking.

2. Theoretical context

2.1. Learning approaches and key competencies for HESD

Learning approaches as defined within Education for Sustainable Development (ESD) and HESD are an overall objective rather than a defined body of information and knowledge (Hopkins, 2012). The UNESCO outlines:

> "ESD empowers learners to take informed decisions and responsible actions for environmental integrity, economic viability and a justice society for present and future generations, while respecting cultural diversity. […] ESD is holistic and transformational education which addresses learning content and outcomes, pedagogy and the learning environment. It achieves its purpose by transforming society." (UNESCO, 2020)

Since the late 1990s and within the Bologna reform of Higher Education (United Nations, 2003), the discourse on education has shifted from an input orientation, focusing on lists of essential educational content, to an outcome-based competency approach (Giangrande et al. 2019; Wieck, Withycombe & Redman, 2011; Godemann, 2006). These outcomes include enabling people to engage effectively in this increasingly complex world and contribute to transforming its structures. Therefore Rieckmann et al. (2018) outline: "There is a general agreement within the international ESD discourse that the following key sustainability

competencies are of particular importance for thinking and acting in favor of sustainable development" (Rieckmann et al., 2018, p. 39):

Table 1. Competencies in HESD for sustainable development (relating to Rieckmann et al., 2018).

Systems thinking competency	**Ability to recognize and understand relationships, analyze complex systems, deal with uncertainty**
Anticipatory competency	**Ability to understand and evaluate multiple futures – possible, probable and desirable - create one´s own visions for the future assess consequences of action**
Normative competency	**Ability to understand and reflect on norms and values that underline one´s actions and negotiate sustainable values, principles, goals and targets, in conflicts of interest**
Strategic competency	**Ability to collectively develop and implement innovative actions that further sustainability at the local level and afield**
Collaboration competency	**Ability to learn from others; understand and respect the needs, perspectives and actions of others (empathy); understand, relate to and be sensitive to others (empathic leadership),**
Critical Thinking	**Ability to question norms, practices and opinions, reflect on one´s own values, perceptions and action**
Self-awareness competency	**Ability to reflect on one's own role in the local community and (global) society, continually evaluate and further motivate one's actions, and deal with one's feelings and desires**
Integrated problem - solving	**Overarching ability to apply different problem-solving frameworks to complex sustainability competency problems and develop viable, inclusive and equitable solution that promote sustainable development**

Concerning the development of didactical-pedagogical concepts, this approach of teaching means it is less about "WHAT we teach and more about HOW we teach" (Howlett, 2016) to offer learning situations that enable these competencies to trigger the desired effects and reactions in learners (Howlett, 2016; Ehrenfeld, 2008; UNESCO, 2006). Accordingly, forms and fields of learning as well as methodological-conceptual approaches are needed that support a self-determined, active, but at the same time also reflexive and social learning. Previously, investigated learning approaches in ESD and HESD with a high value of interpersonal and personal action and reflection are:

- Social learning (see Bandura, 1971; Wals, 2010; Wals & Jickling, 2002)
- Collaborative learning (see Dillenbourg, 1999; Strijbos & De Laat 2010; Zhang Ayres & Chan, 2011)
- Interdisciplinary learning (see Rieckmann, 2016; Adomßent & Michelsen, 2014; Leal Filho et al., 2009)
- Participatory learning (see Reid et al., 2008; Tsien & Tsui, 2007)

- Transdisciplinary learning (see Rieckmann et al. 2018; Sipos et al., 2008; O´Sulivan, 1999; Wals, 2011)
- Project-based learning (see Kaliva, 2016; Gudjons, 2008)
- Critical Thinking (see Rieckmann et al., 2018; Wieck, Withycombe & Redman, 2011; Kruse, 2009; Moon, 2008)

This list is not intended to be exhaustive regarding general competency-promoting teaching concepts or forms of learning for sustainability. It leads to an approach which implies more 'thinking' before starting to create, which is also relevant for applied studies like design. This seems to be especially of interest when dealing with the wicked problems (Tulder, 2018) of sustainability. For students this also means that design solutions for the unsustainable practices within the fashion supply chain as discussed earlier, are not easy and fast to find. More time is needed here to think, discuss and reflect before going into prototyping and design processes (Pasricha & Landgren, 2011). Within that context Critical Thinking can foster to act critically in personal and interpersonal spaces, but also "to seek professional success, and to become a member of a smart society" (Halpern, 2014).

2.2 Critical Thinking

The necessity of Critical Thinking and the resulting reflexive action is clearly emphasized by Rychen (2008) as a competence for ESD and justifies this in the constantly changing requirements for learning in times of social and technical changes. However, there is no uniform definition for Critical Thinking (Moon, 2008) and it is discussed as a competency (Wieck, Withycombe & Redman, 2011; Chatfield, 2017; Kruse, 2009) as well as a learning method or learning process for sustainable development (Rieckmann et al., 2018) and responsible personality formation (Moon, 2008; Paul & Elder, 2003). The adjective critical implies not a negative (criticize) way of thinking, but a thinking thought out and carefully considered out of facts and not of own emotions, attitudes and biases. Critical Thinking is important not only for carrying out daily professional activities, but also for enabling people to raise reasonable, critical questions leading towards the best solutions (Paul & Elder, 2003). It supports being able to reflect on their own and other people's activities, and for understanding the importance of their personal impact to the development of organization, society and the planet (Wieck, Withycombe & Redman, 2011; Scriven & Paul, 1987). The learning approach of Critical Thinking is highlighted in this research, because it is a competency which is being required of students not only in their personal and professional life but is also referred to ESD and HESD as a key competency (Rychen, 2005) and as a basic competency (Wieck, Withycombe & Redman, 2011) for sustainable thinking and acting in the reviewed competence frameworks in this research. This paper will give an overview of didactical approaches and within that the competencies needed to implement sustainability in the fashion industry for a systemically change.

3. Methodology

The research presented in this paper is based on a preliminary qualitative analysis of five curricular for Bachelor (B.A.) Fashion Design to generate a first overview concerning the status of sustainability. By 2019, fashion design can be studied in Germany at eleven public institutes for higher education. Within this research, the five analyzed curricula are the ones who are publicly displayed by the respective institutions (HTW Berlin, 2015; UdK Berlin, 2013; HAW Hamburg, 2011; HS Trier, 2013; HS Weissensee, 2012). The selection of the curricula from these institutions of the preliminary analysis was based on an internet research and the available list of fashion design schools at the German associations of fashion designers (VDMD, 2020; German Fashion Council, 2020).

Table 2. Overview and main characteristics of the analyzed institutions.

The aim of the pre-analysis is to derive a first insight on the status quo of fashion design education in Germany concerning aspects of sustainability, especially ascertaining a competency-based approach for sustainability or topics related to that content in any module or course. The curricula as well as module manuals were analyzed by keywords and coding of sustainability related content like “sustainability”, within that sub-keywords like “sustainable design”, “sustainable textiles” or “circular design” as well as keywords like “social competency” regarding a deliberate competency-orientation of studies.
Furthermore, after this a qualitative literature review on ESD and HESD was conducted to derive relevant information on latest adequate requirements of learning for sustainable development (as proclaimed by the SDGs) concerning relevant learning approaches and underlying competencies for the to be developed course concept. The literature review is supposed to identify learning methods and approaches for sustainable development in ESD and HESD and learning approaches and application for Critical Thinking in ESD and HESD.

4. Findings

4.1. Sustainability in fashion design curricula in Germany

A first sampling in the preliminary analysis shows: The category "competency" is either not mentioned in the prescriptive curriculum published (HAW, 2011), is defined only in the context of professional competency in a module manual (HS Weissensee, 2013, HTW Berlin, 2015) or is vaguely defined as “discussion compentency” (HS Trier, 2013, p. 20). Only one institute mentioned “social competency” (UdK, 2013, p. 15) as a learning approach within “cooperation with partners”. Categories like “learning approaches” within “interdisciplinary”, “social” and “personal” competencies that could function as validation not only for “learning outcomes” as acquired of the Bologna Reform for Higher Education (see United Nations, 2003), but also as an aspired competency enhancement for students towards a sustainability approach, are only mentioned in one curriculum (UdK, 2013). Furthermore, sustainability-related categories (for example “sustainable thinking”, “sustainable materials”) were not found in four out of five analyzed documents. Only one mentioned “ecology” as a topic in a module about fibers and textiles, where as ecology was also addressed in a module referring to an own design project on collection development (HTW Berlin, 2018). Innovative strategies like “circular design”, although widely discussed in fashion research and the industry as a concept to approach fashion supply chains´ sustainability issues (Earley, 2017; EllenMacArthur Foundation, 2020) are not mentioned in any of the analyzed curricula. This relates to the assumed that the subject of fashion design is predominantly still mainly taught as the classical profession of an industrial designer as it was 20 years ago (see Obregon, 2012; Fletcher & Grose, 2012; Fletcher & Williams, 2013; Faerm, 2011). It is clearly highlighted in four out of five module manuals, that the modules are mostly oriented towards professional competency. The category of “Critical Thinking” as a competency or as a learning approach is not mentioned in any curricula. Triggered by the quest for sustainability, a holistic or systemic turn is demanded vigorously by international design researchers, not only in the profession of fashion designers and the industry, but also in education (Goldsworthy, Earley & Politowicz, 2019; Fletcher, 2014; Ehrenfeld, 2016). This need for a systemic change is not yet represented in fashion design education in the analyzed module manuals and curricula. Naturally, this preliminary analysis cannot reflect all learning and teaching scenarios of fashion design and instructors´ individual course plans or projects (HTW, 2019). But it can be summarized that on an organizational level sustainability in fashion design as well as the corresponding learning approaches and competencies for HESD are not base of any of the analyzed curricula so far.

4.2. Main areas of learning

When starting to engage, reflect and discuss deeply within the topics of sustainability, students firstly need a strong and expanded knowledge in terms of an Ecological Literacy as

Orr (1992) stated. To adapt this term to sustainable fashion education, students need not only knowledge in sustainable design strategies, materials and fibers, but also in sense of sustainable values and attitudes (Fletcher & Tham, 2016; Fletcher & Grose, 2012). This more holistic approach is guiding towards a "Sustainability Literacy" for fashion design (Ermer, 2019). Decision-making for designers and interventions of designers can only be integrative, future-oriented and sustainable, if the design strategies are thought through. This refers to the impact these decisions will have on other people and the environment, affected by or integrated within the respective supply chains (Fletcher, 2014; Fletcher & Tham, 2016). It orients towards a learning approach of *social learning* (Bandura, 1971; Wals, 2010; Wals & Jickling, 2002), that both characterizes and contributes to a learning system in which people learn from and with one another and "collectively become more capable of withstanding setbacks, of dealing with insecurity, complexity and risks" (Wals et al., 2009, p. 11). Social Design for example, "a design that attempts to fill the deficits of political commitment, to step into the gaps left by the state or government in its constant withdrawal from social responsibility for society, for its citizens" (Banz, 2016, p. 15), refers directly to these insecurities.

Accompanied by a disposition to learn to live with the uncertainty of the future under these circumstances, rather than to reduce uncertainties in pedagogical discourse there is seen a need to accept vagueness and emergence as essential properties of sustainability (Wals & Rodela, 2014; Kagawa& Selby, 2012). Seeing the aspects of a design process as several small different possible connected processes (e.g., choice of fiber, purpose, colors, production steps etc.) *collaborative and interdisciplinary learning* settings come to focus which also highlight especially personal and interpersonal competencies as important for students in future working situations (Sterling, 2011; Rieckmann et al, 2018). Collaborative learning is achieved within a joint development of a task (Zhang, Ayres & Chan, 2011). All group members contribute their own specific knowledge and skills equivalent at all stages of the work. These multi - stakeholder approaches (Tulder, 2018) are mostly benefitting when coping with the wicked problems, that can occur within non-sustainable situations. Hence, not only *interdisciplinary learning*, but a *transdisciplinary learning* (Rieckmann et al., 2018; O´ Sullivan, 1999) is required, that refers to all these different stakeholders along the supply chain, which means also farmers and textile workers as well as the consumers ("users") of fashion. Since this also implies a project-based learning, it is a learning close to real life working scenarios (Kaliva, 2016; Gudjons, 2008). Fashion design students often are familiar with project-based learning typical for design thinking processes, but not in sustainability related contexts (Faerm, 2012). It is an action-oriented form of learning that is geared to the interests of the learners in terms of content. It offers them a social learning environment, in which they can work out problem solutions in a self-organized manner and realize them in the form of artefacts or concepts (Kaliva 2016, p. 12). Therefore, the aim for this didactical proposal for fashion design studies is to collect as many different equitable perspectives, information and skills as possible within envisaged learning processes (fig. 1):

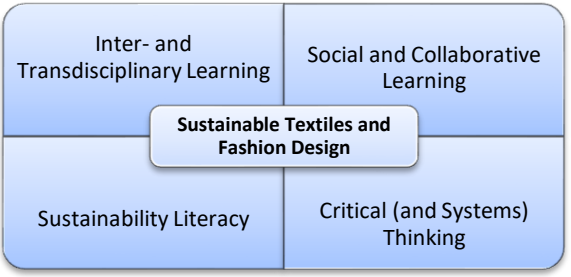

Figure 1. Main areas of learning for sustainable fashion design studies.

Within project-work the collaboration could be of academia and industry, but preferably also of different cultural, professional and personal backgrounds of students (Fletcher & Tham, 2019; Earley, 2017; Fletcher, 2014). For educational learning approaches this also means, learners should be able to take on different perspectives and thinking beyond their own disciplines, as well as including intercultural and international aspects in problem-solving approaches and decisions (Wals, 2010) for a "Sustainability as flourishing" (Ehrenfeld, 2016, p. 62).

The learning areas of the course concept refer to a multiple competency approach (see tab. 1). Critical Thinking has an established role in the various reviewed competency frameworks (Rieckmann et al., 2018; , Wieck, Withycombe & Redman, 2011; Rychen & Salganik, 2005), within which it is understood as a basic competency or key competency and as a valid teaching and also a learning approach for HESD (Moon, 2008; Chatfield, 2017).

Table 3. Key competencies for HESD (Rieckmann et al., 2018) and learning areas for a course concept "Sustainable Textiles and Fashion Design" (HTW Berlin).

Key Competencies (C.)	**Learning areas of the course**			
	Inter-/transdisciplinary	**Social/ Collaborative**	**Sustainable Lit.**	**Critical Thinking**
Anticipatory C.	**x**	**x**	**x**	**x**

Systems Thinking	**x**	**x**	**(x)**	**x**
Interpersonal C.	**x**	**x**		
Intrapersonal C.	**x**	**x**		

4.3. Topics of intervention and learning for fashion design

Based on the findings within the literature research for competency-based learning approaches in ESD and HESD relevant for the course concept, topics of interest are built along the single steps of the circular fashion supply chain (fig. 2). Today it is assumed (Ellen Macarthur Foundation, 2020; Nicoletti, 2018; Smith, Baille & Hattie, 2017) that the circular supply chain must replace the linear supply chain for a sustainable and resource saving approach in fashion (see Ellen Macarthur Foundation, 2020; Cradle to Cradle, 2020). The single phases of the circular supply chain are (fig. 2): design strategies, textiles and materials, production and manufacturing, distributing and sales, the use phase of products and the phase of discarding, recycling or prolonging the use phase through different kind of "second life" or "third life" concepts (for example upcycling or sharing).

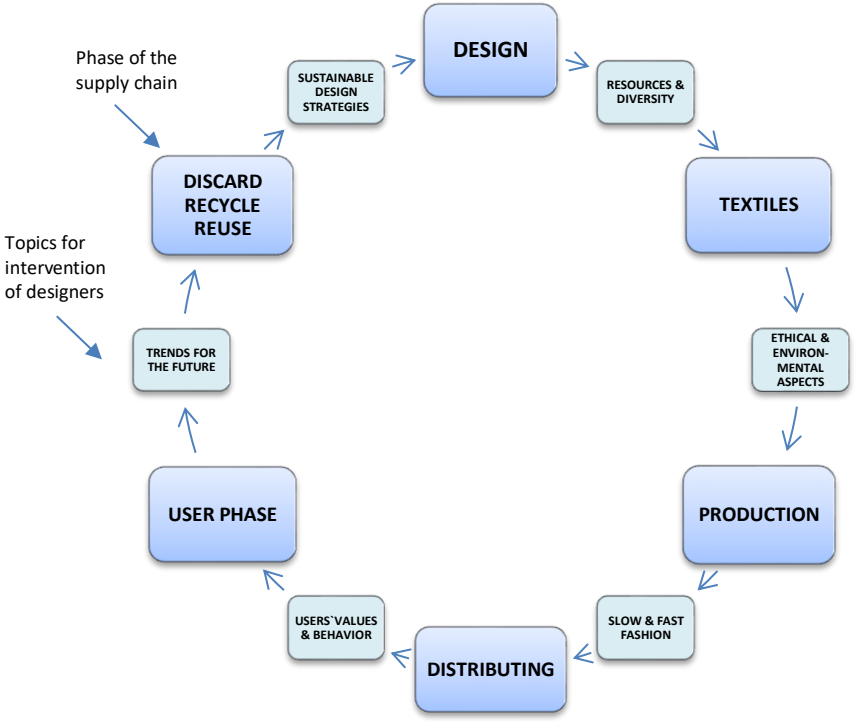

Figure 2. Fashion Supply Chain and relating topics of intervention for the proposed course concept (simplified, own representation).

Not only the topic of sustainable design strategies, but also all other proposed topics are in need for interdisciplinary discussion and work in class. For a holistic approach all topics are subject of discussion (Fletcher & Tham, 2019; Ermer, 2019; Hasling & Ræblid, 2018; Fletcher, 2014). In sense of a circular design approach, this supply chain can have multiple more and also different circles (Earley, 2016). For example, design a product for several uses or users to prolong the lifecycle of a product. At last, regarding the acclaimed systemic change of the fashion industry also the behavioral mindset, views, assumptions, and attitudes not only of designers, but also of users of fashion have to be taken into account for a critical discussion for new solutions in fashion design studies (Pasricha & Landgren, 2013).

5. Discussion

The first finding within the analysis of the five curricula for the Bachelor program fashion design showed that not one single institution has integrated sustainability-related topics in their curricula neither as relevant sustainability - related key competency nor as basic learning approaches towards HESD. Only in one curriculum it was referred directly to aspects of sustainability (HTW, 2018). Although this analysis cannot display the overall situation thoroughly, e.g., specialty Master programs were not observed within the analysis and extracurricular projects within sustainability related topics are not displayed, it gives a first insight into foundational studies. Furthermore, it can be stated, within comparison to fashion design education research in other European countries like Finland, Great Britain or Denmark, Germany is clearly lacking behind (Earley, 2017; Hasling & Ræblid, 2018; Aalto University, 2020).

The literature research showed, to start with Critical Thinking at the beginning of a course can help students to get out of the phase of helplessness (Ermer, 2019; Moon,2008; Armstrong & LeHew, 2011), that can evolve naturally during project-work (Conner, 2012) and especially in regard to sustainability related topics (Ermer, 2019, Hasling & Ræbild, 2018), However, it takes time to introduce and practice Critical Thinking and within a course concept for example for just one semester, as estimated for “Sustainable Textiles and Fashion Design” at HTW Berlin, there might be not enough time to process and practice this new and systemic way of thinking as to establish a new routine (Armstrong & LeHew, 2011; Paul & Elder, 2003). The integration of Critical Thinking in fashion design studies on a long term can be seen as a clear benefit not only for students´ personal development, but also for a sustainable future-orientation of their work. Thus, it is rather recommendable to integrate it in all design studies starting already within the first semester to get used to the specific way of thinking and reflecting. Simultaneously, students can get used to discussing design ideas more broadly within this interdisciplinary or transdisciplinary approach. They can learn to empathize with colleagues and different kind of stakeholders along the supply chain through these collaborative learning movements. Especially when diving deeper into the difficult sustainability-related topics of fashion, Critical Thinking can also offer students new

ways of thinking into a very objective and factual view, to come from feeling into thinking and acting (Moon, 2008). The point here is not to change or improve the uncertainties, students are going through in their learning processes, but rather for them to accept and to adapt to these uncertain situations (Wals, 2013). At the same time, it is of importance that these educational spaces "should build a culture of learning awash with uncertainty and in which uncertainty provokes transformative yet precautionary commitment rather than paralysis" (Kagawa & Selby, 2010, p. 243).

6. Conclusions

It can be stated, although there already exist various reliable competency frameworks for HESD, that could support fashion design education to adapt the requirements sustainability asks for, the implementation into curricula is not yet accomplished. Thus, regarding movements towards the integration of the SDGs into the fashion supply chain, also fashion design education in Germany currently lacks behind. In reference to the "decade of action" (United Nations, 2020), an immediate need for action to integrate sustainability in the respective curricula is required. A systemic change of the fashion industry is without alternative and within the last few years the global fashion industry seems to have noticed. In Germany, there has been a rise of governmental and institutional coalitions recently to engage more in sustainability-related issues, e.g., towards a sustainable supply chain (Lieferkettengesetz, 2020) or to enable more transparency within the supply chain for users of fashion (Grüner Knopf, 2020). Within learning processes taking in all stakeholders around a product of fashion, a noticeable move not only towards the integration of sustainability in education, but also for the industry at large can be created. Therefore, next to the need for a competency-based education, a beneficial implication can also be seen by the authors in a much closer collaboration within transdisciplinary projects of organizations within industry and academia to move towards the successful integration of sustainability.

Competency-based frameworks for sustainable thinking and acting are valuable proposals that can offer a starting point for a new didactical focus of learning in fashion design education. A learning model integrating *Critical Thinking* as well as *Sustainable Literacy, Collaborative and Social Learning* and *Inter- and Transdisciplinary Learning* can support a holistic set of learning approaches for fashion designers that is not only beneficial on a professional and personal level, but also regarding a call for action for sustainability in fashion.

Abstract | Design methods are increasingly used by multidisciplinary teams to tackle complex issues within the public sector through participatory approaches of codesign to gather information and create innovative solutions. However, can we categorize these projects as research projects or as design projects? These questions echoed following a multi/interdisciplinary research project (design, nursing and psychology) with the codesign of a tool for future nurses that was translated into the prototype of a portfolio fostering a reflexive nursing practice to improve patient safety competencies. However, diverging views of design research between these disciplines emerged and highlighted ambiguity regarding the operational nature of design, where focus is put on design practice rather than on its ability to produce knowledge. Considering this, it seems relevant to think that design research needs a clearer scientific positioning to be recognized by the healthcare sector before claiming to revolutionize it.

KEYWORDS | PUBLIC SECTOR, HEALTHCARE, INTERDISCIPLINARY RESEARCH, DESIGN RESEARCH, DESIGN METHODOLOGY

1. Introduction

Design research is still at its early stages and questions remain regarding its objectives, methodologies and impacts in knowledge creation and in knowledge application, especially in interdisciplinarity research projects. In other words, what is design research, how and why is it conducted within multidisciplinary contexts? Is the objective of design research to produce knowledge or to create products and services? To this extent, design research needs to be discussed and this discussion is particularly needed in interdisciplinary research where some confusion seems to remain as to the contribution of design in terms of knowledge production within the scientific research project.

Design as a research methodology can be understood as an active, situated and engaged project type research which some call project-grounded research where the design project is equivalent to the research field of social sciences, like action research, or to the laboratory of experimental sciences (Findeli, 2004). This is particularly true when design methods are used by multidisciplinary teams to tackle complex issues within the public sector through participatory approaches of co-design with stakeholders in order to gather information and to create innovative solutions (Bisson & Gagnon, 2005; Côté, Bélanger & Gagnon, 2017). In that sense, Sanders and Stappers (2008) remarkably illustrate the distinction between the use of design methods for a design project and its use for a research project. For instance, the end result in a design project usually takes the form of a product and/or a service unlike the ones pursued by a research project that are directed at the production of scientific knowledge relying on the thoroughness of the social sciences approaches (Bisson & Gagnon, 2005; Gagnon, Côté & Barré, 2012). More importantly, this distinction is significant because the scientific knowledge production is then clearly situated within the design research project where it can support informed decisions and actions.

However, these distinctions can sometimes be blurry in interdisciplinary research practices, especially when the research team members rely on different disciplinary epistemologies. Nevertheless, the validity of the different paradigms is to be accepted in order to produce knowledge for all disciplines involved in the research (Findeli & al., 2008; Morse & al., 2007. In Nimkulrat & al., 2020). These reflexions echoed following an interdisciplinary research project (design, nursing and psychology) aiming at a smoother transition from academic to professional contexts in nursing practices. The project was developed around the codesign of a tool for nurses that could be translated into the prototype of a portfolio fostering a reflexive nursing practice to improve competencies regarding patient safety (St-Germain & al., 2019; St-Germain & al., 2020). Misconceptions about the object of design research emerged within the research team and highlighted the misperceptions regarding what design research is really about and how to distinguish it from design practice. Hence, in this particular case, research and practice cultures are different: the healthcare field is dominated by a research paradigm relying on evidence-based practices (Chamberlain & Craig, 2017), whereas the design research field can be associated with research *on* design, *through* design or *as* (for) design (Frayling, 1993; 1999; 2015). Design research *on* design is

conducted from a historical or sociological perspective regarding design-related productions. This is perhaps the easiest way to get scientific recognition since the subject of the research concerns design culture interpretations which can simply be associated with an evidence-based practice paradigm. However, it is less easy to arbitrate between the other research approaches introduced by Frayling, research *through* and *as* design. Research *through* design is what Findeli (2004) claims to use within project-grounded research, which is situated in the research-creation perspective of Stévance & Lacasse (2013; 2018) and more broadly, to action research in social sciences. In that respect, design is used to study a research problem through the action's context (i.e. design project) in order to identify contextualized interpretative elements that are otherwise difficult to obtain and then, contribute to the production of knowledge. Design *as* research is certainly the most controversial of design's research approaches because it situates the creative process as the research itself, an epistemological stance that should be shared by the design research team from the onset to the extended research team in order to fully embrace the potential of multidisciplinary views. In this paper, we discuss issues and challenges associated with design research through a case study from a healthcare context involving a multidisciplinary team where misconceptions towards design research led to misunderstandings. Moreover, the paper illustrates the challenging conciliation of innovation through design within a project-grounded research paradigm (Findeli, 2004; Verganti, 2009; Gagnon & Côté, 2016a; Gagnon & Côté, 2016b). In other words, if this kind of design research strives to be recognized and transform the public sector, it still needs to better define and communicate its knowledge production within its proper epistemology and methodologies, especially in multi-interdisciplinary research settings like in the public healthcare system.

2. The INSÉPArable project

The Canadian healthcare system faces difficult challenges in relation to an excessive workload for medical staff and hospitals often ill-adapted to the changing realities of patients and caregivers. In fact, a large-scale survey with Canadian nurses (O'Brien-Pallas, Tomblin Murphy & al., 2005) and the work of Alderson (2010) highlighted the hardship and even the distress that nursing staff increasingly has to deal with in its workplace. However, it is the lack of workforce that is most concerning in Quebec (Canada) because it could imply that its healthcare services may have fewer nurses willing and/or able to work in these conditions resulting in a possible degradation of the quality of care. In other words, the tenuous nursing workforce combined to a more complex healthcare system (i.e. aging population, rising technology use and interdisciplinary work advocated by management) could lead to considerable and avoidable errors regarding patient security (MSSS, 2015). Therefore, how could nurses feel less tired, stressed, distracted and overworked in order to favour a patient safety culture guided by multifaceted bioethical values?

The INSÉPArable project stemmed from this context, where the French acronym can be broken down into: IN (infirmier/ère – i.e. nurses), SÉ (sécurité – i.e. security), PA (patient – i.e. patient) forming an *inseparable* unit for the elaboration of a tool; a reflexive portfolio for tomorrow's nurses aiming at the consolidation of their patient safety competencies (St-Germain & al., 2019; St-Germain & al., 2020). This tool is intended as a support in patient safety training for nursing students and also for employed nurses who are looking to improve their competencies through continuous learning. Moreover, in Quebec, the professional order overlooking the nursing profession requires, from its working members, a professional continued education portfolio to maintain their skills as well as to ensure safe and high-quality caregiving (OIIQ, 2012). Currently, this portfolio is essentially used for an annual update of the hours its members devoted to continuing education and consequently, if they reached the minimum training required by the Quebec's professional nurses order. However, according to St-Germain & al. (2019; 2020), the transformative power of the actual portfolio is limited in its actual form because it does not engage nurses in a reflexive approach where they are invited to reflect on changes in their practice following a training, nor does it support them in achieving real personal and professional development that would lead towards a more humanistic caring perspective and better partnership with patients and their family. Therefore, the INSÉPArable project aimed at bridging these gaps in the professional portfolio by endowing nurses with a tool that fosters knowledge acquisition and thrives to maintain patient security competencies no matter the management and environmental factors found in their workplace. This kind of professional portfolio would allow nurses to continuously acquire and update their competencies in order to develop a safe and sound practice from the outset as students, to practitioners in the healthcare system. The reflexive practice, based on the learners' cognitive, functional, personal and relational as well as ethical skills (Chanel, 2013) and called for in the INSÉPArable project, should then enable nurses to have a better understanding of who they are as practitioners to ensure high quality care by meeting the patients' needs adequately throughout their careers.

In order to elaborate this kind of professional portfolio, the INSÉPArable research project relied on a design research approach which was similar to Julier & Kimbell (2016) standpoint on how transdisciplinary design research could allow a socially oriented co-production of knowledge shaping and informing change. In that context, Julier & Kimbell (2016) argued that research guided by design could favour a mediation between the observed realities and the projected possibilities by documenting public issues through the study of ambiguous places and/or events in order to highlight the differences between improvement and innovation. Thus, the design approach in the INSÉPArable project was clearly developed as a methodological stance that was based on the study of the relationships between physical and emotional environments, of the nurses' and patients' experiences as well as of the issues related to security in order to explore possible solutions suitable for the public sector. In that way, the conclusions drawn from design research could be translated into new spaces, products, services and systems as well as into new users, organizations and contexts

not only to improve the actual reality, but also to transform its material, virtual and organizational forms (Julier & Kimbell, 2016; Côté, Bélanger & Gagnon, 2017). This posture is quite close to the reflection of Stévance & Lacasse (2013) on research-creation as a space for dialogue and exchange between scientific research and creative practices based on applied discursive strategies. In other words, a research-creation project is a research approach established *from* or *through* a creative process resulting in a double dissemination: a creative production and a theorical discourse (Stévance & Lacasse, 2013: 122). Thus, the INSÉPArable project planned to adopt a research-creation approach or, as Findeli (2004) defines it, a project-grounded research approach where the expected end-results were not only intended to take the form of a reflexive tool for nurses but also a contribution to scientific knowledge for public design in healthcare systems, especially regarding design's input for reflexive nursing practices in their actual work environments.

3. The methodology

The INSÉPArable project, within a project-grounded research perspective, called for an inductive methodology that was translated into an ethnographic qualitative research which enabled the collection and analysis of data from the healthcare experiences of patients and nurses as well as to the documentation of the nurse's work environment (spaces and tasks). In that respect, the methodological strategy was based on 4 types of data collection as well as the prototyping of the portfolio (*Figure 1*):

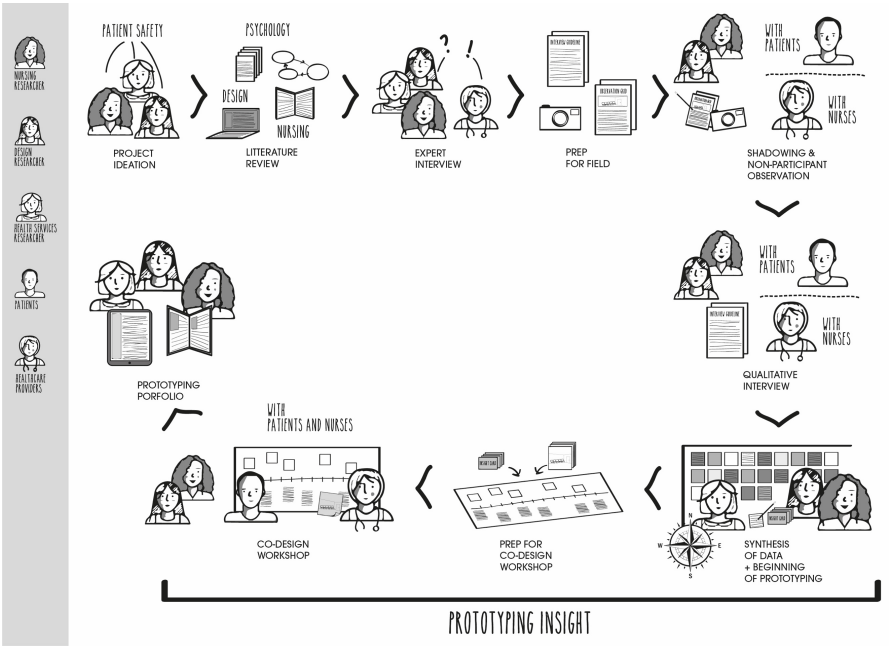

Figure 1. The initial INSÉPArable project methodology diagram

1. **Literature review and expert interviews** to understand the transition between academic and professional settings in the nurse's training as well as the interdisciplinary relation between nursing and design disciplines in research projects. This first phase prepared the immersive data collection (observations and interviews) regarding the interactions between patients and nurses as well as the interactions between nurses and their work environment.
2. **Non-participatory and participatory observations** of the context and of the interactions within the context of care units were conducted to obtain in-depth information. Four observations were made in acute care units (general medicine) and six in long-term care units (rehabilitation). Moreover, the observations were planned to cover the different working shifts of the nurses (day, evening, night and weekend). In terms of non-participatory observations, the data collection was made through space mapping, objects and medical equipment inventories and human interactions recording within the care units. Furthermore, a second type of observation took place using a shadowing technique consisting of a participatory observation which allowed the researcher to follow a nurse during a 2 to 3-hour period and document his/her journey through spontaneous qualitative interviews, notes and sketches/photographs of the caregiving experience in context (*Figure 2*).

3. **Semi-structured qualitative interviews** of approximatively 1 hour followed the shadowing activity among participating nurses and patients. A total of 20 qualitative interviews were completed in order to identify weaknesses and/or flaws in patient safety, incidents and/or accidents and perceptions of the caregiving experience as well as the healthcare environment (*Figure 2*).
4. **Codesign workshops** were introduced to validate the data collected through visual communications (i.e. personas, storyboards, etc.) and the design of a tool, the professional portfolio, with the intention to create a prototype. Carried out by the design team, the data analysis from the observations and interviews were conducted by 2 postgraduate students (one from nursing and one from design) as well as 2 design researchers to develop an initial prototype that evolved during the preparation of the final codesign workshop. Moreover, it should be noted that the design team interpreted most of the data to facilitate the development of the prototype and to integrate the material dimensions needed to situate the nursing practice and to understand the complexities and the interrelations with patients in the healthcare environment. During that time, the nursing team produced an interpretation of the data that focused only on the nurses' experience that was not intended for the prototype development but for a theorical construction of nursing practices. Therefore, two interpretations of the phenomenon were developed in parallel. The nursing team conceptualized one with a focus on the nurses' experience as an iceberg/sphere model where the nurses' work is sometimes visible (i.e. technical care, physical safety, etc.) and sometimes invisible (i.e. patient partnership, caring relationships with patients, etc.), the portfolio was then intended to help make visible the invisible part more consciously. The other interpretation was proposed by the design team and took the form of a portfolio prototype to be validated through a final codesign activity that brought together a wider audience of 16 participants from diverging backgrounds (nurses, healthcare managers and patients). The activity took the form of a 3-hour workshop accompanied by research assistants (postgraduate students from nursing and design) as well as facilitators (product design undergraduate students) who animated the codesign activities where participants tested the prototype and commented on its validity and on its relevance to nursing practice realities.
5. **Portfolio design iterations** were drawn from the first and second codesign workshops by 4 undergraduate product design students and two design postgraduate students under the supervision of the principal design researcher. These iterations were also punctuated by a few meetings with the nursing team to adequately integrate all of the data.

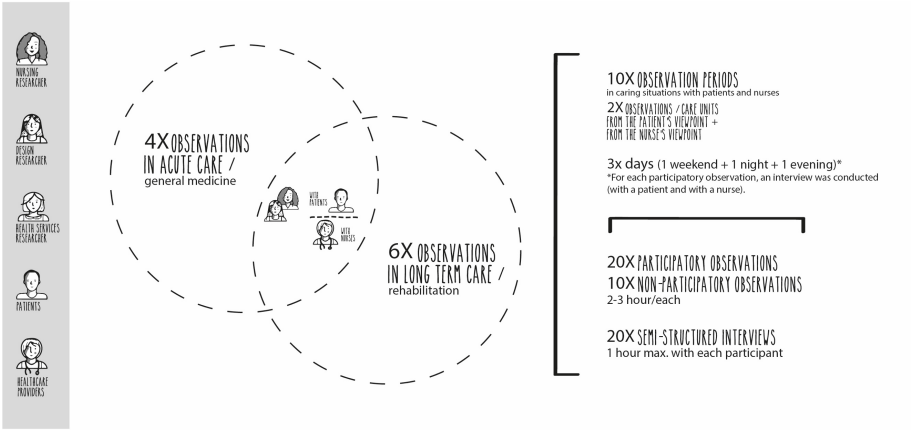

Figure 2. The INSÉPArable project immersive qualitative data collection

4. The results

In the pre-analysis stages of the research, design researchers created the first prototype with a design and a nursing research assistant who collected the data. This initial prototype was inspired by the idea of a compass indicating the course towards patient safety that emerged from the pre-analysis of the field data. As illustrated in *Figure 3* centre, two main axes divide the compass; the vertical axis modulates the levels of awareness needed in nursing practice from little to considerable and the horizontal axis, the levels of empathy from functional to relational. Moreover, this first data synthesis also allowed the elaboration of an earlier version of the nurses' and patients' persona profiles. This initial prototype was then refined by the design team where the data analysis of all the interviews and observations allowed the production of nurses' and patients' experience summaries. Consequently, in the light of this more in-depth data analysis, illustrations of the healthcare work environment for nurses were created in the form of typical situations and personas encountered in the nursing practice. Thus, the prototype includes not only an improved version of the compass but also (*Figure 3*):

- 8 profile cards (4 nurse and 4 patient personas)
- 16 situation cards from caregiving experiences and work organization (simple, complicated and complex caregiving situations)
- 1 board for problematic and risky situations with solution proposals
- 1 notebook for nurses

Furthermore, the analysis of the nurse's work contexts, tasks carried out as well as material and spatial realities of the units' environment helped to acquire a better understanding of external factors pressuring their work (i.e. built environments and work organization).

Following the realization that patient safety far exceeded the nurse's sole responsibility already occupied by numerous tasks, it felt important to shed light, through the portfolio, on the units' physical and material environments as well as on the work organization issues that can affect patient safety. Finally, the analysis of the last codesign workshop clarified the usefulness of the tools included in the prototype which should be intended for nurses as training tools to foster reflexive practices regarding their work. In fact, the analysis of the discussion themes that took place during the final codesign activity made it clear that the portfolio could be beneficial in academic contexts as well as in continuing education activities. However, a number of questions were raised regarding its utility for nurses' daily practice. For instance, some stakeholders mentioned the opportunity to use the portfolio as a managerial tool, but this questioned the original intent of the project concerning the objective related to fostering a reflexive nursing practice and the need for more data of that particular managerial context emerged, as well as the need to address it in order to improve the portfolio.

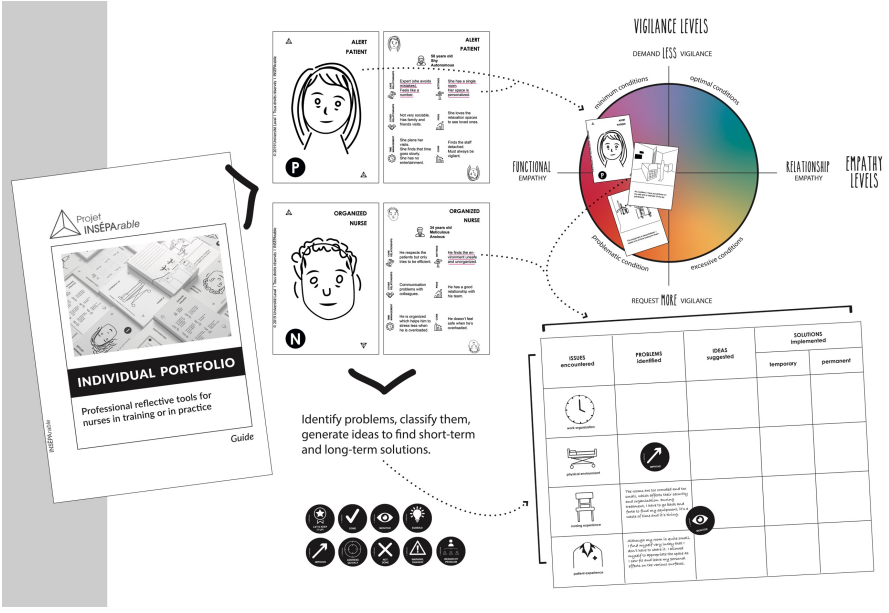

Figure 3. The INSÉPArable design project prototype: an illustration of its tools

5. A priori, learnings and limits of the INSÉPArable project

From a design perspective, the portfolio prototype in its actual version can be viewed as a materialized hypothesis which should be further tested in healthcare settings. On the one hand, the analysis of the last codesign workshop brought to light the need for iterations in

the portfolio's actual form in order to be of use in its application as well as to present a genuine solution to the raised issues that stemmed from the problematic. On the other hand, the portfolio's development conditions suggested a methodology review to better define design's contribution to knowledge production, to interrogate the interdisciplinary context of the project and thus, to mitigate the research project's results according to respective disciplines. Finally, the dual objective of the project-grounded research (i.e. design project and research project) can lead to some confusion regarding design's contribution to knowledge production, at least in this case. Moreover, it can be tricky for less versed researchers in research-creation or project-grounded research to understand the prototype as a situated knowledge production formalizing nursing practices as a conceptualized comprehension similar to a theorical model construction. In this sense, references to the conceptualizing categories of Paillé and Mucchielli (2012) can be of use to illustrate that the compass concept mobilized in the prototype development belonged to this kind of categorization. Understandably, it may be tempting to consider the portfolio as a finished design project, even in its prototype form, to be solely used as a tool for nurses. Hence, the discussion will focus on these matters.

5.1. The design project's limits and design's contribution to knowledge production

The main limit of the approach used in the INSÉPArable project is associated with how the final hypothesis (i.e. portfolio prototype) relates to the complexity of its objectives and of its data collection. Given the needed resources and time required to produce the portfolio, the first two prototypes were mainly based on the formalization of the nursing practice and patient safety issues through a series of tools: a compass, patient and nurse profile cards (persona) and problematic situation illustrations of work organization and healthcare spaces. The project development did not focus on reflexive learning strategies, strategies that could have helped further development of the portfolio through situational validations. One workshop with nurses and patients was insufficient to validate such ambitious tools as well as to support consequent and iterative design work. Ideally, discussions with a broader set of stakeholders involved in the nurses' work organization and environment should have taken place in order to investigate more thoroughly patient safety issues. A better understanding of training contexts could also have allowed greater achievement of the primary objectives, even though the codesign workshops were positive in regard to their application in training contexts. Nonetheless, validation tests should also be considered in order to improve its understanding as well as to allow design adjustments. In short, the analysis conducted by the design team allowed to identify problematic elements in nursing practice through the combination of experiential and material data. So, beyond the patient-nurse care relationship, the prototype illustrates how the work and spatial organization are crucial external factors in patient safety issues. In other words, with regards to the data collected and the limits associated with the research methodology, the prototype helped to conceptualize the patient-nurse care experience partially, but enlighteningly.

5.2. A methodology tested through interdisciplinarity

The research question was initially situated in a nursing context while the methodology was mainly based on a project-grounded research approach (Findeli, 2004). The conjunction of these two approaches aimed at some form of innovation through its data collection and its participatory methods coming from codesign workshops. The prototype production as a research result should have brought novelty to the healthcare field, which is not accustomed to this type of formalization. Furthermore, the methodological stance implied a strong connection to a collaborative approach where the interdisciplinary work should have led to integrative knowledge production supporting the design project (Findeli & al., 2008). In this light, it seems important to address the challenging interdisciplinary work of the INSÉPArable project. The research process of the project remained sequential and disciplinary putting interdisciplinarity to test mainly because traditional ways of working prevailed on both sides. On the one hand, the general research context was characterized by formal meetings, work in consecutive stages and analyses coming from disciplinary frameworks. On the other hand, a more iterative design approach combining qualitative analyses to visual representations as well as to spatial and material data was difficult to share between researchers from such different disciplines, resulting in an asymmetry in the analysis tools used by the research team. As Stévance and Lacasse (2018) point out, a research-creation project must favour a synergy among the researchers involved which is not always easy to create. Furthermore, Sanders and Stappers (2008) highlight «gaps» in interdisciplinary teams as symptoms of the expert mindset where each member then feels the need to defend his-her discipline to avoid misunderstanding or even, just to be heard.

It is, therefore, hardly surprising that joint analyses were difficult to obtain and that a research protocol better suited for this type of approach should have been conceived from the start in order to facilitate internal collaborations. Consequently, the knowledge production was generally accomplished in a disciplinary and independent manner (*Table 1*): the nursing team came up with the iceberg/sphere model concept, while the design team developed the compass concept.

Table 1. «Disciplinary integration in research» (In Nimkulrat & al., 2020, p.272)

	Multidisciplinary	Interdisciplinary	Transdisciplinary
Level of interaction	Team members cooperatively conduct research in parallel	Team members coordinate frequently and consistently throughout the project	Team members act, plan, and combine research as a collective
Problem definition	Usually guided by one disciplinary paradigm and often	Mutually developed by researchers from multiple disciplines	Transcends disciplinary boundaries; context-specific with multiple

	framed by lead discipline		stakeholder perspectives
Epistemology	Team members rely on disciplinary epistemology, but of differing paradigms.	Team members may rely on disciplinary epistemology, but must accept the validity of different paradigms.	Team members rely on a transcendent or common epistemology that reflects the nature of the problem.
Design research questions, methods and theory	Team members use traditional disciplinary approaches; research questions and scales are framed by the discipline that defined the problem.	Team members coordinate research design, questions, methods, and theory; temporal and spatial scales and conceptual frameworks are synchronized.	Team members develop new conceptual frameworks that transcend disciplinary boundaries; research design, questions, methods, and scales are collectively developed.
Knowledge generation	Knowledge created within disciplines, but conclusions may generate research questions that are applicable to other disciplines.	Knowledge created that may impact knowledge structures in all disciplines; conclusions generate new types of interdisciplinary research questions.	Knowledge restructured through the creation of new shared knowledge; conclusions drive new theorical frameworks and areas of research.
Products	Disciplinary or summary of combined disciplinary findings for disciplinary journals.	Joint synthesis manuscripts; for interdisciplinary journals.	Joint synthesis manuscripts that transcend disciplinary orientations; for interdisciplinary journals.

Moreover, the iceberg/sphere model concept was mainly based on the nurses' interviews whereas the compass concept attempted to integrate all the collected data. However, it seems important to emphasize that these two models have their own value and complementarity which deserve to be better articulated. Hence, the INSÉPArable project was generally conducted through expert, even disciplinary, approaches where interdisciplinarity turned out to be a challenge. Therefore, it would be more appropriate to qualify the project as based on a multidisciplinary approach, useful for nursing in one way and useful for design in another (*Figure 4*).

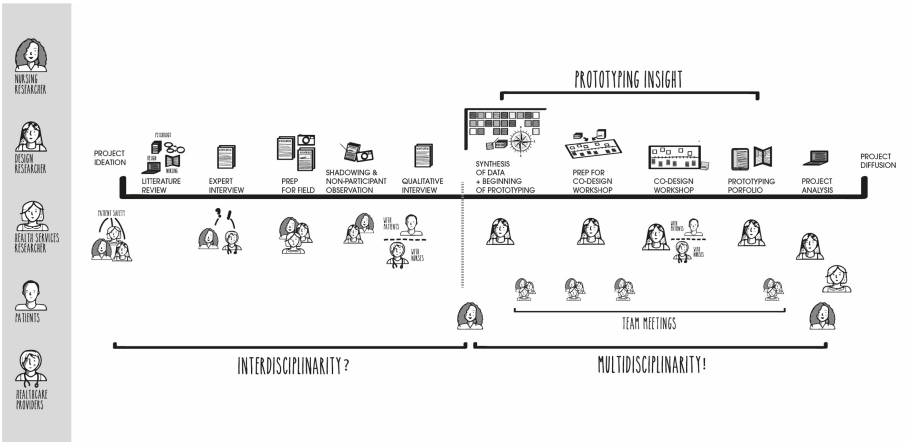

Figure 4. The INSÉPArable project, a multidisciplinary project: A revised research approach

5.3. A dual purpose to discuss

This situation is certainly common to several projects which claim to be interdisciplinary, but this research project questions the mutual understanding of the research cultures specific to each discipline involved. The dual purpose of the design approach certainly brings its share of confusion precisely because the design project carried out (i.e. the portfolio prototype) offers potential applications which can limit the perception of its interpretative value as well as the scientific rigor on which its production is based. Moreover, it may also seem difficult to clearly distinguish the different design research approaches, their particularities and epistemological stances. Frayling (1993; 1999; 2015) was one of the first to point out the ambiguous nature of design research through a categorization (i.e. research *on* design, *through* design and *as* design). Thus, if the design research paradigm *on* design is easy to articulate as the production of knowledge on design, it is still difficult to award a contribution to knowledge production within the research-creation/project paradigm or *through* the design project as defined by Frayling (1993: 1999; 2015; Bisson & Gagnon, 2005; Findeli & al., 2008). Finally, the most contested approach is certainly where design, as a creative process, is considered research in itself (Frayling, 1993: 1999; 2015; Bisson & Gagnon, 2005). Consequently, it goes without saying that the design research team shares Frayling's reservations towards design *as* research, whereas the design project should not be considered as scientific research *per se.* Therefore, as seen with Sanders and Stappers (2008) as well as with Kimbell and Julier (2016), it now seems clear that the chosen approach in the INSÉPArable project was based on a rigorous qualitative methodology leaning on Findeli's (2004) project-grounded research model and on Stévance and Lacasse (2013; 2018) research-creation definition while using the conceptualized data collection methods for design research from Bisson & Gagnon (2005). To conclude, it is precisely this epistemological stance that should have been better defined and communicated within the

INSÉPArable project in order to avoid misunderstanding regarding design's contribution in knowledge production. The impression of operationalization and/or hegemony of design could have been avoided to make way for a real interdisciplinary collaboration with the objective of shedding light on knowledge creation and application for each and every discipline involved in the research. Lesson learned.

Abstract | This paper explores if and how mechanisms from economical and design strategies could be transferred into political structures to fasten up processes for representative democracies in order to react to matters like climate change in time. We filter and summarize helpful cases to transfer their success principles to representative democratic systems in Europe. This happens from an analytical and design research point of view. Concluding this paper, the insights are used to propose extensions for the current representative system with new approaches to tweak it to enable a faster and meaningful change, which is urgently needed against the backdrop of an increasing number of worldwide challenges.

KEYWORDS | DESIGN AS POLITICS, DESIGN AND DEMOCRACY, DESIGN STRATEGIES, CLIMATE CHANGE, REPRESENTATIVE DEMOCRACIES, DISRUPTION FOR CHANGE, TRANSDISCIPLINARITY

1. Introduction

Processes of the representative democracy are solid but at the same time often painfully slow. Change often takes a long negotiation process that is conducted between the different stakeholders of these processes. The results are often long-term outcome-focused plans including objectives, budgets, and measures. These plans are then implemented into the operative decision making and administration structures of the democratic system which is creating additional lag due to their bureaucratic logic. This makes sense for working out agreements in large scale long-term policy-making amongst different actors with different political agendas and diverging views and values where time is no critical factor.

When the rigid system of representative democracy is faced with wicked problems (Rittel, Webber, 1973) like the acceleration of digitalisation or the exponentiality of growing issues regarding climate change, fast decision-making to reach meaningful action seems almost impossible. Politicians appear hesitant in their reactions towards a seemingly overwhelming demand for change. With small steps, the giant system slowly moves towards a direction, but change is barely recognizable.

Challenges for the political actors are the multiple, diverging interests of citizens (cf. Mulder 2011), accompanied by the parallel fear of politicians to cause imminent societal divisions and growing tensions in society when change is happening too fast for those in economically weak situations and places.

There are the progressive actors, fighting for actions to defeat the multiple crisis (Brand, 2016), and pushing for significant change within the near future. And there are individuals and groups that are caught in the structures of the current system and are not able to transform easily or only with a tremendous financial effort towards sustainable action – like the farmers trapped in the conventional agriculture system.

In this tense situation, the question arises, how a transition phase can be developed by utilizing elements and mechanisms for acceleration to reach e.g. a zero-emission industry in Europe within the coming decade.

Coming back to the need for rapid change-making in representative democracies the central question of this paper is: what processes and principles of economy and design can be extracted to speed up sustainable and social change in representative democratic structures?

The approach of this paper is to extract mechanisms that can be used to extend and enhance the present structures of the representative democratic system with flexible, innovative approaches from the economical and design sector. This bears the potential to make the political system more agile and prepared for increasing complexity and societal divides.

We extract principles and tactics with potential for experimentation, providing new perspectives – always respecting the requirement and objective of a representative democracy to fulfill and moderate the demands of a heterogeneous, open and diverse society (cf. Putnam et al. 2001, cf. Sennett 2012).

We are aware that economical processes are faster, because the degree of freedom to come to a decision more quickly, is higher within commercial entities because fewer values and diverging interests need to be accounted for. We are aware that this paper describes the domains of economy and politics only in a broad outline. Additionally, we recognize that our perspective is written from a European centric perspective and therefore also from a privileged point of view.

2. Design of Democracy

When reflecting on the model of Manzini/Margolin (2016) named "Design of, for, in and as Democracy" this paper mainly focuses on a Design of Democracy, which aims at "improving democratic processes and the institutions on which democracy is built". The other paradigms – the Design *for*, *in* and *as* Democracy – play an important role as well, because this paper explores worlds of interdisciplinary knowledge exchange (as) and asks how to revitalize democratic structures through experimentation, which allows for more stakeholders to participate and active citizens to be part of those mutual actions (for, in).

3. Strategy towards the Future – Don't let the past shape the future

Our basic hypothesis is that current representative democratic systems underline and maintain the status quo, instead of looking at future opportunities. As a consequence, the current actions are only aligned towards a strategy based on the paradigms of the past. But it's not the past that is going to save us from the current crisis, instead, it is the future. Today many people have future angst and lean towards a past that has created a lot of the problems of today. We should better give these people an idea of favorable futures to prevent further populist ingratiation. We have to shift our focus from re-action to action.

Even if lately actors in the political domain decided to make a big step towards the future, to tackle the next phase of technological development in Europe (e.g. the Decode research consortium[1] or the Diem25 European Movement[2]), we would like to give one example,

[1] decodeproject.eu
[2] diem25.org

which shows the lag with which the representative democratic system is acting when it comes to fast and decisive action:

In 2019 the French government offered a 5,5 billion US dollars fund for digitalization and innovation for their entrepreneurial scene (Dillet, 2019). After a year of talking about initiating a similar fund, the government of Germany is still in the planning phase of a "Future Fund" of 1,2 billion US Dollars (Sigmund et al, 2020). An example from the private sector in comparison: Between 2017 and 2019 the Japanese Softbank offered 200 billion US dollars in their so-called Vision Fund (Brien, 2019).[3]

This demonstrates the disproportion between the determination to act (and the need for action) in the public sector on the one, and the private sector on the other hand. This can also serve as an indicator for the difference in degree of optimism and faith when it comes to strategizing for future developments.

4. Think beyond the crisis

Thus, we claim a *Politics of the Future* that should act as a flexible, evolving and adaptive practice serving as a bridge towards new, alternative systems which will enrich the existing structures.

We propose the introduction and implementation of additional parallel structures that accompany and inform the traditional organization of democratic decision making. These structures would utilize the quality and potential of design as a way of thinking and focus on forward-looking action towards more sustainable and integrative scenarios for the future.

In order to create preferable futures (Hancock & Bezold, 1994; Dunne & Raby, 2013), we have to overcome our limited view of the status quo as one of crisis and challenge. We have to widen our view and set sight on the shores of a new system we imagine to be better for more people and the planet. We have to undertake the creative effort to integrate new and old, future and past against the background of opportunities created by new knowledge, new technologies and a rising motivation for change.

5. Design as translator between different disciplines

Within this approach, design has the ability not only to take on the role of an adaptive facilitator between disciplines, domains, and systems but can also work as a translator for languages and taxonomies of different systems and is able to organize the inter- and

[3] 2017 93 billion and 2019 200 billion Euros

transdisciplinary processes due to its disciplinary openness and adaptability (Findeli et al., 2008).

Design as a discipline is able to dive into the terminology, habits, and frameworks of other disciplines (Park, 2010; Jonas, 2010). Through its openness it can adapt its methodology and processes to a certain context and mediate between different actors and "life-worlds" (cf. Brandes et al, 2009, cf. Joost et al, 2014). At the same time, it is capable of tackling multi-disciplinary challenges, which is relevant for an increasing number of issues that need to be considered. We want to use the power of design to translate and mediate between the economical and the political field and look through the lenses of design methods and business strategies towards politics, strengthening the approach towards an extendable representative political system.

6. Principles

As a first step towards a design-driven Politics of the Future, we have identified and formulated six principles. We use examples of economic strategies and design practice to illustrate these principles. We then come back to the initial question of "How to accelerate current democratic processes by applying these principles?"

[MINIATURISATION] Downsize the scope – Embrace experiments

Idea: Create a frame that is feasible to allow for quick and secure modelling and testing of possible solutions.

Strategic perspective with aspects from economy and design:

Building a Framework for experimentation and temporarily decoupling it from the existing system frame that has hindering regulatory paradigms.

Companies often test new systems or processes in a scaled-down version like a pilot plant or test-pilot a project with limited scope before scaling the system or implementing it company-wide. Risky or experimental solutions are often tested in safe environments or laboratory settings (sandboxes, testbeds). Successful test-pilots then have the power to generate great stories which make it easier to gain buy-in from investors, corporate sponsors or important stakeholders.

Example:
Eskilstuna, a Swedish industrial town of 65.000 inhabitants, is a leading role model in the circular economy. Based on the initiative of a group of local politicians they developed a visual, user-friendly system for recycling their daily garbage. Under the provision of free garbage bags in seven different colors, the citizens can establish an intuitive recycling system

at home. Through a visual detection system, the recycling facility automatically sorts the garbage and reaches a really high recycling rate.

But this is not the only systemic solution this Swedish town has implemented: They also initiated “Retuna” (retuna.se), the first worldwide recycling shopping center. Opened in 2015, by the Initiator Anna Bergström, the center has already reached break-even after three years. Owners of 14 shops can draw on the collection and storage, filled with donated secondhand goods of citizens. The shop owners are using the donated material to upcycle it into new products or for the repair of bikes or audio equipment (Wagner, 2017; Ammar, 2019; Stadter, 2020).

What did we learn for the Design of Democracy:
After testing an experimental framework which proved as working (as in the example of the Swedish town Eskilstuna) an up-and cross-scaling process could be the next step (cf. Schubert & Uğur Yavuz, 2020). After another iteration, a transfer to several similar sized towns in the same or other cultural contexts could take place, always planning for a phase of adaptation to the specific localities and their respective conditions. If scaling up on a regional level generates positive outcomes, the approved system could be scaled up on a national, European or international level. Thus, a higher impact will be created, and the adapted system will run more smoothly because it was iterated several times in a smaller scale before expanding it as a more standardized concept. The quality of design enables understanding and easy adoption of verified systems by making complex interconnections apprehensive through the use of designerly means like interfaces, blueprints or visual manuals.

[PARALLELISATION] Simulate zero gravity – create environments with less friction

Idea: Create parallel structures outside the existing ones to avoid bureaucratic friction.

Strategic perspective with aspects from economy and design:
To build parallel tracks outside of the institutional structures.

More and more companies found innovation units, collaborate with or act as venture capitalists, form (or participate in) incubators and accelerators to circumvent their own bureaucratic culture and procedures. They shift to funding initiatives round-per-round after successful results and proof-of-concepts instead of budgeting on a per-year basis. They scale promising projects fast and stop the failing ones early.

If we look at other areas where institutions are challenged by disruptive forces like the digital revolution, a growing number of private commercial institutions understand that their traditional top-down, plan-based, step-by-step way of working and controlling is not always

feasible when it comes to dealing with fundamental shifts in the way businesses operate and customers consume.

Example:
Organizations and companies like Google (e.g. Google Ventures, Google X) have spear-headed a whole new way of developing products and innovation initiatives by introducing new problem-solving and innovation strategies and added them to their existing portfolio of instruments. Many companies have built parallel tracks outside of their corporate structures (or only loosely associated with these) to short-cut their own bureaucracy, gain speed and flexibility when exploring new business and technology landscapes. BMW for example is involved in the car-sharing service *Drive Now* as is Mercedes in *CarToGo*. Cannibalizing their company's traditional business model of selling cars would not have been this easy or even possible inside the company's own structures. Today companies and products are often developed in “incubators” and scaled in “accelerators” without their origin companies intervening much in the decision making or business operations.

While observing that governments and municipalities initiate formats like think tanks, future labs, or citizen assemblies, the outcomes are not really recognizable due to the lack of scaled implementation. There is a need to integrate newly established structures and insights back into the “bigger system” in order to create a long-term impact.

What did we learn for the Design of Democracy:
When governments and municipalities have capacities to initiate parallel, innovative endeavours, a “back coupling” to the existing system is needed. The reconduction and refeeding of the insights is necessary to innovate for the bigger picture and create real impact. For a meaningful back coupling, designerly approaches like *infrastructuring* (Star & Ruhleder 1996, Ehn 2008) – combined with visual means – can support the integration.

[PROTOTYPING] Always-in-beta – Use iterative prototyping to find “market”-fit

Idea: Create a very basic solution that you then continuously improve with feedback from the target users or groups.

Strategic perspective with aspects from economy and design:
Using Rapid Close Loop Learnings for problem-solving and continuous improvement of the beta-solution.

Design thinking focuses on the iterative approach of testing assumptions and failing early while learning and improving the solution, service or product with each cycle. Innovation strategies like the *Lean Startup* idea focus on rapid iteration, solution-testing and continuous improvement cycles towards a scalable product-market-fit solution.

In the challenging race to new markets, start-ups around the world are abandoning traditional waterfall-processes in favor of agile product development methodologies and many organizations strive to implement innovation ecosystems utilizing a scaled-agile approach at enterprise level. Product-market fit is reached by following a quick test-based development process where mistakes are made early and cheap. Several interrelated issues are explored and coordinated in parallel while constantly synthesizing basic testable working solutions and prototypes. The insights and ideas from constantly testing and evaluating prototypes are then fed back into the process and continuously improve the solution with every cycle in consequence.

Example:
Tesla first tested their product – an "improvised" EV sports roadster (a remodeled lotus elise) – with a small target group of prosperous clients. By improving their expensive niche product step-by-step with less financial effort than if done for a mass market vehicle, Tesla learned everything they needed for the later scaling-up phase when targeting a broader mass market. What they learned in their small-scale project had tremendous impact when building huge production streets like the GigaFactory (Musk, 2006).

What did we learn for the Design of Democracy:
Many current administrative procedures are really painful and time-consuming experiences both for employees and for citizens. At the same time each administration unit provides an ideal testing ground for innovating bureaucratic procedures. Successfully tested innovations could then be applied on a much bigger scale.

Through integrating prototyping strategies into the development of services and processes a market fit is iterated step-by-step. Through constant improvements and adaptations to different contexts and user needs, the developed system is open and flexible. This principle could be transferred to new political agendas. Through an iterative "always-in-beta" status, agendas can span a range of diverging citizen's living conditions and can react more easily to changing environmental and societal parameters.

When it comes to dealing with pressing complex issues like the climate crisis that have to be tackled immediately and with dedication – a wicked problem which cannot be addressed without accounting for its multi-dimensional, interrelational and fuzzy nature – one important approach is fast closed-loop learning, adoption and constant solution-modelling.

A learning system with the right feedback loops in place can continuously improve itself and offer new ways of working till the right fit with the changing context and its shifting paradigms is accomplished.

[ANTICIPATION] Anticipate futures – Make “bets on the future”

Idea: Look at current developments (like demographics in western countries or decreasing price and increasing capacity of micro-computers) and start building solutions based on your projections of these prospects.

Strategic perspective with aspects from economy and design:
Cost-curve analysis and Scenario Modelling.

Strategies that use anticipation as their principle, focus on the future intersection of a business (in development) and a certain technological trend or dynamic trajectory (economies of scale, network effects, cloud computing, mass-adoption of certain behaviors). These strategies often include portfolios of multiple innovation initiatives, big bets as well as pipelines of ideas and flexible resource allocation frameworks.

Example:
When Netflix was a DVD rental business, they saw that prices for mobile bandwidth were coming down and smartphone distribution and bandwidth speed was accelerating. They figured that in the future people would be able to watch video content by streaming it on their mobile devices (cf. Oomen, 2020). After modelling this scenario, they decided that it might be smart to start building a platform around this anticipated business model. Had they ignored this or not tried to predict developments related to their industry this opportunity would have been a bigger threat to their existing business model than a new business opportunity.

Tesla's success was based on one big bet that the cost of batteries would come down so fast that electric cars would become affordable to the masses. This could be demonstrated with a simple cost-curve analysis. But acting with dedication based on this model afforded a lot of courage.

What did we learn for the Design of Democracy:
Anticipating future developments like the development of prices (of batteries or solar panels for example) or demographics and courageously acting upon these projections gives us the opportunity to create better futures because we learn to anticipate them and act on the basis of various forward-looking models. We can avoid a purely reactive mode relying on data from past developments.

Design approaches for projecting and forecasting the future (Jonas, 2007; Hanock & Bezhold, 1994; Dunne & Raby, 2013) can enable courageous and forward-thinking concepts. It can enable political stakeholders to switch from a reactive to a proactive mode and position themselves as proactive drivers.

[NARRATION] Create powerful narratives – Focus on story and experience

Idea: In order to get buy-in for change you can leverage the power of story-telling and the intuitive human relationship with visual language to bridge imagination gaps and stop purely theoretical discussions.

Strategic perspective with aspects from design and economy:
User Experience Design, Storyboarding and Narration Frameworks, Critical Design.

Designing and implementing strategies for large organisations often involves a large amount of storytelling to get ideas across towards employees, stakeholders and customers. Persuasive narrative structures are used in presentations, marketing and pitches to bring ideas to life and convince stakeholders and decision makers to take action towards realizing the described and visualized scenario (Boudens et al 2019).

Example:
When AirBnB tried to imagine their service, their business model and their customer experience as one coherent system they asked a former animation artist (Pixar) to help them storyboard their room-sharing service (Akkawi, 2018).

What did we learn for the Design of Democracy:

By taking advantage of the immediacy and emotional quality of (visual) narratives you can make it easier for people to comprehend complex interrelations and to get them motivated for action and behavior change. This also works vice versa by creating dystopian narratives (using the critical design approach for example) that then show scenarios that could evolve when we do not act or act in non-sustainable ways. Effective storytelling can help to enable game-changing decision making (e.g. through movies like *An inconvenient truth* by Al Gore).

Storytelling puts information into a semantic, sequential and digestible order. Thus, it becomes efficient as it is now more comprehensible and recognizable. This tactic is not so often used in political discourses probably due to the fear of being recognized as unprofessional or superficial, but it sure would help to make political agendas better accessible to a broader public.

[HACKING] Hack the System – Create informal solutions & “make” politics

Idea: Learn from the example of hackers and subversive artists and improve the system by breaking it in ways that help to create better versions of it.

Strategic perspective with aspects of design and economy:
Use re-framing techniques, mash-ups, up- and recycling, a tinkering mindset.

Thinking of alternative uses for existing solutions and tinkering with combinations and re-

configurations is part of technology innovation and product development in smart organizations (3M for example “invented” the post-it accidentally when they found a “hacky” way to re-use one of their glues that had failed at the originally intended purpose). Having laboratories, cross-industry collaboration and open-source projects often leads to unintended successful innovations for corporations.

Example:
Developing smarter ways that short-cut or re-frame current systems, we might be better able to reach our goals and improve the system at the same time. If you make policies that increase the costs of driving cars within the city limits, you allow rich people to live out their convenient unsustainable lifestyle while forcing behavior change onto people with less income. But if you make the streets smaller and allow for more bicycle space (as it was implemented in Bogota or Brussels in Covid-19 times) you make it more painful for everyone to drive a car in the city – especially bigger cars – and at the same time you reward people for riding the bicycle in the city.
When the city of Copenhagen was planning to build their new waste-to-energy plant in the middle of their city to limit traffic and emissions from transportation they asked the architects to come up with a proposal that would help the citizens to perceive and experience the new power plant as an improvement in living quality rather than a necessary evil. The architects found a very bold mash-up solution by adding a skiing slope on top of the building allowing the citizens to use “their'' energy plant for recreational activities (Murray, 2019). The re-framing of a utility building shows how powerful designing-out-of-the-box is when you have the courage to realize such projects.

What did we learn for the Design of Democracy:
The Copenhagen example shows that questioning the existing, enables new transformative thinking, imaginations and alternative realities describing a preferable future. When politics moves beyond a reactive mode, it is also possible to think and act beyond the existing and learn how to add, alter and combine existing solutions into something new.

7. Conclusion

From a design research point of view, this paper addresses new ideas and perspectives for the extension and improvement of representative democratic systems by borrowing from other domains like economic strategies. We extracted and condensed several principles to be utilized for acceleration and creative problem solving. These principles can be applied as stand-alone approaches or be combined as a strategy.
Decoupling processes from existing frameworks offers the advantage to think and make in new ways. The challenge lies within the re-integration of new models and approaches into the existing system. It is this translation procedure that calls for further research and investigation.
Maybe there could be some overarching, interdisciplinary political entity as a horizontal

interface in between the different departments with the objective to address such issues of synchronization, scaling and implementation.
The key benefit from the dialectic working of traditional representative democratic processes on the one hand and innovation strategies on the other hand combined in one approach, for a faster and more agile change-making agenda, would be that the democratic system itself could become more resilient during times of crisis. Looking back to the described need for new approaches in design of democracy (Manzini & Margolin, 2016), this paper describes pragmatic and supplementary approaches for finding ways of addressing complexity.

Disrupting governance by Systemic Design and co-creating the public value

Carolina Giraldo Nohra[a], Eliana Ferrulli[a], Silvia Barbero[a]

[a] Politecnico di Torino - Department of Architecture and Design

*carolina.giraldo@polito.it

Abstract | Massive transformations characterize our current era at a multidimensional level, and our governments worldwide are facing the urgency to translate this complexity into a manageable common strategy. Strong synergies and cooperation on a quadruple-helix model are identified as primary conditions to build value for society. In that view, systemic perspectives and participatory methodologies - which Systemic Design combines - can trigger innovative processes of sharing knowledge and experiences among different stakeholders and can build innovation in the public sector. This paper investigates how Systemic Design methodology can be used for a governance "paradigm shift" for value creation, on a long term perspective. Such a method opens the way to a more adaptive and co-creative innovation in policy-design processes, by exploring new ways and tools provided by design, which enable broader and collaborative access to public governance. Applying a systemic perspective into those strategies means to favor a type of governance, whose outcomes are iterative and autopoietic, creating endurable public value.

KEYWORDS | SYSTEMIC DESIGN, POLICY-MAKING, CO-DESIGN, GOVERNANCE, VALUE CREATION

1. Introduction

Massive transformations characterize our current era at a multidimensional level. From the environment and climate change to market instability, towards waste pollution and enormous production, these are just a few examples of the complexity and "wickedness" of nowadays. Such trivial and interconnected phenomena cannot be solved with the traditional linear and analytical method of problem-solving, but they call for a radical shift in policy regulation around the world.

Even if there is an increasing acknowledgement of the systemic nature of global challenges, however, it is still a significant challenge for the different governments worldwide to translate this complexity into a manageable common strategy to address present and future transitions (EEA, 2019). Such wicked scenarios are often promoted and reinforced by a linear model of governance, which encloses problems into "silos", and limits the understanding of the bigger picture (Head and Alford, 2015).

The need for quick response has brought to a "reactive policy-making" that contrasts with a model based on the generation of value in the public sector, which inevitably requires a long-term perspective. Moreover, this bureaucratic model rejects external views on topics and policies which are often generated "behind closed doors", favoring a perceived sense of opaqueness from the outside and minimizing people participation. For this reason, there is an urgent need to disrupt these silos and to shift towards a more adaptive and collaborative policy framework.

Such system transitions in governance disrupt the established investments, jobs, behaviors, knowledge and values. The aim is to constraint governments to impose policy instruments that are consistent with long-term environmental goals, as Sustainable Development Goals. On that long-term perspective, how to build value in governance? It is necessary to change the conception of "value creation", which is used and abused in our current economy, and which is mostly absent in the public sector (Mazzucato, 2018). In that view, the first condition to reach sustainable development is to build strong synergies and cooperation between the socio-economic components of the system. By providing a common understanding of complex problems and sharing responsibilities to cope with change, participatory approaches enable adaptive governance and resilient systems.

To approach such complex relations in governance and their wickedness, we need systemic and interconnected solutions (Brown T., 2011). In the last decade, Systems Thinking has provided practical approaches for raising social awareness about interconnected societal complex systems (Jones, 2018) and Systemic Design has shown the means and knowledge to navigate these wicked scenarios aiming to maximize the value of government.

Design practices like participatory design and co-design (Bødker & Grønbæck, 1991; Manzini & Rizzo, 2011) are born from this approach, and they all share a systemic perspective (Bødker, 1987). This one has been instrumental in the definition of a new role of design

inside complex social systems and set up the bases for social innovation as a space for design thinking and research (Jones, 2014). Design for policymaking has opened the space for design practices to be involved in the construction of policies addressing designers' skills and knowledge towards higher goals like sustainable behaviors and development (Kimbell, 2015). These practices have been vital in the development of the discipline and have helped designers to move from the production sphere, leading them to become significant actors of social transformations (Buchannan, 1992).

From that view arises Systemic Design, which approaches and tackles problems on a systemic and complex level through the creation of strong and synergic linkages among all the stakeholders involved. This co-creation process favors and reinforces the socio-economic systems connected, on a long-time perspective. Nevertheless, we must acknowledge that design is not yet "completely" inside the governance culture, even if there are examples around the globe of design-gov cooperation through the so-called "innovation labs".

This paper aims to explore the Systemic Design methodology for a governance "paradigm shift" towards collaboratives approaches for value creation. Such methods in policy-design processes explore new ways and tools of an adaptive and co-creative innovation. This opens doors for everyone to access public governance, while directly and effectively responding to people's needs and governments future trajectories.

The paper is structured as follows. In the first section, the research frames the understanding of the wicked problems' nature in the public sectors. The following section introduces the main challenges that our current governments are facing when approaching today's challenges. It reflects the importance of participatory approaches, on which design leverages, to build innovation and create value for policymaking in the public sector. Finally, the discussion is narrowed, explaining how systemic design can unveil the hidden assets of a context underlining its strengths and threats in a policymaking scenario.

2. Wicked problems and current state of the art

The last century, our extractive society model has brought irreversible impacts on ecosystems at every scale. Such problems are associated with climate change, pollution, chronic diseases, unemployment, poverty and corruption. The interactions between them are classified as the so-called "wicked problems". These, defined by Rittle and Webber (1973), are represented by their complexity, uncertainty, interdependence, and highly interconnected social-ecological systems. Later on, Martin (2009) reframed the wicked problems identifying them in four dimensions:

First*, causal relationships are unclear and dynamic.* Suggesting that the causes and effects of wicked problems are complicated to identify as their complexity makes them ambiguous. (Roberts, 2000). This uncertainty can also be considered political in a public sector context when it is overseen in the causes and effects of such wickedness. For example, is climate

change a problem or just a manageable consequence of the quest for growth? (Bason, 2018). A current example of such a situation in 2020 where the wildfires in Australia: was the government more prepared on preventing them or into fixing the consequences?

Second, *the problem does not fit into a known category*. The wicked problems undertake interconnected and overlapping challenges, and characterized by cutting nature over several policy fields and levels of governance. This cross-cutting nature means they are embedded in other problems like economic development or environmental preservation (Weber, 2008), increasing the levels of uncertainty (Van Bueren, Klijn, and Koppenjan, 2003). This interpretation of the problem presents a significant limitation to the managing authorities as their notion of problem-solving is "evidence-based policy", which intends that those policy decisions are based on reliable information of "what works". (Bason, 2018)

Third, *attempts at problem-solving change the problem*. Such dimension is related to the linear approach on problem-solving and how the reactive nature of it has perpetuated the wicked problems over time. In the case of governance, this is reflected in the classic top-down dynamics where the inflexible system only allows "one-shots solutions" for potential ideas, plans, laws or initiatives. From that perspective, wicked problems require more iterative and nonlinear ways of addressing problems (Halse et al.; 2010).

Fourth, *there is no stopping rule.* As wicked problems cannot ever truly be solved, there are no criteria to know if they have ever been addressed, meaning they imply a no "stopping rule" (Rowe, 1987) (Ritchey, 2011). Such argument comes from the assumption that every solution proposed can always be upgraded and improved in an iterative process.

In that view, understanding the nature of wicked problems can allow us to comprehend the nature of the current issues on the governments which address such problems linearly.

3. Governance challenges and decision-making

The current system at the moment addresses problems into "solving" and "fixing" with reactive formulas and not considering that our complex situations are not something we can rationally analyze and 'solve' in predictable ways. The current practice of our governments to usually enclose problems into closed-off "silos", limits the understanding of the bigger picture (Head and Alford, 2015), by generating a clash among policy planners and policy implementers (Bason, 2014). Indeed, environmental challenges are a perfect example of wicked and complex problems: ambiguous and unstructured, overlapping in their impact on different domains, not entirely and forever solved so this requires a continuous and iterative process of trying, learning and monitoring (Bason, 2018).

Indeed, in exposing the complexity, uncertainty and no-linearity of wicked problems make it clear that transitions towards particular sustainability outcomes cannot merely be planned and implemented. That means the public sector needs to comprehend the nature of wicked

problems to be able to generate systemic solutions towards long-term environmental and socio-economic goals. Moreover, to address increasingly globalized environmental challenges, active cooperation on a quadruple helix model (governments, industries, communities and research institutions) is needed. This introduces two key concepts of this paper, closely linked one to each other: on the one hand, the shift from “government” to the broader concept of “governance” and on the second hand, the practice of co-design in policymaking.

Firstly, with the term of “governance”, is intended "the totality of interactions in which government, other public bodies, private sector and civil society participate (in one way or another), aimed at solving public challenges or creating public opportunities" (Meuleman, 2008). Consequently, this implies the shift in the role of government: from acting as a pilot with the knowledge and tools to steer society towards sustainability, to act as an enabler of society-wide transformation processes (Bason, 2018). Such argument leads to the second concept of co-design. An appropriate definition of co-design methodology in policy-making delivered by Blomkamp E. (2018) who describes it as a design-led process, in which different kinds of people and knowledge cooperate in public problem-solving, guided by creative and participatory principles and tools.

It is a matter of fact that nowadays almost every government worldwide, especially in Europe, is facing the urgency to shift towards sustainability. In fact, the newborn *European Green Deal* (which aims to make Europe the first carbon-neutral continent by 2050), as well as the *New Circular Economy Action Plans* (which focuses on the use of sustainable resources, especially for high-impact sectors) and the broader and global SDGs, they all witness the willing to cooperate for a more sustainable future.

Nevertheless, the clash between wicked problems and traditional problem solving, together with the shift from government to governance represents a significant reframing of Europe's sustainability challenges and response options. Even if it is acknowledged an urgency shift towards sustainability, however, implications for public policy and institutions are mostly unexplored.

As pointed out by the European Environmental Agency (EEA) the complexity of sustainability transitions opens the way to additional governance challenges, especially in terms of directionality, coordination and the management of unexpected consequences.

Governments deliver the “Directionality" by defining visions, pathways and targets. Such action implies inevitably for an articulation of alternative futures and how to get there. Fundamental on that sense is specific normative choices, underlining the importance of public engagement and deliberation.

The different activities and the diversity of actors across sectors and scales of governance creates the need for coordination. Public institutions have a crucial role to play in ensuring horizontal coherence across policy areas, as well as vertical coherence between local, national and international levels.

Finally, new emerging issues implies a need for both analytical approaches (e.g. horizon scanning) and adaptive governance approaches, grounded in monitoring and learning, that enable the timely reorientation of transition processes. The table below presents the main governance challenges and how they relate to the characteristics of sustainability transitions.

Table 1. Characteristics of sustainability transitions and their governance implications. Retrieved at European Environmental Agency report 2019.

CHARACTERISTICS OF SUSTAINABILITY	GOVERNANCE IMPLICATIONS
Multidimensional Changes in Socio-technical Systems	Policy mix approach that goes across environmental, industrial, sectoral (mobility, energy, food, housing), tax and educational policies. This is important to achieve horizontal policy coordination.
Multi-actor Multi-scalar Process	Multilevel governance allows top-down guidance and funding as well as local policy experimentation. Such polycentric governance involves flexible and self-organising activities by non-state actors.
Mission Orientated Targets	Indicators about the governance direction (e.g. through financial incentives, regulation, targets) and more specific indications about innovation pathways (through roadmaps and foresight exercises).
Disruption and System Reconfiguration	Stimulate sustainable innovations but also engage incumbents and potential losers (via compensation or reorientation policies).
Promoting Transformative Innovation and Experimentation	Portfolio approaches, project-based learning and experimentation, especially with radical innovations (social, technical, business models)
Risks, Unintended Consequences and Adaptive Governance	Monitoring and adaptive governance, to ensure directional flexibility and address side-effects.
Urgency and Acceleration	More robust innovation and diffusion policies. Phase-out and innovation policies (through bans or stronger environmental regulations).

Nowadays, despite the significant investments of money and resources in tackling our current major challenges, it seems that most of them are just superficially solved (e.g. plastic pollution). While these problems continue to be a source of expenditure in the public policies agendas, new ones seem to emerge, increasing the pressure.

The aforementioned demonstrates again that wicked problems cannot be addressed as our institutions are used to - with a linear approach -, but it calls for a change in directionality - in a more systemic way -.

4. Co-creation for value creation

So how to address the wickedness in the current governance challenges?

Mostly the wickedness of our current scenario comes from the lack of value creation. On that view, value intends the wealth creation or the benefits that society obtains from the system - and vice versa -: provisioning services (e.g., food), education institutions, health and social care services, housing, social security, infrastructures, energy, water and waste system, regulating services (e.g., flood control,) and cultural services (e.g., recreation) (Cole and Parston, 2006). These categories of the public value are a way of measuring countries' progress towards the achievement of societal goals - such as the Sustainable Development Goals -.

Through this paper, we aim to expose furthermore an idea of innovation in which public policy actively shapes and co-creates services that drive more sustainable and inclusive forms of welfare and growth in our current system (Jacobs et al; 2016). From that perspective, we intend co-creation as a collaborative design process among public sectors, private sectors, research institutions and civil society. In this scenario of collective policy design, all the actors involved, including citizens, are all intended as equal partners in design and delivery, and people are assets and not just subjects of policies (Sanders and Stappers, 2008; Gillinson et al., 2010).

Certainly, this type of model faces several barriers:

- **the current reactive policy-making** which is more focused on fixing the market failures and re-distributing wealth among other value-extraction activities (Mazzucato, 2016);
- **a siloed-shaped public bureaucracy** which rejects external views on topics and policies, minimizing people participation;
- **lacking consciousness**, public servants are not even aware that there is a different way to develop new approaches (Bason, 2014);
- **lack of tools and platform** to conduct co-creation in practice (workshop, toolboxes, innovation labs).

Nevertheless, it is crucial to underline that input from a diverse group of stakeholders is needed to effectively incorporate both social and ecological dynamics in environmental decision-making processes (Irvin and Stansbury, 2004; Reed, 2008). Indeed, by confronting their different sets of values and world-views, a much broader scenario is analysed from the beginning. More specifically, including different stakeholders can contribute to:

- **a deeper knowledge on different scales**, which has a central role in order to support adaptive governance and ecosystem-based management programs (Gadgil et al., 2003);
- assure higher quality and an **endurable decision making** towards environmental challenges (Millennium Ecosystem Assessment, 2005);
- **make the implementation processes smoother**, saving time and money on political wrangling (Pahl-Wostl and Hare, 2004).

Besides the benefits brought from a diverse stakeholder engagement, participatory and co-creative approaches reinforce other social aspects necessary to address wicked problems:

- the enhancement of social learning and capacity building;
- the increase of transparency by building trust;
- the mediation of power through cross-sector collaboration.

By providing a common understanding of complex problems and sharing responsibilities to cope with change, participatory approaches enable the first conditions to build adaptive governance and resilient systems.

5. Systemic Design as leverage for policy-making and value creation

As our system challenges have turned into more wicked, the design discipline on its problem-solving nature has broadened its approach to services and systems (Ceschin & Gaziulusoy, 2016), by extending to a wider network of actors and co-design practices. That evolution of the discipline has brought to a considerable growth of the policy design field.

On that view, there is an increasing amount of literature on design in policymaking, which examines the use of design approaches in policy making teams or “policy labs” (Kimbell, 2017). Nevertheless, to clearly understand the relevance of the design discipline in the policy field, Bason (2014) explains that design provides a diverse way of understanding policy problems. In his view, design is intended as a hybrid blend of research methods from different disciplines like anthropology, systems thinking, and data science, through cooperation among different stakeholders. Other authors like Christiansen and Bunt (2014) make a similar affirmation defining the usefulness of design to cut the distance between policy and implementation (Mintrom and Luetjens, 2016) (Hobday, Boddington, and Grantham, 2012).

For a Policy Design practice, it is imperative to address the before mentioned pressing issues on value creation in our system. Moreover, it requires to implement a method that allows the combination of technology, design, business and social organization. On that view, systemic perspectives and participatory methodologies can trigger an innovative process of sharing knowledge and experiences among the actors mentioned above. To tackle such wickedness globally means that "Systemic and interconnected problems need systemic and inter-connected solutions" (Brown and Wyatt, 2015). To address that among the design methodologies is the Systemic Design (SD) which approaches the complex phenomena on a systemic level through design tools. This expertise provides a method that is focused on the holistic analysis of territory, allowing the design discipline to serve as a mediator among technicians, economists, humanists, and others (Celaschi, et al; 2013), generating autopoietic open systems based on contextual values. Furthermore, this method merges human-centred design inside complex, multi-stakeholder systems (Jones, et al; 2018) which can highlight the potential opportunities for value creation, delivering new collaborative relations among the local actors and entities (Barbero & Fassio, 2011). Jones (2014) also underlined that SD combines designer skills such as research, reasoning methods and visualization practices, creating innovative reconfigurations for complex services and systems.

The capabilities of SD can serve effectively to the components of participatory co-design that Policy Design processes require. On that view, SD favours the visualization of opportunities for value creation, enhancing the active collaboration between stakeholders, and boosting locally-based value chains (Barbero, 2012). To understand its implementation in a policymaking scenario, it is furthered explained its 6 main steps (Battistoni et al., 2019):

- **Holistic Diagnosis (HD)**: Composed by a desk and field research, which scopes out the system context on the economic, social and environmental perspectives, taking into account the flows of energy and matter;
- **Definition of problems and leverages for change**: taking the framework established by the HD, the system connections and patterns are examined to highlight the possibilities for value creation and threats that inhibit it in future scenarios. The challenges and opportunities are regarded as leverages for change from which the new system strategies can be defined and initiated;
- **Design the system**: A new system model is designed whose aim is to create value in an autopoietic way and tend to zero emissions by optimizing energy and material flows and by valorizing resources;
- **Outcomes Evaluation:** assessment of the environmental, economic and social advantages that comes from the new model of value creation (production);
- **Implementation:** the execution of the new designed system for the specific scenario, considering an estimation of the new business plan feasibility;

- **Results analysis and feedback:** assessing the executed system and unlocking more opportunities, to make the system autopoietic.

Through these steps, SD unveils the hidden value of the socio-economic assets of a territory, creating new valuable relations and synergic linkages, in a long time perspective. Indeed, design capabilities reveal more about the individual and their context and can encourage civil servants to unlock opportunities for an iterative creation of value on a contextual level.

Based on the previous, we suggest SD as a useful method to translate the political vision into executive actions (policies) through the integration of SD steps into the so called policy cycle (Birkland 2001; Raulik-Murphy & Cawood 2009; Hobday et al., 2012). In both the processes, stakeholders and their relationships cover a central role in the socio-technical system targeted for the policies implementation, and they both acknowledge the iterative nature of the process itself. In 2008, Knill & Tosun elucidated the five main steps that constitute a policy cycle, namely: 1. agenda setting, 2. policy formulation, 3. policy adoption, 4. implementation, and 5. evaluation. A policy cycle starts with the problems classification and the priority setting in the policy agenda. It follows a draft of the policy proposals which will be later assessed and implemented. Ultimately, policy impacts are measured, evaluated and reformulated iteratively. This means that the policy cycle is constant and infinite (Maffei et al., 2013), and subject to continuous improvements.

The table below shows which SD's step can be integrated into each policy cycle step and its potential impact per phase.

Table 2. Integration of the systemic design steps into the policy cycle.

POLICY CYCLE STEPS	SYSTEMIC DESIGN STEPS	POTENTIAL IMPACT
1. Agenda setting	1. Holistic diagnosis 2. Definition of problems as leverage for change	HD highlights the hidden resources of a territory and helps police-officers in identifying more effective targets to address their policies, also leveraging on the criticalities and opportunities raised through the HD
2. Policy formulation	3. Design the system	Based on the holistic review of policy strategies, SD supports the policy formulation by designing a new and more resilient system based on the local assets
3. Policy adoption	4. Outcomes evaluation	A jointly and broader feasibility evaluation is given taking into consideration the environmental, economic and social benefits, implying a governance foresight vision

4. Implementation	5. Implementation	SD supports the policy cycle in developing programs to execute short and long term policy plans for a local value creation
5. Evaluation	6. Results analysis and feedbacks	SD supports the assessment of the implemented system, by measuring its resilience under the economic, environmental and socio-technical lens

SD methodology has already some implementation cases, on a policy design level, in projects or regional initiatives. For example, the Design School of the Politecnico di Torino has experimented the methodology both in European projects (e.g., RETRACE Interreg Europe project and ProGIreg H2020 project) and collaborative studies with industries (e.g., Agrindustria Tecco s.r.l., Luigi Lavazza S.p.A., and Groupe Poult).

Even though design has still a long way to be recognised as a powerful means in a governmental environment, there are examples of innovation agencies worldwide that have similarities with the design approaches, at different governance levels. Among these:

- **MArs solution lab (social innovation lab):** Based in Canada, brings together governments, industry, non-governmental organizations, academia, and community to assess complex problems from the citizens' view. They collaborate with multiple stakeholders to develop, prototype, and scale new solutions, and create opportunities to learn how to shift the system and local policies.
- **The Finnish Innovation Fund - Sitra (National Agency):** is a future-oriented organisation that promotes Finland's competitiveness and the well-being of the Finnish people. It's aimed at anticipating societal change, fostering innovative models and boosting business that aim at sustainable development. Sitra focuses and assesses the social change and their impacts on Finland's policies.
- **OECD- Observatory of Public Sector Innovation (Intergovernmental Agency):** It is focused on assessing and reviewing examples and shared good practices of public sector innovation to deliver practical advice to governments on how to make innovations work.

These examples illustrate how the systemic approach is delivered in similar ways at different scales. Also, they prove there is ample room for SD to grow in the policy design field: by integrating it into governmental agencies, SD can have an impact on the policy at a micro and macro scale. These increasing practices aim to shift the role of public investment generating policy imperatives for governments seeking smart growth and wealth creation.

6. Limitations of the approach: challenges to establish a value creation model

Such approaches, as SD for the generation of policies towards value creation, deliver an extensive and holistic research background. Nevertheless, it is likely to point out some constraints related to the SD methodology which have been introduced at the research phase.

One of the main challenges on tailoring SD for different scenarios is the accessibility to database consultation. In the early research phase, this challenge is widespread as database platforms in each country have different units, language, and update status. In most cases, the critical point is to find an average amount of available data, to make a holistic diagnosis properly. Moreover, this process of quantitative and qualitative data collection, requires a robust cooperation between stakeholders and managing authorities, which is limited by the siloed-shaped bureaucracy, as previously explained.

Secondly, to approach policy design processes with SD, it is required a direct engagement with civil servants, industry, and community representatives which allows increasing awareness on local resources, opportunities, and challenges. Unfortunately, the bureaucratic cultural paradigm, strongly fixed into a top-down approach, limits cooperation among all the actors. That is why this is recognised as a critical point for SD to enable a quadruple helix approach, which is needed for adaptive governance.

To overcome such barriers, SD has a system visualization component that eases the decision-making process. This one delivers a broader perspective for all actors and allows more enriching feedback from all the participants. The idea is to stimulate participants in the policy design process to think holistically.

Lastly, another crucial factor is the time frame that managing authorities need to establish in a Policy Design process: in many cases there is a fixed period to execute specific actions for which a specific budget has been already defined. In that frame, SD has to come with actions that only serve on a current scenario and for an immediate change, which is not possible because policies have effects after several years the policies are released. For the same reason, SD effects are complicated to measure because they are designed on a long time perspective. This means that the impacts must be planned with a foresight vision on short, medium and long term views, in order to address the change and a broader value creation.

7. Conclusions

Today, to address the wickedness and the creation of public value, governments are focused on reaching targets such as the SDG by 2030. Even if those targets seem broad, governments' efforts must address them with a sufficient directionality. Nevertheless, in the

majority of the cases, policy servants can feel lost from the broadness of these concepts. Even if there is an increasing acknowledgement of the systemic nature of global challenges, however, our governments persist in using a linear approach to tackle those problems. It is still a significant challenge for the different governments worldwide to translate this complexity into a manageable common strategy to address present and future transitions (EEA, 2019).

As widely discussed in this paper, the first condition to reach sustainable development is to build strong synergies and cooperation between governments, institutions, businesses and citizens. In that view, this paper has discussed how collaborative policy design processes, developed among different stakeholders, are essential to move towards value creation in a long-term horizon: they enhance social learning and capacity building, they build trust, and mediate the power through cross-sector collaboration.

Systemic perspectives and participatory methodologies - which SD combines - can trigger innovative processes of sharing knowledge and experiences among different stakeholders and can build innovation in the public sector. Applying a systemic perspective into those strategies means to favour adaptive governance, whose outcomes are iterative and autopoietic, creating endurable public value.

Following this, SD can act as a mediator in those policy-design processes that address complex problems and deliver new solutions. Indeed, SD favours the visualization of opportunities for value creation, enhancing the active collaboration between stakeholders, and boosting locally-based value chains (Barbero, 2012). On that purpose, systemic design can unveil the hidden assets of a context as shown in projects and regional initiatives such as RETRACE Interreg Europe project, ProGIreg H2020 project and many collaborative studies with industries.

Nevertheless, we must recognize that systemic design is not yet “completely” inside the governance culture, even if there are examples around the globe of design-gov cooperation through the so-called “innovation labs”. These agencies are approaching the public value at different levels and, even if the number is gradually increasing, it currently amounts to 162 spread around the world (http://publicsector-map.designforeurope.eu/en/). However, these innovative experiments certainly require fundamental changes in our current governance and economic system works.

This momentum must not be missed, expertises such as SD need to be at the forefront of a governance culture to unlock the generation of new public value and public policies that create and shape a different economic future.

About the Authors:

Carolina Giraldo Nohra PhD is a Research fellow at the Politecnico di Torino - Department of Architecture and Design. Her research is focused on the convergence between Systemic Design and Circular Economy approach with particular attention in policies and strategies that foster circular city models in post-industrial precincts (Italy & South Africa).

Eliana Ferrulli is a PhD student in Management Production and Design at the Politecnico di Torino (Department of Architecture and Design, 2020-2023). Her doctoral research focuses on fostering industrial innovation towards a Circular Economy framework, with particular attention to reinforce the connection between consumers and companies in building more resilient socio-technical systems, through Systemic Design.

Silvia Barbero PhD is an Associate Professor at Politecnico di Torino (Department of Architecture and Design). She is a lecturer of Product Environmental Requirements at the Design and Visual Communication degree and of Open Systems at the Systemic Design Master degree at Politecnico di Torino. She is also responsible for the stage & job design curriculum. Her research mainly focuses on Systemic Design applied to territorial sustainable development.

Disruptive technologies and behavioural change: Design fiction as trigger for critical thinking.

Mila Stepanovic*, Venere Ferraro,

Department of Design, Politecnico di Milano,
*mila.stepanovic@polimi.it

Abstract | Design research and practice are increasingly interested in critical theories and practices, especially when it comes to the use of disruptive technologies (i.e., wearables, artificial intelligence, etc.). These technologies can support users in changing behaviours towards societal issues (i.e., environmental sustainability, health, safety, etc.). This paper reflects on how Design Fiction discipline can trigger critical thinking toward the use of disruptive technologies, considering its societal and ethical values, for designers and researchers dealing with design for behavioural change topics. The case study of this paper shows the results of the workshop held with design researchers and aimed at developing the near-future scenarios for the technologies able to tackle behavioural change related to the specific societal challenge; this, supported by the use of several existing tools found in the literature. We will discuss and make some suggestions that emerged from the results of the new approaches for the design for behavioural change research and practice

KEYWORDS | DESIGN FICTION, CRITICAL THINKING, DESIGN FOR BEHAVIOURAL CHANGE, DISRUPTIVE TECHNOLOGIES

1. Introduction

> "Our world is increasingly involved and engaged in complex […] debates and experiments. […] design researchers should adopt practices, methods and tools to reason about futures' scenario relevant to nowadays debate." (Grand and Wiedmer,2010)

Building on this, the design and HCI community are increasing their interest in critical theories and practices, especially when it comes to disruptive technologies. These technologies are changing the way people behave, act, interact and think, they can be powerful tools to support the user in changing behaviours towards societal issues such as environmental sustainability, health, safety, etc.

In this paper, the authors analyse the current design for behavioural change research and practice and reflect on how Design Fiction can help designers and researchers trigger critical thinking when using disruptive technologies. Authors suggest that the Design Fiction approach might help designers and researchers be more critical toward the societal and ethical issues and the role of behaviour and technology. (Rapp, 2019) Design Fiction with its principles may indeed be, considered an alternative approach for behavioural change researches and practices. As Tanenbaum (2014) explains:

> "Design fiction [...] allow us to adopt a range of different intellectual commitments and values about the future and explore the consequences of those commitments […]".

This paper describes the first findings and results of on-going doctoral research aimed at suggesting the new approaches for the design for behavioural change research and practice, based on design fiction principles as a way to trigger critical thinking regarding the ethical and societal issues when dealing with disruptive technology. To better understand the influence of design fiction on design for behavioural change research and practice, we set a workshop (case study), addressed to design researchers. During the workshop, we decided to evaluate several design tools aimed at developing envisioning future scenarios about the technological artefacts able to tackle the behavioural change, starting from the societal challenges while using design fiction-based approach.

Through this workshop, we observed and analysed the impact of design fiction principles, such as envisioning storytelling, and the influence of Science Fiction (SCI-FI) films on creating scenarios about the technologies able to tackle behavioural change.

In conclusion, we will summarize the results gathered from the workshop and discuss the further steps of the research.

2. A potential meeting for critical thinking

Innovation in the technology sector makes new technologies rapidly disrupt the previous one. The disruptive technologies may change entirely both how we use the technology and design artefacts able to influence human behaviour. Said so, the role of disruptive technologies considers a larger context, such as its impact on the individuals, society, and environment.

These technologies can motivate the user through engaging interaction modalities and forms that can reach the user in a non-intrusive way, but also as Goodwin (2008) explains:

> "Any disruptive technology that enables entirely new behaviour can cause fundamental changes in how people see the world."

When designing disruptive technologies, there is a high demand for ethical and societal issues. It is crucial to guide human behaviour ethically and sustainably and understand the impact of human behaviour and the use of technologies for the future.

Several tools have been designed with a purpose to help designers in creating technological artefacts able to tackle a behavioural change, such as Design for Sustainable Behaviour (Loughborough University), Design with Intent Tool (Brunel University), Behavioural Design Toolkit (Doblin & IIT University), Brains, Behaviour & Design Group toolkit, etc. By analysing them, we realized that these tools often draw upon the traditional design principles, suggesting the established strategies and solutions, rather than stimulating critical inquiry about the future behaviours and the impact of behaviour on the outer world. In regard, Ilstedt and Wangel (2014) explain:

> "Sustainable lifestyles are today, however often depicted through a sacrifice-based cultural narrative […] These ideas, or expectations, about the future thus provide an opportunity for intervention."

For this reason, we decided to introduce the critical practices, with a particular focus on design fiction as a way to reflect on design for behavioural change research and practice, and imagine the future of technologies. Rapp (2019) is proposing the design fiction as a possible alternative tool for designing for behavioural change:

> "Design fictions […] could represent a tool for reasoning on how current behaviour change designs embed values, opportunities and threats […]."

Based on this ground, we introduce experimentation on how design fiction can trigger critical thinking in design for behavioural change research and practice dealing with technologies.

3. Case study

The experimentation object of this paper investigates the influence of design fiction principles, such as “what if?” scenarios, with a focus on the narrative dimension of design fiction and its potential to trigger critical thinking. The experimentation was carried out with nine participants actively involved in design research, six PhD students and two Research fellows, coming from different fields of design (smart materials, digital manufacturing technology, interaction, and experience design, industrial design, fashion for sustainability, cross-cultural teamwork in design-based learning). The objective of this experimentation was to produce a near-future scenario that describes the context, the role, and the shape of a technological artefact - considering its material properties and the experiences related to the interaction modalities, semantic, social, and ethical values - able to tackle the behavioural change. Here and after, we will introduce the method used in the experimentation and describe the activity (workshop).

3.1 Researching through the critical inquiry: Methodology

This workshop was founded on the use of the PPPP (Dunne and Raby, 2013) model, which stands for Present, Plausible, Possible, and Preferable future, and it aims at defining the different kinds of potential future. The reason for this choice was to facilitate the journey from the present to the preferable future in production of the near-future scenarios. For the experimentations, we created a fit on purpose format for which we assigned existing tools to different stages on the “P” scale. (see Fig. 1)

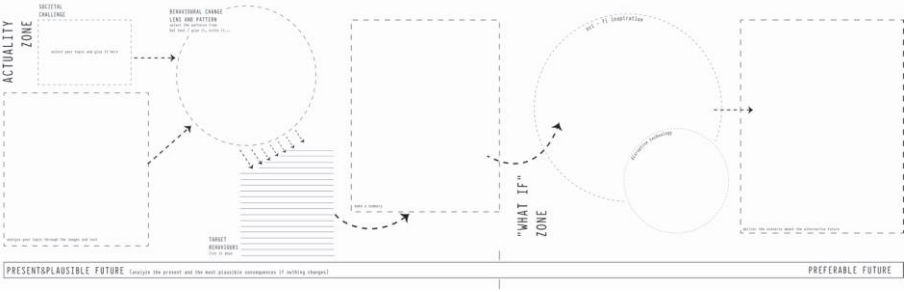

Figure 1. Application and formating the PPPP model according to the tools used in the experimentation.

A format proposed in this workshop is a linear approach to designing, where the “present and plausible future” encompass the topic of the Societal Challenge, the human behaviour (DwI Tool), and the setting of the design brief. Just after, comes the “What if?” zone that leads to the construction of the near-future scenario (preferable future). The participants were, indeed, asked to develop a near-future scenario (considered as intangible explorative

artefact) to envision a “preferable future” in which the protagonists are the not-yet-existing technological artefacts.

Summarizing in one day workshop, we asked to develop a near-future scenario in a format of narrative story through stages organized within PPPP Model, by using the following support tools:

1. Present and Plausible stage: Explore the Societal Challenges Topics

For setting societal challenges topics, we took as a reference the Loughborough University research about the design for behavioural change as a driver for sustainable innovation: Environmental sustainability, Health and Wellbeing, and Safety. Table 1 below shows how we categorized the societal challenges in macro-topics and sub-topics within these.

Table 1. Societal challenge topics.

Macro topic	Topics
Environmental sustainability	Air pollution (1), Waste management (2), Energy saving and pollution (3), Water saving and pollution (4)
Health and Wellbeing	General health prevention (1), Worker’s health (2), Ageing (3)
Safety	General citizens safety (1), Cyber safety (2)

2. Present and Plausible stage: Analyse the behavioural matter (Design with Intent Tool)

The second element of the experimentation is the Design with Intent tool (DwI), found the most suitable for our experimentation, for creating the Design for Behavioural Change brief. We used it as a tool to help researchers describe the target Behaviours and strategies for influencing behavioural change. DwI tool is based on eight lenses and several patterns within each lens, proposing a different strategy for designing the products and services able to tackle the behavioural change. In our experimentation, we narrowed the selection of the lenses and patterns to five. (see Fig. 2)

Figure 2. Selection of five (5) DwI lenses with patterns for our experimentation.

We set the Cognitive, Perceptual, and Machiavellian lens as mandatory to use, or combine, while the use of the Ludic and Interactive lens was facultative. (see Table 2)

Table 2: Selection of the lenses in relation to their principles.

Lens	Principle
Cognitive lens	Takes inputs from the behaviourist economy and cognitive psychology
Perceptual lens	Combines the concepts of gestalt psychology and product's semantic
Machiavellian Lens	Proposes solutions based on the thought that "end justifies the means."
Ludic lens	Proposes the strategies that can engage the user long in time.
Interactive lens	Uses the interaction modalities and interfaces to stimulate the user's behaviour.

3. "What if zone?": Exploring the fictional worlds (Tech Inspiration Cards - TICs)

This tool has a purpose to help participants in giving a shape to the technological artefacts, inspire on the not-yet-existing technologies and near-future worlds, within SCI-FI films. In specific, understand how diegetic prototypes are contextualized within the fictional historical, social, and political sphere, and as a consequence open a discussion and critical reflection about the disbeliefs and collective imaginary about the future, and inspire the imagination when it comes to exploration of the new forms, interactions, materials,

applications, and others, but also to take into consideration possible ethical and societal implications. For building this envisioning tool, we analysed which disruptive technologies will be the most suitable to tackle behavioural change in the next 15 years. As support, we used the Seealsology tool that collects data from the Web and classifies data on different levels. What emerged from this analysis is that disruptive technology appears in many different levels of application and forms, but taking into consideration our application, we realized that we could narrow the classification of disruptive technologies on four macro categories: Artificial Intelligence, Simulated Reality, Wearables, and Smart Materials. According to these latest tendencies in the technological sphere, we started research for SCI-FI films that represent these technologies in the future. Data extracted in Seealsology were transformed into keywords and helped to the creation of the tool "TICs": a selection of cards containing the film's title, images, and plot. (Fig. 3)

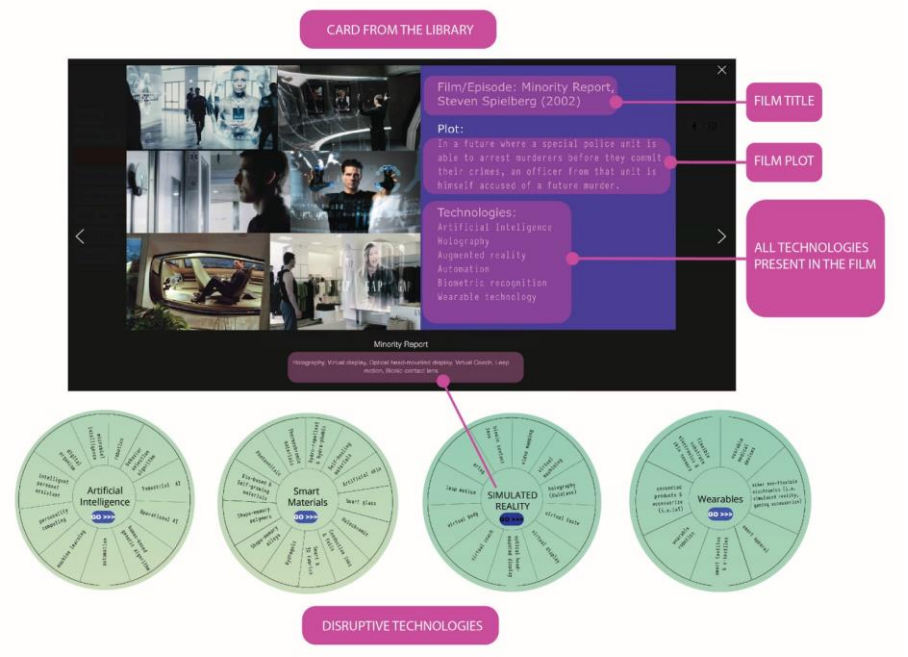

Figure 3. Tech inspiration cards: design fiction support tool for envisioning the near future technologies through the SCI-FI films.

4. Preferable Future stage: Analyse the potential role of the technology (Fogg's Triad) and production of the Scenario

At this stage, the participants started to reason about the not-yet-existing technological artefact. Firstly, the participants selected a disruptive technology to implement in the

artefact they want to design. Then, they reasoned on how this technology may influence human behaviour. To facilitate this phase, we introduced Fogg's Functional Triad (2008), for defining and describing the role of technologies on three levels: technology as a Medium (provides the experience), technology as a Tool (can increase the capability), and technology as a Social Actor (creates the relationship). (see Fig.4)

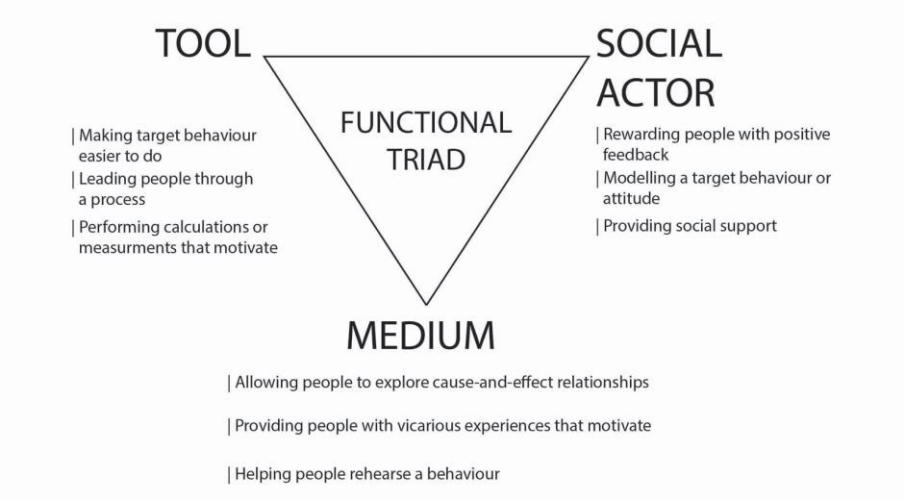

Figure 4. Fogg's functional triad describing the role that technology can have in persuading the users.

The Functional Triad was used just as a support tool here, after the TICs, to help the participants start reason on a not-yet-existing technology in a functional sense. They were not limited to this. The development of the scenario contextualizing the technological artefact had to contain the inputs from all the activities of the workshop.

3.2 Activity

The experimentation lasted one day, split into two sessions. The morning session was framed into three activities: (1) Selection and analysis of the Societal Challenges' topic; (2) Use of the DwI tool for defining the behavioural issue and target behaviour; (3) Definition of the General brief. The afternoon session was framed into two main activities: (4) Take inspiration for technology from the SCI-FI films for identifying, and (5) imagine how these will evolve 15 years from now, in terms of applications, interaction modalities, aesthetics, etc. As a support tool to help in describing the potential of the technology to influence human behaviour, we provided Fogg's functional triad. Here, we describe the outputs.

Group 1 selected the topic Cyber Safety, focusing on digital assistants - control and management of personal data. They identified a lack of awareness when dealing with these devices due to the poor comprehension of data. The results of the use of DwI tool and selection of the strategies are in the table below:

Table 2. Group 1 selection of the DwI lenses and patterns, and they purpose.

DwI Lens	DwI Pattern	Target behaviour
Interactive	Tailoring, and Summary Feedback	(1) Inform the user about the relationships, activities and functions of the digital assistant, (2) Monitoring of the collected data, (3) Acting pro-actively toward the data collection, (4) Communicating with the assistant in a uncomfortable, intentional and unconventional way.
Perceptual	Metaphors, Possibility trees, and Transparency	
Ludic lens	Unpredictable reinforcement	
Machiavellian	Degrading performance	

Table 3 shows the brief set by the participants, and how they explored the SCI-FI films and selected the technologies to use in their designs in regard.

Table 3: Relationship between the Brief – SCI-FI title – Selection of technology – Role of technology (Group 1).

Brief	Selection of SCI-FI titles	Selection of technology	The role of technology
Design a solution able to increase the awareness and agency related to the use and expectations we have from digital assistants, where the concept of "tailoring metaphors" for data storage, and transparency concerning user - assistant.	**"Her", "The Entire History of You" and "Nodesive" (AI).**	**AI**	**Technology as a tool able to increase the capability of the user by improving the comprehension toward the use of device and management of personal data.** **Technology as a social actor because it aims at improving the communication between the user and the device.**

Their scenario is about the personal assistant as a digital organism that expands regarding the users' needs. In the year 2035, data will become recognized as the property of the user, and he will be able to decide when and how much data to provide through different "metaphoric profiles" (i.e., relatives profile, secretary profile, partner profile), manipulated through different interaction modalities.

Group 2 selected the topic of health prevention related to eating habits and food quality, focusing on bad eating habits. The strategies and target behaviours defined through the use of DwI tool are represented in the table below.

Table 4. Group 2 selection of the DwI lenses and patterns, and they purpose.

DwI Lens	*DwI Pattern*	*Target behaviour*
Cognitive	*Habits, Emotional engagement, Personality, Scarcity*	*Eat earlier, Balance diet, Change the way of cooking, Foresting sociality, dimension of eating, cooking and sharing; Create good eating conditions.*
Perceptual	*Fake affordance, Mood, Nakedness*	
Machiavellian	*Worry resolution, Serving suggestion*	

Table 5 shows the brief set by the participants, and how they explored the SCI-FI films and selected the technologies to use in their designs in regard.

Table 5. Relationship between the Brief – SCI-FI title – Selection of technology – Role of technology (Group 2).

Brief	Selection of SCI-FI titles	Selection of technology	The role of technology
Design a technological product able to prevent the users from eating late in the evening and change their attitude toward healthy food through enriching the social dimension and suggest new cooking techniques.	“Little Joe” (olfactory stimulation technology) “Strange days”, “Arkangel”, and “Black Museum” (behaviour control and surveillance), “Her”, “Hang the DJ” (OS-human relationship and personalization), “Gattaca” (bioengineering technologies)	AI, Smart Materials, and Wearables	The technology is a medium because it provides the experience able to influence the positive attitude toward the healthy food. It has a role of a tool because it suggests a new technique for cooking. It has a social actor when it wants to enrich the social dimension.

This scenario is about a man, tired to cook in the evenings and needs to acquire healthy eating habits. At the moment he tries to reach a "fast food", the item starts to look spoiled. At the same time, the "healthy choice" reminds John to eat healthily. The scenario describes some smart cooking tools that activate chemically and change the food properties; an automatic cooking machine and wearable able to track the health and user's needs.

Group 3 started with the topic of Air pollution. They identified negative behaviour emerging on two levels: (1) the industries, waste management, and transportation, and (2) the use of chemicals at home. The table below shows how they used the DwI tool:

Table 6. Group 3 selection of the strategy for behavioural change and identifying of the target behaviour.

DwI Lens	DwI Pattern	Target behaviour
Cognitive	Habits, Social proofs, Emotional engagements, Community and Consistency	Avoid misuse of chemicals in everyday life that harm health and pollute air.
Perceptual	Colour association, Fake affordance	

Table 7 shows the brief set by the participants, and how they explored the SCI-FI films and selected the technologies to use in their designs in regard.

Table 7. Relationship between the Brief – SCI-FI title – Selection of technology – Role of technology (Group 3).

Brief	Selection of SCI-FI titles	Selection of technology	The role of technology
Design a solution able to persuade people to use chemicals properly in everyday life.	"Existenz" (simulated reality, organic technologies and materials), "Hitchhiker guide to the galaxy" (materials and flexible technologies), "Her" (OS).	AI, Smart Materials, and Wearables	The technology is a medium because it has to provide the experience able to increase awareness toward the use of chemicals. It becomes a tool because it is supposed to enhance the human capability of surviving in a polluted world.

The scenario is about a polluted world where people need to wear protective equipment continuously. The rich people wear artificial skin suit while the poor people wear the DIY (Do It Yourself) equipment, made of living organisms stored in living organisms' banks. Before going out, it is necessary to measure pollution. They wear the organic head accessorize that indicates the level of pollutants through the change of colour, a helmet for data collection, and a protective mask. These artefacts purify the air too.

4. Discussion

The experimentations provided useful insights for the research, and we were able to find out whether the tools we selected for the design of near-future scenarios were purposeful or not in trigger critical thinking. We evaluated this through (1) observation of the performance of each activity through pictures and notes, (2) analysis of delivered scenarios, (3) questionnaire submitted to participants. We realized that the participants got very engaged in analysing the topic, negative behaviours, and the most plausible futures. (fig.5)

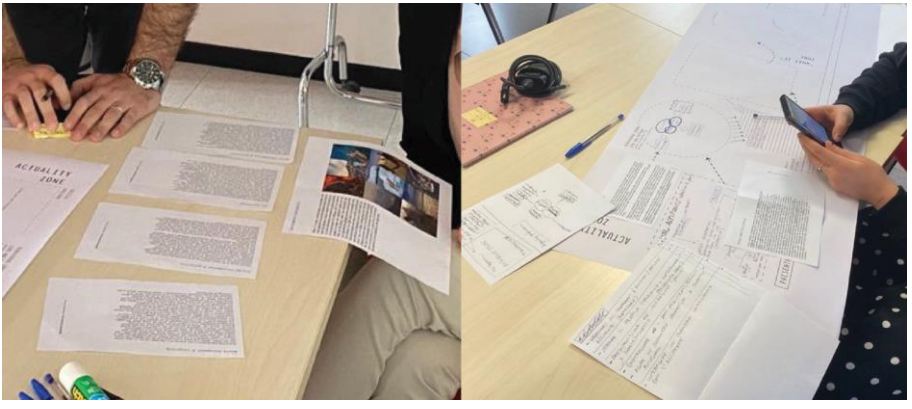

Figure 5. Participants involved in the first activity: Selection of the societal challenge topic.

From the results emerged, that all groups were capable to analyse critically different topics, and use independently the DwI tool. At this stage, they started already to think about the possible design solutions. In the afternoon the participants started to use the SCI-FI Tech inspiration cards and library. (Fig. 6)

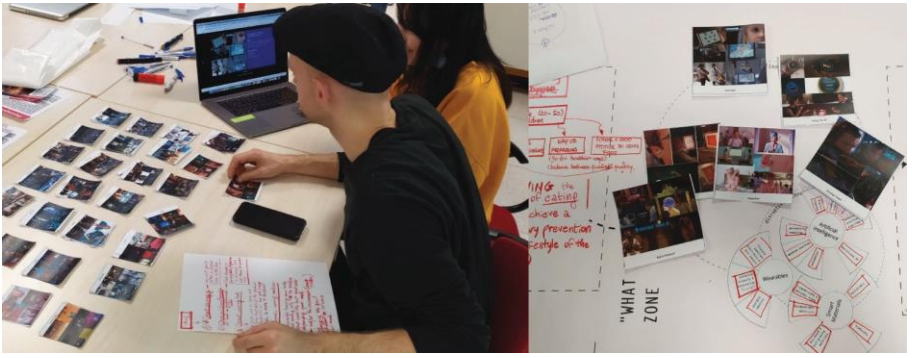

Figure 6. Participants using the SCI-FI cards and library and defining the technology from which to start the scenario.

While discussing proactively with the participants, we found that Group 1 and Group 2 approached insecurely to TICs, and they tended to select those films that they were familiar with, which prevented them from thinking critically on technologies. They also claimed a lack of time to explore more contents and go on-line for videos. While facing difficulties, Group 2 inverted the stages, by trying to define the technology for the scenario first, and then explore the SCI-FI, but they stated that this inversion made the process even more difficult.

About the scenario, we realized that participants produced very different scenarios, using mainly the text, while some of them used the sketches and user journey. (Fig.7)

Figure 7. Participants while producing the scenarios.

Group 1 introduces the near-future scenario as a world in which are established new laws regarding the use and management of data, but they do not consider behavioural aspects. They suggest a new interaction modality, still describing them poorly, and TICs did not help them much in envisioning the not-yet-existing technologies.

Group 2 focused on the performances of near-future products and technologies, but they lack an explanation of how human behaviour changes. They missed the detailed description of context and why the user should change his attitude toward the food in the near- future.

They make a wide selection of film inspirations, but it's difficult to identify what they inspired on.

The scenario of Group 3 was the one that moved more toward the near future compared to others and that succeed in creating the story through analysing the context and socio-political implications. Although they do not specify behavioural aspects in a sense how the technology supports the changes. Yet, they explain well the adaption of the human to new climatic conditions and development of new habits and behaviours. The solutions they propose are envisioning, and the inspiration taken from the films is evident.

The third method we used for evaluation is the questionnaire, based on open questions and the qualitative evaluation of the experience, transformed in qualitative data. The questionnaire was divided, into two main sections: (1) General information and (2) Activity. From the General information, we collected some data regarding the participants' previous experience with the topics and comprehension of the relation between the fields of Societal challenges, Design for behavioural change, and Design fiction. Less than half of the participants have already used the Design for behavioural change tools and strategies (Fig. 8).

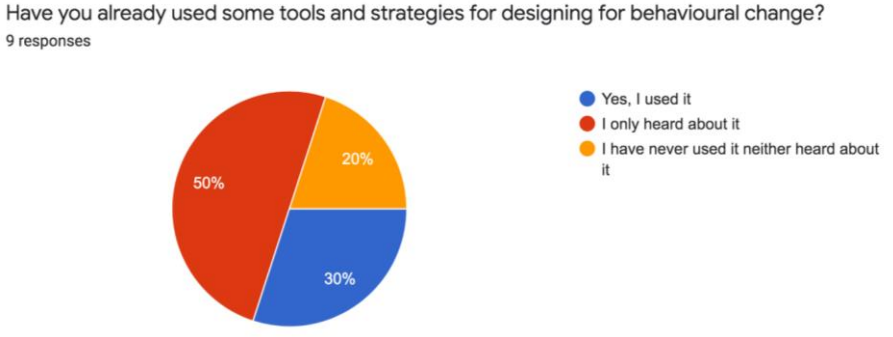

Figure 8: Chart showing the participants' familiarity with the Design for Behavioural Change field.

Additionally, we were interested in understanding whether the participants were able to understand the relationship between different topics tackled in this workshop, and the answer was generally positive, although some of the participants, suggested thinking about inverting some tools or introducing them in the beginning, such as TICs. (Fig. 9)

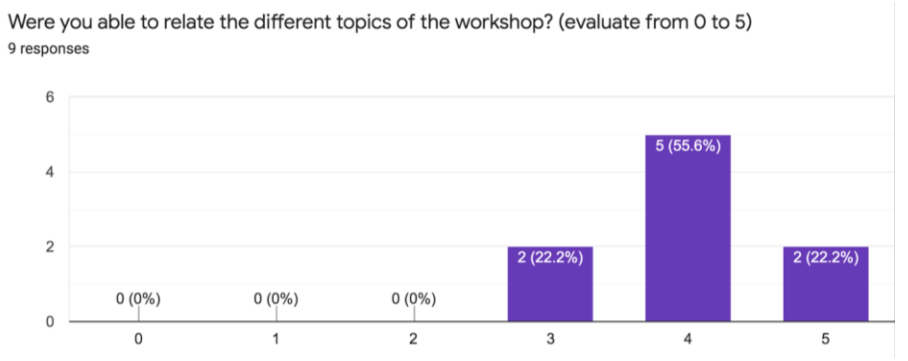

Figure 9: Chart showing the comprehension of the participants in finding the relationship between different topics of the workshop (SCs – DfBC-Technologies).

The participants believe that the near-future scenarios may help in designing critically, although they experienced some difficulties while dealing with it. Participants stated that the use of DwI helped in triggering critical thinking for behavioural aspects. While for disruptive technologies, the Tech library was evaluated as less triggering by the participants. The use of Societal challenges as a starting topic was not motivating enough for participants. Finally, emerged that in this experimentation, critical thinking was more triggered for behavioural issues than for disruptive technologies. (see Fig.10)

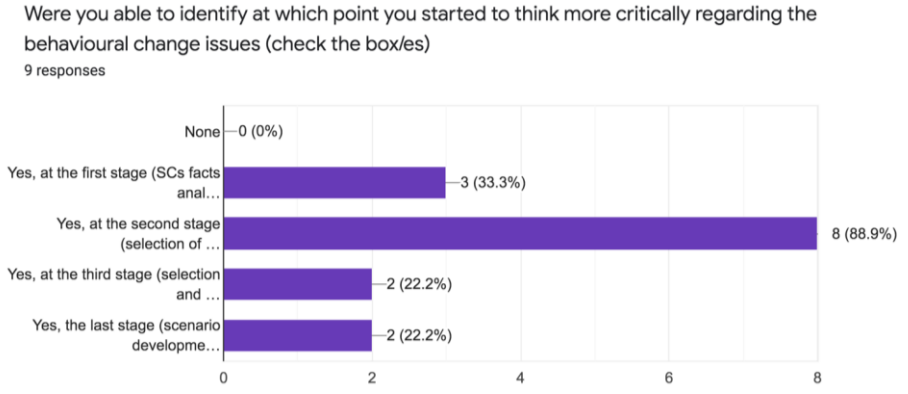

Figure 10: Chart showing how the participants evaluated the critical thinking in relation to the stages of the workshop.

5. Further development

This experimentation helped us understand the effectiveness of selected tools in developing a near-future scenario. The DwI tool was well used and useful for the purpose. The same happens with the Functional Triad. TICs need refinement, such as a platform that enables participants to navigate easily through the tool by having a clearer image of the technologies in films and how these are related to the fictional context. We noticed that the current format was incomplete as representation and the relation to the societal and ethical dimension wasn't perceptible enough.

Additionally, we noticed that final scenarios neglected some aspects of behavioural change, and the description of not-yet-existing technologies and the world construction were a bit bland. The protocol based on the PPPP model at this stage of the research was useful to understand the strengths and weaknesses of relating different theories and tools, but it won't be purposeful to continue this doctoral research. Based on the results that emerged from experimentation, we will set the new protocol. The new protocol will aim at relating the proposed theories and tools in a better way by expanding the social, ethical, and behavioural dimensions and build stronger relationships between these elements and the design of technological artefacts. The protocol with TICs will be subsequently applied and tested in two different institutions, one is the academic contest with design researchers, and another is the educational context with students, to tailor the approach for designing consciously technological artefacts able to tackle the behavioural change.

Does design thinking matter? Empirical study and survey on the effectiveness of design thinking

Hannah Park

School of Architecture and Design, University of Kansas, USA

Abstract | While design thinking has been broadly integrated into design education, it can also be deployed in any discipline's curriculum. However, without measurable validation, it is challenging to advocate the effectiveness of design thinking. This article introduces experimentation in design thinking to a group of Journalism and Mass Communication major students as a case study to examine the impact of design thinking on non-design major students' empathy and creativity development skills. In fall 2018, the student group participated in a design thinking workshop. Through the workshop, the participants' competencies in empathy, storytelling, attention to detail, and personal approach to the users, significantly improved: 53.41% on average. A significant difference also emerged in the type of emphasis on the participants' concepts. Compared to the concepts from the pre-workshop assignment (53%), the concepts from the post-workshop assignment emphasized how people's everyday life would change more than the functionality of the product (93%).

KEYWORDS | EFFECTIVENESS OF DESIGN THINKING, DESIGN THINKING FOR NON-DESIGNER, MEASURABLE VALIDATION OF DESIGN THINKING, EMPATHY MAP, DAILY JOURNEY MAP

1. Introduction

Design thinking is a people-oriented problem-solving method that prioritizes one's empathy building process for users and creativity. Ever since IDEO brought design thinking to the mainstream design industry in the early 1990s, it has been a popular problem-solving method in contemporary design pedagogy. (Decker, 2019) While the method has been broadly integrated into design education, it also has significant possibilities to be deployed in any discipline's curriculum. However, the effectiveness of the design thinking methodology for students is still questionable. Despite the amount of literature in design thinking, it is challenging to find any research in the evidence-based validation of design thinking. Furthermore, it is also ambiguous how design thinking is beneficial for a certain type of learning factor(s). In this article, storytelling refers to the ability to embellish narratives in order to communicate the core message more effectively. (Decker, 2019)

Without evidence-based and measurable validation, it is challenging to advocate the effectiveness of design thinking. This article aims to broaden the educational application of design thinking to the non-design field by introducing experimentation with design thinking on a group of non-design major students. In the Fall 2018 semester, fifteen senior journalism and mass Communication major students participated in a design thinking workshop in their message development class. The workshop included two exercises: empathy map and daily journey map. The effectiveness of the workshop for those students was measured in two ways: a comparison study of pre- and post-workshop assignments and a post-workshop survey. In this article, this experimentation is adapted as a case study to examine the impact of design thinking on non-design major students' empathy and creativity development skills.

2. Background

2.1 Empathy and Creativity in Journalism and Mass Communication

Among the many advantages of design thinking, empathy and creativity represent some of the most well-known learning components of design thinking. In this article, empathy refers to the ability to understand and feel from the users' point of view. (Empathy, n.d.) This has been a critical element for designers in search of pursuing the human-centered approach. According to Tim Brown, the chair of IDEO, "Empathy is at the heart of design. Without the understanding of what others see, feel, and experience, design is a pointless task" (Brown, 2020).

Empathy has also been a crucial element for non-design fields, such as journalism and mass communication. Empathy is one of the core skills in journalism, as it enables journalists to understand people's biases and also drives meaningful storytelling (Smith-Rodden, 2019). For reporters, empathy factors into the interviewing process as it fosters mutual trust and negates stereotypes (John, 2019). In her book, Pursuing an Ethic of Empathy in Journalism,

Janet Blank-Libra also states that the "core principles of empathy are directly relevant to journalism, particularly to the reporter who uses a narrative approach to storytelling" (Blank-Libra, 2016).

Empathy in design thinking enriches one's creativity (Carlozzi, Bull, Eells, & Hurlburt, 1995) as it facilitates "a mindset of curiosity and a posture of discovery when faced with adversity" (Perry, 2017). In this article, creativity refers to a structured and systemic problem-solving ability with unique ideas (Fyffe & Lee, 2016). Creativity has been not only a core competency in the design field, but also in the non-traditional creative fields. Journalism and mass communication education emphasizes creativity (Buckingham, 2013) as creativity fosters entrepreneurial journalists (Hunter & Nell, 2011) and media entrepreneurship (Ferrier, 2013).

Research confirms that creativity should be a critical component of journalism education as journalists need to practice their creativity to discover "deep meaning rather than superficial actuality" when they witness events. (Liao, Chang, Liang & Liang, 2016) For instance, in mass communication education, advertising major students benefit from creative excellence to develop better portfolios for their first jobs. (Windels & Stuhlfaut, 2017) This paper aims to evaluate how design thinking, a methodology that is known to enhance one's empathy and creativity, can also be used with non-design major students through the following experimentation.

2.1 Experimentation Background

In the Fall 2018 semester, fifteen senior journalism and mass communication major students participated in a design thinking workshop in their Message Development class at the University of Kansas. The students developed marketing strategies to promote a denture adhesive product, Poligrip. The workshop took place in the early phase of the project. The participating students had completed initial market research and defined targeted consumer demographics, yet they had not started developing marketing plan. The students had never been trained in the design thinking process. The workshop took approximately 40 minutes and consisted of two exercises: A. Empathy map and B. Daily journey map.

3. Methods

3.1 Experimentation method

The workshop started with an empathy map exercise. An empathy map is a type of character developing tool that allows one to synthesize one's observation on the users and draw unexpected insights. The design thinking workshop integrated a modified version of *Bootcamp Bootleg*, a working document published by the d.school, Stanford University

(Baggereor & Both, 2013). The students engaged in the exercise in groups that consisted of four or five students. The exercise took approximately 25 minutes.

1. Each student team received a large sheet of brown paper (approximately 4ft. in length and 3ft. in height) The Participants drew a circle in the middle of the paper.
2. Based on the user demographics which the participating students had defined prior to the workshop, each student team created a simple persona inside of the circle. The persona included a sketch of the user's figure as well as the user's name, age, occupation.
3. Each team created a four-quadrant layout around the persona. The four sections represented the following. Does: What would the profiled user do related to her/his denture? Says: What would the profiled user say related to her/his denture? Thinks: What would the profiled user think related to her/his denture? Feels: What would the profiled user feel related to her/his denture?
4. Each team wrote as many action items on Post-It notes as possible for all four sections.

Figure 1. Empathy map example

As soon as the participants completed the empathy map exercise, their next exercise included a daily journey map which allowed participants to map their targeted user's

everyday lifestyle as a narrative of daily activities. The participants visualized a timeline that depicted a typical day of their targeted user from the moment he/she wakes up to the moment he/she goes to bed. This exercise is inspired and modified from the customer journey map. Often referred to as a user journey map or journey map, the customer journey map provides a visual depiction of the timeline of a user's interaction with the product in order to understand the relationship between the product and its users (Kaytes, n.d.) (Rosenbaum, Otelara & Ramírez, 2017). It is a widely used tool for understanding user experience. While the customer journey map entails the convergent variations of the timeline that focuses on the user's interactions on the particular product, the daily journey map for this workshop entails the divergent variations of the timeline that encompass all of the daily activities of a user.

The exercise intends to allow the participants to understand the users as people, not merely customers. By portraying the daily journey of the user and including daily activities that are not relevant to the product, the participant could also capture unexpected inspirations. The participants continued to work in groups which they formed during the previous exercise. Following are the steps of the exercise:

1. Each team received a large sheet of brown paper (approximately 4 ft. in length and 3 ft. in height). The Participants drew a circle in the middle of the paper.
2. Based on the persona that the team created during the empathy map exercise, the students mapped a morning-to-bedtime journey of the character. Students were encouraged to draw images where applicable. As an option, students could re-draw the simple persona inside of the circle with more details if needed.
3. The students moved the relevant Post-It notes from the empathy map to the appropriated locations in the journey narrative to reflect the correlation between the two exercises.

Figure 2. Daily journey map example

When the participants conversed with their team members during the exercise, they were required to embody a first-person perspective. For instance, instead of saying, “I think she wants to eat lunch,” they said, “I want to eat lunch,” as if they were the user.

3.1 Evaluation method

The process included two types of evaluations: A. Comparison assessment of pre- and post-workshop assignments, and B. Post-workshop survey.

A. Comparison of pre- and post-workshop assignments: Before the workshop started, the students were asked to write any marketing concept for the denture adhesive product that they could rapidly ideate in 5 minutes on a letter-size paper. After the workshop, the students were also required to repeat the same task with different concepts. The participants’ submissions from these assignments were evaluated based on the following four attributes: empathy, storytelling, attention to detail, and personal approach to the users.

a. On a scale of 1 (strongly disagree) to 5 (strongly agree), the participating students’ pre- and post-workshop assignments were evaluated based on the following criteria.

- C1. The concept shows an empathic attribute of the users.
- C2. The concept demonstrates a storytelling attribute.

- C3. The concept captures the details of the user experience.
- C4. The concept contains a personal approach to the audience.

b. The assignments were also evaluated on whether the concept is focused on the product (C5) or people (C6).

B. Post-workshop survey: After the workshop, the students participated in a survey reflecting their perceptions about the workshop and learning outcomes.

On a Likert scale from 1 (strongly disagree) to 5 (strongly agree), the first part of the survey asked how the workshop helped the participants' understanding on the users and concept development.

Following is a list of questions:

- Q1. The workshop motivated me to understand my users.
- Q2. The workshop helped me to build the goals of the concept.
- Q3. The workshop helped me to come up with strategies to attract my users.
- Q4. The workshop helped me to come up with different concepts/ideas than what I initially thought or planned.
- Q5. The workshop helped me to be more empathetic to my users.
- Q6. The workshop improved my brainstorming skills.

The second part of the survey consisted of three free-response questions that asked the participants to share the least and most valuable aspects of the workshop as well as suggestions for improvement.

Following is a list of the questions.

- Q7. What is the least valuable learning outcome about this workshop?
- Q8. What is the most valuable learning outcome about this workshop?
- Q9. How would you improve this workshop?

4. Results

4.1 Comparison assessment of pre- and post-workshop assignments

Table 1 indicates the results of the evaluation method A-a from the pre-workshop assignment.

Table 1. Results of the evaluation method A-a: Pre-workshop assignment.

P12	4	1	1	4		•
P13	4	5	4	4		•
P14	did not participate.					
P15	3	2	3	4		•
Total	43	35	38	41	1	13
Average score (excluding P14)	3.071429	2.5	2.714286	2.928571	Percentage: 7%	Percentage: 93%

Table 3 addresses the improvement of the criteria since the workshop.

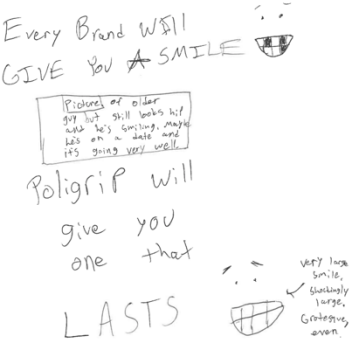

Table 3. Comparison of the evaluation method A-a results between pre and post workshop assignment.

	Pre-workshop assignment average score	Post-workshop assignment average score	Impact of the workshop

C1	2.1333	3.0714	Improved by 43.97%
C2	1.6	2.5	Improved by 56.25%
C3	1.7333	2.7143	Improved by 56.59%
C4	1.8667	2.9286	Improved by 56.89%

Compared with the pre-workshop assignment outcomes, the outcomes from the post-workshop assignment demonstrate a dramatic improvement in all of the four criteria: empathy, storytelling, details of user experience, and personal approach. For instance, Table 4 is one of the outcomes from the pre- and post-workshop assignment.

Table 4. Example of the pre- and post- workshop assignment outcomes

	Pre-workshop assignment (A)	Post-workshop assignment (B)
Scanned image of a handwritten/ drawn answer		
Typed answer from the scanned image	Flexodent still puts zinc into several of its products (An image of sad face) #1 worst company!	Every brand will give you a smile (An image of smiling face with decayed or missing teeth) Picture of older guy but he still looks hip and he's smiling. Maybe he's on a date and it's going very well. Poligrip will give you one that lasts (An image of smiling face with healthy teeth) Very large smile, shockingly large. Grotesque even.

*Competitor's product name

Compared to the pre-workshop assignment, Pre, the answer from the post-workshop assignment, Post, in Table 4 is more elaborated and descriptive. The answer from the Pre empathizes the negative aspect of the competitor's products that have zinc as one of the ingredients. The Post embellishes the message with a specific user scenario and implies how the product can assist the user's everyday life. The Post demonstrates much stronger empathic and storytelling attributes, details of the user experience, and personal approach to the audience. Furthermore, while the Pre focuses on the product, the Post focuses on the user.

4.2 Post-workshop survey

Table 5 shows the results of post-workshop survey from Q1 to Q6.

Table 5. Post-workshop survey results from Q1 to Q6

	Q1	Q2	Q3*	Q4	Q5	Q6
Average Score	4.0769	4.0769	3.4167	4.3077	4.3077	4.3077

*One participant did not participate in this survey.

The average score for all the questions was 4.0823 (4:agree); thus, the participants agreed that the workshop helped them to understand their users, build goals of the concepts, ideate strategies to attract their users, ideate different concepts/ideas than what they initially thought, be more empathic to their users, and improved their brainstorming skills. The survey results suggest that the workshop was most helpful for ideation, empathy, and brainstorming, while it was least helpful for coming up with strategies to attract users. The Q1, Q3, and Q5 are relevant to the empathy competency, while Q2, Q4, and Q6 are relevant to the creativity competency. The survey also revealed that the workshop was slightly more effective for creativity (average score: 3.9338) than empathy (average score: 4.2308).

The feedback from participants – the answers from Q7, Q8, and Q9 – on the design thinking workshop was positive as the participants recognized the benefits of the workshop. The participants defined embodying themselves in the user's shoes and impromptu brainstorming as the most valuable learning outcomes that they gained from the workshop. They also suggested having more time to complete exercises, more classroom space for the teams, and more examples of the exercises.

4.3 Observation

Besides the formal evaluation, there were other noticeable differences in the following area from the comparison studies of pre- and post-workshop assignments. The concept statements from the pre-workshop assignments showed more ambiguous and high-

sounding terms such as “Joy” and ‘Beautiful,” while the ones from the post-workshop assignments reflected more engagement with the daily life of the users.

After the first exercise, the empathy map, the students referred to the user in their persona as “he” or “she,” which created a distance between them and the user. After the workshop, students expressed enthusiasm for having more confidence to ideate more user-centered marketing concepts.

5. Conclusion

Through the design thinking workshop, the participants’ competencies in empathy, storytelling, attention to detail, and personal approach to the users, significantly improved: 53.41% on average. A significant difference also emerged in the type of emphasis on the participants’ concepts. Compared to the concepts from the pre-workshop assignment (53%), the concepts from the post-workshop assignment emphasized how people’s everyday life would change much more than the functionality of the product (93%). The post-workshop survey results revealed that the workshop was most beneficial for the participants in generating various concepts, becoming more empathic, and improving brainstorming skills.

“Journalists tell stories based on facts, but stories cannot be told without imagination” (Liao, Chang, Liang & Liang, 2016). Empathy and creativity have become core competencies in non-traditional creative and artistic fields, such as journalism and mass communication. This article examines the effectiveness of the design thinking on non-design disciplines through experimentation using the design thinking method with a group of journalism and mass communication major students. The experimentation results indicate a significant possibility that design thinking can be integrated into non-design education. Specifically, the experimentation demonstrated how design thinking could cultivate a deeper understanding of the targeted users and enhance their creativity. By engaging with the design thinking exercises, the participants contextualized themselves as the users and captured the details of their users’ everyday lives. The details they recognized organically emerged as inspirations for potential creative and storytelling solutions.

Reflection on the experimentation directed the following additional studies. The experimentation can be assessed with a wide range of non-design disciplines to strengthen the argument of the effectiveness of design thinking. A long-term component of design thinking’s effectiveness can be measured and compared with its short-term effectiveness. The design thinking process consists of five vital phases: empathize, define, ideate, prototype, and test. This experimentation mainly focused on the ‘empathize’ aspect. Further testing that includes the other four phases can broaden the spectrum of the study.

Education formats to integrate Design with Humanities, Politics, Social Sciences & Education.

Anna Lottersberger[a]
[a]LAND education
a.lottersberger@landeducation.org

Abstract | The paper looks at future forms of university education in Italy, especially regarding traditional non-design disciplines, such as humanities, politics, social sciences and education, to explore how design can contribute and be enriched by the integration with them. Graduates from these areas of study are hardly satisfied with the professional skills acquired during their studies while employers complain about graduates' deficits in terms of soft-skills, which are conversely part of the design competency framework.
Hence, design can play a catalyst role in challenging these disciplines to close the skill gaps and to explore future scenarios.
The paper introduces a blueprint with four semester-long elective courses coupling students from design and the aforementioned disciplines. *Design Debates* combines design and philosophy, S*ensemaking* design and sociology, *EducationXEducation design and e*ducation. *Society Prototyping* design and political sciences.
These proposals are meant to invite universities and design institutions to imaginatively reconsider traditional curricula.

KEYWORDS | EDUCATION, SPECULATIVE DESIGN, HUMANITIES, SOCIAL SCIENCES, POLITICS

1. Introduction

The paper intends to look at future forms of university education and to explore how traditional disciplines such as humanities, politics, social sciences and education can be enriched by the integration with design in higher education in Italy. The objective is to discuss four innovative educational formats where students from these fields collaborate with design students.

The paper reviews the situation of higher education in Italy in terms of employment prospects and graduates satisfaction with a particular focus on adults with tertiary education in humanities, social sciences, education and design.

1.1 Higher Education in Italy

According to the latest OECD report (2019) on education in Italy, the employment rates in Italy - compared to the OECD average - are comparatively low while the rates of competences' mismatch are higher than on average among participating countries.

Tertiary educational attainment is increasing for younger generations, even though the share of tertiary-educated 25-34 year-olds is still relatively low at 28%.

Higher education is offered by three types of institutions in Italy: universities (including polytechnics), arts, music and design higher education institutions and higher technical education institutions.

In Italy, 88% of tertiary students are enrolled in public universities generally with open admissions. Only some tertiary programs have limits on the number of students, though this is not the case for humanities, social sciences and education.

The unemployment rates for adults with a tertiary qualification are relatively high. The rate for adults graduated in the fields of STEM (science, technology, engineering and mathematics) is close to the OECD average. Instead, the unemployment rate for adults with a tertiary education in arts, humanities and social sciences is relatively low at 23%. Nevertheless, these fields remain popular among younger generations as 31% of graduates are enrolled in arts, humanities and social sciences programs.

In Italy, adults with a tertiary qualification earn 39% more than those with a secondary education, which is a low value compared to the OECD average.

At the same time, Italy has one of the highest rates of NEET (neither employed nor in education or training) among OECD countries. 23% of tertiary-educated 25-29 year-olds are NEET compared to the OECD average of 11%.

Lower earnings and limited employment prospects are critical factors that hinder equal access to tertiary education and social mobility in Italy.

1.2 Graduates Satisfaction

According to the latest survey of the University graduates' employment conditions in Italy (Almalaurea, 2019), a large share of Bachelor's degree graduates from humanities and social sciences are hardly satisfied with the effectiveness of their degree in terms of employments prospects and adequacy of the competences acquired during their studies.

81% of the graduates with a Bachelors' degree in Philosophy state that the on-the-job use of competences developed during their degree is limited to nil. The share is 85% for graduates in Political Sciences and Sociology, 45% for graduates in Education and Design.

75% of graduates in Philosophy are minimally satisfied to totally dissatisfied with the professional skills acquired during their studies, compared to 74% of graduates in Political sciences and Sociology, 42% in Education and 45% in Design.

42% of graduates in Philosophy state that their degree was neither required nor useful to perform their current job, compared to 34 of graduates in Political Sciences, 37 of graduates in Sociology, 10% of graduates in Education and 22% of graduates in Design.

1.3 Skill gap analysis

The latest QS global Employers report (2019) shows that, beyond field-specific knowledge, there are deficits in fresh graduates' training in terms of workforce readiness. The most desirable soft skills are: critical thinking, complex problem solving, written and oral communication and teamwork.

In Italy, more specifically, employers state that there is a major disconnection between the education system and the labour market (OECD, 2017). The separation between education providers and organizations is rooted in the principle that schools and universities should be independent from the industry, even if there is an increasing attention towards the so-called "Third Mission" of university, which is described as the "propensity of structures to open up to the socio-economic context" and is one the quality evaluation criteria of the Italian National Agency for the Evaluation of University and Research Institutes.

Traditional educators generally stand for theoretical teaching over competence development, despite a general agreement on the importance of transferable skills, which are indeed strongly demanded by the employers, who report the graduates' deficits in terms of team-work, flexibility and organization skills.

Beside this, many fresh graduates enter the labour market without any previous work experience, which, on the contrary, is highly valued by employers' hiring managers.

2. Design education competency framework

Contemporary organizations are facing ever-changing and complex challenges that require a broader range of competencies. Hierarchical and silo structures, which were perfect to address complicated problems, have been overtaken by horizontal and matrix structures, where teams are increasingly multidisciplinary as multiple expertise, skills and perspectives are required to allow the organization to tackle complex problems and strive. The prevalence of this not-so-emerging work approach requires some particular soft skills: critical thinking, complex problem setting and solving, and effective verbal, visual and oral communication (Reuveni & Vashdi, 2015).

In Italy, where soft skills are hardly nurtured in traditional university pathways, employers would still expect to find certain ones (problem solving, communication, organizational and management skills) as part of the graduates' background, while the organization still holds the responsibility to transmit its value system (Mangano, 2017).

Hence, the lack of professional competences and soft skills is a crucial challenge, especially for students enrolled in humanities, political sciences and sociology programs, as it is apparent from the graduates' employment rates, conditions and salaries.

On the other side, the competences highlighted above are considered the key elements of the design attitude (Boland & Collopy, 2004), and the pillars of the holistic framework of design competence. (Gribbin et al., 2016).

Furthermore, another approach can be favored to leverage the theoretical knowledge of humanities and social sciences curriculum and the methods and competences of design education: speculative and critical design (Dunne & Raby, 2013). This approach entails envisioning tactics to explore possible and preferable futures through scenarios and physical prototypes.

2.1 Design attitude and competency framework

When Boland and Collopy (2004) describe the approach of 'Managing as Designing', in terms of Design Thinking, they recommend managers the adoption of the so-called design attitude, which refers to a particular mindset and approach to problem solving that designers develop to create meaningful designs for products, services and processes. The assumption is that designers are meant to face problematic situations as opportunities, starting from a proper investigation, questioning the conventional options, and inventing also higher-risk alternatives, whether they are recognized as the most appropriate ones and they can be exploited thanks to the team capabilities (Dunne & Martin, 2006).

Gribbin and others (2016) focus on specific competences to define a holistic approach to design competency, reinforcing the definition of design attitude thanks to the integration of cognitive competences, meta-competences, functional competences and social competences. Again, teamwork, context assessment, problem setting and solving,

visualization, communication and presentation are some of the skills inscribed in this framework (Hummels & Vinke, 2009). Hence, the design attitude is a feature that can differentiate design from other disciplines, even if it can be a valid element in any competency framework.

Design scholars are increasingly critical towards Design Thinking, despite the wide diffusion of it among non-designers, as it suggests a distinction between thinking, on one side, and action on the other one (Kimbell, 2011). Kimbell, in particular, use practice theories to analyze design activity and designers' expertise, proposing a pair of concepts, design-as-practice and designs-in-practice, to acknowledge the impact of the context, stakeholders and end-users. This approach surely questions the central role of designers and the opportunity to identify specific designers' cognitive styles, yet it recognizes that design practices tend to be rule-based, routinized and embodied, which can lead to tentative generalizations.

The idea of expanding the domain of designing to non-professional designers is also at the core of Design for Social Innovation, as described by Manzini (2015). He distinguishes between two different meanings of design: 'diffuse design' and 'expert design'. The first refers to the design that can be performed by everybody and the latter stands for the design performed by those who have been trained as designers. While it is assumed that the design attitude and specific competences can be cultivated outside the domain of design learning, it is crucial to recognize that design experts can trigger and support impactful social projects by actively interacting with experts from the fields of humanities, social sciences and education.

Along with these perspectives, Relational Design puts the focus of design practices on the occurrence of human and non-human inter-action and intra-action within situated social contexts. This approach calls for a mutual and respectful 'relationality' among all actors, blurring the boundaries between professional designers and so-called 'complementary relational designers', and stresses the value of a socialization of designing. This angle also implies the analysis of four relationalities, listed as philosophy, 'diverse capitals', alternative economies and poly-disciplinarity (Fuad-Luke, 2014).

Within this social turn we see a shared discourse about the necessity for the design practice to create a social economy for the public good, with a central involvement of non-design professionals and citizens, whether this is driven by government and service providers or grass-root innovators, which require an effective development of trans-disciplinary knowledge and capabilities.

2.2 Speculative and Critical Design

While Design Thinking has been crucial to expand the adoption of a design attitude to other domains, and Social Design and Relational Design have adopted a more open and inclusive approach about design practice to seek ecological, social and economic alternatives to

respond to communal contingent situations, they still operate within the boundaries of reality as it is, usually dealing with specific market or situated community issues.

The potential use of the 'vocabulary of design' can be further explored to break the limitations given by reality, and pose provocative questions to inspire new possibilities altogether. This parallel design channel can take specific forms of speculative and critical design (Dunne & Raby, 2013). This approach celebrates the realm of possible, plausible and preferable futures. It provides a space to speculate and experiment with 'what if' scenarios and how things could be. They deal with the exploration of ideals, ideas and fictional objects to create visible projections of the future.

Speculative and critical design practices offer a space to imagine and discuss alternative possibilities, and help redefine the relation to reality itself. Design is the medium, through its imagination and critical approach, to trigger future thinking, grow socio-cultural awareness, raise questions, move to action, and to explore alternatives that challenge today's world (Auger, 2013).

Speculative design in its various forms, namely Conceptual Design, Design Fiction, Design Futures, Adversarial Design, Critical Practices and Near Future Design, is adopted as a pedagogic practice in design education (as currently surveyed by SpeculativeEdu, the education project funded by ERASMUS+), to help students develop a set of skills and behaviors (narrative construction, user interactions, implication assessment, communication and contextualization), by reflecting on the dynamics of today's world and equipping them with an open mind-set to manage and reinvent their role in a complex, fast-changing world (Ward, 2013).

In the last ten years, several higher education institutions that have explicitly introduced speculative design courses in their curriculum. Among them, there are: Parson's The New School (USA), UC San Diego (USA), MIT (USA), Royal College of Art (UK), Goldsmith's University (UK), Edinburgh Napier University (UK), the University of Split (Croatia), the Institute for Transmedia Design (Slovenia), Madeira Interactive Technologies Institute (Portugal), Design School Kolding (Denmark), Australian National University (Australia).

3. Four hybrid education formats

Historically, Italian universities keep humanities, politics, social sciences and education separated from design, and higher education institutions dedicated to design don't offer humanities and social sciences 'degree programs. Hence, there is minimal interplay between students and faculty from philosophy, sociology, political sciences, education, and design.

It's important to highlight that most Bachelor and Master programs in design have already incorporated courses of anthropology, psychology and sociology in their curriculum to help students deepen their user research and analyze the social transformations at a global and local scale, and some of them even act as social innovation incubators, like the MA in 'Eco-

Social Design' at the Free University of Bozen-Bolzano and the MA in 'Advanced Design: Services' at Bologna University, just to name two programs currently offered in Italy. These programs officially welcome applicants from a wide range of fields, but they generally belong to the respective design departments only.

On the other hand, humanities, social sciences, political sciences and education very rarely offer any design learning experience.

What is proposed here is to encourage the interaction between students and scholars who are currently teaching and learning humanities and social sciences with those who are in the field of design. The assumption is that design and, in this case, a speculative and critical design approach might play a catalyst role in challenging the aforementioned disciplines, addressing the workforce needs, closing the skills gaps, while facilitating alternative visions of the future.

This paper represents an exercise in 'university making', by imagining four bi-disciplinary distinctive courses, to invite education leaders from the fields of humanities, social sciences, education, design - and not only - to reimagine the way the university works. These four courses are intended as feasible, practical ideas to perform speculative multi-disciplinary projects drawing knowledge and competences from the existing curriculum.

Universities must move quickly to abandon the antiquated system of discipline silos to one that connects all disciplines through faculty and students thanks to integrated classrooms (Park & Benson, 2013).

3.1 Design Debates

Design Debates combines the fields of design and philosophy. Students are taught to think in future scenarios, as plausible and preferable alternative ways of being. The course takes inspiration from the interaction between philosophy and architecture pursued by Jacques Derrida, Peter Eisenman and Bernard Tschumi in the 'Chora L Works' project (1982) to translate the principles of deconstructionism to architecture (Derrida & Eisenman, 1997). While their cooperation is considered troubled and the design has never been executed, it probably remains one of the most significant examples of the possible collaboration between the philosopher's reasoning and the designers' interpretations (Derrida & Hanel, 1990).

In the academic world, Carnegie Mellon University has been experimenting for ten years with BXA interdisciplinary programs. The Bachelor of Humanities and Arts degree, for example, allows students to combine their concentration in Design with a concentration in a discipline from the College of Humanities and Social Sciences, such as Philosophy. In this case, students have to take a minimum of nine courses in this field, thus interacting with Philosophy-major students. On top of this, in their 'Capstone Project', students have to demonstrate the extent of their interdisciplinary work also through experiments and team-work projects.

The course of Design Debates aims to explore new philosophical constructs to speculate about different distinctive social practices to explore scenarios through the design and prototyping of objects (Bleecker, 2009).

For the course of Design Debates students are asked to write philosophical theories in the form of manifestos and narratives, which are, at the same time, an outcome and a medium to speculate about the future. Students are also tasked to design fictional products to explore applications and implications of new philosophies and ideologies. These constructs can speculate about plausible, original situations that are represented by the fictional objects. Students are invited to raise questions about the socio-cultural, economic and ethical implications and effects of their ideologies.

The objects embody these speculative constructs and act as science-fiction props to provoke the critical thinking of the students, who play with probable benefits and pitfalls and engage in wider conversations about the society and their future.

3.2 Sensemaking

Sensemaking explores the collaboration between design and social sciences (Staley, 2019). Starting with readings from information design and visual sociology (Pauwels, 2000), the course entails the collection and analysis of complex data about the society to discern patterns and meanings, to develop sociological frameworks, and to create visual narratives to make them more understandable for policy makers.

This course learning is based on futuring techniques, such as cross-impact data analysis, Delphi forecasting techniques, expert interviews and focus groups, information design methods and tools. Students are taught to scan the environment (across the STEEP domains: Society and culture, Technology, Economy, Environment and geo-Politics) to acquire data, translate them in viable information, assess the potential implications, infer the possible ramifications of them on a broader social context, and eventually to use visual design tools and artifacts (conversation subjects, conversation prompts and experience enablers) to trigger and consolidate the outcomes (Manzini, 2015).

A meaningful example of such combination can be found in the Master in Urban Planning and Policy at Northeastern University (US), a program combining political sciences subjects with design and planning ones. In particular, 'Information Visualization Principles' and 'Practices and Information Design Critique Seminar' are two core modules for all tracks, including Urban Analytics, where the capstone project is in partnership with a local, state, or federal agency or nonprofit institution and the scope is to assess a local problem, visualize and present recommended solutions.

Going back to the Sensemaking course, the objective is to help students identify their own anti-thinking attributes, stereotypes, certainty bias and fears that might hinder their

information gathering. Students need to learn how to become deeply aware of the information filters, in terms of source of the information and in terms of content of the information they collect and use to analyze the context and make their recommendations to potential policy-makers.

3.3 Society Prototyping

Society Prototyping is an evolution of platforming and role-play practices (Staley, 2019; Duchatelet et al., 2019). Platforms, simulation gaming and other low-risk immersion experiences help individuals actively prepare for the future (Johansson, 2007). Building a platform belongs to the futuring techniques and offers a variation of the current economic and social activities, to change the organization culture and design more sustainable products and services (Fry, 2008).

Examples of social prototyping are widely present in design academia, for instance the 'Social Innovation Journey', an action format to engage communities developed by Polimi DESIS Lab at the Politecnico di Milano. According to the described practices, design students are meant to collaborate and design with citizens, experts and other stakeholders (Fassi et al., 2013). These participatory experiments are particularly meaningful because they have a direct and concrete impact on real situations, on the other side, for the same reason, they imply a serious commitment, risk assessments should be carefully carried out, and the design outcomes must be feasible.

The Society Prototyping course intends to work on a different level; it's a staged activity and it's enacted in the safe space of the classroom; design and political sciences students can dare to promote bolder rules and initiatives, as their choices don't have an impact on actual communities, except their own.

In this course, the students from these two fields collaborate to build small scale experiments or even full-scale pilot projects where they get a first-hand, tangible experience of what a scenario could be like - within the protected environment of the university - to incubate societies-in-miniature. Society prototypes begin as projections of the future. Students can prototype mini utopias or even dystopias. They can define the features and the rules of their own micro society as a living laboratory. The students enact their scenario and pretend to be resident of their imagined environment. For example, they can set a new tax, a privacy surveillance system, or abolish private means of transportation. Students interact with each other, design new products and services that allow the execution of the scenario, explore how the infrastructures and the manufacturing system might change, and investigate how socio-cultural dynamics might evolve.

The course learning is based on trend analysis, systems thinking, and scenario building. Students are invited to explore issues, such as ethics, sustainability and responsibilities of further development of the prototype. Students shape how they might want to live with

each other in future, practice public participation, policy making and democratic decision making.

3.4 EducationXEducation

EducationXEducation entails the development of pedagogies and pedagogical approaches to create new learning experiences. This course is not strictly related to graduates' dissatisfaction with their studies nor to the deficits identified by the employers. Nevertheless, due to the general considerations regarding youth employment and skill gaps, this course is proposed to address current technical needs, adaptive challenges and possible future scenarios for the labour market.

This course revolves around the principles of teaching as a science, and more specifically covering the practices of learning through inquiry, learning through discussion, learning through practice and learning through collaboration (Laurillard, 2012). It elaborates on the artistic pedagogical experiments by Bruno Munari and the structural ones by Enzo Mari (Branzi, 2015) to imagine alternative didactic formats. An example of this combination is represented by 'EDDES Educating Through/With Design', a research cluster created by the Faculty of Design and Art and the Faculty of Education of the Free University of Bozen-Bolzano, starting with the education-focused studio in Visual Communication (Camuffo & Dalla Mura, 2017), which has eventually originated the joint Academic Master program 'Design for Children' dedicated to both designers and educators to rethink the learning experience at different levels.

For the EducationXEducation course, the intention is to use future thinking and imagine possible teaching and learning scenarios. The course requires a methodical process which seeks long-term trends in the education and professional environments. These methods include the access to trend data, comparative analysis techniques and scenarios building exercises to enact the imagination (MacLean & Scott, 2011).

Education and design students collaborate to develop new pedagogies and education formats for any level of education, from kindergarten to tertiary education. Students can elaborate on new pedagogical approaches and are tasked to design both spatial environments and key tangible artifacts to make the learning experience complete and effective.

4. Conclusions

These proposed course descriptions can be read as four ideas to integrate humanities, political sciences, sociology, education and design in Italian universities, and break the traditional academic 'silo' system. The 'studio' can be adopted as a course environment populated not only by design students but also students from other other areas of study, thus nurturing their critical thinking, complex problem solving, written and oral

communication and teamwork skills, and anticipating what happens in professional environments.

In the introduction the problematic status of tertiary education in Italy is briefly discussed. Universities are often described as “ivory towers into smithereens”(Moscati et al., 2010), and there is a growing public view that questions the belief that everyone who is willing should pursue higher education and recommends that only disciplines that lead to employment should be promoted.

The paper, on the contrary, assumes the crucial role of traditional fields of study but invites academic leaders to reimagine the scope and the teaching methods that these disciplines can adopt to work on projects that go beyond commercial endeavors and contingent social issues, through trans-disciplinary team-work and alternative education formats.

In particular, the four courses proposed in this paper imply a bi-disciplinary approach, as a starting point that combines only one discipline from the humanities/social sciences array, with design, and specifically through a speculative and critical approach. It is understood that these proposals can be seen as fairly timid and limited. At the same time, as the examples suggest, its implementation is rather feasible and only two departments need to agree to overcome predictable academic obstacles (learning requirements, number of credits/hours, teaching setting, budget). Hence, it is meant as an initial blueprint, a marginal development of existing education practices, to influence further development and experimentation while contributing to a wider debate on the evolution of higher education and challenging universities and design institutions to reconsider their curriculum and their instructional design approach.

Speculative design scholars often cite this quote from ‘Dark Horizons’ by Tom Moylan (2003): “The transformative potential of Utopia depends on locating it in the future, on thinking through the process of transformation from the present, and identifying the potential agents of transformation”.

Education leaders are encouraged to speculate about the future of the society, imagine preferable scenarios and adopt a critical design approach to define the agents of transformation and implement these experiments where the same speculative design approach can be embedded into students learning experiences.

Abstract | Nowadays, information about almost every topic are connected, accessible and not only bounded into the academic, "disciplinary" field. The need of keeping trace of the collection and elaboration of those information has been manifested through the years by the development of a plethora of different tools, methods and strategies. The proposed RTD experiments have been built upon a common design tool (the mind/concept map), but with a different, lateral approach to the mapping activity itself. By mixing common design tools (maps) directly with "extraneous" platforms to the research practice (social networks), the authors propose an experimentation to keep the mapping activity an iterative, context-dependant and updated tool. Three different experimentations on mapping material related frameworks are presented and discussed, trying to identify a new disruptive approach where people can easily participate into the debate.

KEYWORDS | RTD EXPERIMENTS, GIGA-MAPPING TOOL, SOCIAL MEDIA, COMPLEX SYSTEMS, ITERATIVE MAPPING

1. Introduction

Nowadays, information about almost every topic are connected, accessible and not only bounded into the academic, "disciplinary" field (e.g. the incremental push from European commission in spreading the knowledge towards Open Innovation, Open Access and Open Science pillars[1]). In order to pursuit a *design task* [2] (of every nature: project, research, activity…), the need of keeping trace of the collection, elaboration and interpretation of those information has been manifested towards the development of a plethora of different heuristic and pragmatic tools, methods and strategies (Dorst, 2019). All of these tools are connected by the ultimate goal of bring some order into this complex environment from which design activity takes inspiration (Kolko, 2010), so that it will be easier to organize, manage and re-elaborate those collected information.

This need for information organization and management is directly conductible to a tradition of design reasoning that we can easily synthesize, at its first stage, with the activity of *framing the design task* itself. This framing activity usually considers all of the following criteria: the disordered nature of design problems (Rittel, 1988); their embeddedness in cultural and social processes (McDonnell, 2015); their dependence of contextual variables that are going to be important to frame the design task (or not) (Dorst, 2018).

Because the ultimate intent of the designers is to control the scope of what they have to deal with, the designer reasoning process of task framing cannot be made in one single step, but by its nature is forced into an *iterative*, *long* and *variable-dependent creative process* (Dorst, 2019; McDonnell, 2015).

So, framing a design task of each nature into a complex context is characterized by the ability of the practitioner in organizing, managing, elaborating a potentially huge amount of information into a context-dependent environment. And this is impossible to make in one shot, an iterative approach is compulsory.

Due to this context/time/social-dependency of design activity, the proposed work will focus on observing if it is possible to collect information for a design task framing by mixing academic and non-academic sources, in order to profit from a complex scenario instead of trying to make order in it, trying to update one of the existing tools.

[1]Further information on: https://ec.europa.eu/info/research-and-innovation/strategy/goals-research-and-innovation-policy_en

[2] We use the locution "design task" instead of design problem because of the co-evolution of problem and solution concepts in the design activity (Dorst, 2019; McDonnell, 2015)

2. Methodology

2.1 Research through design (RTD) approach

Research Through Design (RTD) approach, is based on the assumption that a typical design activity may play a significant role in generating knowledge (Stappers & Giaccardi, 2017).

It tries to employ methods and processes from design practice as a legitimate method of inquiry, presenting the intrinsic ability of converge different information together through a process of composition and integration (Zimmerman, Stolterman, & Forlizzi, 2010).

With this approach, 'doing design' is a part of 'doing research' because of the realization of prototypes (usually artifacts) that promote the birth of new interactions, engagements and interrelations that would be otherwise not easy to emerge.

Assuming that the prototype should not be necessarily a physical product, but more a source of data to be analyzed and observed (Savic, Selena Huang, 2014), the proposed experiments have been built upon a common design tool, born and developed with the role of enlightening new interactions and interconnections: the mind/concept map.

2.2 Mind and concept mapping as a design tool

Displaying complex information is an old practice that can be traced back to the '70s (I. Nassi, 1973) and '80s when flow charts and other visual models (Tufte, 1983) were developed.

Mapping, as a qualitative visualization tool (Eppler, 2006), has become a common practice in the design field. Mind maps, concept maps, (Eppler, 2006) (Davies, 2011) system maps and journey maps (ServiceDesignTools[3]) are just a few examples of types of node-links maps that could be applied in the design process.

According to Eppler's classification, the *mind map* is a radial diagram that represents semantic or other connections between portions of material, while the *concept map* is a diagram showing the *relationships between concepts*, including cross-connections among them.

If the mind map could be intended as a note-taking instrument, the function of concept map is to foster learning or knowledge sharing in a constructive and systematic manner.

However, in the field of service design, mind maps are used to support unconstrained thinking starting from a topic, idea or problem put at the centre of a blank surface.

2.3 GIGA-maps: an overview

While the aforementioned examples are characterised by clear and defined shapes and patterns, the structure of the GIGA-map is less rigid, tailored to each specific case.

To introduce the concept of GIGA-mapping, authors rely on the thinking of Sevaldson and his framework of systemic design (Sevaldson, 2018).

GIGA-mapping is one among the System Oriented Design (SOD) methodologies that have been developed in the Oslo School of Architecture and Design (AHO) since 2005. Such practices have been introduced in order to cope with the need of teaching design students how to investigate design problems in a systemic way.

Similar systemic methodologies are very useful in design practice, because they help in framing problems that are complex and context dependent. The same problems described in the introduction.

In fact, one of designers' main challenges of these times is certainly the fact that they have to learn how to leverage "causes and effects, trends and dynamics, requirements and parameters" (Sevaldson, 2018) that influence the design process. This is also due to the fact that resulting outcomes, namely products and services, become part of a globalized world where cultures and technologies are in rapid development.

In order for projects to be successful, a consistent inquiry needs to be conducted in collaboration with experts, users and stakeholders. GIGA-mapping emerges organically as a tool for carrying out this *systemic co-inquiry*.

Differently from other analytical tools with systemic purposes, like the ones developed and used in system engineering or in hard system models, GIGA-mapping draws from design and theory of constructivism (Hein, 1991).

In reaction to a specific problem, it doesn't simply help in understanding the world 'as it is'. Instead, GIGA-mapping is most profitable in pursuing *'what ought to be'* and in understanding which are those "courses of action aimed at changing existing situations into preferred ones" (Simon, 1969).

GIGA-maps need to be designed according to the specific situations; therefore, they can present custom and heterogeneous forms. Being visualizations, they usually exploit known models based on hierarchy, time, space/geography and intensity or concept maps, but then GIGA-maps reinterpret such base-layers, mixing them between each other's and providing, for instance, *blends between quantitative and qualitative information* (Sevaldson, 2011) - Figure 1.

Figure 1. Example of many different GIGA-maps available online. Each one presents a tailored form. Their purpose is process visualization, not visualization for communication.[4]

In fact:

> "the format of the GIGA-map, allowing and encouraging the mix of differing categories, graphic expressions, media, and mixed methods approach, results in a very resilient and adaptive mapping model because they are design constructs and not obliged to follow predefined rules" (Sevaldson, 2018).

It is important to emphasize that the produced visual artifact is just the tick of the iceberg. The most of the value of GIGA-mapping resides in its capability to assist the group of people involved into the mapping with the achievement of new composite understandings and perspectives.

They are result of negotiations and balancing among point of views belonging to people with different backgrounds. Empathy based on knowledge of other perspectives is the precondition for dialogue and the prevention of destructive conflicts. GIGA-mapping helps in building such requirement, by leveraging system thinking with intuitive and flexible visual tools.

[4] For high resolution images go to http://bit.ly/gallery-GIGA-maps or https://archive.is/MQASD.

While describing GIGA-maps, Sevaldson mainly refers to experts, users and stakeholders as the people who take part into the process. Epithets of those actors are already clues of the reasons behind their selection. However, the mapping could certainly benefit from the involvement of a critical mass of contributors that are not directly selected by the leaders of the inquiry and that can help in overcoming the saturation of topic that is naturally reached in later stages of the process.

Furthermore, it could be especially useful when dealing with design problems that tackle debated topics. In such cases, important insights derive not only from the understanding of the problem itself, but also from how the general public acknowledge and interact with it.

However, the involvement of such a large public requires explanation of the tasks and other work of communication design. Up to the moment of writing, GIGA-maps do not cope with any of those.

In fact, as described, GIGA-maps proved to be a successful practice, one that is capable of leveraging huge amounts of information. Yet, to accomplish such results, GIGA-maps "break the barriers of information quantity by separating the process tasks and the communication tasks" (Sevaldson, 2011). If the GIGA-map is meant to be understood by its creators only, how can any general public intervene on them?

The presented contribution wants to further explore on the practice of GIGA-mapping by considering it as a hybrid form of mind and concept map applied to the design practice and customized for a research-trough design experiment. In doing this, the authors tried to set up the conditions useful for extending the mapping also to a general public.

In the following experimentation, the GIGA-map, likewise a prototype, is then considered as the expedient also for overcoming natural limitations that concerns to a mapping activity and, more in general, to design task framing:

- Saturation of the contents due to the number of people dealing with the task framing
- Saturation of the contents due to time available for the framing activity
- Saturation of the physical space available to collect, manage and organize all the information necessary to define the frame.

Those limitations will be better presented in the following paragraphs, strictly related to the task framing activity towards the GIGA-map tool.

3. RTD EXPERIMENT ON GIGA-MAPPING

A general approach to the generation of GIGA-maps was introduced during a doctoral course on designing RTD Experiments. In this course, only the first activity was set: the choice of the ideal type on which to set the display. Afterwards independently, different groups of students approached the mapping activity.

In the specific case of the authors, the activities that have been carried out, the results and findings to which they have led will be described below. As previously mentioned, the group's approach to GIGA-mapping has to be considered as an RTD experiment. The main objective of the experimentation was not to provide a complete fulfillment of the concept framing itself, but mostly to explore how to overcome natural limitations of the GIGA-mapping activity.

3.1 RTD experiment activities

- Activity 1: Choosing the ideal type

The base-step to start mapping a concept or framing a task is, for sure, to define the starting point: the ideal type. The ideal type is defined as: “social constructs for empirical investigations” (Fox and Alldred 2017). It must be a single concept idea, without any positive or negative connotation from which expand the knowledge. So, in order to produce a nice amount of information and push the mapping activity to the limit, the authors choose a quite controversial design-themes: plastics, bioplastics and materials selection. In fact, to monitor the evolution of the map itself, the authors tried to choose an ideal type for the map that could be interpret on several, multiple layers and commonly easy to understand.

The following activities have been set up and defined by performing them during the very first experimentation upon the “plastic” ideal type and then they have been repeated for the subsequent two ideal types (bioplastics and material selection).

- Activity 2: Ideal Type Review

The mapping experiments are intended to monitor the gravitating concepts around three ideal types taken from the authors' research areas that can be easily identified as complex systems related to materials. In fact, the choice of the ideal types was made on research topics of which the authors were experts, to facilitate the research of initial information and data and to analyze with a critical lens the subsequent collected information. Then the literature, the state of the art of research and the market have been reviewed and grouped, ready to be disclosed. The activity was carried out until a feeling of saturation was reached.

- Activity 3: Map fulfillment

As the map started to be populated with several keywords, authors experienced the incoming of the first limitation of the mapping tool: the number of people involved in the

map fulfillment income into a 'content-saturation', where new keywords proposed were related to already written ones - Figure 2.

Figure 2. Image of the pilot mapping activity made by the authors on the "Plastic" ideal type.

To overcome this first limitation, authors choose to place the ideal type at the mercy of more people, trying to establish co-design and co-building activities.

Authors have not provided pre-knowledge or rules to the new participants to maintain no judgement approach. The activity was carried out within the authors' home university with the involvement of about 40 students of master course about material selection - Figure 3.

Figure 3. Ideal types at the mercy of the students.

- Activity 4: Clustering/Layering

A "critical" review of the information collected in Activity 3 was therefore made. Thanks to the knowledge base (Activity 2) and the map enlargement (Activity 3), authors were able to cluster, organize and manage the new information coming from the previous activities - Figure 4.

Figure 4. Clustering and layering activity by merging authors' previous knowledge of the themes and the new information acquired by the co-mapping activity.

Each information collected was therefore clustered in specific thematic areas and subsequently clustered, based on the perceived meaning of the expressed keyword (positive or negative) and the ability of that punctual information to generate debate.

- Activity 5: Design of digital contents

Once that the map reached a new level of "saturation", due to space and time available to fulfill the map, the enlargement of the map has been promoted by introducing the activity on non – academic social networks. Respecting the approach of mixing sources of information, as suggested by the GIGA-mapping approach, a digital content based on the revised map has been generated.

Social networks allow a diffusion and sharing of contents over space and time. In the academic field, are considered good tools for engaging with one's peers, enhancing awareness and developing professional connections (Kelly, 2018). In order to exploit those platforms to enrich the GIGA-map complexity and interconnection, authors started to design digital contents specifically for a non-academic social network, taking its formats and potential. In this way, three GIGA-maps profiles have been activated: Giga.Plastic (first), Giga.Bioplastic and Giga.MatSel (then) - Figure 5.

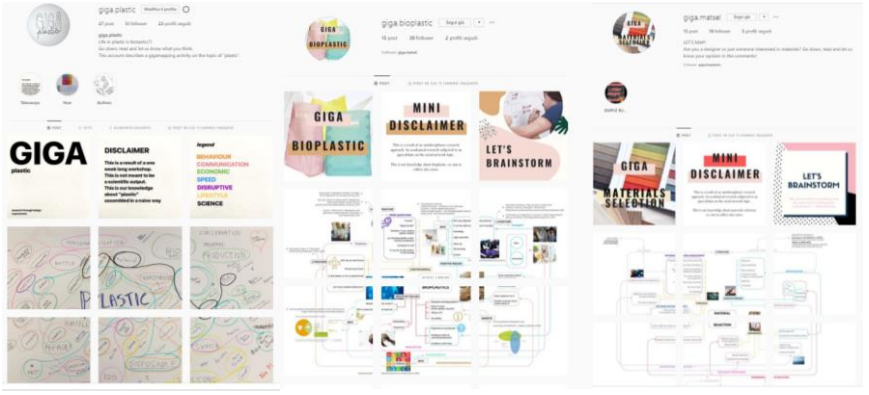

Figure 5. Overview of the GIGA-maps profiles.

- Activity 6: Call to social debate

Above all the contents, the main *triggering* keywords have been extrapolated to create debate and interest. Thanks to the enlightenment of the most suitable keywords that could provide a debate, audience has been called to comment with several unstructured stratagems (tagging profiles, sharing instantaneous contents and spreading profile contents). The social channels (one for each ideal type selected) periodically disseminated to different communities and checked to manage the debate.

- Activity 7: Update social debate

The profiles are still monitored and an update is planned in the following months to respond to the most active debate topics, so that the GIGA-map can grow exponentially.

In Figure 6 are portrayed the planning of the different actions, stakeholder involved in each, and a flow representing the amount of people called into action for each activity.

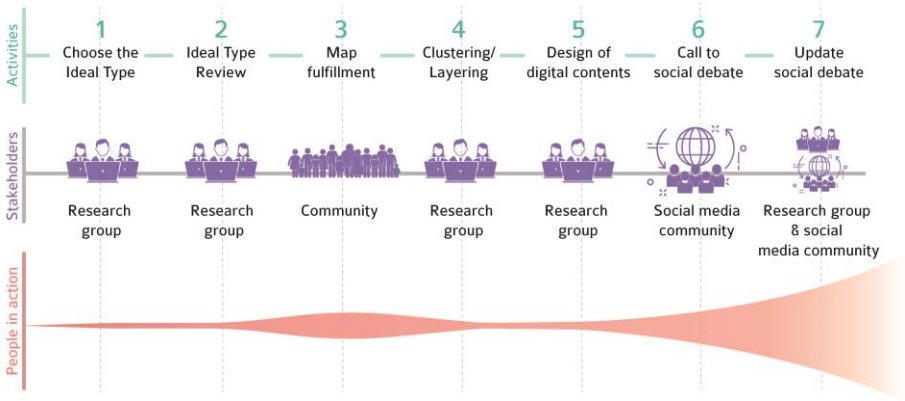

Figure 6. Schematisation of the performed activities, in correlation with the stakeholders and the people in action.

3.2 RTD experiment dimensions: overcoming the mapping limits

In Figure 7 it has been illustrated how passing through the different activities can help practitioners to overcome the limits of GIGA-mapping. The *first dimension* of GIGA-mapping is considered as the starting one, in which a certain individual or research group worked for the visualization of data in an established place and time frame.

Through the third activity proposed (increasing the number of people fulfilling the map) it was possible to overcome the limit of the people involved in the research by bringing the mapping activity to a social level. A *second dimension* can therefore be reached, it enriches the panorama of possible arguments and expands the mapping point of view.

In Activity 6 (call to social debate), in addition to the limit of people, further exceeded, it can be seen how the space variable can also be surpassed. In fact, there is no longer a defined and controlled space where the debate takes place, but it is a multimedial and potentially infinite space. In this way, the *third dimension* of mapping can be reached, which goes beyond the context-dependent limits (people and space available).

The *fourth dimension* can be reached by going beyond the time limit. With the last activity, the seventh, and therefore with an iterative updating of social debating/map-building, the fourth dimension of mapping can be reached. Thanks to this, the mapping can continue to evolve, and it is possible to create and share new contents, strictly dependent and updated to the tenor of the debate aroused or the new research carried out.

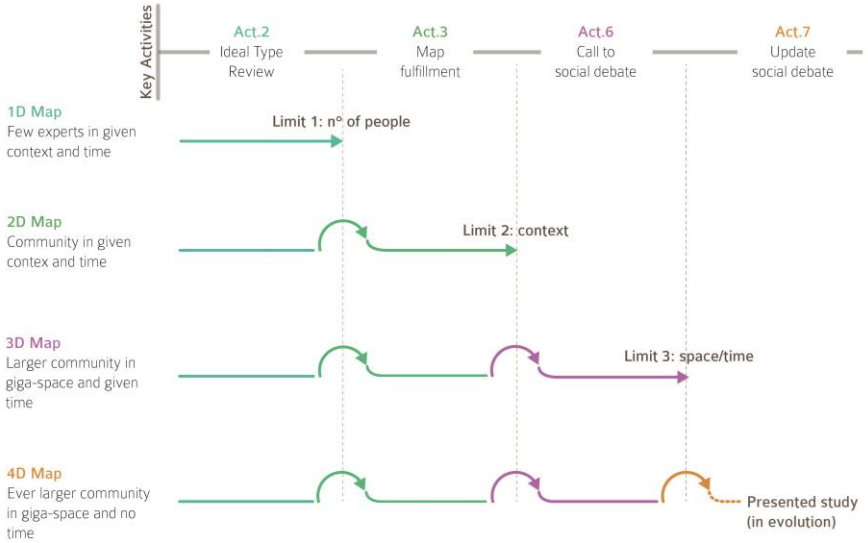

Figure 7. Schematic view of the limitation overcoming by dimensional evolution of the map.

3.3 RTD experiment reliability

Therefore, embracing the iterative nature of the design activity and overlapping this iteration with the dynamic environment of social networks, the authors' objective has been to provide a possible new hybrid scenario. This experimentation opens a view on how to create a dynamic design task framing, by mixing common design tools (maps) directly with "extraneous" platforms where people can easily participate into the debate (social networks). In fact, in potential, the "social-network GIGA-maps" can provide an evolving, context-dependant and updating mapping activity.

In order to maintain a certain rigour and to mediate all the possible information incoming in the social network environment, it is not possible to by-pass the intervention of competent people to have a certain level of contents reliability.

The Figure 6 also focuses on how authors developed the experimentation pinpointing precise moments of review and reflection upon the collected information. In Activity 1, 2, 4, 5 and 6, have been established moments of definition, clustering and mediation of the contents in order to avoid unstructured or too vague information and set the point only on usable concepts. By doing this, all the potential discouraging information can be easily managed by the competent-on-theme people (in this case authors) and the conversation can be carried out by maintaining a neutral view (as much as possible).

4. RESULTS

The presented work has been carried out, however in a limited time span, due to the commitments time span. Nevertheless, with the potentiality offered by platforms such as social networks, it can be easily carried on for a longer time.

So, starting from the main concepts expressed in the Introduction:

- design tasks usually drive practitioners towards a disordered environment and there is a need to put order in it by collecting and elaborating information;
- the embeddedness of design activity into social and cultural processes is something compulsory in the design activity;
- the interdependency between the design activity and its context naturally links to a time-space dependant dimension;

the authors found in the social networks platforms a fertile soil for reinforcing existing tools commonly used by designers to frame their tasks.

One of the most interesting findings of this activity has been to translate the perceivable frustration incoming from the early saturation of the task framing activity into a catchy and amusable one, by using platforms normally addressed to spare time purposes.

In order to maintain a certain rigour and to mediate all the possible information incoming in the social network environment, it is not possible to by-pass the intervention of competent people to have a certain level of contents reliability and some content reviewing and updating steps. So, the social GIGA-map is not an independent reality and must be curated.

The participation to the debate coming from people with unknown and different backgrounds permitted the arising of audience's doubts and concerns related to the topic. This is a very interesting point in order to familiarise and moderate the communication of design research activities, to promote an efficient divulgation that normally follows research advancements – Figure 8.

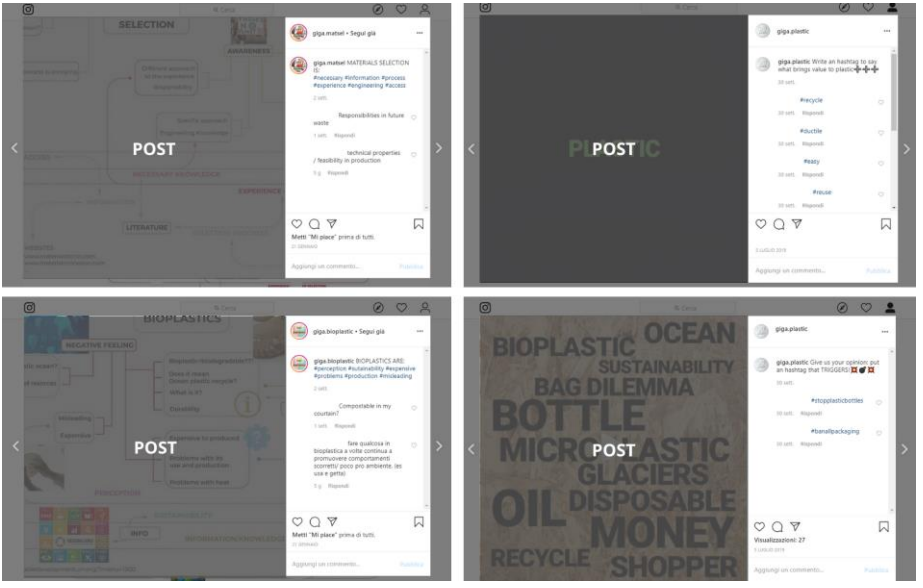

Figure 8. Examples of the audience interaction with the social GIGA-map.

The overall audience reached at the end of the expected time necessary to report the results of this experimentation into this context was of about 121 people and 38 new interactions have been registered to the three profiles.

The profiles will be monitored in the next months to understand also if a more-intense intervention about the social media contents could catch the audience attention and inspire a more intense debate on the defined topic.

5. DISCUSSION

In the presented work are still present some limitations and further adjustments are required.

- Some topics are more suitable than others

In example, the first main limitation may occur on the topic definition: in average, in the GIGA.plastic and GIGA.bioplastics profiles audience was more reactive and curious about the topic itself by suggesting new keywords but also expressing several doubts about it, probably because of the contemporary debate upon those topics also on other levels (newspapers, new government directives, etc.).

The audience stops to interact with the map when the topics are more related to a sectorial public (e.g. GIGA.matsel on material selection) and they limited themselves just to observe the phenomenon.

We can assume then that already engaging topics are more suitable for this kind of approach, because the chosen channel is addressed to an unknown public.

- Engaging a well-defined public should be done before spreading the social profile

All along the experimentation, authors found that to address the profile to a '*probably interested*' public could be more convenient in order to collect a good amount of information. Even if the main objective of this work was not directly linked with the complete framing of the research topics, authors should affirm that the potential of this new approach could be empowered by an accurate a-priori selection of the addressing public (e.g. interacting with already existing platforms that work on dissemination).

- It is necessary to update and constantly nurse the profile itself

It has been noticed during the experimentation that audience reaction was more evident in the immediately following of an updating activity. Exploiting the possibility offered by the social network to post some 24h-lasting contents, authors tried to catch the audience attention by renovating the call to action from time to time - Figure 9.

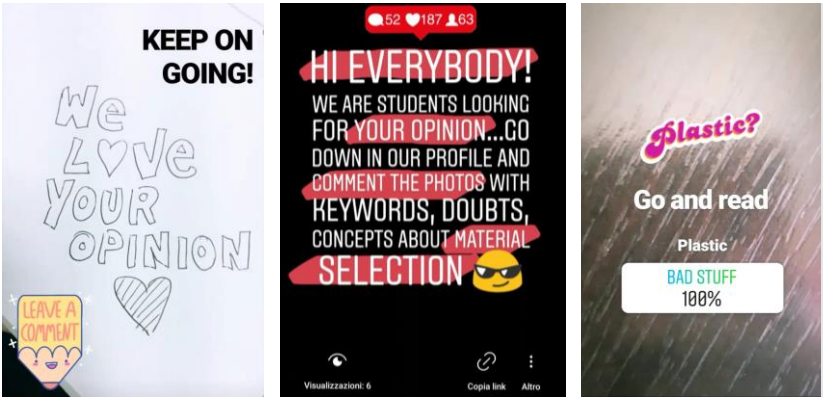

Figure 9. Examples of 24h-lasting contents to keep the audience focused on the topic

By doing this, it has been possible to enlighten an increasing activity of the audience in completing the map; so the suggestion is to structure the introduction of new contents also in terms of time, considering that the audience attention must be kept high on the debate constantly. Those are for sure only preliminary observations about the results, due to the acerbic state of the experimentation itself, being it a first attempt.

Further works and further experimentations are certainly needed in order to establish if the proposed work could set up the basis for a new methodological approach for exemplifying the design task framing activity, exploiting the mixture of several tools.

Exploring visualizations of design processes from a design activist perspective – a scoping study

Karina Goransson*, Anna-Sara Fagerholm,

Karina Goransson
Anna-Sara Fagerholm
*karina.goransson@miun.se

Abstract | The purpose is to investigate how design processes are visualized in research, with the overall aim to highlight dominant structures from a design activist perspective. The method used is a scoping review of literature and a visual content analysis. The results show that there is no established standard for visualizing design processes. The visualized models are often implicit, creating difficulties regarding the validity and effectiveness. The linear model is the norm when presenting design processes visually. The design requirement of attractiveness in the visualizations seem to be closely linked to the individual expression of the researcher. From a design activism perspective, there is a potential for disrupting existing power structures in design processes by questioning how they are visualized. There is a need for more sophisticated user-centered methodology in order to gain insights from the models presented.

KEYWORDS | DESIGN + PROCESS + METHODOLOGY + DESIGN ACTIVISM

1. Introduction

In this paper, we draw on the design activism perspective representing design's central role as raising awareness about values and beliefs (Markussen, 2013). Through this theoretical lens, we want to question how design processes are visualized in order to evaluate the effectiveness of the visualization of the research results and their comprehensiveness. In accordance with previous researchers, it is important that visualizations of design processes can be understood cognitively, otherwise it does not generate insights and knowledge of the recipient (Schreder, Windhager, Smuc and Mayr, 2016).

Recently, there has been a wide interest in design methodology and processes (Faiola, 2007; Hall, 2011; Walker, 2017). However, the development of methodology for design-oriented research has been rather limited (Verschuren and Hartog, 2005). Although, in 2010 scholars argued that the transfer from theory to designedly methods had not been fully realized yet (Bredies, Chow and Joost, 2010). Here, Morelli (2011), claims that methodological frameworks inherited from industrial production are adapted to new situations which generates rapidly changing methodological perspectives. In addition, Walker (2017) argues that the research field is well-established, but there remains potential for the development of methods and frameworks. Hence, additional studies in this field are needed (Koskinen et al, 2011). Also, techniques for evaluating the effectiveness of design methodology and visualizations could be improved to provide stronger evidence and validity for models used (Agrawala et. al., 2011). In accordance, scholars argue that design scientists must propose new methods and tools that guide and facilitate innovation processes (De Rouvray, Bassereau, Duchamp, Schneider & Charbonneau, 2008). Therefore, it is interesting to raise awareness from a design activist perspective.

In alliance with Escobar (2018), this papers view is that design affect people's way of being, knowing and doing. From an ontological perspective, design matters. How we design affects how we live our lives, consequently it is relevant to investigate how we design our design processes. By having a critical thinking view, this paper strives to raise awareness about values and beliefs on how we present knowledge, to contribute to a disruptive way of thinking regarding accessibility and meaning making.

Against this background, this paper investigates how design processes are visualized in research, with the overall aim to highlight dominant structures from a design activist perspective.

2. Theoretical background

Traditionally, design activism mainly originates within the design field where the solution is an artefact (Bichler and Beier, 2016). Today, contemporary design activism is part of a progress including social design, community design, participatory design and critical design (Julier, 2013). Design activism can be about disrupting existing power structures by

questioning the ways of being in the world (Markussen, 2013), and in some studies, design activism is referred as a design movement (Cetin, 2016; Clarke, 2013; Julier, 2013). According to Seliger (2014), the definition of design activism stands for responsible design. Design activism has been a topic of growing interest and research throughout the past decade (Aiello & Parry, 2019; Escobar, 2018; Markussen, 2013). For example, scholars suggest that design research needs a new framework based on the notion of design activism as a disruptive aesthetic practice (Markussen, 2013). In accordance, we argue that design activism should be seen as having an aesthetic dimension, along with its political dimension.

By designing meaning is created (Ehn, Nilsson & Topgaard, 2014; Escobar, 2018). In this sense, design is closely related to culture (Balsamo, 2011). When we design something, for example visualizing results and design processes, cultural meanings and perceptions is created. A decade ago, Fällman (2008) presented a model of classification of design research, arguing that methods and structure are the heart of the understanding and practice of design. This classification is related to Fraylings' (1993) three concepts: research *on* design, research *through* design and research *for* design as a way of understanding the field. In accordance, this paper contributes to research *on* design.

To give a brief overview on the topic, the first generation of design methods were based on systematic and rational 'scientific' methods and the second-generation methods moved towards recognition of appropriate solutions where designers were partners with the problem 'owners' (Cross, 2007). In the 1960s, the development of design methods borrowed approaches from engineering and during the 1980s, important sources of the social context of design were social science, cognitive science attend anthropology (Bayazıt, 2004). Also, the 1980s was the establishment of design as a coherent discipline of study in its own right with its own things to know and ways of knowing them (Cross, 2007).

Additionally, the purpose with design methods are to improve design performance, as a reminder including essential steps with the aim to help the designer to structure the thinking (Daalhuizen, 2014). Studies within this field often have the purpose to model the design process and/or to develop design methods (Tromp and Hekkert, 2016). Visualisation of design methodology is done through models used to clarify results, and thus can be seen as mediators of knowledge (Eppler and Aeschimann, 2009). Models visualizing the design process are usually essentially linear, reflecting goal-oriented problem solving (Ingram, Shove and Watson, 2007). Cross (2007) points out, that design research is struggling to move away from that linear design thinking. Although, it is the model of information transmission by Claude Elwood Shannon (1949), that has influenced design theory mostly, and criticisms of this model have also been developed to several models of design and human communication (Crilly, Good, Matravers and Clarkson, 2008). In 1949, this model was extended to include pictorial arts and more text (Shannon and Weaver, 1949).

Models, which are mental or physical structures, influence our thinking and acting, consciously and unconsciously and describe arrangements of components and their representation within larger systems (Davis, 2012). Furthermore, models are tools that allow us to

communicate abstract concepts and the actuality of using models shows our increased awareness of models' influence and how people make sense, they can also be a basis for what theories that are important for design as a discipline (Ibid). For example, design principles are essentially models predicting how different visual techniques affect cognition and perception (Agrawala, Li, and Berthouzoz, 2011). From a critical aspect, Agrawala et.al (2011) point out that models often are implicit, and it is not easy how to control validity and effectiveness.

In accordance, there are many fundamental design requirements involved in the visualization development of the design methodology to be presented. This paper draws on the theoretical contribution by Vande Moere and Purchase (2011) presenting The Vitruvius triangle including: *Utility* – described as functionality, usability and effectiveness, *Soundness* – concerning quality and reliability (for example the visualization technique of the three-map can be seen as robust as it has been widely used), and *Attractiveness* – which is about the aesthetic of the visualization or the appeal of a given solution. Furthermore, attractiveness is not just about the visual form, it can also apply to the methodology or structure of the solution itself (Fishwick, 2006). As in most design-related fields a balance between the aspects of utility, soundness and attractiveness is sought (Vande Moere and Purchase, 2011).

3. Method

This study draws upon a scoping review of literature and a visual content analysis resulting in a concept map using both quantitative and qualitative approaches (see Figure 1). A study of literature is conducted to identify knowledge gaps and thus motivate researchers to close these holes as well as to create an overview of previous research (Webster and Watson, 2002). According to Mays et al (2001) scoping studies are used to rapidly map key concepts with the aim to explore complex research areas, particularly areas that have not been properly reviewed before. Arksey and O'Malley, (2005) argue that the method is useful when mapping fields of study where it is difficult to visualise a range of material. In the search strategies, the keywords “design + methodology” were used to search and systematically cover the number of models used in the field of design. The initial systematic search strategy resulted in a large number of articles (see Table 3 in the section Results).

To investigate what design elements are used to communicate the design process visually, all articles found were examined in relation to inclusion and exclusion criteria. The inclusion criteria of this study are articles that have visualized the design process in a model. The criteria's for the articles reviewed; in this study the examined design methodology models are published in the sample of journals 1) titled as figure or model by the researcher; 2) presented anywhere in the published article 3) presented as a visualization of the design methodology or design method or design process. Exclusion criteria is articles that did not visualize the design methodology process in a model (see Table 1).

Table 1. Presentation of the scoping review of literature and sample layout.

Keywords	**Design + methodology**
Sample of Journals	Design and Culture Design Issues Design Studies The Design Journal Visual Communication Visual Communication Quarterly International Journal of Art and design Education
Period of review	2007–2017
Number of articles found by using key-words	173
Sample	70 articles visualizing the design process
Exclusion	103 articles *not* visualizing the design process

The study followed by a visual content analysis and a concept map in order to provide a detailed pattern and categorize the design models found in design research. Concept mapping demonstrates how relationships are visualized between different concepts (Lanzing, 1996). In this study we provide a free form concept mapping including overlapping circles and non-hierarchical connections to organize data and suggest relationships giving way to a more qualitative understanding (Wheeldon and Faubert, 2009).

The coding categories (see Table 2) are inspired by the model of design requirements in the Vitruvius triangle by Vande Moere and Purchase (2011), presented in the previous chapter. Although, we have reinterpreted this model and in the content analysis we have focused on the aspect of *Attractiveness* (the visual aesthetic aspects) in order to investigate how the design processes are visualized. In consequence, the two other aspects *Soundness* and *Utility* are excluded variables in the coding scheme as the former two often are included as evaluation criteria for scientific research (Vande Moere and Purchase, 2011).

Table 2. Box-model showing the coding categories in the content analysis.

Forms (the most prominent shape in the model)	Triangles, Squares, Circles, Other* (*Other: text, arrows, dotted lines or a mixture)
Process (how the process is visualized)	Flows, Linearity, 2 x 2 - matrix, Other* (*Other: a mixture)
Technique (handwritten or made by computer)	Sketch, Graphic, Other* (*Other: photography or a mixture of above techniques)

Thus, based on the discussion on the Attractiveness requirement by Vande Moere and Purchase (2011), the categories that underlie the visual content analysis are developed. In order to categorize the models found, we thereby focused the content analysis on the three categories of Attractiveness including: 1. forms (geometrical forms of triangles, squares or circles), 2. process (Flows, Linearity, 2 x 2-matrix) and 3. technique (sketch or graphic), see Figure 1 below.

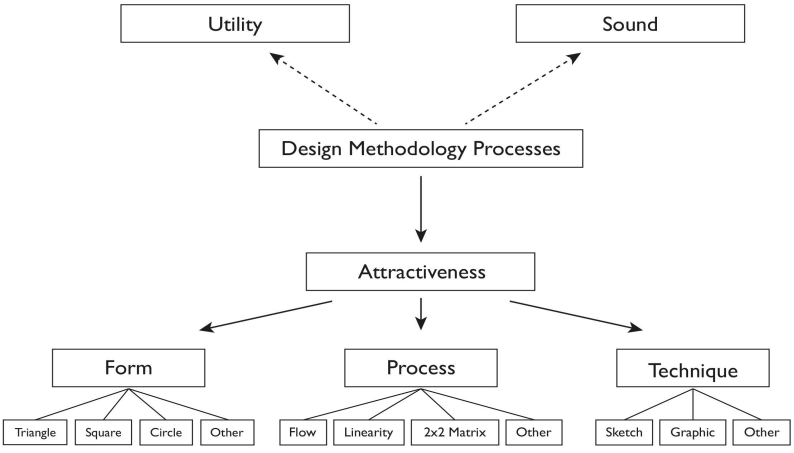

Figure 1. Tree-map showing inclusion criteria (boxes with arrows and lines) and exclusion criteria (boxes with dotted arrows).

In the first category, variables of triangles, squares, circles or other was included and the most prominent shape used to visualize the design methodology model was examined. In the second category, the content analysis focused on how the process itself was visualized as a flow or linear process or as a 2 x 2-matrix, even here the variable of other was included. The third category examined the technique used in the visualization of the design methodology model, and here the variables investigated whether it was a sketch or a graphic illustration, or other techniques used.

4. Results and Discussion of Results

Linked to design activism, the results indicate a need for more sophisticated evaluation methods when visualizing design processes, to ensure that the results are accessible and understandable. Models illustrating design processes are often implicit, which creates difficulties regarding the validity and effectiveness of the models. None of the examined

visualizations are similar. Hence, every researcher communicates their own model. The initial systematic search in scientific journals of design resulted in 173 articles (see Table 3 below). The analysis resulted in a concept map. Design processes are often visualized as linear processes with square shapes. Circles are common when illustrating design processes that are flowing. The results also show that there is no established standard for visualizing design processes.

Table 3. Articles published in journals of design research between 2007–2017. N-value: 173.

Sum	59	5	67	31	2	0	9	173

By doing a visual content analysis we found that 70 out of the total 173 articles have visualizations of design methodology processes. In comparison, 103 articles seemed to focus on design methodology since these articles matched the keywords, but they turned out not to have any visualization of the processes. By that means, these articles are excluded, and we

call these nonvocalized design methodology processes. One example of an excluded article is Dong and Vanns (2009), who presents the design methodology with an inclusive design and user-centered approach without visualizing the process. An example of an article that is visualizing the process and thereby is included in the result, is a study by Bredies, Chow and Joost (2010) where they present a design process model evolutionary phases mapped across design and use. The results indicate that a substantial body of work has grown around design methodology in design research during the last decade. For example, in 2017 there are 49 articles found compared to 2007 when it was 9 articles. This could be seen as a sign of an increased interest in design methodology and design thinking. Interesting though, is that there are no matches found by using the keywords "Design + methodology" in the Journal of Visual Communication Quarterly, and only two articles found in the journal of Visual Communication. This might be an expression of that design methodology is not commonly occurring in the field of visual communication, so far.

4.1 Visualised design elements

In the following section we discuss what design elements are used to visualize the design process by using a concept map. The results are categorized into three fields and the categories discussed are related to the code manual in the content analysis in order to map the attractiveness of the models found by their visual Form, the visualized structure of the Process and Technique used (see Table 4).

Table 4. The quantitative results from the content analysis. N-value: 110.

Forms	Triangles = 2 pieces Squares = 38 pieces Circles = 23 pieces Other = 47 pieces
Process	Flows = 32 pieces Linearity = 36 pieces 2 x 2 - matrix = 8 pieces Other = 34 pieces
Technique	Sketch = 15 pieces Graphic = 80 pieces Other = 15 pieces

Forms

The most prominent forms in the models are squares (38 models) and one example is Methodology for context-sensitive system design by mapping internal contexts into visualization mechanisms by Jung (2010) where the researcher visualizes roles of context in a time sequence. Also, circles are commonly used (23 models) and an example is Students' responses

to inclusive design by Herriott and Jensen (2013). The study visualizes design activities and finds patterns that are behind a process that is perceived chaotic. There are hardly no triangles in the visualized models (2 models). Triangle-based models are found in The Interaction Design Research Triangle of Design Practice, Design Studies, and Design Exploration by Fällman (2008) and A Design Approach by Artifacts and Projection presented by Chow and Jonas (2010). Also, the result show that there are many models consisting of a mixture of squares and/or circles, arrows and text boxes, these models are coded as Other. One example is in the study the roles that artefacts play: technical, social and aesthetic functions by Crilly (2010) where classifications of functions are defined in a table and then into a function matrix showing how different functions are combined. Another example is the study Cognitive Activity-based Design Methodology for Novice Visual Communication Designers by Kim and Lee (2016) where a model includes text blocks visualizing a linear and chronological process with the purpose to give help to more effective cognitive activities during the design process.

Process

In a study by Bousbaci (2008) there is an overview model on how the models have evolved over time from linear to circular and at last reflective. The results show that it is most common for the researcher to visualize the process as a line with a start and an end, either from left to right or top to bottom. This type of design methodology processes is categorized as *Linear*, and here the result shows that 36 models are visualized as a linear process. Here, we see a parallel to the statement by Crilly, Good, Matravers and Clarkson (2008), that design methodology is highly influenced by the linear model of Shannon and Weaver from 1949. One example is a model published in the study *Sketching sounds – Kinds of listening and their functions in designing* by Nykanen, Wingstedt, Sundhage and Mohlin (2015), where the results shows that sound design is a listening process and the authors argue that there is a need for new tools and methods when sketching sound. Another example is the study *Are Inclusive Designers Designing Inclusively? An Analysis of 66 Design Cases* by Herriott (2013), which compares an authoritative model with the aim to reach a special type of design goal with the practitioners working towards that goal.

Another common way of visualizing the design process, is through flows (32 models). One example is a model published in *What makes software design effective?* by Tang, Aleti, Burge and van Vliet, (2010) where the researchers have explored decision making in the design process and how designers can design more effectively. Another example is *The design of implicit interactions: making interactive systems less obnoxious* by Ju and Leifer (2008) where a model shows the structure of design problems through signs from different layers, not in a linear order. One last example of visualizing the process in a model with flow is *Designing for the unexpected: the role of creative group work for emerging interaction design paradigms* by Pirhonen and Murphy (2008) where the method draws on structural semiotics to emphasize the design when visualizing the design process.

Only eight models consist of 2 x 2-matrix, one example is a study by Pierre Johnson, Jen, Thorup and Brooks (2017,) where models are developed as dialogical tools in the shape of design discussion posters used when discussing design solutions in the design process. Also, the results show that there are many models that are difficult to interpret as there is no clear or explicit form or process, these models are coded as *Other*. One example is a model with five steps in the article *Assessing methods for effect-driven design: Evaluation of a social design method* by Tromp and Hekkert (2016) where the researchers study the effectiveness of the effect-driven design method Social Implication Design (SID) presenting improvements.

Technique

The results show that the technique used to make visualizations are mostly made by computer using a graphic technique (80 models). Here, a model by Vezzani and Gonzaga (2017) statutes as an example of this phenomena as they try to define an educational model for the good of society. Also, there are models based on sketches, and in these 15 models a hand-drawn technique is used. This is for example illustrated in a model in the shape of a 3D conceptual map by Bidault-Waddington (2017), including strategies toward urban development with the aim to notice design thinking and the role of critical designers in organizations. Another example is *Connecting Values: Teaching Sustainability to Communication Designers* by Benson and Napier (2015) where the researchers work with visualizing individual values and mapping the activities into the design process connecting to sustainable frameworks.

15 models are categorized as *Other* and these models contain either both graphic and sketching techniques or/and photographs. An example is a model using photographs and a 2 x 2 matrix deduced from the 4 Stagioni method in the study *Active, Local, Connected: Strategic and Methodological Insights in Three Cases* by Morelli (2011), arguing for a need for new methods related to sustainability. Another example is a model with six criteria containing both sketches and photographs used in a model in aesthetic design methodology (McCardle, Storer, Torrens, Whitehead, Mailley and Farrell, 2011).

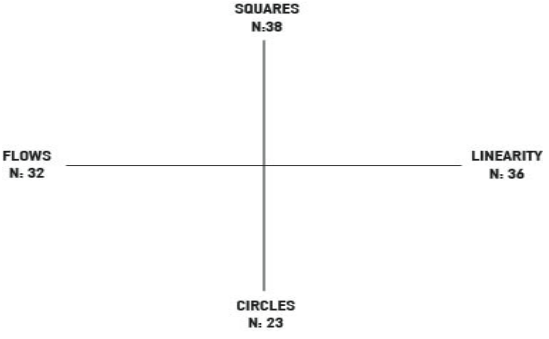

Figure 2. The picture above shows the results of the concept map.

4.2 Concept map

The results of the concept map include examples of models containing squares and circles visualizing the design process with flow and linearity, in nonhierarchical connections (Figure 2 above). This was further developed into a free-form concept map (see Figure 3 below).

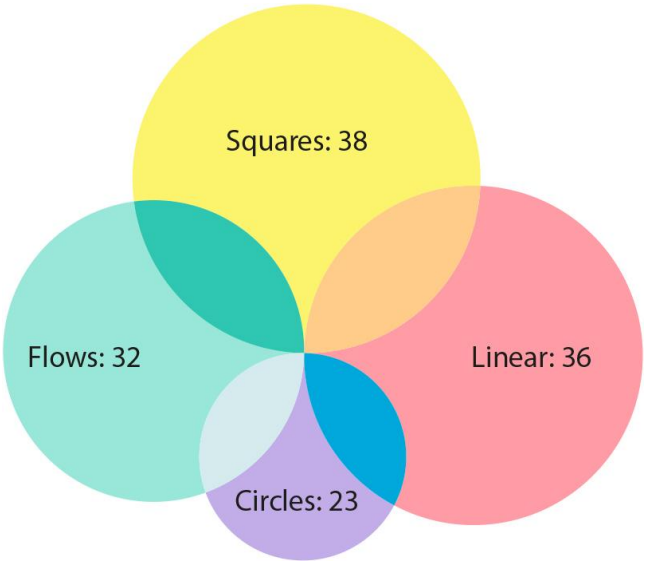

Figure 3. Free-form concept map with overlapping categories summarizing models containing circles and squares in flow and linearity, in nonhierarchical connections.

The free-form concept map shows that design processes often are visualized as linear with square shapes. Also, there is no standard model among the published models. This indicate that there are different views among researchers on how to visualize design methodology processes in a model. Notably, squares are a commonly used to visualize the design process linearly. At the same time, circles are a common when illustrating the design process as a flow.

It is also interesting to reflect upon the phenomena of the great amount of nonvocalized design processes found in research. Out of 173 articles, 103 *did not* visualize the design process, and this could indicate that there is a visual territory to further develop in design methodology research. In accordance with Shneiderman (2014), we agree that visualizations are cognitive processes with the aim to gain insights and looking upon the result from this point of view, many of the models in the category of Attractiveness can be developed using more

images, and less text. This result goes along with Puwa and Sharma (2012) pointing out that images are easier to address than words and by visualizing design methodology processes even more people can absorb and understand complex research. Although, Drucker (2011) argues that that there is a problem associated with validity and how reliable visualizations are, and this issue is present in the results.

6. Conclusions

This paper investigates how design processes are visualized in research, with the overall aim to highlight dominant structures from a design activist perspective. Linked to this perspective, there is a need for more sophisticated user-centered methodology when visualizing the design process in order to gain insights from the models presented. There are several types of visualizations of design processes, but several of them can be perceived as being too complex. There is a potential for disrupting existing power structures by questioning how results are visualized. Models should be explicit for increased understandability, accessibility and validity.

This study shows patterns of linearity processes when visualizing design methodologies, and this can be an indication of that the heritage of the transmission view presented in the Shannon and Weaver model from 1949, even now is present. This confirms that the linear model still is the norm when presenting design methodology processes visually. Also, the linear process is closely related to the squared format and this shows that it is attractive to visualize design process in a cubistic form and on a clear line, either from left to right or from top to bottom.

The design requirement of Attractiveness in the visualization is closely linked to the individual expression of the researcher, and a conclusion is that none of the visualized models are entirely similar. Instead, this study shows that many researchers communicate their own model. In this context we would like to emphasize the potential fragility of the process and that this pluralism of models could generate a lack of stringency and a weakness of opacity. In order to improve design processes in research we suggest that the concepts of validity and reliability should be taken into account when visualizing design processes. A reflection related to this is that many of the examined models could be seen as not being explicit, i. e. implicit models require a deeper reading to be understood.

Finally, this study underscores the potential of having a design activist perspective when looking upon these visualizations; this perspective can broaden our understanding and raise awareness about existing structures in design processes.

7. Further research

Exploring visualizations of design processes arises several questions related to design activism. It would be interesting to further study for example, how design research can become even more innovative in developing models that are understood cognitively and communicative? This aligns with the conclusion that the visualizations of design processes often are too complex. Therefore, knowledge of universal design principles and attractiveness needs to be developed, and how to evaluate the functionality and quality from a user-centered approach. We are also looking forward of future studies to come focusing on Utility and Soundness in The Vitruvius triangle.

Fashion-Tech Revolution: Future Frontiers from Products to Processes

Alba Cappellieri[a], Chiara Colombi*[a], Livia Tenuta[a], Susanna Testa[a*]
[a]Politecnico di Milano
*susanna.testa@polimi.it

Abstract | The fashion industry is a highly pluralistic and diversified context in which material and intangible products, cultural capital and human resources merge together. As the outcome of a complex integration process among different methodologies and areas, fashion contributes to a new reading of the cultural changes which shape our present. By drawing on various codes fashion is capable of generating a narrative which bestows meaning on the relationship between references, materials, technologies, products and processes. Given the need to rise to modernity's challenges and to be innovative, the forms of cross-fertilisation in the contemporary world are becoming ever more daring, while the number of disciplines involved is steadily growing, and the skills required are becoming increasingly specialised.
Nowadays, the fashion system is linked to technological progress. Fashion-Tech sector is originated in the interplay among fashion design and digital technologies and is a special disciplinary niche, as it is marked by elements which are unprecedented in history in terms of revolutionary impact. This process of hybridisation has opened up new possibilities in terms of innovation, and it has generated products and services with enhanced performances, whereas technological advancements have been given the chance to enter consumers' lives and bring them innovation. From design to retail, from product to communication, fashion and technology are interconnected and the shift from craft to industrial production, from an analogue dimension to a digital one involves not only all stages of the production process, improving them and making them quicker and more efficient, but also the design practice, changing its meaning and purpose.
The paper aims to trace and define the revolution taking place within the fashion world, those avant-garde movements which are experimentally operating on the boundaries of different disciplines, describing realities that are sometimes in contrast with the traditional practice. In particular the research investigates how these dimensions, resulting from the intersection between fashion and technological progress, are impacting on human beings, on their relationships with the garments, with their bodies, with the environment and with other people. The paper will analyse the changes induced by the fourth industrial revolution in the field of fashion and the impacts on processes, products and languages.

Moreover, it will analyse the technologies currently employed in the fashion landscape, along with their possible applications in future scenarios, referring to the most relevant case studies in the field. Cases will be introduced combined into clusters, according to the subject areas involved, that represents Fashion-Tech innovation tracks:

- Artificial second skin: body equipment with embedded sensors able to monitor human body parameters that are critical for healthcare;
- Hyper-body: products are becoming increasingly connected with the body, becoming part of it;
- Fashion-Tech takes care: sustainability – intended as efficiency, recyclability, transparency, mission orientation and ethical upgrades – can cover the entire fashion supply chain;
- Physical avatars: digital beauty in real layers.

These are not intended as market trends, but rather trajectories, at a different stage of development, orienting the design practice within the Fashion-Tech field. They result from observation, analysis and interpretation of emerging issues in the Fashion-Tech context, conducted by desk research.

The paper concludes with a reflection on the role of design in guiding technological innovation, highlighting how fashion design, within the Fashion-Tech paradigm, can accomplish, or at least offer, the possibility of bringing the results of the most daring scientific progress closer to a human and tolerable dimension.

1. Introduction

> "The avant-garde is the symptom of a new situation ... The arts of our century are characterized by the tendency to move towards borderline areas where each art touches the boundaries of the other, often invading its territory." (Spatola, 1969)

The worlds of design and fashion are inextricably linked to the temporal variable. Indeed, the historical context integrally and intimately defines objects: not only does it determine their reason for existing in relation to needs and functionality, but it influences the stylistic, material and technical choices.

The complexity of the fashion sector, its intrinsic and communicative value, and its relationship with time can be well exemplified through the linguistic paradigm.

Clothes, like words, cannot exclude the comparison with time. In linguistics, the sign—the word—is formed by the arbitrary union of a signifier and a meaning (Ferdinand de Saussure, 1979). The signifier, or expression (Hjelmslev, 1991), can be a sound—in the oral sign—, or a handwriting—in the written sign—. The meaning instead is the content, which the sound or handwriting wants to convey, and the concept embodying the mental notion of an object. Meaning makes it possible to understand or express the sense, value or content of a sign. In communication, the sign has a dual function: one of a referential type, that is to tell something about the world; the other one is an aesthetic one—to communicate something self-related.

Like words, objects can also be traced back to this model. They have a tangible dimension which can be experienced through senses. They have also an intangible dimension of content, a referential meaning which refers to reality. Lastly there is an aesthetic meaning that refers to imagination, more or less similar or dissimilar to the representation of reality. The link that binds meaning and signifier is not natural and necessary, but arbitrary, as a cultural product that exists in a certain historical and geographical moment.

It is precisely in this arbitrariness, in this mutual bond between the parties of which the space-time component is a fundamental variable, where the concept of 'contemporary' resides.

In the world of design, we can define 'contemporary' not only as what has been designed and produced in the present time, but also as what is aware of being contemporary, therefore able to fully express the *Zeitgeist*, the spirit of the time (Blumer, 1969; Vinken, 2005): the collective taste, the general moral, ideal and cultural climate that characterises a particular historical period. Therefore, only some of the objects produced and made in the current context can be considered in all respects contemporary: the fact of being able to trace their genesis back to the present time is therefore a necessary but not sufficient requirement to be defined as such.

Clothes, like other categories of artefacts, are balancing a dualism of difficult reconciliation: on the one hand the cyclical re-proposition of tradition, its enhancement and the maintenance of ties with the past, on the other the push towards innovation, the search for a language compatible with the complexity of the present and the ongoing digital revolution. The paper is

particularly interested in analysing those Avant-guard (Szabolcsi, 1971) realities breaking the cyclical re-proposition of tradition, instead taking new directions to explore other territories and generate innovation, proposing not only a new aesthetic, but also a new vision of the world. But where do they head?

2. Hybridisation and Innovation

> "Who are we, who is each one of us, if not a combination of experiences, information, books we have read, things imagined? Each life is an encyclopaedia, a library, an inventory of objects, a series of styles, and everything can be constantly shuffled and reordered in every way conceivable." (Italo Calvino, 1988)

In his Six Memos for the New Millennium, Italo Calvino (1988) listed multiplicity among the six values that were to underlie the new millennium's literature. He envisaged the novel of the future as a large network in which different kinds of knowledge and diverse codes could generate a new and multifaceted vision of reality. The multiplicity value anticipates aspects which were subsequently to characterise both the internet and the structure of unsolvable complexity inherent in the contemporary world, a 'system of systems' based on integrated links and the coexistence of diverse elements which inform everything (Gadda, 2007).

Indeed, the world nowadays is becoming increasingly complex and interconnected; thus, the challenges of the modern times require the cooperation of various actors who avail themselves of different types of knowledge and skills, thereby integrating them and making them complementary. Our present is propelled forward by rapid changes which have affected every area of knowledge. In the meantime, the vast availability of information has blurred our perception of points of reference once embedded in our history, such as the analytical, linguistic and cultural ones.

In a context such as the present one, a dialogical approach shifts an individual and partial perspective to a choral, inclusive one, and may therefore enable the creation of shared and integrated solutions based on multilateral participation.

The boundaries between various branches of knowledge are not closed, but rather allow for constant infringements, and in fact present themselves as areas open to contamination and mediation (Lozupone, 2015). Indeed, modern disciplines are best seen as a complex interaction (Pizzocaro in Bertola & Manzini, 2004) among a plurality of systems (Von Bertalanffy, 1971): the various empirical sciences may therefore be reduced to conceptual models, each of which relies on interdependent elements that intersect one another.

The reasons behind such hybridisation, or cross-fertilisation, among different branches of knowledge with little in common are numerous. The first of these is the possibility of

generating innovative solutions, as knowledge transfer is indispensable to give rise to new ideas.

This blend among diverse fields has led to noticeable innovations across a number of them. Therefore, in a contemporary perspective, the ability to innovate appears to be largely dependent on various forms of cooperation among numerous areas of knowledge.

Fashion as a discipline has always been characterised by the intertwining of complex trajectories based on thematic references, borrowed methodologies and the appropriation of various unrelated fields of expertise, with the clear aim of generating innovation.

In the course of history, fashion and technological advances have often influenced one another. This process of hybridisation has opened new possibilities for fashion in terms of innovation, and has generated products and services with enhanced performances, whereas technological inventions have been given the chance to enter consumers' lives and bring innovation to them.

The fashion system is entirely affected by technological progress nowadays. Consequently, the Fashion-Tech sector, which originated in the interplay between fashion design and digital technologies, is a special disciplinary niche in the contemporary world, as it is marked by elements which are unprecedented in history in terms of revolutionary impact. Indeed, digital technologies have wholly pervaded the fashion system in its processes and products, have altered the DNA of traditional paradigms, and have changed the role of the actors involved (Testa, 2019). The interplay of various sectors is attracting a growing number of actors and businesses both from the fashion and the technology sector.

The introduction of digital technologies and ICT has marked a revolution in the fashion system (Testa, 2020). This modern revolution has led to more flexibility in the classic design paradigms, especially those concerning processes, codes and materials, and has mellowed former dichotomies into a seamless spectrum. Natural elements and man-made materials, analogue and digital technologies, standardisation and customisation, the artisan's and the engineer's approach, the outward appearance and the essence, the shape and the function, have all ended up coexisting in this context, and have merged with one another.

Today the fashion industry is a highly complex pluralistic and diversified organism in which material and immaterial products, cultural capital and human resources merge together. As the outcome of a complex integration process among different methodologies and areas, fashion contributes to a new reading of the cultural changes which shape our present, and by drawing on various codes it is capable of generating a narrative which bestows meaning on the relationship between references, materials, technologies, products and processes. Given the need to rise to modernity's challenges and to be innovative, the forms of cross-fertilisation in the contemporary world are becoming ever more daring, while the number of sectors involved is steadily growing, and the skills required are becoming increasingly specialised. Fashion's boundaries are open to the boldest forms of research and experimentation. They are the result of the interplay and mutual integration of highly diversified and specialised fields, which

range from medicine to aeronautics, from engineering to city planning, and from biology to cosmetics. It is these mergers which supply the lifeblood of creativity and innovation. Contemporary fashion designers are forced to operate on more levels in increasingly complex contexts, and to harmonise diverse elements which are in contrast if not in outright diametrical opposition. They therefore show a shared inclination to a high degree of flexibility which conjugates the cross-fertilisation of different kinds of knowledge and know-how and experience a similar need to experiment materially and to reach a developed vision of the technology they apply. Such modus operandi strives to seek and define original scenarios and presupposes a special ability in audaciously stretching the designers' initiatives beyond the comfort zone, thereby challenging and breaking the limitations derived from traditional paradigms such as matter, codes, and processes (Cappellieri, Tenuta, Testa 2018).

3. Future Scenarios for Fashion-Tech

3.1 Methodology

The following part of the paper will address the peaks of innovation and will describe future scenarios for Fashion embracing the digital shift through the identification of future possible directions in regard to new Fashion-Tech products, consumption habits, markets conducted with the scope of evaluating and identifying opportunities and requirements for development of main topics within the areas of Fashion-Tech.

These scenarios may be referred as 'Design Orienting Scenarios' (Jegou and Manzini, 2000) as they allow the exploration and description of promising innovations involving a set of relevant actors. The scenarios are then visualized through a Cartesian coordinate plane, producing a 'Design Plan'—design directions for the development and refinement of innovative body equipment in the field of Fashion-Tech—.

Starting from the idea that a trend is a direction of movement or change in an observed value (Thomsett, 2015), information is the common denominator among all the emerging future directions that are described in the following sections. These are not intended as market trends, but trajectories, at a different stage of development, orienting the design practice within the Fashion-Tech field. They result from observation, analysis and interpretation of emerging issues in the Fashion-Tech context.

This process proposed by Jegou and Manzini (2000) was particularly useful as it helped us approaching in a systematic, coherent and organised way a complex situation with a large quantity of variables. The followed process started with a desk research, with an overview of the state of the art in Fashion-Tech through literature search and review, case studies analysis and interviews.

We then identified main macro trends within the field of interest. A macro-trend can be defined as a change in the context of the current system that may have a potential effect on its

development (Manzini et al. 2009). For the field of Fashion-Tech we found as a relevant and discriminating element the degree of interactivity of a product (autonomous interaction/controlled interaction) and its scope in relationship with the body (functional/expressive).

It was created a Cartesian coordinate plane according to the polarities:

- the scope on the abscissa axis: on one side functional body equipment and on the other one expressive body equipment;
- the degree of interactivity on the ordinate, based on autonomous interaction and controlled interaction.

Lastly, we used the Cartesian coordinate plane to map the case studies and we built different alternative scenarios exploring potential reconfigurations of the current fashion system. The scenario building methodology we followed made use of a polarity-based approach, represented within a Cartesian coordinate plane. Polarities show possible variations along one dimension of a piece of body equipment, between opposite directions.

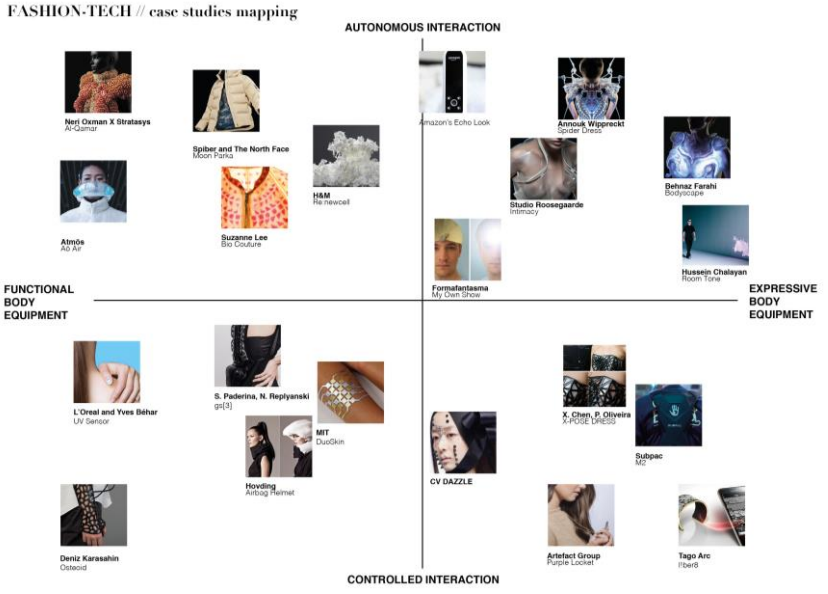

Figure 1. Fashion-Tech Design Plan, case studies mapping. Source: Authors.

3.2 The Four Macro Areas

Four macro areas emerged from the Design Plan methodology that may represent a direction of future development and potential applications of the products for the Fashion-Tech.

The four scenarios are:

1. Artificial Second Skin: body equipment with embedded sensors is able to monitor human body parameters that are critical for healthcare
2. Hyper-Body: products are becoming increasingly connected with the body, becoming part of it
3. Fashion-Tech Takes Care: sustainability – intended as efficiency, recyclability, transparency and ethical upgrades – can cover the entire fashion supply chain
4. Physical Avatars: digital beauty in real layers

For each Fashion-Tech scenario, most of the products, technologies, fabrics or techniques come from worlds apparently far from that of fashion and are only the result of the meeting of different disciplines and fields. Medicine, architecture, gaming, robotics and automotive are just some of the areas where most of the innovations we are seeing are being implemented.

The examples contained in the following paragraphs are presented in an order that is not intended to highlight the state of diffusion, marketing, or development process of the product, but to picture and highlight general common trends, the existence of some avant-garde sectors, generated by contamination and integration with areas other than fashion. It is in fact a transversal research towards the approach to innovation in the field of fashion.

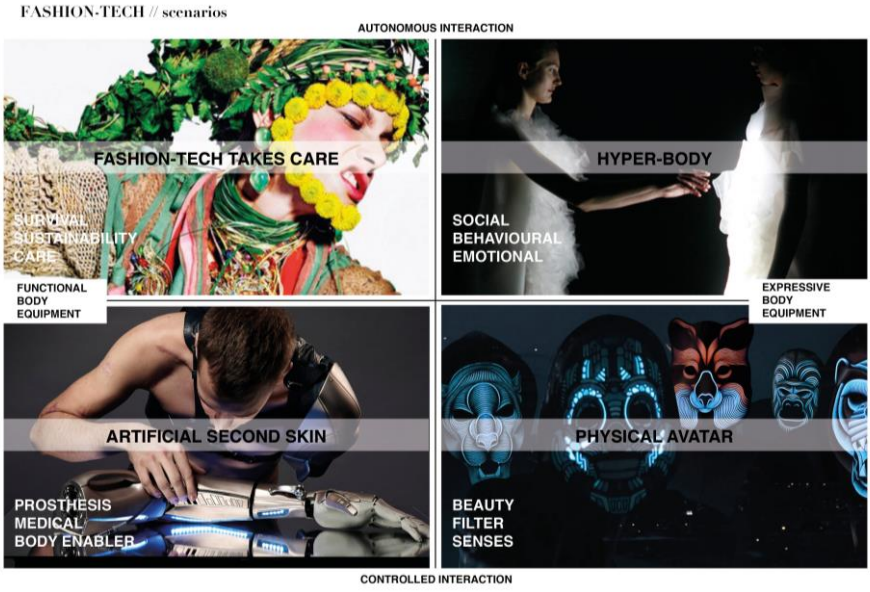

Figure 2. Fashion-Tech Design Plan, scenarios. Source: Authors.

3.2.1 Artificial Second Skin

The first scenario concerns body equipment behaving like a second skin, from one side monitoring or intervening on body parameters and on the other side acting as body prostheses to control external environments or smart devices.

It features products whose interaction activation is controlled: they can be activated either by the environment or by the users, enabling them of enhancing their performances, opening the possibilities of spreading new behaviours. For this reason, this category of body equipment is mainly purely functional.

While health and wellbeing products had previously been focused on providing information on the users' vital signals for a quantified self to improve lifestyle and control it, wearables and smart textiles with embedded sensors can monitor physiological, neurological and body kinematic parameters, critical for healthcare (Cho, 2010). Body signs, such as heart rate, respiration and motion patterns, can provide data to detect behavioural changes and health risks, diagnosing issues at early stages (McCann & Bryson, 2009; Cho, 2010). Fashion and product designers, and textile, electronics and material engineers are the main professionals involved in this first macro area. It is a mature and marketable scenario, that involves robotic, automotive, military and medicine fields.

Within the medical field, GS[3], designed by Snezhana Paderina and Nikita Replyanski, is a graduated spine support system providing dynamic back support. It is addressed to patients suffering from medical conditions, which cause joint hypermobility and chronic musculoskeletal issues requiring daily spinal support. Using data assessed by an integrated neural network, the lightweight cable mechanism of the graduated spine support system can easily and precisely be adjusted to the wearer's rigidity and support level. Within the same field, VTT Technical Research Centre is interested in creating wearable sensors and technologies to understand human movements and behaviours, while CCT Group is developing protection sensors and actuators, artificial muscles and second skin interfaces.

Moving to the field of safety, the main target group for protective wearables is mostly sick or elder people, who are statistically not highly familiar to digital technology. This instead may be helpful to predict possible future accidents or health problems. According to a study published in Smart Clothing Technology and Applications, people in general are keener in welcoming in their daily body equipment smart items that would satisfy physiological and safety issues (Cho, 2010), which are placed at the base of the Maslow's pyramid of human needs.

Thus, the need for protective garments is further proven. Protection is not only connected with monitoring the body but also with safety. Hövding 3 is an airbag for cyclists that is worn around the neck such as a collar. In the event of an accident, the airbag inflates and covers head and neck as a protective hood. Sensors inside the collar read the cyclist's movement pattern 200 times per second. In the event of an accident, the airbag inflates in 0.1 second.

The UV sensor by L'Oréal and Yves Béharto fits into body equipment designed with safety purposes, as it protects the wearer against melanoma. It is a small UV Sense device which works without the need for a battery: its dimensions are so small that it is possible to be worn on a nail. The device tracks sun exposure, as a way of lowering the risk of skin cancer.

Finally, the last case study deals with a piece of body equipment directly applied on the skin. Designed by MIT Media Lab, DuoSkin is a fabrication process that enables users to create customized functional devices which can be attached directly on their skin, as metallic jewellery-like temporary tattoos. Using gold metal leaf, a material that is cheap, skin-friendly, and robust for everyday wear, DuoSkin is designed to allow three types of on-skin interactions: sensing touch input, displaying output, and wireless communication. DuoSkin devices enable users to control their mobile devices, display information, and store information directly on the skin.

3.2.2 Hyper-Body

Hyper-body concerns body equipment designed with a high aesthetic and expressive value and not fully controlled by the user's will.

In the relationship between technology and fashion, the body plays a crucial role. While on one side technologies are becoming autonomous, contactless, wireless, on the other side products with embedded technology are becoming increasingly connected with the body and the skin, in some cases becoming part of them.

Starting from medicine, engineering and military fields, artists, fashion and textiles designers together with electronic engineers explore how to develop new body languages, through wearables and smart textiles.

Some projects are working on designing wearable items with behavioural attitudes, able to respond with a certain degree of autonomy to body or environmental stimuli. Some products are able to react thanks to the properties of the smart materials as My Own Show by Formafantasma. This head piece moves from the idea of preserving the privacy of the wearer and works against facial recognition. Hacked flashlights mounted on a golden radiating wire construction will flash as a reaction to other cameras, resulting in overexpose of the face of the wearer. The headpiece questions the thin borderline between the private and the public, and the way we daily 'sculpt' our own image on network communities.

Some other more radical projects investigate instead the capability of a garment to assume the behaviour of animals.

The Spider Dress 2.0 by Dutch designer Anouk Wipprecht, for example, well shows the power and beauty of technology when integrated into body equipment. The 3D printed item features animatronic mechanical limbs with sensors, that protect the wearer's personal space.

Conceived to respond to external factors through proximity and respiration sensors, the piece extends or retracts its limbs once the sensors are stimulated.

Another project that explores the relationship between people is Intimacy by Studio Roosegarde. These high-tech garments are made of smart e-foils able to track and respond to the wearers' life signals, such as heartbeat. The e-foils become more or less transparent based on the wearer's interactions with people, creating a sensual play of disclosure.

Within the context of project exploring the behaviour of the human body, Bodyscape focuses in particular on highlighting and enhancing the wearer's movement through light. As the wearer moves, the garment lights up thanks to embedded LEDs. The lights are controlled by a gyroscope that tracks the shoulder movements of the body. Bodyscape is not only a technologically advanced fashion item produced using 3D printing technology, but it also raises fashion to the poetic dance of light and human movement: it amplifies the performative qualities of the body in motion and creates an enchanting, illuminated choreography of the movements.

In this context of Fashion-Tech performances it is simply not possible to overlook the work of Hussein Chalayan, one of Fashion-Tech's visionary forerunners, who began experimenting with the application of wearable technology to haute-couture right from the establishment of his brand in 1994. He has amazed the public of his fashion shows with clothing that changed shape by means of microchips, dresses with countless embedded LED lights which reproduced the same effect as pixels on a screen, and tables that turned into gowns. For his SS 2017 collection he cooperated with Intel on a line of technological clothing that was showcased at Paris Fashion Week. As models moved along the catwalk, images relating to their stress levels were being projected on the wall behind them, something that was made possible by the biofeedback which the accessories they were wearing kept sending. Glasses powered by the Intel Curie module gathered biometric data from three different sensors. Combined they were able to infer stress in real-time. That data was then communicated to a belt via a Bluetooth and then translated into the visualizations displayed on the wall as the models moved down the runway.

It goes from products to services able to store data and working through artificial intelligence.

Echo Look is the device launched in 2017 by Amazon that acts as a virtual stylist giving fashion advices. It is a smart camera that reacts when the user awakens its smart soul, invoking Alexa the Echo products virtual assistant. Once the outfit is worn, Alexa is asked to take some photos in different positions and from all angles. Having collected the data, Alexa compares the outfit with other ones already stored in its database, giving a preference based on algorithms. Thanks to these smart devices Amazon can collect an infinite amount of data and information about its users extremely quickly. These data are useful to better profile consumers' tastes with ever greater precision, to propose items that we might purchase on its platform.

3.2.3 Fashion-Tech Takes Care

Sustainability goes across design, production and retail covering the entire supply chain and it is intended as efficiency, recyclability, transparency, mission orientation and ethical upgrades. Involving mainly smart textiles and digital manufacturing, the level of maturity of this trend is very high as well as its marketability. Usually the presence of technology is behind the scenes and it is managed by material and textile engineers, biologists, computer scientists and fashion and product designers.

Due to the fashion industry´s high impact on the environment, investing in technological solutions to decrease its negative effects is crucial (Forbes, 2016). While digital technologies, such as 'see-now buy now' concept or digital solutions offered by companies such as Berge and Teko Solutions can decrease waste by producing only what is in demand, involving microbiology and biotechnology into fashion to produce biodegradable garments can close the cycle of production, disposal and re-use (Seymour, 2010). Thus, some realities, such as BioCouture and Bolt Threads, are advancing sustainability working with sustainable fibres and production techniques. While BioCouture´s aim is to grow garments from bacterial cellulose (Seymour, 2010), Bolt Threads is brewing spider silk protein to then spin it into yarn (Forbes, 2016). According to Danielle Wilde, Associate Professor at the University of Southern Denmark, designers should learn from biology in order to shift their design process to more sustainable practices. On the other hand, a sustainability related issue requiring attention relates to different theoretical life spans of textiles and the electronics utilized in wearables (McCann & Bryson, 2009), which can be challenging for a workable integration of the two (Seymour, 2008).

Moon Parka, developed by Spiber together with The North Face, made from artificial spider silk, is designed to endure the harsh conditions and intense cold of the South Pole. Spiber staged a five-step innovation cycle in order to produce ever better qualities of artificial spider silk. It starts with molecular design: designing amino acid sequences, on the basis of bioinformatic analyses, that deliver better tensile strength, elasticity and heat tolerance. The second step is gene synthesis: synthesising genes that produce the desired amino acid sequences. Then, microbial fermentation. The synthesized genetic DNA is introduced into microorganisms. Test spinning can begin as soon as 10 days after gene synthesis is complete, once fermentation and refining conditions have been fine-tuned. The fourth step is spinning. The fibroin proteins produced through microbial fermentation are refined and formed into fibres. Spiber established a scalable spinning process that paves the way for mass production of artificial spider silk. Finally: prototyping. Spiber produces textiles and composites from their new materials; they assess their productivity and functionality. They feed back this data into the next generation of molecular design, after which a new cycle begins. The result of all this hard work is enormous: compared to when they started in 2008, they have dramatically increased productivity and decreased costs, bringing us to a place where large scale adoption of protein materials is finally becoming a reality.

Sustainability is becoming a trend, and this is demonstrated by the interested to the topic by the fast fashion giants. H&M group have partnered with Swedish company re:newcell, whose unique technology recycles used cotton, viscose and other cellulosic fibres into a new, more sustainable dissolving pulp. The pulp can be turned into new textile fibres and be fed into the textile production cycle. The partnership is another step towards H&Ms goal to use 100% recycled or other sustainably sourced material by 2030. Also, the birth of the first global retailer in fashion launching Gold level Cradle to Cradle (C2C) CertifiedTM T-Shirts. C&A produces in consideration of the environment, in a way that does not create excess waste, uses only safe chemicals and dyes, produced in a socially responsible way and is designed for its next life.

Sustainability also includes all those products that foresee an 'apocalyptic' vision of the world, in the event that there is no action in time with sustainable solutions.

Some products for example are designed to assist us in the act of breathing, such as Aō Air Atmōs. Consumer concerns regarding air quality are increasing on a global level due to the high levels of pollutants found in urban areas, which is seeing new products like the Aō Air Atmōs wearable air purifier be developed. The purifier works by being worn over the face and creating a light seal over the face to let the user enjoy purified air throughout the day when commuting or exercising. The unit doesn't focus on creating a tight seal around the face in order to not cause discomfort and allow the skin to breathe instead of feeling hot or constricted.

Other projects instead explore alternative territories, such as life in space or on other planets. For the future - the fourth revolution - Neri Oxman predicts the arrival of what she calls the Biological Age, in which microorganisms, living matter, and wearable micro-biomes will be designed that nourish the skin or photosynthetic buildings will be built that convert carbon into biofuel.

3.2.4. Physical Avatars: Digital Beauty in Real Layers

In the last scenario, the user-controlled product becomes a purely ornamental interface to create new digital-experiential levels within the physical world.

The body can be counterfeited as with CV Dazzle. CV Dazzle explores how fashion can be used as camouflage from face-detection technology, the first step in automated face recognition. The name is derived from a type of World War I naval camouflage called Dazzle, which used cubist-inspired designs to break apart the visual continuity of a battleship and conceal its orientation and size. Likewise, CV Dazzle uses avant-garde hairstyling and makeup designs to break apart the continuity of a face. Since facial-recognition algorithms rely on the identification and spatial relationship of key facial features, like symmetry and tonal contours, one can block detection by creating an ‘anti-face’.

In other cases, the body can be revealed according to the type and intensity of interactions.

X.pose for example deals with digital data production. Since we have already ceded control of our digital data emissions, X.pose broadcasts the wearer's data for anyone and everyone to see.

Users can directly control the aesthetics of their items, customizing them and adapting them to their taste. TagoArc is a bracelet featuring a full E Ink display that can change according to the user will. Thanks to a smartphone app it is possible to change the displayed pattern on the item an infinite number of times.

Another layer that can be created is that of memory taking a digital form. Design studio Artefact Group created a conceptual smart locket that wirelessly interacts with social networks to display a digital memento of friends or family. Intended as a benchmark for how fashion and technology can complement each other, Artefact's Purple is a proof-of-concept locket that wirelessly receives images and messages from the wearer's social networks, offering a 21st century update to the traditional keepsake. The locket is able to connect to social networks, but rather than swamping the wearer with every possible update, the user first selects the people they'd like to receive notifications from. An accompanying app enables further options like creating personalised keepsakes with filters and effects, or adding and removing people from the update list.

The added layer can also be haptic to amplify the musical experience. Subpacby M2X is a tactile transducer to be worn on the back that conveys to wearers a physical impression of sounds just as if they were in a real club.

4. Conclusions

> "As we move deeper into the twenty-first century, it becomes ever clearer that the ultimate, most intimate territory for design is not electronics, or interiors, or furniture, or the web. It is us—our own living, breathing, biological selves." (Rick Poynor, 2013)

For a long time, digital innovation applied to body equipment has been mostly carried out by the technology industry.

Engineers and scientists have moved their research mainly in function of an improvement in terms of quantifiable performance, data and mathematical results, with the aim of pushing humanity constantly beyond its limits.

Contemporary society is markedly based on performance, on overcoming borders, breaking records, in the incessant pursuit of the myth of the super-human. The fantasy that nourishes the common imagination is that new technologies applied to the body and clothing have the aim of becoming functional prostheses capable of improving human performance and therefore, as a direct consequence, his quality of life. But is this really the case?

In this regard, the reflections of Sobchack are interesting. Through her essays, she deals to varying degrees with the theme of the 'techno-body', a personal and stringent question following the surgical amputation of one of her legs as a treatment against cancer. In her 1995 essay on computer theory, Sobchack criticizes the "delirious liberating rhetoric of technophiles" and does so from the position of someone who is "technologically enabled in the most intimate way", but who is not and does not feel, however, a cyborg. In particular, she addresses Baudrillard (1991): "(...) Unlike Baudrillard, I have not forgotten the limitations and finitude and naked capacities of my flesh – nor, more important, do I desire to disavow or escape them" (Sobchack, 2004, p.172). While not a 'technophobe', Sobchack argues that a critical emphasis on the 'lived body' is crucial to providing an ethical basis for issues relating to the intersection of technology and the body (Sobchack, 2004, p.172). This is why performance for those who live with the need to use bodily prostheses is no longer a priority, but the priority becomes the possibility of 'normality'. And this is precisely the crucial point. The theme of innovation and performance, whether or not enabled by digital technologies, is approached from a different point of view from engineers and scientists to designers. Progress has long been a monopoly of science and this has led to its being associated over time with values linked to performance and functionality.

Today, an increasing number of designers are working in the field of biological research, creating speculative and critical design projects, in an attempt to encourage the public to actively participate in the discussion of scientific advances and ethical issues surrounding them.

The growing interest in these hybridizations is evidenced by the inclusion of degree programs in design that intersect with scientific disciplines, from Design Interactions at the Royal College of Art in London, to Contextual Design at the Design Academy in Eindhoven, to the Master courses dedicated to Fashion-Tech at Politecnico di Milano.

In this territory, design and fashion have the task, or at least the possibility, to bring the results of the most daring scientific progress closer to a human and tolerable dimension.

What is urgently needed is to initiate a substantive discourse on the role and contribution of designers when collaborating with scientists and engineers.

About the Authors:

Alba Cappellieri is Full Professor at the Politecnico di Milano, where she teaches Jewellery Design and Fashion Accessories. She is the Director of the International Master in Fashion Accessories Design, of the Master on Brand and Product Management at the Milano Fashion Institute (consortium of Bocconi, Politecnico and Cattolica universities). She is a member of the Scientific Committee of the Ecole Van Cleef & Arpels in Paris and of the Fondazione Cologni in Milan. From 2013 to 2016 she taught Design Driven Innovation at the Stanford University. In 2017 she was appointed Ambassador for the Italian Design Day at Osaka, in 2018 at Sydney and in 2019 at Baku, in 2020 at Miami. From 2014 she is the Director of the Jewellery Museum in Vicenza, the only Italian museum exclusively dedicated to jewellery. She curated several International design exhibitions and her last publications include “Jewels of the twentieth century, from Art Nouveau to 3d Printing (Skira, 2018), “Chains, jewellery in history, function and ornament” (Silvana 2018), “Brilliant” (Corraini 2016), “Jewellery a la Mode (Corraini 2016), “Sentimental jewellery” (Marsilio 2014), “Italian design meets jewellery”(with M. Romanelli, Marsilio 2013), “The italian Way: craftamanship and innovation” Electa, Milano 2011, “Antonio Citterio: Architecture and Design” (Skira 2012), “Ron Arad: Architecture and Design” (Mondadori Arte 2008).

Chiara Colombi, PhD is a Fashion Designer and Associate Professor at Design dept. and Faculty Member in the Fashion Design programs at Design School - Politecnico di Milano. She has 12 years’ experience in education, research and professional consultancy in the fashion design field with a main professional focus on trend research methods, product--system development and merchandising and retailing, with a specific focus on the fashion sector. Her experiences cover European research activities; field projects and consultancies for main fashion brands. Her research, teaching and professional experience is funded in the close relationship established with productive and professional entities. These connections aim to define research projects deemed to be relevant from an industrial, socio-economic perspective and possible topics for various studios, workshops, research projects and grants. She has more recently specialized on the impact of digital technologies and social media both in research and consultancy activities.

Livia Tenuta, PhD in Design, Livia Tenuta is Assistant Professor and Fashion Design Program Board Secretary at Politecnico di Milano, Design Dept. Her research is dedicated to future scenarios and innovation for fashion, focusing in particular on wearable accessories. She is faculty member and vice-director of the 'Fashion Direction: Brand&Product Management' post graduate course at the Milano Fashion Institute.
Since 2014 she is curatorial coordinator at the Museum of Jewellery in Vicenza, the first museum in Italy dedicated to jewellery.
Among her publications: Fashion in the Age of Technology (Aracne, 2020), Jewellery& (Marsilio, 2018), Skin (Marsilio, 2016), Around the Future (Marsilio, 2014).

Susanna Testa, PhD in Design, is Assistant Professor at the Design Department of Politecnico di Milano. Her research focuses on interaction and technological innovation within the field of fashion, benchmarking state-of-the art initiatives, technologies and products related to the fashion ecosystem. Among academic activities, Susanna lectures at the Bachelor's courses in Jewellery and Accessory Design working primarily with emerging manufacturing technologies, Fashion Illustration and Portfolio & Digital Branding (Politecnico di Milano) and she is didactic coordinator of the Master in Accessory Design and of the Master in Fashion-Tech (POLI.design). She is part of the faculty of the Master in Fashion Direction: Brand & Product Management at Milano Fashion Institute (consortium of Bocconi, Politecnico di Milano and Cattolica universities).

From the product to the object. The speculative design practice as instance

Chiara Scarpitti

Researcher at University of Studies of Campania "Luigi Vanvitelli" -
Department of Architecture and Industrial Design.
chiara.scarpitti@unicampania.it

_DCs Abstract | Switching from the function-object to the speculative-object transforms the meaning of the object, in so far as it is no longer a passive element of the discourse, but the triggering actor of an embodied reflexive process. In this perspective, the object transforms itself, from a functioning commodity to an open minded "thing" full of meaning. (Bodei, 2009). Understanding it as a device of thought, the speculative-object, becomes the narrating subject for a cultural reflection on humankind and it definitively changes its ontological status. (Harman, 2018). It imposes itself as a cognitive trigger of emancipation compared to a predeterminated thought, toward a deconstructive logic that does not give absolute solutions. In this context, the designer transforms himself from the one who solves problems (problem solver) to the one who identifies problems (problem-finder), through an investigative approach oriented towards evolving scenarios. Speculative objects therefore connect subject and thought and the more they exhort a disruptive vision, the more they demonstrate their intrinsic capacity to produce change.

KEYWORDS: RESEARCH THROUGH DESIGN, SPECULATIVE DESIGN,

PROBLEM-FINDING, CRITICAL MAKING, MATERIAL CULTURE.

_DCs 1. At the roots of *Speculative Design.*

In a post-industrial scenario as the current one, where the production system is increasingly converted into new configurations, the concepts of function and meaning of the product need to be reanalyzed. The transition from the *functional product* to the *speculative object* - understood as the ability that design has to consolidate a critical vision of the world into an object - is now being strengthened at a global level, not only through the emerging designers that implement it, but also the research conducted in the more institutional places of education.

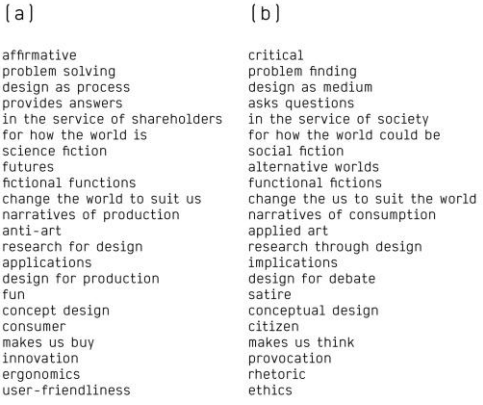
In the essay *What is criticism?* Renato De Fusco analyses different meanings of "criticism", from an etymological, philosophical and historical point of view. In many definitions found, criticism indicates the ability to examine, through a sort of judgment, the results of particular notions, doctrines or works, in order to understand their contents and evaluate them appropriately. "Criticism's definitions are followed by those of "criteria", which are to be considered as the constructive elements of criticism, sharing the same root, *kpivo* (distinction). (De Fusco, 2002). The criterion is the parameter that guides the choice of a specific critical interpretation. However, over time it evolves continuously, in relation to the changing cultural and social sensitivity and subjective taste.

But the critical approach also indicates a particular analytical attitude that aims to build an elaboration of a certain thing or event. Traditionally, this term has been closely related to disciplines such as art, history, philosophy and only in the last few decades this term has been strictly related to the culture of the project, to the point of identifying a theoretical and applicative specific field.

Referring to the intellectual aspect of the project, Thomas Maldonado argues that his vocation par excellence has been "to disagree, to think differently", and that his expression somehow is a form of heterodoxy. "Heterodox are to be understood as all those who, in one way or another, act in opposition to dogmas, doctrinal bodies, models of behaviour, symbolic orders, and even existing power structures […] Rebels, oppressors, antagonists, transgressors, and in some cases openly revolutionary. The tradition of the heterodox is certainly the tradition of intellectuals." (Maldonado, 1995).

Through the description of intellectual figure by Maldonado and De Fusco's definition of “criticism”, it is clear that a speculative design approach leads to a breakthrough in the creation of new meanings and relations between object and user. This premise helps us to understand the typology of approach that led to the birth of Radical Design between the late 60s and 70s in the cities of Milan, Florence, Turin and Naples. By collecting the main experiences of those years - counter-design, conceptual architecture, poor technology, eclecticism - Radical Design starts to spread thanks to the theoretical and practical work of Archizoom, Superstudio, UFO, Global Tools, leaded by architects and designers as Ettore Sottsass, Gianni Pettena, Andrea Branzi, Ugo La Pietra, Riccardo Dalisi.

The term “radical”, coined in 1966 by the historian Germano Celant, indicated a position of change with respect to the social, political and industrial system in force. Among the themes supported by the movement, there was a return to a process of "making design" closer to mankind, in opposition to the current industrial de-humanisation and rigid functionalism with a rationalist imprint.



By promoting social interaction, spontaneous creativity, free individual expression, far from stereotypes and pre-established systems, Sottsass argued that "all the terms, relationships, controls, classical organizations had crumbled, had been overthrown, to give way to the new images which turn on and off here and there, caused by vital explosions where there are, by sexual activity, by heroic ambition, by frenetic activity, by repentance, by selfishness, by terror, by insolence, in a sort of chaotic, confused, overwhelming and overflowing landscape. (....) What does my furniture have to do with all this? It is trivial and does not matter. But the idea would be to invent new unlimited possibilities, new forms, new symbols: to seize the things that are dying to see if it is possible to inject more energy, more life, more dynamics into people's lives." (Sottsass, 1965). Perceiving utopia as an initial stimulus on which to build the desired reality, and so tracing alternative ways of living and dwelling, the user participated in a wider social project that included an awareness towards the consumer’s society. In this perspective, the hypothesis of a perfect industrial world, made of many perfect and functional products, homologated for everyone, was dropped.

Following the economic boom of the 1980s and the widespread interpretation of design as a mass product, the theoretical legacy of Radical Design found new life in 1999 in the Anthony Dunne's book *Hertzian Tales*, further developed in *Design Noir* (2001). In opposition to an affirmative design that can give absolute answers, Dunne & Raby's Critical Design consisted more in "an attitude than anything else, a position rather than a method […] Naming it *Critical Design* is simply a useful way of making this activity more visible and subject to discussion and debate." (Dunne and Raby, 2001).

If comparing the two movements, despite the different historical moments, there are several common aspects: the corrosive attitude, the intellectual inclination, the will to deconstruct an existing system, the speculative and questioning approach. Another analogy derives from the fact that both had fertile ground for development from two different periods of crisis: on one hand the energy crisis of 1970s, on the other the early economic recession of 2000s. The spread of divergent thinking in these two precise historical moments is not accidental, but testifies the evident need to react, through the elaboration of an alternative cultural proposal, capable of unhinging an obsolete system.

In 2013, drawing up a series of parameters of the "speculative" project, Dunne and Raby publish the A/B manifesto. (Figure 1). The decalogue parallels a design as it is traditionally recognized, consistently with the market logic of a contingent functionality, to a design as it could be, influenced by the needs of society, beyond the market’s logic. Therefore, A "Design for production" corresponds to B "Design for debate", A "Applications" corresponds to B

"Implications", A "Consumer" corresponds to B "Citizen", in a dialectic of total transformation that involves the entire design process.
In *Speculation Everything*, published in 2013 by MIT Media Lab in Cambridge, Raby and Dunne state "how this is an intentionally eclectic and idiosyncratic journey through an emerging cultural landscape of ideas, ideals, and approaches. […] to explore the idea of "speculative everything" and design as a catalyst for social dreaming." (Dunne and Raby, 2013). The field of research is, therefore, strongly connected to the design of what is possible, not yet imagined. It is about to temporally place the research in a projected dimension, adopting the design project as a functional element to a destabilization of acquired certainties. In this sense, speculative elaboration is configured as a "political" choice that in turn creates new ways of expression and unexpected fields of action. Its aim is to pose a question mark on the world, encouraging new types of behaviour. It moves consciences. It becomes a concrete stimulus in reality, taking possession of every means available.

(a)	(b)
affirmative	critical
problem solving	problem finding
design as process	design as medium
provides answers	asks questions
in the service of shareholders	in the service of society
for how the world is	for how the world could be
science fiction	social fiction
futures	alternative worlds
fictional functions	functional fictions
change the world to suit us	change the us to suit the world
narratives of production	narratives of consumption
anti-art	applied art
research for design	research through design
applications	implications
design for production	design for debate
fun	satire
concept design	conceptual design
consumer	citizen
makes us buy	makes us think
innovation	provocation
ergonomics	rhetoric
user-friendliness	ethics

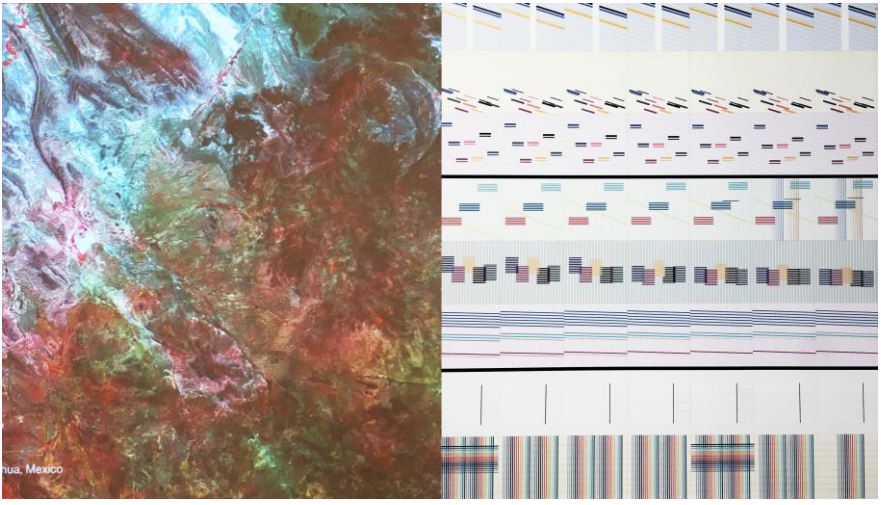
_DCs Figure 1. A/B Manifesto. In Dunne, A., Raby, F. (2013). *Speculation Everything.* CA: MIT Media Lab.

_DCs 2. *Problem-Finding* approaches.

In a civilization invaded by the dimension of goods, the design of an object plays a crucial role. Relating to the *object-industry* connection, what has been happening in this last decade is that, without waiting for a specific company commission, the designer has started to move independently in order to intervene directly on the social, political and cultural demands of society. It is quite a radical change in the way of designing and producing, which leads to the

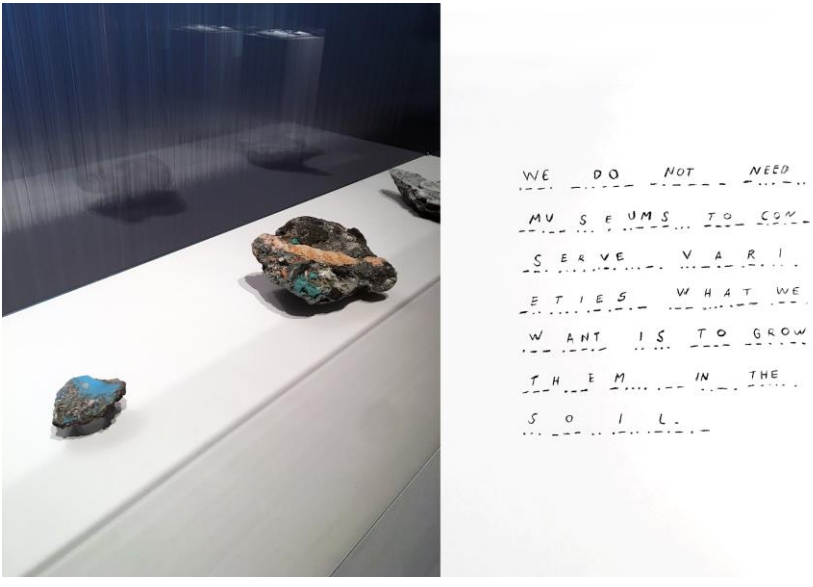
creation of objects that do not perform specific and closed functions in themselves, but, provided of “a different spirituality” (Branzi, 2006), take on new appearances and purposes.
For the designer, it is practically a matter of working on the object for its cultural value and intrinsic capability to sensitize the thought, destabilizing it. In this scenario, a new "designer-thinker" figure emerges - someone who accepts the challenges of the contemporary world, putting together complex inventive processes.
Referring to the theory of Speculative Design, among the most relevant characteristics of an object, there is the fact that there is no tangible and predeterminated industry for it. These objects do not have a circumscribed market, but are linked to a visionary dimension, a work in progress creation. Indeed, by not turning to a traditional market - through the staging of a sort of anti-industry - the divergent thinking and the critical reflections that derives from it, are devoid of any immediate economic purpose.
By implementing this operative modality, the designer acts with a strongly intellectual approach, transforming himself from the one who builds perfect models (*problem-solver*), to the one who instead identifies problems (*problem-finder*) in a constant investigative logic towards non-definitive solutions. It is evident that the *problem-finding* activity, in contrast with the traditional concept of design as an outcome of problem solving, opens the discipline to a different theoretical approach. In this case, the value of the project is determined by its ability to actively relate to mankind, imposing itself as a device for a cognitive process, oriented to a deconstructive logic, far away from reassuring solutions.
Closely connected to contemporary art practices, speculative objects acquire, in man's life, aims that the functionalist spirit of the last century had always looked upon with distrust. Far away from basic functions, their use is overturned compared to a past conception for which the consumption of an object took place through an exchange of physical type. Beyond a rationalist logic, the speculative object embraces a complex sensibility and leads to a disorientation on the part of consumers, stimulating broad and deep reflections. With the construction of objects so conceived - through operations of an aesthetic, material and sensory nature -, the difference between intellectual and physical consumption vanishes, highlighting a whole series of emotional and conceptual components that exist in the man-object relationship.
In this vision, the dialectic between project-industry-object transits through different modes of investigation that free design from the sole "industrial" denomination, towards other more inclusive interpretations, since the crisis of industrial products - in relation to its "ontological" change and areas of research - opens new perspectives to a more independent design. It's an openness witnessed by the frequent use of new production methods such as, for example, the numbered series, the unique piece, the adoption of hybrid materials and techniques, the spectacularisation of the process, performance, the use of digital devices. Even visual design, indeed, takes on a central role and becomes a "common space to facilitate processes of understanding, approach and management of the fragilities of our time. […] It becomes a cultural device to dismantle prejudices by acting as an intermediary for the construction of

cultures of civilization and life scenarios that are sustainable, solidary and fair. […] The designer, in this sense, has an enormous responsibility, because in his being a measurer of what exists, he records and keeps track, reads and interprets, conveying an idea of the future […] and affecting reality". (Piscitelli, 2019).
By highlighting unexplored fragilities and desired possibilities, the speculative approach makes the object a strategic vector for new dialogic processes. The aim, at the end, is to open questions and to understand what role design could play in the immediate future, acting first of all in the perspective of change.



_DCs 3. The transversal instances of contemporaneity.

The industrial supply chain has now become fragmented and it's not been considered anymore as a monological reference for the development of design. In an challenging and not yet decided reality, in this sense, the speculative object can address a myriad of possibilities, constantly renewing itself through the contribution of diversified knowledges. According to the asynchronic evolutions of contemporaneity (Agamben, 2008), in a highly experimental investigation territory, design hybridizes with heterogeneous knowledge such as, for example, electronic and materials engineering, biotechnology, natural, social and economic sciences, philosophy and human-studies in general. The transdisciplinarity of the project is therefore a fact from which to understand the future horizon, the interweaving of fields, their specific interdependence and therefore the nature of design itself.
In the acceptance of this multiple encroachment vision between the fields of knowledge, the seed of a deeper nature of design - intended as an intermediate and binding agent - is hidden. (Langella, Ranzo, 2013). This transdisciplinary perspective responds, indeed, to the complex relationship that binds nature, man and the things that surround him, in an anti-hierarchical and anti-speciesist vision (Haraway, 2016), conform to the growing complexities of the world. As the anthropologist Eleonora Fiorani states, "boundary fields do not limit themselves to opening or cutting out new fields, contaminating concepts, categories, methodologies, procedures, models, experiments, knowledge taken from separate differentiated disciplinary fields, but they elaborate and develop them from within their own methodologies, articulating them into models, experiments, devices, with effects of translating meaning and opening up new perspectives of methodologies, which are decontextualized and contextualized differently because they then have repercussions in the same disciplines of origin". (Fiorani, 2012).
Feeding from more branches of knowledge, belonging both to scientific and humanistic culture, the speculative approach reinterprets reality, implementing "migrations" of thought beyond the traditional disciplinary dichotomies, for an interconnected dialogue between object and man.



From the spaces of science and art, between architecture and politics, fashion and new technologies, combining the digital and the organic, design culture has slowly built its own identity, autonomous compared to other disciplines. In this sense, the relationships between designers, engineers, scientists and researchers must be read in an inevitable perspective of collaboration. According to a speculative approach, dealing with real issues - such as environmental sustainability, political debate, social emergencies, the relationship with new technologies - designers make objects in the broadest sense of cultural devices. Among the most urgent topics, the design project also addresses a series of complex themes such as geopolitical phenomena, gender equality, technological body, robotics, synthetic sciences.

To understand this language and the new action fields, among the most emblematic examples, we can refer us to the exhibition Broken Nature, curated by Paola Antonelli and inaugurated at the Milan Triennale in 2019. Here, the objects exhibited were designed to the survival of man on earth, the preservation of living species, the care of the territory and biodiversity, the coexistence of digital technologies and organic materials. The exhibition was practically devoid of design products intended as industrial, in conformity with a mass market. Installations, videos, study maps, material experiments and technological devices create a science fiction landscape where it is impossible not to ask questions about the current role of the designer, in the acceptance of how the discipline is radically changing, once again. (Fig.2, Fig.3).

In many cases, these objects are the result of self-produced collaborations and co-funded research within a trans-disciplinary empirical-experimental practice. The storytelling of the process is as important as the final result: the works are always accompanied by critical texts, photographs of work in progress, interpretative scenarios, which reveal their complexity and demonstrate their singularity. A singularity that is inextricably linked to the vision of the individual designer or the work team. Through the staging of these objects, the positivist vision according to which the designer is a problem-solver vanishes definitely, affirming himself instead as the one who identifies fragilities, questioning them, without absolute solutions. In this perspective, speculative objects have the ability, through both their physical and narrative existence, to act within reality by raising awareness aimed at new behaviours and human-world interactions.

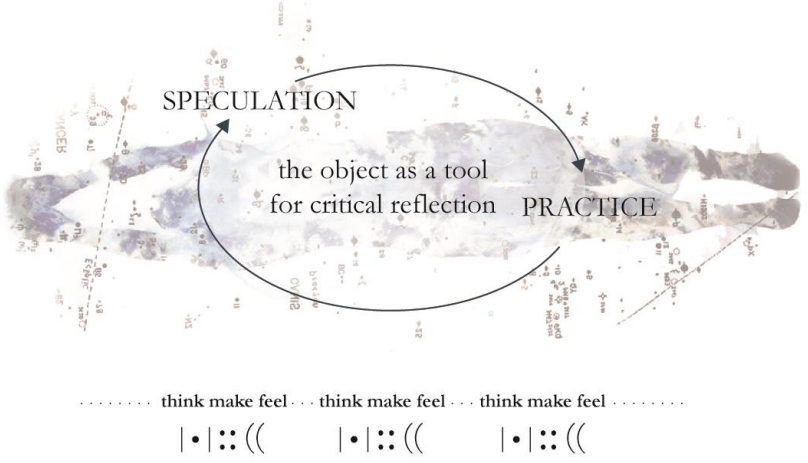
_DCs 4. The object as a device of thought.



The never-ending crisis of today's society has made us aware of the limits of industry and economic development and it has brought to light countless reflections on a design related to a mankind integrated with the macrocosm. (Caffo, 2017). In this context, the task of design is to produce objects capable of being instruments for a concrete and aware exploration of the real. Acting against an industrial overproduction without logic or meaning, the objects resulting from a speculative approach express a point of view of reality. Therefore, they are not passive observed objects but objects that observe: both because they condense within them the world expressed by the designer, and because, considering themselves as subjects (Harman, 2018), they reaffirm the ability to communicate, to give meaning, to shape the world.

A speculative "research through design" that investigates the object as a thinking device poses itself halfway between an intellectual elaboration and a technical exploration of the artefact, understood as a dual possibility of design investigation of the object. In the transition from the functional-object to the speculative-object, the relationship with the material could play a fundamental role. With the integration of thought into matter, it is possible to introduce a different way of making design that acts in the interstitial space that exists between the conceptual elaboration and the material experimentation of an object.

In the laboratory space, far from a design fiction logic, a material approach of a critical object can use concepts and visions simultaneously with instruments, techniques and machinery. Similar to the alchemist, the designer transforms materials and workshop experience into knowledge, since the ability to transform materials also transforms thought. This modality is the more necessary the more research will focus on issues related to manufacturing production and physical construction aspects of the object. An innovation of these logics can only take place from the inside and through a reconfiguration of spaces, tools and materials used for the practical realization of the objects. Within this dynamic, the place in which manufacture is carried out evolves from a space outside of thought, to a space within which speculative elaboration takes place, in a total symbiosis between thought, material and object. In order to do this, innovative materials, advanced manufacturing techniques, self-built instruments, are combined with reflexive processes and experimental methods for the production of the artifact. This type of research, hybridizing digital and analogical, if left to the exclusive digital instrument, it would be impossible to implement. "The tactile, the relational and the incomplete are part of the physical experience that is lived in the manual act of drawing. Drawing symbolizes a wider range of experience […] as well as the act of playing an instrument, the infinite exploration of the mysterious qualities of a certain chord. The difficult and the incomplete should be positive events in our intellectual activity; they should stimulate us, just as simulation and facilitated digital manipulation of already complete objects cannot do. (Sennett, 2008).

With the adoption of these trans-disciplinary modes, it is possible to see an evolution of design practice capable of distorting the constructive systems of objects from the depths. Reinforcing the methodology of “design through design" with a speculative investigation that includes a conceptual-practical double track, it is possible to highlight the connections between the critical-intellectual aspects and those of an experimental nature. Reclaiming the meanings of matter, substance, process, the laboratory activity is therefore intended as an expansion of speculative activity, for a reduction of design barriers between thinking and doing. In this operative space, matter can be understood as a "hyper-contemporary" instrument of the project. The workshop space, on the other hand, takes on the meaning of a place of knowledge through senses, with a continuous feedback from and to new theories and methods. In this perspective, the critical approach holds together both strictly scientific and humanistic elements, through an unconventional aesthetics and new ways of interaction with the objects. The essay wants to affirm the conclusive thesis that it is precisely through a simultaneous critical/physical approach to the production process, that a deep innovation of the object, in its speculative and technological innovation, can be achieved.

By investigating structural logic from the inside, reconstructing processes, materials and possible interactions, it is evident how speculative-material research can be configured as one of the most evocative areas, for its ability to open horizons and explore new possibilities of being for the objects. Every time an object expresses a new technological challenge, with its presence it offers the viewers a reflection on what and how it is possible to exist in the world. In the context of a theoretical-critical culture of the contemporary object, it is necessary to reflect on the relationship between the metaphorical capacity of the object to evoke something else and its material or technical connotation. Object, subject and thought are connected to the extent that there is an exchange of energies and a mutual influence. In this sense, the implementation of these workshop processes takes on the meaning of a precise choice by the designer of whether or not to explore a certain sensation, for a not merely functionalist purpose, but one that is above all cognitive. Technology and materials are not only used for an aesthetic or functional optimization of the object, but they themselves are an instrument of knowledge, capable of establishing a new mental relationship with the human beings.

_*DCs Figure 4. Speculation / Practice, Author's Study Graph, 2020.* Uninterrupted making processes, where the functional object is replaced by the speculative object, understood as a tool for critical reflection, outcome of a never-ending evolution.

From trustful empowerment to overwhelming guilt: pedagogy in current activism practices.

Alexia Autissier[a*]

[a]Designskolen Kolding, Denmark
*autissieralexia@gmail.com

Abstract | This paper seeks to unpack the pedagogical value of environmental activism as a practice within the context of a medium-sized Danish city. The approach of an empirical field study, conducted as through immersive observation and combining knowledge from activism theory, communication design and ethnography, led the research to deepen a behavioral understanding of design practice through sensory ethnography, workshop and interview. The findings showed the role of trust as a base for growing a powerful community. A design experiment was carried out to recontextualize, reflect and test the previously observed elements out. Understanding this behavioral logic could create knowledge for empowering communication assets. Acting as observer, objective interviewer, activist-facilitator, the author highlights activism as a multifaceted empowering platform that tends to create social meaning among citizens and develop knowledge for all, but which could eventually, on the other hand, stimulate guilt and rout if the message formulation misses its audience.

KEYWORDS | ACTIVISM, ETHNOGRAPHY, COMMUNICATION DESIGN, PEDAGOGY

1. Introduction

Protest is an ancient practice, predominantly concerned with the correction of injustice (Beder, 1991). Protest actions such as demonstrations, blockades, protest marches and meetings are the traditional method for groups of people to communicate to the wider public. It is used as:

> "a method for involving people in a meaningful experience in challenging unjust laws or actions; a way of demonstrating to others the depth of commitment felt by a group about an issue; a means to obtain publicity and apply pressure on politicians" (Martin, 1984; Beder, 1991).

Activists are daring citizens willing to raise their voices and get involved in public life. This paper investigates insights for the pedagogical quality of the mediation of activists in the community. Visual communication is built around the purpose of conveying messages and, in this case, communication works as an exchange between activist as designer and the audience to create response-ability and engage a conversation (Martin, 1984; Bush, 2003).

This paper is about observations of a four-month-old pacifist volunteer group, Food:Re:Formers, (also referred to as “FRF”) in a medium-sized Danish city. Organized as an informal egalitarian grouping, the volunteer base is composed of local students and young activists. With very limited financial resources, they rely mainly on the active participation of their supporters (Pickard, 2019). Focussing on the local area, the group aims for the reduction of food waste and the engagement of local stakeholders, centering their work around the value of sharing. They engage with citizens as well as policy makers through workshops, events and discussions in order to raise awareness around the issue and what is required to address it. The empirical focus of this dissertation is shaped around the ways in which the Food:Re:Formers share knowledge and shape their stakeholders’ relationship. The study concerns the quality of the activists’ workshop and its effect on citizens’ involvement. The question was whether and how the teaching experience facilitated by the activists from Food:Re:Formers caused a change in the audience’s behavior.

2. Methodology

Through action research (Checkland et al., 1998), the effect of an activist informative experience on an “inactive” audience was studied using the following methodology : participatory observation (Allen, 2017), sensory ethnography (Pink, 2019), visual data collection such as photo ethnography, drawing; audio recording, surveys, formal and biographical interviews (Levinson, 1978) with volunteers and stakeholders. This dissertation analyses how the sender and receiver of a message interact and learn from each other, within a realist environmentalist context (Hasler et al., 2019). Through this blend of data collection the author tried to comprehend the way the Food:Re:Formers use pedagogy and inclusion to achieve understanding and spark action amongst their audience (Sauvé, 2017).

Firstly, a literature review into activist practice and environmental pedagogy was conducted. Observational research in the field was then used to create knowledge through immersion into the FRF's organization. This took the form of a group discussion and was documented through notes and photography. Conducted in parallel, an ethnographic interview of the two co-founders was operated, alongside with sensory ethnography methodologies. The first interaction with the group lead to participatory observation, putting an end to our contextualizing phase and beginning an empathic understanding of our area of concern which would, in an action research perspective, develop our framework of ideas. In order to gain further access to the teaching intentions as well as experiencing direct contact with the audience (Kolding citizens), we completed our participatory observation of the event with a research planning survey. The gathered insights helped finalize a research participant map coupled with a user-groups definition to understand the variety of stakeholders involved in or revolving around FRF.

The preceding observations lead to a grounded conception, by way of the generation of design principles and of an experience simulation coupled with field activity. These worked in combination as a design experiment and helped to explore the role of facilitation within an educational sustainable food picking concept. By this means behavior patterns were observed and insights gained. The ladder intervention was purposely held outside the Food:Re:Formers' context in order to implement the knowledge of action previously collected into the real world, while addressing a similar audience (Sanders et al., 2012). In essence, and to understand how FRFs work, the workshop modelled on their approach was carried out by the researcher, at a school, for lunch time, involving a similar audience and topic.

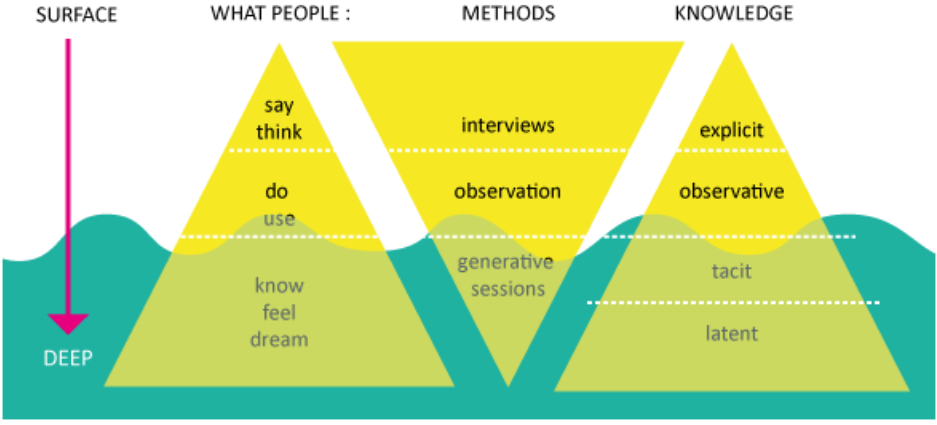

Figure 1. Sanders et al., 2012.

3. In action: recipe for knowledge sharing

Three main situations were observed during a two-week time frame: (1) the volunteer meeting, (2) the Dumpster Dinner and (3) the Smørrebrød workshop. The first two instances were organized by the FRF. The aim in the first session was to get an understanding of their inner organization and their point of action; and for the second session, the aim was to observe their interaction with stakeholders. The third session was a design experiment created in order to put into action the collected knowledge and comprehend its components outside the context of the activist group. So: first the author observed the FRF activities, developed a model of them and then set about testing this model by simulating the FRF approach.

3.1 Preparation

This section explains the FRF's organization (internal organization and relation to the community) and action plan for the event to come (the Dumpster Dinner).

The first part of preparation is the volunteer meeting: a closed working day where the agenda is decided. It helps ensure everyone has the same information. Based upon observations and corroboration through an ethnographic interview, there appears to be no leader in the group; the organization seems horizontal (Pickard, 2019). Every participant is invited to pick a role which suits them best in terms of time and skills. The meetings take place in the new headquarters offered by the municipality (Hasler et al, 2019). Equipped with a brand-new shared kitchen, the area resembles a living-room: a large "family" table, around which participants take part, is set out with a large amount of food.

The food is provided by a local anonymous collaborator shop as surplus food (items which cannot be sold due to superficial damage of the packaging or contents). The items were collected by the volunteers as the main resources for the upcoming Dumpster Dinner. The process of sorting (items past the sell-by date), cleaning and preparing the food is a chance for the volunteers to get to know each other and to share tips and recipes, increasing the collective knowledge of the group, and testing out the recipes which will be served during the next event.

Figure 2. Food:Re:Formers in their headquarter kitchen.

3.2 Cook!

This section explains the FRF's facilitation role during the event (the Dumpster Dinner), as well as the setup for it.

The FRF´s competence sits in raising awareness and creating events to inform about the issue of food waste. By these means, they aim to activate their local community. The main "external" monthly action, the Dumpster Dinner is a three-hour event where fifty people are served with a meal made from surplus food. The event is inclusive, free, open to everyone and created in collaboration with Tobber's, a well-known local restaurant. The dinner is thoroughly planned and cooked in a team-effort. In the dining room, the guests snack on appetizers, socialize and learn. A lecture about the new local recycling system is given, followed by a "conversation starter" activity where strangers from the same table are invited to share knowledge from their (un)sustainable daily practices. After this hour of extra-activity, the buffet is presented. To find out what kind of citizens this event attracts, research planning surveys were handed out. This data collection was meant for the participants to express their "before" and "after" impressions and thoughts of the event. 52 questionnaires were distributed and 35 collected.

Figure 3. Volunteers cooking for the Dumpster Dinner.

Figure 4. Participants of the Dumpster Dinner evening.

3.3 The Smørrebrød workshop

A design experiment was held as a method to determine the relationship between factors affecting the FRF process and its output. This section explains the design experiment inspired from observing FRF actions. The facilitation role was intentionally removed and replaced by textual content, presenting the ecological footprint of the showcased ingredients. Here, the author wanted to test the importance of the facilitation wrapped up within the experience.

Inspired by Shameplane.com's approach to showing data upfront (Müller, 2018), this workshop was an attempt to move the audience through informative content. Inspired from previously collected insights from the FRF modus operandi (Kimbell, 2012) such as: inviting participants, building a trust ground, using food as a conversation starter, providing the participant with freedom of choice and information about their consumption. It was organized without input from FRF. The workshop took place at a higher-education school. It was aimed at local Kolding citizens and internationals (six participants, aged from 21 to 54). They were invited, during their lunch break, to create their smørrebrød (typical Danish lunch composed of a slice of bread and a selection of ingredients on top) in two stages.

First came the smørrebrød creation, then, an individual written questionnaire. The participants received the following materials: plates, cutleries, their regular canteen environment, a variety of the most regular components of smørrebrød (rye bread, tomatoes, salmon, cucumber, pâté, cheese, boiled eggs, hummus, mayonnaise). Key component of the workshop, data sheets bearing further information about the environmental cost of each of the dietary pieces. Designed to be as visual and fast-to-read as possible, the ladders were placed next to their related piece of food. During the second phase, participants were provided with a questionnaire so they could reflect on their actions. They were asked to respond, without interaction with other participants. The researcher played a very light facilitation role, directing participants from phase 1 to phase 2.

Figure 5. Participant of the workshop making smørrebrød.

Figure 6. Participant answering the Smørrebrød Workshop's survey.

4. Taste as result

Though recent, the organization of the FRF is settled. With a core of about 30 activists from various backgrounds, the group has started onboarding local stakeholders and created a bridge with their audience, raising awareness through creative and engaging platforms. Their will to teach and share is assumed, the co-founders mentioning their wish to make a change from the bottom by influencing behaviors through criticality. Though efficient, their gathering concept, collecting citizens from various levels of eco-engagement, remained, as from the results of the research planning survey, fairly superficial. Succeeding in raising awareness, there seem to remain a weakness in action taking from the audience side. As an attempt to explore the facilitation role, the Smørrebrød workshop was designed to encourage action taking and criticality by inviting the audience to act by themselves and follow their judgement. Our model might not be accurate as the length, type of food & context differs. But this brief experience helps us comprehend by collecting insights. It was observed in participants' behaviors and reflected in their answer to the reflective questionnaire, that some of them were distracted or uncertain, when their decision process seemed to be disrupted by the presence of data sheets; while others navigated peacefully in the buffet, picking ingredients "eyes closed". The majority of participants expressed guilt as a result of their food choice in relation to their sense of sustainability.

5. Discussion of the research

Often comprised of a blend of political participation, civic engagement, and compromises (Diaz Romero, 2013), activist movements are a peer-to-peer platform of interaction as well as a bottom-up voice which attempt to be heard among numerous other groups both local and global. They are actors campaigning for environmental protection, seeking to confront and disrupt governments and corporate power. These environmentalists -classified as greens, from the light negotiators, to the dark provocateurs- exist in multiple shapes (Beder, 1991; Hasler et al., 2019), and act both against and with the states as seekers of a working relationship with policy makers (Hasler et al., 2019). Nevertheless, even activists of the lightest green complexion are, by their actions, confrontational in some way and for a person or group to choose such a strategy generally demonstrates a lack of faith in society's decision-making structures or a lack of access to formal communication channels with decision-makers. Protest action is the resort of the weak. It is the action of those outside of the power structure and, as such, protestors are only weakly able to influence the way governments will respond to the pressures placed on them (Beder, 1991).

From the field study, three targeted stakeholder groups have been identified: volunteers (active citizens), (inactive) citizens, policymakers. For volunteers, who already possess a level of sustainable education, FRF wants to be a platform for sharing and developing their sustainable involvement, as well as networking. Assuming citizens lack sufficient knowledge about the environment, the aims of FRF are to inform them, get them into action, to

provoke and to inspire new habits. The aforementioned stakeholders are very likely to spread the word and onboard their community, reaching policymakers as a consequence of the demand to come. The third stakeholder group, also directly targeted by FRF, includes the municipality, stores and local businesses. These empowered actors are the only ones able to make a global-scale difference and are of a key interest in the action.

“Ground trust” is basic for encouraging coordinated action with each one of their stakeholders. None of the FRF ingredients of action is chosen without consideration. First, the FRF only uses invitations and never forces interactions. Second, the activist always talks eye-to-eye, in a day-to-day manner, which emphasizes equality, inclusion and transparency in the conversation. Third, the chosen medium, food, is an inexhaustible topic of discussion, incredibly creative and non-confrontational. It is a social mediator, a daily routine, a shared and relatable community value (McCoy, 2003); donated by familiar supermarkets and selected with care by expert activists. Finally, the context, Tobber’s restaurant, is a safe and known place for Kolding residents. The chef is known for his quality food, and the environment is cozy. The event has gained a good reputation and has been recommended by relatives or the local news. The participants of the dinner are not perfect strangers, but familiar faces who can be met around town. To put it in a nutshell, the very local context of Kolding community as well as the FRF methodical modus operandi plays a strong role in trust building and invites knowledge sharing. Trust is a soil for growth.

Picking from the previously cited ingredients, we have attempted to mimic the activists’ action but reduced the role of the potentially essential part: the facilitator. Regretting a lacking bridge between the food prep and its eating phase during the Dumpster Dinner event, we have decided to take it as a pretext to empower the participants of the Smørrebrød Workshop. This was under the assumption that consumers would be happy to get more knowledge about the provisions they are used to buying for themselves and will take more considered decisions, which would make them reflect on their usual pick. Unexpectedly, and probably because of the purposely removed facilitation action, when presented with such an amount of information, some participants experienced confusion and felt overwhelmed. All of them were affected by the information but responded in different ways. One group would ignore the information notes, while the second one would consider them but would feel guilty about their selection. There is an interesting bridge we can create here, resulting from this last observation: guilt seems to be the result of the overwhelming feeling created by the weight of the content. On the contrary, during FRF activities, it seemed like the volunteers’ facilitation eases the burden of serious of the topic, making it more digestible for the audience. There is here a clear, mappable pattern of guilt contrasting with empowerment and trust drawing at the horizon as our research led us into deeper feeling observation (Sanders et al., 2012).

6. Conclusion

This empirical study was to explore the sharing mechanics of pedagogy, the bridge between this activist group to their direct environment. Observations show their use of a variety of methods: the volunteer welcome day, the Dumpster Dinner. Further insights were gained through artefacts and experiments: interviews, surveys, documenting on site, workshop. The gathered knowledge seeks to map out an understanding of the pedagogical approach of activism.
It was my objective to participate as much as feasible in the FRF actions and call up my communication skills and knowledge in the sender-receiver exchange process, in order to understand the needs. My role as a researcher was multifaceted, interchanging from spectator to participant.

Design is about the recognition of the human element in communicating. FRF's methods are intuitively dealing with this through the facilitation. The message is in part the medium (MacLuhan, 1964). The researcher intended through the workshop to explore this facilitation role by removing and replacing it with informational sheets. Providing to the participant the same informational content, the inanimate bit was designed graphically to improve its accessibility (time and content). Attempting to compensate the role of facilitator, the designer acted here as a visual translator and information designer. Whether or not the role facilitator could be reshaped into raw facts delivered through a graphically optimized medium was explored. The ladder experiment resulted in an unexpected answer from the audience, a raise of conscious provoking a feeling of guilt so far unperceived and unexpressed during the two first sessions.

FRF is a key platform, bridging citizens as well as the rest of their stakeholders towards the reality of facts. Leader of their community, they want to spark action amongst citizens as well as local representatives of power (stores, municipality, local businesses, etc.). Most of the time senders of messages, the FRF is also an open space for sharing, from citizens to stake-holders, and the other way round; but most important, FRF is opened-ears as well and flexible enough to support and learn from their community. This learning-from-each-other dynamic is helping the community grow towards sustainability and inclusivity.

Observed at every stage of the activists' action when presented with facts to process, we can identify two responses from stakeholders: empowerment, often resulting from a pattern of trust-building followed by an invitation to acting and/or share an experience; on the other hand, confusion looms when a pattern of overwhelming information coupled with a shaming tone of the message. At the extreme we have noticed in that case of decision making, confusion leads to the feeling of guilt for the participants.

Activism bears many interests from a communication design perspective, I have focused my interest on the educative quality of the activist's message, in all the various forms it could take (content, meaning, medium). The safe space of interaction they created as well as this strong ground of trust make them distinguished game-changers amongst their community.

Guilty Materiality: why we play down material relations.

Stéphane Treilhou[a], Clare Green*[b],

*c.green@rubika-edu.com

Abstract | In a recent conference keynote, a key researcher on influencing product lifetimes through product design presented her current hierarchy of strategies for the implementation of a circular economy. Not surprisingly at the top of this list are refuse (do not buy) and reduce (consume less), closely followed by reuse, repair and refurbish. Moving to a circular economy involves paying attention to, and prolonging the lifecycle of the material artefacts we use. While material relations are at the centre of the consumption habits we now need to modify, there are many reasons why engaging with materiality may be avoided. As designers we don't tend to look systematically at the different reasons why attention is not paid to a large part of material relations. Therefore this paper aims to present and discuss, in a more systematic way, the different factors that generate what could be termed 'guilty materiality'.

KEYWORDS | MATERIALITY, PERSON-PRODUCT RELATIONSHIPS, SUSTAINABLE CONSUMPTION, KEEPING HABITS, ENTANGLEMENT

1. Introduction

In a recent conference keynote, the co-author of a seminal article (van Nes & Cramer, 2005) on influencing product lifetimes through product design spelled out her hierarchy of strategies for the implementation of a circular economy (Cramer, 2019). Not surprisingly at the top of this list of ten points are refuse (do not buy) and reduce (consume less), closely followed by reuse, repair and refurbish. Moving to a circular economy involves paying attention to, and prolonging the lifecycle of the material artefacts we use. While material relations are at the centre of the consumption habits we now need to modify, there are many reasons why engaging with materiality may be avoided. As designers we don't tend to look systematically at why, as a society, we avoid paying attention to a large part of material relations. Therefore this paper aims to present and discuss, in a more systematic way, the different factors that generate what could be termed 'guilty materiality'.

Identifying the different themes that negatively influence the way we consider material objects is a somewhat subjective issue. For this reason, the selection of possible themes presented here cannot be considered exhaustive. The aim is therefore to explore a certain number of themes which could potentially modify our relations with material artefacts.

Insights from addressing this subject with master's level design students and from wider research into longer product relations support this discussion. Out of eight different studies into longer product relations carried out between 2012 and 2019, three in particular (see Table 1, below) highlight ambiguous aspects of material product relations and reasons why we may tend to overlook or avoid these relations. This research involves two different cohorts and research protocols: design students on one hand in an inventory based study, and two different groups of (non-designer) adults aged between 40 and 71 in an inventory-based study and a cultural probe based study (Gaver, Dunne & Pacenti, 1995, Mattelmaki, 2006).

Table 1. Overview of 3 studies into longer product relations

study name	content	participants	main instructions given	output
1. DAILY STUFF THAT MATTERS	Mini-(memory) inventory	**35** *18 - 25yrs*	think about and note down ten everyday objects that matter to you and that you plan to keep/keep using	sketched list with notes and comments
2. WHAT I SEE AT HOME	Virtual + in-situ recorded oral inventory	3 45 - 55yrs	a) describe all the objects you see when you visualise your kitchen, b) other objects visible in kitchen not mentioned in a)	audio recording transcribed, researcher notes + photographs
3. probe of everyday things	Probes, starting with all I touch in a day inventory	8 40 - 71yrs	note everything you touch, at home, from morning 'til night. Don't note big furniture and fixed objects, nor single use items (eg: paper hanky, food)	Self-report notes in different formats, story-telling, photographs

2. Some problems with material object relations

> "By their number, their redundance, their superficiality, the lavishness of their forms, by playing with fashion, by everything about them that goes beyond their pure and simple function, objects do nothing but simulate the essence of sociability - STATUS…That is what generates this madness, this frenzied world of trinkets, of gadgets, of FETICHES which try to mark eternity with value, and in the absence of salvation by grace attempt salvation through things." (Baudrillard, 1970, p77 - 78)

Beyond the sphere of design, in everyday life, a certain number of themes can distort the way we look at material objects, and by extension distort our relations with them. The quote above from French sociologist, philosopher and cultural theorist Jean Baudrillard was written fifty years ago, but remains appropriate today and does not encourage us to have positive vision of our relations with objects. Starting this overview with a quote from the 1970s is also a useful reminder that negative attitudes towards material things and thing-relations are not a new phenomenon. In the design sphere attention is generally focused on the objects and products being created and their desirability, but there is perhaps not much attention paid to what makes us avoid products, objects and object relations. For this reason, it may be useful to try to identify themes which may negatively influence material object relations and perhaps contribute to making us avoid looking at things and the reality of our material relations.

2.1 Overflowing

A useful start-point is a theme that could be named "too much". Faced with the scale of the current environmental crisis, a natural reaction is illustrated by the words of Claudia Dona (1988, p152): "we live in a world overflowing with our own productions, a world in which objects besiege us, suffocate us…"

According to an article in the L.A. Times in 2014, the average American family possesses 300,000 things in their home. A detailed and widely cited study by a team of researchers at the UCLA, between 2001 and 2004, on 32 middle class Californian families noted even in the smallest house studied (90m^2 with two bedrooms and a living room) 2,260 objects visible. As an illustration of the profusion of things in every part of the homes, the study mentioned that each of the families on average had 55 things stuck to the surface of their refrigerators.

In the last twenty years there has clearly been a growing awareness of the number of objects in our homes. There has also been considerable communication around the subject, for example Graham Hill's (2011) TED talk entitled "Less Stuff More Happiness", or James Wallman's (2016) talk on "Stuffocation". Daniel Miller (2008) comments that "we live today in a world of ever more stuff - what seems a deluge of goods and shopping".

Even if these commentaries are a reflection of reality, looking at objects in terms of an undetermined mass or an incessant uncontrollable flood may also be a way of not

addressing directly our relations with these things. In a more recent work by Miller, the author notes that

> "Stuff is ubiquitous and problematic. But whatever our environmental fears or concerns over materialism, we will not be helped by either a theory of stuff, or an attitude to stuff, that simply tries to oppose ourselves to it…" (Miller, 2010, p5)

In study 2., in the form of virtual then in-situ inventory of what could be seen in their kitchens, the three participants (working mothers aged between 45 and 55) each overlooked a large majority of the things in their kitchens during the virtual recollected scan of their home space. Notably in each case the things overlooked and not mentioned were pots of kitchen utensils and cutlery, stacks of chopping boards and water jugs and bottles. This "stuff" simply didn't register in a vision of their kitchen at a distance, so while being problematic, some stuff is managed by being not seen.

2.2 Transitory

The stuff concerned by the 'deluge of goods' is perhaps mainly what Stuart Walker (2017) calls the "unremitting production and marketing of short-lived, unrepairable and often relatively trivial products…that arouse feelings of dissatisfaction and stimulate consumption and waste." There is a tendency to separate certain objects carrying meaning from the mass of trivial, cheap objects destined to become waste. The "Significant Objects" project of Rob Walker and Joshua Glenn illustrates this idea. , The authors bought a variety of trinkets without value, and then gave them value by asking writers to create stories about them, before re-selling them with the stories attached. The authors wanted to test whether adding "meaning" could artificially transform the value of an otherwise worthless artefact.

Chapman (2005) writes that 90% of material resources extracted today will become waste in less than three months. This suggests that there is a large percentage of "stuff" that never reaches the status of 'object' and transits directly and invisibly to the status of waste. This theme sees objects as something transitory; goods that don't reach the status of relation and go directly from acquisition to rubbish. Fromm (1976) describes the vicious circle of "consumer-buying" as; "Acquisition → transitory having and using → throwing away (or if possible, profitable exchange for a better model) →new acquisition." The goods are considered, from the start, as transitory, perhaps like the plastic toys described by Roland Barthes twenty years before Fromm: "chemical, in substance and colour, the material itself introduces a gut feeling/sensation (*cénesthésique*) of use, not of pleasure. These toys die by the way very quickly and, once dead, have no posthumous life for the child."

Chapman (2008) comments that many people detest our "throwaway society in which lack of quality is taken for granted". Walker (2004) writes that "all physical artefacts will sooner or later decay and be discarded, but their meaning and value can remain relevant" by associating utility, poetry and symbol. A more recent example of selecting objects by

meaning could be the “spark joy” test suggested by Marie Kondo, in the highly popular Netflix series (Chamberlin & Callmer, 2019).

Opposing meaningful and meaningless stuff might seem an unsatisfactory strategy considering the sheer quantity of things encountered. As Barthes suggests, a majority of things are probably unconsciously registered as transitory, and only in terms of their immediate use.

The ambivalent status of everyday use things can be illustrated by part of the verbatim in study 2. In the virtual scan, one participant thinks out loud “and then on the right-hand side there’s various things that we use quite often, so, kettle and pestle and mortar and tea and coffee jars”

When asked if any of these things matter, the participant, rather reluctantly says “The um, we’ve got a Bodum kettle, which is also probably the least annoying kettle I’ve ever had (laughing), so that’s quite good” The kettle, despite being “least annoying ever” didn’t really count as something that mattered, and needless to say, was replaced less than 3 months later.

2.3 Materially inept

Many of the objects in the “stuff” category don’t have a problem of material quality and adding meaning is not always a pertinent response. The comments in the previous section perhaps illustrate another theme that could be named “material ineptitude”. The example of the toothbrush is a good illustration of an object which is very durable but that we are meant to change every three months. It is in fact an object with too much material quality, for which we are only today starting to look for more environmentally relevant solutions. On this subject, it can be useful to add a comment of Barthes (1957, p172) on plastic as material, “…sublimed as movement, almost inexistent as a substance…entirely swallowed up in its use”. The use of certain materials (perhaps certain plastics) reinforces the invisibility and transitory nature of things and thus represents an inept material choice.

The case of toothbrushes concerns generally a combination of two or three plastic materials (polypropylene or polyethylene, nylon and sometimes silicon) but a clearly a product like the smart-phone contains nearly all the elements of the periodic table (Chapman, 2008). The question of material choices is highly complex, and may generate confusion, rejection or avoidance behaviour.

2.4 Toxic (materials and behavior)

Beyond simply inept or unadapted materials, actual toxicity is another theme that could generate negative object relations. If smart-phones represent one of the most visible examples of toxic materials, toxic forms of product and even behaviour that we could qualify as toxic, an example dating from the beginning of industrial design is also quite relevant. The

place of William Morris in the history of design tends to be in relation to using design and by extension well-designed products to improve lives, with for the person behind the production and the consumer. But even in the Victorian era, his wallpapers were suspected of making both workers and buyers ill. It is even more ironic that the colour responsible for poisoning was the colour green. Even after having stopped the use of arsenic in the pigments, in the 1870s following public pressure, Morris himself didn't believe in the toxicity of his products, writing to his dye manufacturer in 1885 "As to the arsenic scare, a greater folly is hardly possible to imagine: the doctors were being bitten by witch fever" (Kirby, 2003). The fact that pigments containing arsenic were already criticised for clothing in the 1860s (Hawksley, 2016) show the paradoxes and slow reactions around toxic products.

While toxicity might be a valid reason for negative opinions towards products, the cases of Victorian wallpaper and of today's smart-phone suggest that the influence is probably more ambiguous and more complex.

Individual research and presentation exercises with a group of final year product & service design masters students on the question of negative connotations of product relations drew attention to problems around plastic water bottles. Discussions within the class very quickly generated considerable interest and a certain anxiety, as none of the students (in 2019) were familiar with plastic leaching, and advice not to re-use old or damaged bottles.

Two insights from study 2. illustrate more ambiguous positions. One participant commented on a set of old plates "we've washed them so much, all the varnish is coming off. And I don't know if it's dangerous or not, because earthenware's got metal in it, but anyway, I'm attached to those plates, but I say we should stop using them because of that…" Another participant jokes about a vintage style toaster that doesn't have an on/off switch so is potentially quite dangerous "but at the same time it's very slim, it's small, it doesn't take up much space, so I can't bring myself to get rid of it".

The student reaction, as well as the two insights highlight that perhaps rather than toxicity, the key issue is perhaps lack of material knowledge.

2.5 Anti-social

The themes mentioned above may influence the way we think about (or don't think about) material objects. It is useful to also keep in mind themes not yet evoked that could be qualified as reasons for considering that relations with objects are in themselves a problem. Claudia Dona (1988, p152) writes that objects "very often distance us from one another both physically and mentally…they make us forget how to feel, to touch, to think". Miller (2010, p5) confirms that a common view is that "stuff somehow drains away our humanity" and that (Miller, 2008) our relations to things come at the expense of our relationships to people. Miller (2008) aims to prove the opposite view that at least in some cases "the closer our relationships are with objects, the closer our relationships are with people", but insights from all three studies suggest that people are often not comfortable admitting object

relations. A typical response in Study 2. commenting a favourite orange coloured mug: “it’s nice and big… I just like that one, it must be my autistic side”.

While directly admitting attachment to everyday objects appeared to initially be unnatural for many participants in the studies, identifying a social meaning was a very frequent and perhaps more acceptable first reason given for an object attachment.

2.6 Morally reprehensible

The arguments put forward by Erich Fromm in his book To Have or To Be (Fromm, 1978) illustrate why object relations may be seen as morally unacceptable. Citing Buddhism, as well as the Old and New Testaments, Fromm describes two fundamentally different modes of existence that are reflected in our daily lives. The “being” mode “means aliveness and authentic relatedness to the world. In the “having” mode the relation to the world is “one of possessing and owning” and Fromm (p65) signals that in this mode of existence,

> “All that matters is my acquisition of property and my unlimited right to keep what I have acquired. The having mode excludes others; it does not require and further effort on my part to keep my property or make productive use of it.”

Beyond the notion of relations to objects at the expense of relations to other humans, Fromm also details what is wrong with these relations: we should not be bound, tied, chained to what we own and what we have…things “are not in themselves “bad”, they become bad; that is when we hold onto them, when they become chains that interfere with our freedom and block our self-realisation.”

2.7 Entrapping

Fromm’s arguments evoke the difference between the static and enclosing nature of “having” and the movement, productivity and activity of “being”. Accumulation is seen as leading to being imprisoned and becoming a servant to our possessions. François Châtelet (1992) comments “those we call primitive peoples have a very good understanding of the problem that accumulation creates. The fact that it can enslave us and that it is not a crime to consume our stocks.”

In relation to themes of entanglement and dependence between humans and objects, Ian Hodder gives an explanation of the notion of “Hau” first described by Marcel Mauss:

> “Enchainment is created because of the “hau” of things—that is their need to be moved on, to be mobile. Gifts are treated as responsibilities that are to be quickly got rid of—it is wrong, impossible, for something to be stationary.” (2014, p22)

Another form of entrapment by objects is suggested by Bruno Latour (2000). In networks where humans are linked with objects, it is possible to question whether the control or mastery is in the hands of the humans or the (technical) objects, and this questions the distribution of power to act between different actors (human and non-human) within a

network. In many situations clearly things make us do things, and Latour gives these things the name "*faitiches*" - linking the verb "*faire*" (to do), and fetiche, highlighting how things in mediation can be seen as problematic.

A related point was raised by the group of master's students, who suggested adding the theme of objects-that-spy-on-us, and objects that collect information on us, which is clearly an issue of growing relevance.

In economic terms, the acquisition of goods (and the acquisition of income) generates a certain number of treadmill effects which in effect tie people down and thus limit freedom and movement. Binswanger (2006) notes four different kinds of these treadmills: a positional treadmill, a hedonic treadmill, a multi-option treadmill and a time-saving treadmill.

2.8 Materialistic

The positional treadmill proposed by Binswanger is related to the acquisition of goods as a means to acquire and keep social status. This theme can be linked to the idea of conspicuous consumption, described by Thorstein Veblen (1899). Ostentatious consumption of luxury goods was identified by Veblen as a means for gentlemen of leisure to gain respectability.

> "The superior gratification derived from the use and contemplation of costly and supposedly beautiful products is, commonly, in great measure a gratification of our sense of costliness masquerading under the name of beauty."

This form of consumption corresponds to the idea of terminal materialism, the fact of desiring objects for themselves (Belk, 2001). A more general definition of materialism given by Belk (2001) is the belief that possessions bring happiness. Belk also notes that in most studies more materialistic people are less satisfied with their lives than less materialistic people. The clearly negative image of materialism contributes to the fact that it can be difficult to admit many material object attachments.

Valerie Guillard (2009/2013), researcher in marketing and management science, identified a tendency that she differentiates from, but links to, materialism. Named the "tendency to keep everything" (*TTG/ tendance à tout garder*), this behaviour is defined as follows:

> "The chronic tendency to keep everything is a personal determinant which manifests itself with certain consumers in a stable and recurring fashion. It concerns useable objects, for which the consumers no longer have any use and are not worth selling."

Guillard suggests that our current consumption society is torn between excessive accumulation and rejecting waste. An interesting aspect of Guillard's research is the very negative description of this tendency. The author suggests effects may be dysfunction for the consumers and their social environment as well as restrictions to mobility. The notion of keeping things is seen as obviously problematic and strange, and the author expresses surprise at certain "TTG" consumers using objects right up to the end of their useful life. On

this point it might be useful to gauge whether ecological questions have modified opinions on this type of behaviour.

In the probe based study (3), completed in 2018, the notion of "keeping" things generated surprising results. Participants were asked to make a list of everything touched in one day, then refer back to the list and mark the things they planned to keep and continue to use. On average participants only marked 21, 8% of things touched during the day as being for keeping. Participants were also asked to note things for replacement in the near future. Very few things were marked in this category, which seemed to suggest, in the context of the study, that daily objects are not consciously for keeping or replacing, or rather that the lifespan of the objects is not something that is thought about. It can be useful to note that what is seen as critical in the Marie Kondo method of decluttering (Chamberlin & Callmer, 2019) is helping people to focus on what they love and want to keep, shifting people's attention away from feelings of guilt and loss.

2.9 Compulsive

In certain cases keeping objects reaches dangerous or pathological levels. Compulsive accumulation or "hoarding" is defined as; "the habitual practice of accumulating obsolete objects privately and the inability to dispose without clear conscious motivation or control" (Cherrier & Ponnor, 2006). The authors signal that the term hoarding initially referred to the behaviour of rats, collecting and transporting an immense variety of things. This extreme version of keeping things is likely to be familiar to many people. Two to five percent of the American population may have this pathology according to Frost and Steketee (2010), and two-thirds of people interviewed for their study of the phenomenon personally knew of a significant case of hoarding. Frost and Steketee illustrate how some examples of hoarders, like the Collyer brothers in New York become forms of urban legends, and are used as a threat by generations of parents to get their children to tidy their rooms.

On a more familiar scale, an essay on clutter (Baker, 1995) raises some useful points around everyday accumulation. Once it is named clutter, material is identified as a problem, as matter out of place. It is the impulse to collect then hating this trait in ourselves. Clutter is also "unstable and volatile" and the revenge of objects on design. Baker calls clutter

> "Disordered things that impede movement or reduce effectiveness …That part of our "self" that escapes "our" control, "proper" control, and is all the more galling for being represented by dumb objects, disobedient objects."

These points made in relation to clutter are an effective conclusion. Our stuff and clutter is a reflexion of our behaviour, and is also in many ways out of control, and our relations with material objects are also unstable and complex.

3. Conclusion/Implications

The aim of this presentation of themes that may generate forms of "guilty materiality" is to show the diversity of the question. The breadth of the subject means that this presentation cannot be considered exhaustive, and the scope of this article does not allow for detailed development. The table below (Table 2.) gives an overview of the themes mentioned. While the ethnographic studies cited here can confirm the possible influence of some themes on object relations, these findings are as yet only indications.

Table 2. Themes that may negatively influence relations with things

1	**too much**	things overflowing, flooding, becoming unmanageable
2	**stuff**	unidentified material, unseen
3	**waste**	things without value
4	**short lived**	seen as transitory
5	**inept materials**	unadapted to life-cycles
6	**material confusion**	and lack of material knowledge
7	**toxic materials**	and lack of information and reaction
8	**toxic behaviour**	and behaviour dictated by things
9	**anti-social**	object relations detract from human relations
10	**morally wrong**	we should aim for "being" rather than "having"
11	**entrapping**	objects can entangle or trap us
12	**restrict movement**	treadmill effects, restricting personal mobility
13	**materialism**	desiring things for themselves
14	**spying**	objects can spy on us, and collect information
15	**hoarding**	pathological behaviour
16	**clutter**	matter out of control,reflecting our lack of control

Further research on the above themes would be useful to better understand negative biases linked to material relations. Stigmatising and ignoring material relations is probably not useful in environmental terms, and may contribute to inappropriate behaviour. Understanding these biases can help to rethink and inform design for more responsible material relations.

This study aims to introduce a question that deserves further exploration, and also identify a number of possible directions for that research. The negative connotations linked to material relations constitute an important study area for the influence they may have on appropriate sustainable material-related behaviour in the near future.

Abstract | This paper presents recent work designing and testing a card game for manifesto writing, including a new edition that focuses on the "Future(s) of Europe" as well as a digital edition. The game began in 2019 with a "Tech Edition" and has since been tested in classrooms and grassroots organisations across Europe. Beyond the basic rules, each trial has brought about significant modifications: in terms of content, timing, number and type of cards permitted, and other aspects of gameplay. In our game the manifesto is conceived of as a *revolutionary* genre - a tool for activists in challenging and complex times. By developing a new set of "provocations" for our European edition, on themes like climate action, countering extremism, the need for unity, action against racism, and finding empowering uses of digitalization, our aim is to help rebuild the commons and encourage consensus on the most difficult issues we face.

KEYWORDS | MANIFESTOS, GAME DESIGN, ACTIVISM, CREATIVE SUBVERSION

1. Come, comrades

This paper presents recent work designing and testing a card game for manifesto writing, including a new forthcoming edition that focuses on the "Future(s) of Europe" and a digital edition. The game, which began with a "Tech Edition" created for a conference on human-computer interaction (Hanna, 2019), has since been tested in university classrooms and grassroots organizations in locations across Europe. Beyond the basic rules (described in Section 3.1), each trial has brought about significant modifications: in terms of content, timing, number and type of cards permitted, forms of collaboration, and other aspects of gameplay.

Figure 1. MANIFESTO! the game. ©Words in Freedom Project.

At its most basic, a manifesto may be defined as a public declaration issued by a group or individual with the purpose of declaring principles and aims. In our game the manifesto is conceived of more specifically as a *revolutionary* genre - a "tool for change" (Hanna, 2019) that by "defining and enacting the identities of radical groups, individuals, and parties ... has galvanized revolutionary movements" for centuries (Lyon, 1999, p.1). In the digital age manifestos have been present since the beginning, for example in declarations made by hackers, cyberfeminists, and techno-utopians. Manifestos are arguably timelier now than ever; while they hold great potential for constructive change, they also reflect the dangers of extremism

and a fragmented populace. The return of a form that was so ubiquitous in periods of crisis is symptomatic of our present upheaval. On balance, however, the manifesto will be presented as a unique and indispensable tool for activists in challenging and complex times. Drawing on our experience collaborating with the Collective Intelligence Unit of the UK innovation organization Nesta to create a "manifesto toolkit" (Section 3.2), we will argue that helping people to articulate their views and crowdsource common principles on key topics is a worthwhile activity.

2. Games for political change

Games by their very nature present a certain ideological worldview, and the rules of the game normalize that worldview. A chess player can only win by defeating the enemy through violence, and by implicitly accepting a system of hierarchy and class centered on the monarchy. Popular children's games such as The Game of Life and Monopoly reinforce culturally specific, often conservative values, for example that the winner is the person who accumulates the most capital by whatever means necessary. Golf enshrines class privilege through the relationship of caddy and player, and through the levying of costly membership fees for use of privately owned land. Under the pretense of innocent fun, games, like all designed objects, tend to reproduce the social relations and ideology of the society in which they were created.

How then do we create games that give players new frameworks in which to think, challenge entrenched ideas, and support meaningful social critique? The French Marxist theorist Guy Debord's Le Jue de la Guerre, in which opponents wrestle with "contesting interpretations of the topology of physical space under spectacular capitalism", offers one interesting example. It not only contains a critique of Western capitalist society but also offers itself as a training tool for the means of changing it (Barbrook, 2015). Under the auspices of "gamification" there have been many attempts to directly leverage games to modify behaviour. In 2007, a game called World Without Oil placed 1,700 players in a fictional oil-scarce world. In the three years that followed, it was reported that most players kept up the fuel saving habits they had learned in gameplay (McGonigal, 2010). Evoke, a game deployed by the World Bank in over-exploited economies, asks players to solve major natural catastrophes and epidemics, largely using profit and market-driven solutions (Waddington, 2013). Games like The Day We Left seek to raise awareness: at the height of the Syrian war, this game placed players within a Syrian family trying to escape the war zone. Its aim was to act as a counter-narrative to stories promoted by privately owned media corporations that Syrian refugees in the West were part of an undercover invasion by Islamic State (Wong, 2016).

Like games, manifestos seek to structure reality. However, while games generally create a reality separate from and in parallel to our own, manifestos attempt to (re)structure *actual* reality through revolutionary speech acts (Puchner, 2006, p.23). Most games leave the "real"

world unaffected, at most changing a player's perspective on the world, whereas a manifesto ideally lays out a path towards or provokes a rupture leading to actual change. By bringing the two together, what we have done in the various editions of our game is to create a system, either open or closed, in which the larger system can be questioned and reimagined (and even, in the closed system, safely smashed). The outcome of the game is a manifesto. Players are permitted to act as revolutionaries, but they are also encouraged to create lines of reasoning and critique that can extend outwards, beyond the limits of the game, to address and unsettle real world systems and institutions.

3. MANIFESTO!

3.1 Tech Edition

MANIFESTO! is a card game for individual or group manifesto writing. While it stands alone as an analogue game, it also serves as a design probe for the Words in Freedom project. The first iteration (the "Tech Edition") was developed in 2019 and first deployed at the annual CHI conference the same year (Hanna, 2019). We wanted to use the game to engage players around issues affecting all of us within technology-related disciplines (and the wider world we live in), in order to: 1) take the temperature of colleagues in the field on adopting a more activist stance, 2) test our notion of manifesto writing as a key activity in pushing technology in a more progressive direction, and 3) test our game for subsequent iterations, and as a design probe for inspiring new collaborative authoring tools, both analogue and digital.

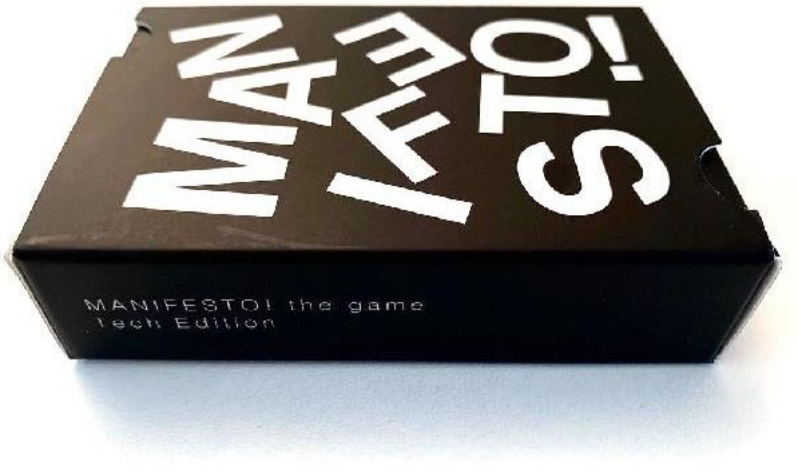

Figure 2. MANIFESTO! Tech Edition. ©Words in Freedom Project.

The rules are as follows: it is a game for individuals or groups of 2-6 players. In each round, player(s) are dealt one random card from each of four categories: Provocation, Orientation, Opening, and Tone. One card substitution is allowed per round. The categories each define a different parameter or constraint of the overall objective. Provocation suggests a broad topic or theme (e.g. “Better for whom?”); Orientation designates the type of manifesto players will create (e.g. “Declaration”); Opening offers the initial phrase (e.g. “We declare”); and Tone is the rhetorical register to be used in addressing the subject or audience (e.g. “Hopeful”). Players use these four constraints as a prompt to write or draw their manifesto individually or collectively. Each round can be timed (we suggest 10-15 minutes per round) or open-ended. When a round is complete players vote for the “winner” - the most persuasive manifesto - and are encouraged to disseminate the text either publicly or privately as a means of continuing the discussion. Having players take turns performing their manifestos in an exaggerated dramatic style is also recommended.

Figure 3. MANIFESTO! Facilitator.

MANIFESTO! was inspired in part by The Thing From The Future (TTFTF), Stuart Candy and Jeff Watson’s design fiction game, which was made to be “hacked and customised” (Candy, 2015). Like TTFTF, MANIFESTO! is distributed under a Creative Commons (BY-NC-SA) licence. Beyond the simple prompt-based game structure, there are significant differences between

MANIFESTO! and TTFTF. While TTFTF encourages players to create an everyday object (e.g. a postcard) that tells a story about a possible future, MANIFESTO! seeks to focus players on thinking about real possibilities for change in the present. In this first edition, MANIFESTO! featured roughly half as many cards (53 instead of 108), a modified game sheet with combined text/image authoring space and room to place actual cards, and colour-coding on card backs to indicate the four categories, which were also different: Orientation, Opening, Provocation and Tone in place of TTFTF's Arc, Terrain, Object and Mood.

In designing MANIFESTO! we sought to allow for productive dissonance between the four cards of a given hand, inspired by the anarchic and chance-driven processes of 20th century avant-garde movements such as Dada, Surrealism, and Fluxus. After all, the avant-garde manifestos of the last century serve as positive models of disruption through noisy provocation, creating new realities on the fly, as R. B. Kitaj does in his *First Diasporist Manifesto* (1989):

> "Diasporist painting, which I just made up, is enacted under peculiar historical and personal freedoms, stresses, dislocations, rupture and momentum" (qtd. in Caws, 2001, p. xxix).

Or as Tristan Tzara declares in his effervescent Dada Manifesto of 1918: "Dada: abolition of prophets: Dada: abolition of the future: Dada; absolute and unquestionable faith in every god that is the immediate product of spontaneity: Dada; elegant and unprejudiced leap from a harmony to the other sphere; trajectory of a word tossed like a screeching phonograph record" (Danchev, 2011, p. 144). Manifestos embody impatience with the old ways, and a push to imagine and realise new ones as quickly as possible: here, now, today.

We encouraged players to subvert the rules of the game if they wished, and in testing many players took advantage of this opportunity to co-create the game with us. These "creative subversions" fell mainly into two types: taking back control, and trying to make the game more democratic. There were several instances where players seized control of various aspects of gameplay to make the game more interesting or better suited to their needs. For example, some players wanted to choose cards that reflected issues they care about, rather than having them dealt at random. In terms of making the game more democratic, one group chose to give every member a chance to lead rather than nominating a single leader. Another group chose not to have a leader at all, while a third group decided to split into two smaller factions because they could not agree on a single set of principles.

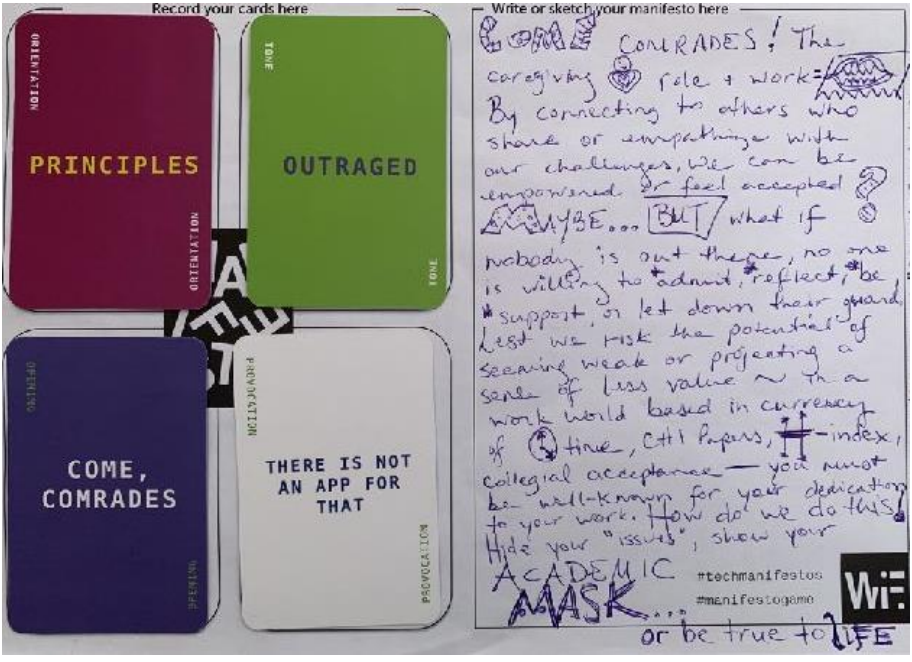

Figure 4. Example manifesto.

3.2 Nesta Collective Intelligence Edition

In late 2019 we repurposed MANIFESTO! to help stakeholders produce a mission statement or list of guiding principles for collective intelligence, in collaboration with a leading UK innovation institute. Working closely with Nesta, we developed a manifesto writing toolkit - a new edition of MANIFESTO! with accompanying rules and materials - to help researchers and practitioners articulate ideas for change, define a set of shared values, and create a sense of community around the idea of collective intelligence.

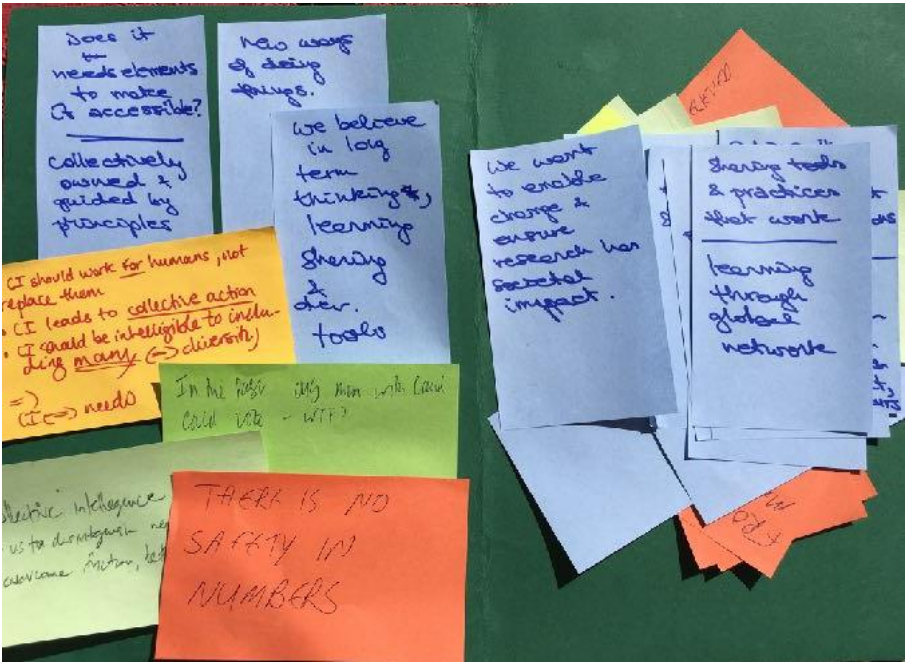

Figure 5. Nesta collective intelligence manifesto brainstorm.

Over the course of two workshops, we introduced the game, played one hand of cards, facilitated discussions around the topic, and gathered the resulting manifestos with five points each from the seven groups that participated. We then extended the discussion to a wider online community interested in collective intelligence using the polling platform Sli.do, allowing anyone interested in the topic to vote on the most important or compelling principles. This crowdsourcing process helped us winnow the original 35 principles (total) down to the top ten. After a week of voting, the following list emerged of the most popular principles (in order):

1. Ask yourself, how can you prevent bias from being replicated? Collective intelligence needs collective diversity.
2. Collective intelligence should serve an equitable distribution of power.
3. Let's use collective intelligence to build empowerment, ownership, and agency.
4. Seek the intelligence of the many; in all its diversity and forms.
5. Imagine if everyone could use, access, and benefit from collective intelligence.
6. Enable change and ensure research has societal impact.

7. Give the unheard a voice, and give that voice power.
8. We believe in sharing tools and thinking.
9. Re-imagine and build new tools - based on the experiences of the many, not the few.
10. AI currently works in the interest of capital - let's use collective intelligence to drive social change. (Grobbink, 2019)

Figure 6. Nesta Collective Intelligence Edition cards and game board.

The rules of gameplay for this edition were significantly different from the original version. The main reason was the shift in purpose or desired outcome: in this case we wanted players to come together and write a manifesto on a common, predetermined theme (i.e. collective intelligence) rather than focusing on a particular, randomly chosen issue (e.g. gender, surveillance, access, machine learning, etc.) on the subject of technology and ethics. In this new edition there were only three categories rather than four - Orientation was unnecessary because everyone was writing the same type of manifesto, i.e. a list of principles. Players were handed one Tone card, and three each of the Opening and Provocation cards, which they used for inspiration rather than as strict constraints. They were permitted to draw additional Provocation cards if they needed more ideas. The game was also slightly longer than

usual, being timed at 20 minutes. The materials - cards, gamesheet, and board - were all re-designed to suit the theme and context, as were the phrases on the cards themselves. We learned from this edition that MANIFESTO! can be successfully tailored to address a specific topic and fulfill a practical goal, and that multiple group manifestos on the same theme can be combined and voted on to produce a single crowdsourced "master" list of principles.

3.3 Future(s) of Europe Edition

Figure 7. MANIFESTO! Future(s) of Europe Edition cards.

The latest physical edition of MANIFESTO! will focus on the possible futures of Europe, where our group is based, to encourage discussion, engagement and envisioning at a time when faith in politics is at an all-time low and hope in the future is collapsing under the weight of the pandemic, the spread of conspiracy theories and false news, grim predictions of environmental and economic collapse, and dystopian visions of society in the vein of *Black Mirror*. By crowdsourcing a new set of "provocations" for our Future(s) of Europe edition, on themes like sustainability, climate action, countering extremism, the need for unity, action against racism, and finding positive, empowering uses of digitalization, our aim is to help re-build the commons in Europe and encourage consensus on some of the most difficult issues we face. We want people to see that their words and ideas matter, that they have something of value to contribute to crucial debates, and that everyone living in Europe - north,

south, east or west, center or periphery, rural or urban - has an important role to play in deciding our collective fate. Fortunately, we are not alone in this pursuit: we have drawn inspiration from a number of recent projects and publications seeking to build new commons and enrich our visions of possible futures (e.g. Bowles, 2018; Candy & Potter, 2019; Latour, 2020; Smith & Ashby, 2020; Staszowski & Tassinari, 2021; as well as the SpeculativeEdu project).

We have begun to assemble a list of new provocations, including some nods to dissenting or discordant voices, with the aim of crowdsourcing dozens more using Twitter and other social media platforms. These initial provocations for our Future(s) of Europe edition include:

Denial is not a policy
Our house is on fire
Stronger together
Stronger apart?
Europe is not a choice, it is a necessity
Sharing not the burden, but the responsibility
Every country needs a Minister of the Future
Economic growth through inclusive growth
Inequality is by design
GDP is not the only measure of well-being
We need a revolution of values
We are not prisoners of fate
Progress or stability?
The new commons

Once again, we will redesign MANIFESTO! to suit the new circumstances and context. For example, the card design will use the official EU colors of Pantone Reflex Blue and Pantone Yellow as well as a stars motif. Gameplay will be based on random prompts as in the Tech Edition in order to generate discussion on a wide range of topics. It will also be important to reach new audiences - not only students and urban professionals, but also (for example) school children with an interest in imaginative games and drawing, newly arrived immigrants with a stake in Europe's future, workers fed up with politics as usual, or older people playing cards and trading gossip in the local park. Manifestos are for everyone!

3.4 Digital version and online platform

We are also expanding the Words in Freedom online platform to host a digital version of MANIFESTO! the game (currently accessible on GitHub), along with the existing Manifesto Machine and Moving Type Machine digital authoring tools (Ashby, 2018; Matos; 2019). The digital version (see Figure 8) mirrors the analogue card came, with the addition of a "SPIN" button for randomly dealing card hands. The online platform will make it possible to crowdsource and share new Provocation cards and game editions to accommodate multiple domains and themes, while ultimately enabling the infinite expansion of prompts, agile experimentation with new variations, the ability to link to existing examples of online digital manifestos, and smoother integration of social media sharing. Some of the potential new

crowdsourced game editions we envisage include: communities, design, higher education, and science.

The online platform will also serve in publishing and showcasing manifestos generated using our analogue and digital tools, with additional functions for facilitating ongoing discussion in the form of comment threads. This is an important new feature that is in response to feedback received from MANIFESTO! participants, who want to know that their manifestos will be visible to a larger public. It also picks up on Latour's invocation for a more dynamic approach to manifesto writing that prompts individuals towards modes of discussion, debate and reflection (Latour, 2010).

Figure 8. MANIFESTO! the game web app.

4. In the future

We are currently testing the cards, along with our existing suite of online tools, in secondary school and university classrooms in Europe. Additional improvements to the next analogue iteration of MANIFESTO! will include: providing two options per Provocation card (doubling the choice of themes); and introducing variations to gameplay instructions, including embodied dramatic techniques, such as the tableau vivant.

Continuing on the Future(s) of Europe theme, our long-term vision involves the design of an interactive multimodal public installation that invites participants to give their voice to a constructive, collaborative and iterative form of manifesto writing on imagining a range of possible and preferable futures of Europe. Installations will be in a select number of European cities and towns (e.g. in public squares, museums, etc.). Some potential modalities we have been considering broadly include: a large visual display, synthetic speech, kinaesthetic interaction, and use of analogue artefacts.

The main idea is to engage Europeans (broadly defined) and anyone living in Europe in talking openly about values, beliefs, anxieties and concerns in a creative and positive space, away from private chat groups and outside of filter bubbles. What does it mean to be European? What does it mean to live in Europe in the 2020s? We want to support the growth of a new commons in Europe and encourage consensus-building on some of the tough issues we face, while at the same time allowing for the healthy divergence of views and productive friction within a respectful and stimulating public setting. The manifesto provides the soapbox and the megaphone — the chance to reflect on our value systems, where they clash and where they overlap — the chance to offend but also to unite.

Abstract | With the appearance and development of graduate school at Johns Hopkins University in the end of the 20th century, the emerging doctoral program and cultivation paradigm was established. At the same time, the doctoral training system pays more attention to the training process and gradually incorporates general knowledge. Also, the general trend of doctoral education is to shift from the 'European model' to the 'American model'. On the other hand, the design doctorate emerged in North America in the 1950s, after which the Chinese design doctorate establishment in 1982. This study comparatively analyzes the existing 19 design doctoral admission systems in China and puts 29 criteria indicators into 3 categories with the help of literature study, field study, and expert interview. Finally, based on the 'application-assessment' system, the researcher proposes several enrollment suggestions for institutes and applicants to refer to, which helps to figure out what are these two stakeholder groups' hope based on the current situation.

KEYWORDS | DOCTORAL EDUCATION, ADMISSION SYSTEM, COMPARATIVE STUDY, DESIGN EDUCATIONAL INSTITUTION, CHINESE CONTEXT

1. Introduction

There have been approximately 30 years since prof. LU Yong-Yi gained her doctorate in the industrial design field in October 1990, which witnessed the very first doctorate awarded to the field of design discipline in mainland China, and it also marked the very first Ph.D. in design cultivated by Chinese independently. Although at that time industrial design was still operated as one of the research directions of architecture in Tongji University, it provided preliminary educational and research materials to people who work in the related fields. After 25 years of Dr. LU's graduation, Tongji University set up Ph.D. Degree in Design in 2015.

During almost 40 years' iteration, it seems that higher education in design discipline has accumulated from specialty to doctor degree. However, the design discipline in China is still in the initial phase. For example, the title of the discipline and degree change every five to nine years at bachelor or master level to cater to academic and political needs, which in turn affects the robustness of design discipline. To some degree, the turbulence reflects the uncertainty of goal and mission in design as a discipline compared to other fields. Moreover, the legitimacy of the existence of discipline generally depends on its knowledge, research construction, and some other factors, which directly refers to its researchers' contribution. Professionals and practitioners, therefore, begin to wonder what kind of educational system may cultivate competent design researchers who will be in charge of knowledge generation and discipline construction. In addition, the admission system is the most direct and efficient access to influence the audience group, which is also the inevitable way to select doctoral candidates (Wang, 2018). For instance, China's 'application- assessment' system was established in 2013 to supplements the examination-oriented education system. However, due to various reasons, application- assessment had not attracted sufficient attention in the field.

2. Methodology

Methods used in this study include literature research, field study, comparative study, expert, and doctoral student interview. Combined with experts' review, students' feedback, research outputs, and practical proposals, this study will give corresponding conceptual doctoral admission suggestions and hope decision-makers to adjust the existing system in design. To be exact, these suggestions cannot directly be made available to the practical situation, but they may help to correct the guidance.

3. Literature Review

2.1 Research on the Admission System Based on Universal Experience

Chen (2019) summarized the existing problems in the 'application- assessment' system for doctors in China from the 5 aspects of application qualifications, tutor power, selection standardization, selection scientificity, and selection effectiveness, and suggested that from the history and experience of ancient Chinese civilization and foreign higher educational practice and modern talent assessment theory draw on ideas. Finally, it is recommended that employers select professional researchers that meet the standards based on the principles of fairness, science, and effectiveness. These three principles also correspond to the first, middle, and third procedure of the doctoral recruitment stage.

Gong and Yang (2018) have discovered the problems from the general experience of the doctoral admission systems in China, such as low quality of doctoral students, insufficient investment in doctoral education, single selection mode, inadequate admissions motivation mechanism, and incomplete quality assurance system. Secondly, the author proposes to improve the existing doctoral admission system from the aspects of admission mode and evaluation system.

Zhao et al. (2018) and others compared the similarities and differences between Chinese and American doctoral admission systems from application conditions, application materials, and selection process, and pointed out the harsh registration conditions, informal expert recommendation letters, the absence of standardized examinations, and the limited admission autonomy of supervisor are issues that affect the admission system for doctoral students. Based on the status quo, the author proposes that the doctoral colleges improve the mid-term assessment mechanism to extend the quality supervision cycle of doctoral students, discover the transferability of doctoral students, and empower supervisors' autonomy.

2.2 Research on College Admission System Based on Empirical Cases

After briefly introducing the background of the 'application-assessment' admission system, Wei Li and Yu-Qian Yang took Harbin Institute of Technology as an example, focusing on the application qualification, application materials, foreign language requirements, and subject assessment in details (Li & Yang, 2017). The author then compared the enrolment data from 2012 to 2015 to illustrate the effectiveness of the Harbin Institute of Technology's implementation of the 'application-assessment' system. Finally, the applicant's comprehensive evaluation form was designed based on the four optimization measures of standardizing the application materials, improving the review and evaluation system, refining the mentor evaluation index, and trialing the review and scoring mechanism to make the reform opinions concrete. Yao et al. (2019) first introduced the college's Ph.D. admission and interview from the perspective of the international education reform of the

School of Pharmaceutical Science and Technology of Tianjin University. They emphasized that the candidate's academic foundation, academic literacy, academic potential, and personality qualities should be explored in a short interview process. Subsequently, the author introduced the general principles of doctoral admissions in the United States and the United Kingdom, abstracted the US doctoral admission tests into an index system consisting of 8 items and 6 abilities, and listed 19 common questions in 4 major categories, covering applicant background, future planning, school selection, etc. Finally, the author suggests that the interview of doctoral admissions in China should adopt a standardized question system and pay more attention to discovering the potential qualities of applicants.

Based on the current situation of insufficient high-quality students, uneven distribution of students, shortage of admissions programs, and excessive administrative power interference, Wang (2018) horizontally compared the 'application-assessment' of doctoral admissions in China with the ordinary admissions system. Then the author illustrated the possibility of operating the two admissions system under different conditions by regarding Nanjing Normal University as an example, such as applying for 'application-assessment' in the science and engineering colleges with a small number of applicants to achieve accurate selection, and enrolling in a liberal arts college with a large number of applicants in the form of ordinary recruitment to raise effectiveness. The author advocates that the two forms of examinations run in parallel to ensure the diversity and accuracy of selection.

2.3 Literature review summary

In the process of literature research, the researcher found that the existing academic studies on the doctoral admissions system are mostly based on researchers' own sensory experience, and there is no evidence for empirical research. On the other hand, the study of the admission system is essentially a type of research based on practice. The lack of empirical research data will cause the dilemma of abstract research conclusions, reduced reliability, and weak reference directivity. Therefore, this study will analyze the existing doctoral admission systems based on 19 cases of design educational institution who have the authority to award a doctorate in China, then discover the common regularity when they make decisions on admission. Finally, the author proposes resilient suggestions on doctoral admission strategy which adapt to design discipline's educational philosophy, subject attribute, and development trends.

4. Discussion

This study selected 19 design doctoral admission systems as research objects from 19 design educational institutions. There are 4 of them located in Beijing, Beijing Institute of Fashion Technology(BIFT) (Beijing Institute of Fashion Technology, 2019), Beijing Institute of Technology(BIT) (Beijing Institute of Technology, 2019), Central Academy of Fine Arts(CAFA) (China Academy of Fine Arts, 2020), Tsinghua University(THU) (Tsinghua University, 2019); 4

located in Jiangsu province, Jiangnan University(JNU) (Jiangnan University, 2019), Nanjing Normal University(NNU) (Nanjing Normal University, 2019), Nanjing University of the Arts(NUA) (Nanjing Institute of the Arts, 2019), Soochow University(SU) (Soochow University, 2019); 2 located in Shaanxi, Xi'an Academy of Fine Arts(XAFA) (Xi'an Academy of Fine Arts, 2019), Shaanxi University of Science & Technology(SUST) (Shaanxi University of Science and Technology, 2019); 4 located in Shanghai, Donghua University(DHU), Tongji University(TJU) (Tongji University, 2019), Shanghai University(SHU) (Shanghai Academy of Fine Arts, 2019), Shanghai Jiao Tong University(SJTU); 2 located in Zhejiang province, Zhejiang University(ZJU) (Zhejiang University, 2019), China Academy of Art(CAA) (China Academy of Art, 2019);1 located in Hubei province, Wuhan University of Technology(WHUT) (Wuhan University of Technology, 2019); 1 located in Hunan province, Hunan University(HNU) (Hunan University, 2019); 1 located in Jiangxi province, Jingdezhen Ceramic Institute(JCI) (Jingdezhen Ceramic University, 2019).

By studying admission documents of 19 institutes, the researcher classified 29 index items into three categories, administrative examination, research quality, and professional appraisal. The three categories can be seen correspond to successive three periods of each candidate. The administrative examination involves applicants' master thesis, transcripts, recommendation letters, and others, which proves the previous achievements. Secondly, most of the research quality requires applicants to provide research outputs, design works, or awards in the last few years; these would reflect their current quality. Lastly, the essence of a professional appraisal is to discover applicants' academic potential, for example, which requires them to write papers on related topics in three hours combined with interview and defense. The following three tables will present the concrete performance of each institute on 29 items.

4.1 Administrative examination

Besides academic activities, administrative management is one of the key elements in the educational system. Investigating administrative requirements will not only help to learn applicants' previous competence, but realize the governor's vision toward doctoral education. Table 1 describes the required administrative documents. The researcher will interpret typical items according to the following statistics.

Table 1. Statistics of administrative examination requirements.

*Legend: 1. student status verification report. 2. registration form. 3. curriculum vitae. 4. Ideological and Political Situation Questionnaire. 5. proof of foreign language proficiency. 6. undergraduate transcript. 7. bachelor's degree certificate. 8. graduate transcript. 9. master's degree certificate. 10. ID card. 11. master's degree thesis. 12. Master's Degree Thesis Review Book. 13. recommendation letter. 14. letter of acceptance from the tutor. 15. health check.

Curriculum vitae reflects a person's general competence and logical organizational capability. Among 19 institutes, only Zhejiang University requires this curriculum vitae.

There are 12 of 19 institutes requires proof of foreign language proficiency, and all of them are comprehensive university. In addition, the rest 7 institutes include 6 art colleges, which indicates the various educational goals. From bachelor level to doctoral level, Chinese comprehensive universities focus more on all-round quality, which parallelly cultivates as many abilities to make well-balanced citizens. When graduated, these people are supposed to engage in extensive careers. On the other hand, art colleges are more practical and equip students with special talents, such as fine arts or dance. Traditionally they spend more time strengthening these talents to be qualified, while this narrows down their career after graduation. Thus, that is why English as a communication tool seems less indispensable to art college students.

Compared to undergraduates, the graduate transcript and master's degree earn more attention. Firstly, masters' courses are based on research skills cultivation, which is similar to doctoral study requirements. Secondly, the performance of the master level reflects applicants' research quality to some degree.

The master thesis presents a general academic quality. According to Table 1, 13 institutes examine the master thesis, including 7 comprehensive universities. However, art colleges pay less attention to this part, for they pursue special talents.

Tsinghua University is the only institute that does not require a recommendation letter. On the other hand, the other 18 institutes require two recommendation letters. Besides, diversified graduation assessment indicates a transformative tendency in Tsinghua.

The tutors' group consists of a group of supervisors, which is a new model to do the tutorial. Compared to one on one supervision, tutor group provides suggestions from diverse

perspectives, which not only releases supervisors' burden but offers more opportunities to do defense for students. Also, acquiring confirmation advance with supervisors will improve the efficiency of enrollment and leave space for applicants to do subsequent plans once failed. Table 1 shows that only Wuhan University of Technology and Hunan University request the confirmation of acceptance from the supervisor in advance.

Based on statistics, the most valued document is the master's degree certificate, which is requested by all institutes. Then are the registration form and recommendation letters. The most unvalued document is curriculum vitae and the Ideological and Political Situation Questionnaire, each of which is only required by one institute. Secondly, Wuhan University of Technology requests most documents, and Tsinghua University and Jingdezhen Ceramic Institute request the least documents, 12 and 3 respectively. Thirdly, Jingdezhen Ceramic Institute is the only institute that has not to employ the 'application-assessment' model in the admission system, of which details will be discussed in the following texts. Lastly, third-party evaluation tells applicants' quality from the side, such as recommendation letter. For lacking censorship, third party evaluation can be subjective and need to balance justice and authenticity.

4.2 Research quality

Unlike compulsory administrative examination, most of the research quality requirements are optional. However, this part is also the key to widen the gap among applicants. Then, points and ranking will be evidence to selected people for the next round.

Table 2. Statistics of research quality requirements.

	16	17	18	19	20	21	22	23	24	25

*Legend: 16. honor and award. 17. paper. 18. project. 19. monograph. 20. patent. 21. recent work. 22. Portfolio. 23. proof of participation. 24. self-evaluation. 25. research plan.

Almost all the institutes request awards, papers, projects, monographs, and patents. These 5 items reflect applicants' achievements and are easy to be quantized. For example, the account of the published paper or award certificate can be scored. However, portfolio, self-evaluation, and research plan suggest applicants studying experience, which is harder to examine immediately but will expose logical construction and thinking process. For academic research, the thinking paradigm is more essential than other qualities.

Self-evaluation is similar to a personal statement, which requests applicants elaborate growth experience, interests, academic background, vision, etc. On another side, self-evaluation reflects one's communicative competence and self-promotion ability, both of which belong to transferability. Also, as an increasing number of doctors choose not to do research work, their employment appears diversified.

Jingdezhen Ceramic Institute follows a traditional examination system, which uses written examination to test applicants' quality. Thus, no research quality material is requested.

4.3 Professional appraisal

Table 3 explains the details of how institutes organize further examinations.

Table 3. Statistics of professional appraisal requirements.

*Legend: 26. foreign language. 27. professional test. 28. professional retest. 29. comprehensive interview.

As is shown in Table 3, most institutes combine the foreign language examination and the professional tests, which is to ensure applicants' quality during the examination paradigm transition period. Generally, Soochow University, Tongji University, and Zhejiang University have neither foreign language tests nor professional tests, but these institutes request proof of foreign language proficiency and research quality evidence before the preliminary test. Besides, the Central Academy of Fine Arts, Tsinghua University, and China Academy of Art offer diverse foreign language examinations to applicants, including English, French, German, and Japanese.

It can be seen from the comparison that all of the institutes have either professional test or retest. This reflects professional quality is as valued as a professional interview. Professional quality is examined by design theory, design creation, or writing, which the details will be discussed below.

According to the admission system, all institutes ask for professional examination except Tsinghua University. Besides, only Nanjing University of the Arts, Shaanxi University of Science & Technology, Zhejiang University, China Academy of Art, and Jingdezhen Ceramic Institute explicitly give reference book lists. Then, Central Academy of Fine Arts, Tsinghua University, Nanjing University of the Arts, Soochow University, Xi'an Academy of Fine Arts, and Jingdezhen Ceramic Institute ask for writing tests under limited time. Next, Beijing Institute of Technology, Central Academy of Fine Arts, Xi'an Academy of Fine Arts, Jiangnan University, Shanghai University, and Jingdezhen Ceramic Institute ask for professional creation. Among them, the Central Academy of Fine Arts, Xi'an Academy of Fine Arts, and Jingdezhen Ceramic Institute request all of the three examination models.

As for the interview, it is requested by all institutes, and most of them explore applicants' professional foundation, research, and creative potential, communicative, and interdisciplinary capacity. Sufficient time is compulsory if juries are willing to discover applicants' potentiality. However, only Soochow University points out the interview should not be less than 30 minutes; Tsinghua University and Shanghai University request around 30 minutes of an interview; Jiangnan University, Shanghai University, Zhejiang University, and the Wuhan University of Technology provide 8-15 minutes presentation with applicants.

According to the conditions mentioned above, the researcher considers more kinds of foreign language examination should be given, or with which combined professional test, because the essence of foreign languages are communicative tools and should not be a limitation to the future researchers. Then, the professional test ought to reflect the educational vision of each institute, which is to promote institutes to cultivate their educational idea and avoid homogenization. Next, interview and discussion guarantee applicants' quality, so time is mandatory. Lastly, the official cultivation plans help applicants to realize the educational experience of the learning period, and this inquires administrative efficiency and inclusion. On the other hand, the hidden information implies confusing educational ideas, which leads to resource waste.

5. Conclusion

5.1 Research summary

The 'Application-assessment' admission system aims to break the limitation of traditional examination, which comprehensively examines applicants' quality. On the other hand, transferability earns increasing attention along with educational paradigm transition from European mode to American mode, so institutes should also consider applicants' undergraduate knowledge structure (Melles, 2009). In addition, institutes should give priority to the efficiency with due consideration to fairness. Confirming with supervisors before selection may increase efficiency, but this also narrows choices and even aggravating injustice.

With increasing consideration of the transferability of doctoral students and multiple doctorates, design discipline ought to make customized admission systems bases on the educational vision of each institute (Hamilton & Carson, 2015). For instance, Beijing Institute of Technology, Jiangnan University, and Hunan University provide a successive master-doctor program to design doctoral applicants, starting from the department of science and engineering. This cultivation mode pays attention to explore the further depth of the field, and institutes mentioned above take advantage of their goodness on science and engineering to introduce this program to the design field.

Doctoral education is different from compulsory education, which should put quality before quantity (Durling, 2002). However, the condition is that most institutes make enrollment plan based on administrative governance rather than practical educational capacity. For example, Wuhan University of Technology publishes a point system and selects candidates based on point ranking at the interview round. On the other hand, Nanjing Normal University releases resilient space to discuss special cases in order not to leave out potential talents in the first round, which set an example for others.

Human beings are ends, and do not use them as means. Information symmetry shows respect for individuals, especially in the education field. To adequately value students' rights, a cultivation plan should be published on official platforms and open to everyone, which also engages the public to supervise and advise the education career.

5.2 Reflection

Based on existing published 19 admission systems, this paper organizes a comprehensive criteria index to analyze and provide the design education field with reference and data. The researcher suggests four aspects should be taken into consideration during doctoral enrolment.

1. Physical health is the basis of scholarship. According to statistics, only 4 institutes request health checks during selection, so health risks exist in doctoral students and even institutes.

2. Moral quality guarantees researchers contribute their outputs to human well-being. For instance, juries may examine applicants' experience in community work, volunteering, etc.; they can also examine this with the help of the third party appraise.

3. Professional foundation provides practical experience and materials to researchers in the future, in which portfolio, patent, or exhibition certificate will be ideal evidence. Cross-disciplinary applicants should also prove related capabilities.

4. Academic quality reflects not only in methodology but also in academic sensitivity, which helps a lot for junior researchers. At the same time, institutes should make customized selection criteria to clarify the educational vision.

Last but not least, this study is the start point of design doctoral educational system research, which will be followed by curriculum comparative research, transferability research, and other related academic issues in the future.

Abstract | Digital transformation and biotechnologies offer powerful means, through which autonomy and automatism could lead to new governance models. As institutions failed to timely grasp their profound implications, a concerning disconnection grows between political and social life. As design moves towards social and political gaps, it now participates in social transformation by challenging current habitus. Whether in a contesting or reforming attitude, design agency generates pressure in and out everyday life, impacting the way politics is thought and practiced. Guided by a correlational approach, the contribution aims to frame a field of research in which design acts politically as a "vector of the present" to cope with instability. Embracing the unfinished character of societal artifacts, design fuels contradictions as vital functions of the democratic discourse, pushing for new conceptions about politics and democracy themselves.

KEYWORDS | DESIGN ACTIVISM, AGONISTIC POLITICS, SOCIAL INNOVATION, SOCIAL ARTIFACTS, EXPERIMENTATION

1. (Re)directions for the XXI century

We live in a time of exceptional turmoil and, at the same time, of dramatic disorientation. This is the time of posteriority of great events that shaped history, returning a vague, undefined present and foretelling an uncertain future as well: it is "a natural habitat of legitimate hopes and expectations, [that] becomes home for nightmares" and widespread nostalgia, ending up framing an exclusive dimension of reality, the "retrotopia" (Bauman, 2017). It appears to be the perfect time to act.

An informatics and technological revolution has been unceasingly shaping the world over the past twenty years: although its achievements comforted the world with an optimistic message, it now gives rise to a sense of shared fear and concern. Acting as a force of change, such a revolution is going to shake the historically consolidated status quo significantly. However, it would not be the first time: as Fulvio Irace (2014) says, "every progress in science coincides with the proposition of new technologies, which certainly produce tools for use, but also, and above all, new lifestyles and new worldviews".

Technological progress goes on at an unparalleled pace now, making it even harder to keep up (Kurzweil, 2004). The fertile combination of the technological and biological front is going to shape tomorrow in a new, radical way[1]: a powerful interweaving that will blur the already thin boundaries between the digital and organic/physical worlds (Schwab, 2017). Such a scenario unfolds the opportunity of designing products and services by borrowing adaptive and evolutionary behavioral patterns directly from biology. The resulting outputs would benefit from an "organic intelligence" (Gerasimov et al., 2019), wherein algorithms will evolve their processing and predictive models through adaptive and combinatorial patterns, proper to organic beings. Such hybrid technologies offer powerful means to support alternative development models, where autonomy and automatism could lead to new governance models: their first implications foretell an unprecedented cultural and economic impact, such that "acting" in the XXI century will mean operating within cybernetic biomes, machine-to-machine systems, where digital transformation requires careful and thoughtful intervention by political actors *in primis*, historically charged to guide their transition and consolidation.

However, even if governments and institutions have traditionally provided tools and models to secure the complex balance among the biosphere-technosphere-sociosphere, on the other hand, it is important to remember that design itself has always acted as a catalyst for innovation aimed to bend technology towards preferable futures. Moving from "making stuff" to "making something" (Sanders & Stappers, 2013) for people and their lives, design offers the sensitivity to research and take action in a moment of a historical transition, marked by deep global issues.

The paper aims to trace how design enters the political dialogue, as a source of constant

[1] As shown by recent MIT Labs activities focusing on the intersection among generative design, computational design, synthetic biology, digital fabrication and materials science (Oxman, 2010; Hays et al., 2015).

destabilization, generating solutions that consent, compete or even dissent with the established order, offering new chances of dialogue among the society-market-institutions system, wherein digital transformation suggests and promotes the (re)shaping of worldviews and the formulations of new governance paradigms for men and things. Today design enters the whole societal context, engaging with "politics" and the "political", a distinction theorized by Mouffe (2005), which triggered a significant debate in political philosophy over the last decades: designers are participating in the debate too, whose practices, discourses and intents happen to raise "questions about their agency and potentiality to challenge our *habitus*, generate alternatives and create positive societal change" (Fuad-Luke, 2015).

2. A technological challenge to politics

The context framed so far in terms of technological advance will produce profound implications on the political dimension, as long as digital technology offers new enhanced tools to deal with complexity, generating new perspectives about dwelling in the future world.

The forces of change acting today feature asymmetrical evolutional rhythms, so that the deep connection between technology and politics is not easily detected. Nevertheless, there is a growing need for political theory to investigate and address the radical effects of emerging technologies (Susskind, 2018), now more than ever. Institutions today react to technological innovations with either slow, outdated measures, or short-term solutions, constantly overlapping and contradicting the older ones. Contemporary conceptual, methodological, and instrumental apparatus result unsuitable to properly frame and understand the current technological actor (Accoto, 2019).

This troubling scenario can be read on a deeper level, where the present is the field where the clash between future and past paradigms unfolds: technology is laying a posteriority character on democracy (Bartlett, 2018), wherein politics misses to embrace the digital within its domains, because of an outdated perception of the "technological" as other from "the political". However, as Susskind (2018) writes, the digital is inherently political. Digital technologies naturally fragment and spread power to all the nodes of its deeply networked structure (Naím, 2013), affecting significantly communication and information systems: the digital transforms the political because it targets political life at its foundations, altering the way politics is made and how and where political action takes place.

Current political systems missed a timely grasp of the incoming digital disruption, triggering a growing disconnection between political life and social life: on one hand, the technological front progressed undisturbed, on the other, society proved to be extremely receptive, facilitating the absorption and diffusion of technological innovation. Runciman's (2018) "technological takeover" is challenging indeed, since he recognizes a strong participation of digital technologies in the failure of current political systems, democracy included. However, while the very idea of failure is anchored in outdated conceptions, it is undeniable that technology is hardly pushing for a mutation of political thought and action. The term

“politics'' suffers from outdated conceptions too, especially when they stem from institutional discourses.
The meaning of “politics” is not a question that resolves in a single take, but a site of ongoing contestation, where any shared assumptions tend to be relatively local and temporary. Embracing its dynamic nature is crucial, because it encourages the stance to discover new theoretical and practical spaces for alternative discourses and functional conflicts. This resonates with the various interpretations that literature offers, among which Mouffe’s (2005) work about democracy as agonistic pluralism stood out, tracing a discourse about democracy as a form of collective life that involves unresolvable differences and conflict. Rancière’s (2015) work also enters the conflictual theme, agreeing with the agonistic struggle among adversaries, where the instability of the resulting order is vital for conflictual political relations to reemerge. Mouffe (1993) calls this potential “the political” and Rancière (1999) uses the term “politics” or “democracy”, but both understand the political friction, disagreement, and disruption as the essence of democratic politics: as a result, whenever the agonistic attitude is missing or consensus overcomes political difference, democracy is lost.
Conflict and dissensus display in an environment where political action is a collective activity expressed in the public realm. Technology is enhancing such expression, thanks to the empowering and auto-organizing effects offered by social platforms and community-oriented services, in which the involvement of institutions to answer social problems does not coincide with a primary need. Acting politically as well as acting through designing in these times means thus moving in a space of possibilities, where freedom and creativity is experienced in a way that can never happen in private, thus embracing the political sphere by giving it new dimensions.

3. Design as catalyst: from value to power

Ubiquitous design relies on digital technologies as accessible means through which people’s capability of *voice* is amplified and extended to a wider range of individuals and communities. Such empowerment gives the chance to self-organize and deal with societal - and political - problems acting within everyday life. This cultural shift has been possible thanks to a broader diffusion of design culture and attitude in the past decade, besides its evolution and subsequent politicization.
In fact, design culture has experienced a continuous transformation as historical phenomena of change gradually disclosed new domains for its theories and practices (Jones, 2014). Assuming a designing approach - *“*using human power to conceive, plan, and realize products that serve human beings in individual or collective goals*”* (Buchanan, 2001) - means promoting better living conditions in a counter-intuitive perspective over reality. Moving from material to human systems (Buchanan, 2001) and from affirmative to critical practices, design culture deeply engaged in social systems, resulting in new operational fields like experience design, organizational design, and service design. These approaches aim to tackle

complex problems by gathering various stakeholders - end users, citizens, employees, partners - in charge of "experts of their experiences" (Sleeswijk Visser, 2005 in Sanders & Stappers, 2008), in order to conceive better outputs to improve lifestyles.
Thus design becomes ubiquitous, as the many-to-many approach involves an extensive range of social players, from professionals to citizens, who happen to apply design thinking, processes and approaches finding themselves managing the designed output directly (Fuad-Luke, 2013; Manzini, 2015).
This leads to the growing fields where design is deployed for social transformation: new social demands match with governmental "inaction", where grass-rooted movements and initiatives aim at filling the resulting social gaps. This trend gains particular relevance in those developing countries, where human rights are not fully recognized[2]. Such design practices, however, intensify even where democracy is a historicized condition.
The structural crisis of the neoliberal paradigm calls for new expressions for social, economic and environmental sustainability: such critical scenarios offer design culture the favorable terrain to renew itself and to address its efforts in the production of artifacts within social movements, experiencing a shift in its aims and methodologies. According to Julier (2013), crisis in the neoliberal paradigm coincides with a spark of activist impulses in designers, so that they embed their practices "into everyday life through intervention with real people in real places" (Julier, 2013), lending their "power of resistance from being precisely a designedly way of intervening into people's lives" (Markussen, 2013).
The efforts underlying co-design and social innovation practices are a whole new way in which design channels positive results in the attempt to "design for democracy[3]". These are recent challenging practices, relevant in triggering new approaches to power through design. By expressing stronger activism, design culture appears to be charged with growing awareness and responsibility, thanks to its strong contribution in the fundamental processes of reality production: given the ubiquitous presence of designed outputs and systems, including the possibilities that digital technologies offer, design activists are challenging the "distribution of the sensible" (Rancière, 2015) to bring light on new perceptions and actions, opening up the public sphere to active participation.
Moving from design culture to design activism, designers participate and amplify an "agonistic revolution", as they enter into various modes of action starting from the free choice of which power structures to work with, for or against: their pluralist and agonist

[2] Design Studio For Social Intervention and Design that Matters provides few examples of a strong design action to support social justice within disadvantaged communities and developing countries. Retrieved February 6, 2020, from https://www.ds4si.org, https://www.designthatmatters.org

[3] In their "Open Letter to Design Community: Stand Up for Democracy, Ezio Manzini and Victor Margolin state the need for designers to conceive, develop and connect new possibilities to support democracy and all that it should embody. Retrieved February 6, 2020, from http://www.democracy-design.org/statements/

agenda is the product of a non-alignment, pushing for a participatory concept of democracy (Fuad-Luke, 2015). Acting as a social compass, design activism ensures an extended participation, encouraging responsibility while disrupting and diversifying the existing habitus. Fuad-Luke (2015) traces the levels of the teleological force in design activism propositions, setting them within agreement, agonist or even antagonist attitudes[4]. (Re)orienting systems and local realities is thus possible thanks to design's stimulation of common will and responsibility, channeled in a path toward *radical* change of institutional and cultural practices and languages.

3.1 Reframing design practices: a political view

Since innovation lies also in the perspective chosen to observe problems within the hosting system, it is worth recalling Fuad-Luke's (2015) framing of social design as the "weaker" form of design activism, due to its roots in the current neoliberal representative democracy. Here, he argues, designers are constricted in a consensual agenda, pursuing public good to re-shape the system from within. Perhaps this is also the reason why there is a widespread tendency to depoliticize most of the social design practices - especially from the outside -, where it is often shrunk to a humanitarian inclination: "the ability of this type of 'do-gooder', socially oriented design to address questions of social justice and inequality is very limited (Chin et al., 2016)". Although these authors refer to some specific humanitarian designs[5], this perspective has helped to cast a shadow over the actual connections between politics and social design.

Basically, design is designing something for someone. Starting from everyday life, design has always been conveying values and messages aimed at (re)defining reality: design can be persuasive as designing a chair is a matter of defining what "sitting" would be like (Redström, 2017). Thus, design is a participating actor in the production of worlds and, as such, "operates in the space between poietics and politics" (Redström, 2017).

Today social design expresses its poietic ability to support democracy, which now lives in a sclerotic condition. However, despite the "weaker agonistic character" traced by Fuad-Luke

[4] Fuad-Luke (2015) lists some case studies working as "spatial agency" and offering counter-narratives, counter-dialogues and counter-actions in public spaces. As for the agreement section the pedestrian bridge designed by Zones Urbaines Sensibles is an example of participatory crowdfunded urban-making. Agonistic approaches are traced in Collectif Etc works, whose built interventions, street furniture or even conferences serve as propositional artifacts, raising questions about public issues. Antagonism is found in *Recetas Urbanas* by Santiago Cirugeda, a project offering downloadable models to trigger political negotiations with exercises of urban allegiances.

[5] Several NGO's are working with designers in this sense. MigrationLab is now running projects in six european cities. The goal is co-creating opportunities with and for migrants, refugees and locals to meet, interact, inspire each other and collaborate through the transformation of urban spaces. Retrieved February 6, 2020, from http://www.migrationlab.org

(2015), social design plays a strategic role for democracy as-is since they share the same structural language: *incremental* change. This is the case of Helsinki City (Berglund, 2013) where several design interventions were later absorbed, adopted and adapted by the city municipalities themselves[6]. Such social progression is supported by a *prototyping-suggesting* attitude of social designers, a stance which seems to facilitate the permission of design intervention into urban and civic environments by those municipalities who are open enough to let the experimentation take place.

Gazing into the future, looking for "preferable" scenarios (Fry, 2010), design implements practices that generate positive alternatives to the current status quo. Social design as a political action stands for this purpose, occurring as a form of activism which "rather than being resistant, is mostly generative" (Thorpe, 2011). Far from an opposing and protesting approach, such design interventions feature a reformist action of the present, or, rather, of all those approaches and perspectives that have contributed to generate the unsustainability of today's world. In fact, social designers enact reflections through the direct involvement of institutions or by addressing their structural issues to return better opportunities of dialogue. Improvement pushes institutions forward, so that urban and civic environments, as well as public services, will look for more creative processes to innovate themselves.

Carl DiSalvo's contribution (2010) on adversarial design offers arguments for further discussion on such design approaches, establishing a meaningful connection among digital technology, society, and institutions. Following Mouffe's discourse (2005), DiSalvo traces a field for design action intercepting both "politics" and "the political": the former stands for the means by which cohesion within a state, organization or social order is achieved; the latter refers to a condition of social life, whose experience and expression no longer occur according to the old models of protest and debate. The distinction between politics and the political in design practice leads to different kinds of design outputs, depending on their combination and final goals:

- design for politics[7], focusing on improving structural transparency and functioning;

[6] Helsinki's DIY-urbanism, urban tactical experimentations and prototyping show as practices where design engages with official urban policy, fueling an "urban vibe", where citizen-led initiatives inspired by degrowth economics met administration - sometimes cautious - support. Such results were meaningful to activists as their actions were rewarded with an empowering institutional acknowledgement.

[7] Horizon 2020 Framework Programme of the European Union founded several laboratories aiming to design open government strategies to improve the governance culture. Here is provided an example of toolkits designed to ease this kind of innovation. Retrieved February 6, 2020 from https://oecd-opsi.org/guide/open-government/design-an-open-government-strategy-or-initiative/

- political design in the agonistic approach[8], aiming to reveal and confront power relations;
- design for policy[9], where public administration is led with a service innovation approach.

DiSalvo's (2012) analysis helps provide design criticism about the relationship between political expression, computation and the processes/products of design.
Such experiences can be traced in a "reformist attitude" of the political system as-is, where design works within the current paradigm. Despite the "weaker" impact on the system - not a disruptive one -, these kinds of interventions gain a character of "feasibility", which designers use as a means to trigger an internal innovation. Here consensus produces a meeting point between realities that suffers from distance: political and social life.
In this way social design exploits certain conditions of neoliberalism - where it stemmed -, to recycle and reprogram them: it is worth noting that this concept aligns with Julier's (2013) concept of design activism, so that applying design to politics to improve its structural issues is still a contestation, as it intercepts a problem needing a solution that conventional approaches to political issues have not offered yet.
Thus design activism occur in different theoretical and practical spaces, seemingly fueled by two complementary tensions: the activist-disruptive and the social-incremental one. Together they discover new meanings for democracy.

4. Politics by design

Design as a significant driver in building future realities seems to embody a new kind of political force, defining a promising field in which it would be possible to implement "the transformation of the entrenched cultures of unsustainability towards pluriverse practices" (Escobar, 2018). By creating "worlds within the world, mutually transforming each other" (Fry et. al, 2015), design discovers itself capable of generating not only new entities and interactions within political life, but also new political entities and interactions.
The paper relies on the complementary interplay between the agonist revolution and the reformist attitude of design acting politically as a promising path leading to the expansion of the conception of politics, compared to the current one.

[8] The sweden city of Malmö instituted a dedicated laboratory for participative initiatives to perform social innovation. Activities are carried out through a design practice-based approach which entails long-term engagements with different social actors, leading to significant impacts on city's settings. Retrieved February 6, 2020 from http://medea.mah.se/malmo-living-labs/

[9] Italian studio Oblo Design, part of government's digital team, provides a quick example of design for policy performed with the direct engagement of citizens. Together they designed a platform aiming to ease the access to public services, with all actors receiving reiterative feedbacks. Retrieved February 6, 2020 from https://io.italia.it

Thus, design agency generates pressure in and out everyday life, impacting unavoidably the way politics is thought and practiced. Fuad-Luke's (2015) concept of design activists crucial positioning as "non-aligned social brokers'' along with the social designers "working from within" suggests a well outlined space for contradictions, stemming from the very nature of design problems and, therefore, of design as a whole. According to Cross (1982), design problems are always ill-defined due to time and/or resource constraints. The wicked feature results in the impossibility of an exhaustive analysis supporting the correctness of the preferred solution, but the designer is still asked to produce a precise solution within a given schedule. Designers, then, cope with complexity by imposing themselves limits to contain the problem and manage it better. Such a process calls for high responsibility, which designers know to hold as practitioners of a poietic activity that always works with internal and external instability: as Julier (2013) notes, designed outputs are unfinished, multifaceted - as they exist either as sketches, prototypes, updates - subject to reiterating reshaping and repositioning. Furthermore, since designers work in complex networks of actors that constantly influence themselves mutually, designed outputs are subject to external constant transformations too, occurring at all levels from meaning to value.

This is why designers are used to thinking critically about the problem at hand, mainly questioning which designing process to adopt from the very first step (Hegeman, 2018). The lack of generally viable models and methods is the key to the *designedly* ways of *design.* Every problem encountered and the way it is positioned from time to time within a specific contingency results in the design of the designing process itself: in these terms design culture seems ready to offer a meaningful contribution to the *plungingly* ways of *politics*. Coping with contradiction helps assuming uncertainty as a foundational feature of reality, something to embrace as it appears in its chaotic beauty, where collective thinking and actions offer a fertile ground for new lifestyles and worldviews. Such shift is taking place as some institutions are recently showing a growing interest in design approaches too, even with weak signals - whether they be the adoption of designing tools to better inform decision-making processes or the diffusion of experimentation through civic participatory workshops -, in order to speed up their regulating actions: guided by design's proactive attitude, they are questioning their own schemes to keep up with contemporary global issues in an anticipatory approach, which should be far from a linear and coherent projection of the present into the future.

If politics calls for coordination, cooperation, control, and management skills within this framework, then facing the high complexity of the coming future - in which time exerts increasing pressure – will mean activating a more elastic transdisciplinary dialogue, made up of as many voices as communities hold. Complexity shows to be the main driver of unfinished products, as long as solutions are actually prototypes meeting the contingent need of a delivery in an everchanging reality. Therefore, politics would develop a deeper sensibility about uncertainty and, most of all, the unfinished feature of societal artifacts, whose experimentation would leave marks and traces to build up f(r)ictions (Mallol, 2011; Fuad-Luke, 2016) as vital sparks of collective life.

Such a combined approach outlines the field of research of "politics by design", which

proposes to investigate the *designedly ways of making political plans*, which embrace parallel and contradictory answers to socio-political issues as a result of a contingent attitude to manage complexity. Design culture is therefore believed to be capable of disclosing experimental areas in which political, digital, and social life can interact and reiterate themselves at deeper levels, where challenges could be faced by many to many. New spaces for free, public and creative expressions would rise, where design as a "vector of the present" would encourage a growing awareness in shorter and longer-term horizons, exerting multiple divergent forces while speaking the language of change in both incremental and disruptive declinations.

5. Conclusions

Correlations examined so far show the need for a more extensive dialogue, whose gravitational point is crossing the plain transposition of instruments and models from one knowledge domain to another, from theory to practice. As discussed before, the hyper-complexity of current systems is not problematic in itself, although it needs a new perspective to be tackled properly. According to the old approach, machine-to-machine interactions would be outlined through a technocratic view. Even so, interactions are inherently human-related: hence a human perspective is needed to unravel the knots, because meaningful interactions take place every time objects and human beings connect. Aristotle wrote that social life is realized thanks to the innate sociality of man, in which he exercises the *logos* as a means of confrontation.
It is in language that *inter-esse* unfolds, the in-between space where interests clash for their acknowledgement first, rather than unfolding in group conflicts about opposite positions. As long as words and actions infuse each other, they produce Mallol's (2011) "commonplace", the ubiquitous social material assemblies which everyday life is made of. These artifacts work together in the definition of - many - possible and divergent worlds, where disagreement stands for a stance, an approach of inquiry and practice: setting the stage for dissensus means reframing the configuration of problems both from a theoretical and operational perspective from time to time, while heterogeneous contributions amplify unpredictability. Thus, the capability of voice empowered by design enhances the interplay between revolution - the disruption of habitus - and reformation - the slow yet more feasible advancement. Such tensions dialogue in an agonistic way, never excluding each other, so that choices and decisions for further regulations will entail an ever-growing responsibility, which needs to be reframed too - along with other political conceptions - since the technologic actor is rapidly gaining less marginal roles within new governance assets. Design seems to be in an ideal position to make a significant contribution, by developing counter-narratives which reframe everyday problems as possibilities that address contingent realities. The specific way in which designers can develop their own thinking and practice gives them the ability to intervene on the sensible layer of reality, where ethics and aesthetics intertwine in such a phygital world, leading to new worldviews and *modus*

vivendi. Here, as Redström (2017) notes, design practices explore and influence some future directions, discarding the others despite their viability. Therefore, the act of choosing which alternative would be the preferable one is full of social, economic, political responsibility. Design is a defining practice and, as such, a philosophical operation, but also and above all, a political one. The responsibility of designers as makers of worlds is significant, urging a reflection about their own ontological potential and how it is perceived from other disciplines, in order to develop a deeper awareness of their moves and their roles in the society of the future.

Projecting Change: Redefining Preservation in the Era of Sea Level Rise

Liliane Wong

Abstract | Historic preservation and climate change act upon our built environment from opposing directions. Preservation sustains a past state of being in the future while climate change renders a past state of being unsustainable in the future. As one attempts to delay change the other causes potentially irreversible change. In a future of rising seas, they will converge in a clash of values. This paper examines the collision of the preservation of coastal heritage and sea level rise through academic investigations of reuse for coastal heritage. Focusing on the question of how heritage coastal communities can be readied for needed but drastic measures, visualization is explored as a means of preparing these communities for inevitable future change.

KEYWORDS | BUILT HERITAGE, SEA LEVEL RISE, CLIMATE CHANGE ACTION, VISUALIZATION, ADAPTATION, COMMUNITY ENGAGEMENT

1. Introduction

The preservation and conservation of buildings and the science of climate change are both modern. The roots of preservation are found in Europe; the Society of Antiquaries of London (SAL) was established in 1751, the Commission des Monuments Historiques in 1831, and the Society for the Protection of Ancient Buildings in 1877. In the United States of America, historic preservation was only formalized with the National Historic Preservation Act of 1966. The roots of climate change science are found in the early 19th century with the defining of "ice age" and the 1896 observations and calculations of carbon emissions by Swedish scientist, Svante Arrhenius. Through the late 20th c., historic preservation focused on "maintaining the artifact in the same physical condition as when it was received by the curatorial agency" (Fitch, 1990). This premise would be challenged in the millennium by climate change and its impact. Preservation aims to sustain a past state of being in the future while climate change renders a past state of being unsustainable in the future. As one attempts to delay change and the other causes potentially irreversible change, these modern phenomena will converge, resulting in a clash of values. Its resolution will require a revolution as long standing beliefs are challenged by an unknown future. Academic investigations are notable for their freedom from pragmatic constraints and, as such, they are often the harbingers of revolutionary ideas. This paper categorizes and analyzes current options for the preservation of structures from the impact of climate change and offers future possibilities through a project explored within the educational environment.

2. Of Climate Change and Heritage

Climate change is the defining issue of our time. Extreme weather, changes in precipitation, heat waves, sea level rise, all pose a threat to our built heritage. Of these different climate threats, sea level rise is significant for built heritage due to the founding of many cities near the coasts. Estimated at 6.8 billion in 2010, the global population is predicted to increase to 10 billion by 2030 and 44% of this population live within 200 km of the coastline (*Human Settlements on the Coast*, 2019). From Shanghai to Tokyo, Rotterdam to New York, it is estimated that 570 cities will be affected (Muggah, 2019). The built heritage of such cities with long and rich histories will be threatened by flooding and rising waters. Venice, with its innumerable historic treasures, is an example of a city that has long battled rising waters. According to researchers from the University of Padua, "[b]y 2200, the IPCC [Intergovernmental Panel on Climate Change] projections indicate that global sea levels could be between around 2 and 5 meters [6.5 and 16.4 feet] higher, which would leave the city permanently submerged if no action is taken to protect it…." (Aristos, 2019).

Coastal cities are now considering various options for protecting against sea level rise. These range from aggressive infrastructural and engineering projects for building sea walls, dams,

and surge barriers to land mitigation strategies and resilience building. These strategies require adaptation and, therefore, change.

2.1 Built Heritage and the Regulatory Process

Built heritage such as Venice is protected by regulations - international, national, regional - that 'manage change.'[i] The protection of such architectural heritage was primarily a national endeavor until the First World War when the resultant devastation crossed international borders. The Athens Charter of 1931 was the first step within an international arena toward the protection of heritage. The two World Wars resulted in the creation of the United Nations and subsequently the establishment of UNESCO. The ground breaking 1964 Second Congress of Architects and Specialists of Historic Buildings in Venice resulted in the establishment of the Venice Charter and the establishment of the International Council on Monuments and Sites (ICOMOS). UNESCO and ICOMOS are global non-governmental organizations that promote the conservation and protection of monuments. Through these organizations, varying charters for the management of heritage are proposed and adopted in an international forum. They span subjects from intangible heritage to ethical treatments.

The development of regulations for combatting the effects of climate change and, in particular, sea level rise, on world heritage is in a nascent stage. UNESCO's World Heritage Committee on climate action and heritage issued recommendations and policies for assessments and managing short term actions. For cultural heritage sites, this equates to mitigation, monitoring, defining responses, research and communication (*Climate Change and World Heritage*, 2007). In 2019, ICOMOS released its comprehensive vision for mobilizing the cultural heritage community around climate change. In 'Heritage and Climate Change Outline Report,' climate change action is summarized as including data gathering/heritage monitoring, mitigating greenhouse gases, strengthening resilience and adaptive capacity to climate-induced impacts as well as preparing for losses and damage (ICOMOS Climate Change and Cultural Heritage Working Group, 2019). In addressing the management of heritage from climate change, the report cites 'loss' and its implications as critical components for combatting sea level rise. These include the consideration of strategies for memorializing, the expanded use of removal and relocation, the recording of sites prior to loss (ICOMOS Climate Change and Cultural Heritage Working Group, 2019). These recommendations exemplify the goal to "maintain" the artifact in the same physical condition as when it was received and, if not possible, to accept its loss. Is 'loss' inevitable due to an adherence to a definition of preservation formulated in an era with different priorities? Does the speed of the pending devastation wreaked by climate change require a reconsideration of that definition? Is there an alternative to loss? What of the possibilities of combatting rising seas using principles of adaptive reuse, principles premised on change? A future of living with and in water will require a reuse of structures beyond our established modes of thinking. The acceptance of such alternatives to losing built heritage will test the

premise of preservation. A comparison of two coastal communities facing the dire threats of sea level rise offers us the range of possibilities for such action.

3. Of Sea Level Rise and Heritage

3.1 A Tale of Two Venices

The city of Venice, Italy, and its lagoon are listed on UNESCO's World Heritage Site. The protection of Venice is governed by many different regulations: The Code of the Cultural and Landscape Heritage, the 1973 Special Law for Venice, public authorities such as Magistrato alle Acque (the Venice Water Authority), a Management Plan with input of both regional and municipal bodies. These regulations share the objective to protect and maintain Venice as an artistic achievement, as an influence on the development of art and architecture, as an archaeological site, as an outstanding example of a semi-lacustral habitat (*Venice and its Lagoon*, 2019). The many governing bodies collaborate to manage change so as to maintain Venice, as much as possible, the historic city founded in the 5th century and first inscribed on the UNESCO World Heritage List in 1987. While Venice has always been under threat from *acqua alta* and flooding, it was hit in November 2019 "by the highest tide in more than 50 years" (*UNESCO closely follows tides and flooding in Venice World Heritage site*, 2019). The UNESCO World Heritage Centre, together with pertinent advisory boards, has agreed with Italian authorities to conduct an advisory investigation of these issues in 2020. In the meantime, citizens of Venice traverse their city on elevated catwalks hovering over the 4 feet 3 inches (1.30m) of flood water that has invaded the ground levels and foundations of Venice's built heritage.

Figure 1. Venice, Italy, at its highest tide of 6 ft (1.96m) in 1966 (left) and at 4'-3" (1.3m) in November 2019.

Figure 2. Venice, Louisiana, USA, rebuilt with houses raised on stilts (left) and on buoyant foundations in the water (right).

Venice, Louisiana, USA, is a community of 200+ persons sited on the banks of the Mississippi River. Its industry includes commercial and sport fishing. Located some seventy miles south of New Orleans, Louisiana, USA, it was devastated by Hurricane Katrina in 2005. Since then, the small fishing community has rebuilt for a resilient future through employing unconventional and even extreme strategies. To withstand rising waters, houses, apartment blocks and small businesses have been raised on piers up to 15 feet (4.6m) above ground. Alternatively, single family homes are built directly in the water, supported by buoyant foundations. This rebuilt community is drastically different than its pre-Katrina existence. Visually, more than half of the town hovers on wood structures or piers high above the beach while streets have been replaced with boardwalks and jetties. Not of historic or cultural significance and unfettered by preservation standards, Venice, Louisiana is a demonstration of the strategies that may be necessary for coastal communities to thrive in future rising seas.

The two Venices provide a striking contrast of climate change action in coastal communities. Representing the opposing ends of sea level rise interventions, they reflect the range of possibilities between retreat, defense and adaptation. The comparison prompts an examination of the relationship between heritage protection and climate change action. In the face of rapidly rising seas and the urgent need to act, how does one negotiate the complexities of heritage protection and its particular conflict with change? What might coastal built heritage such as Venice, Italy, look like utilizing the extreme measures taken to allow Venice, USA, a future with water?

3.2 Sea level rise adaptation

Strategies for combatting sea level rise on heritage property can be categorized as either defensive or adaptive. Defensive strategies include large scale infrastructural interventions

such as Venice, Italy's, implementation of mobile barriers (Modulo Sperimentale Elettromeccanico, Experimental Electromechanical Module) to defend the city from the *acqua alta*, begun in 2003 and pending completion in 2022. It also includes systemic interventions such as those for diverting stormwater or the creation of blue streets that control the influx of water. These are remote interventions that do not touch the built heritage itself but, rather, protect it from afar. Adaptive strategies include the small interventions to the property itself. These include protective retrofit actions – storm and water proofing, flood vents, sump pumps, etc. - that divert water from or incorporate water into the buildings. Both types of interventions "maintain the artifact" in the same relative physical condition thus fulfilling the premise of preservation/conservation.

These interventions suffice for the current state of water levels but with alarming predictions for the near future, additional measures are required now. The case of Venice, Louisiana, demonstrates what these measures might look like. But such additional measures will test the premise of preservation and its very definition. The elevation of structures, high above the water line, is one such example. This type of intervention is derived from flood insurance policies requiring that a structure, rebuilt post-flood, be built at a base elevation above the flood line. While this appears reasonable, it is for the most part unregulated. Those with means can exceed the base elevation to satisfy their comfort level. On the outskirts of New Orleans where Hurricane Katrina devastated many homes, some houses are rebuilt and elevated more than 14 feet (4.3m) above ground – coining the term "lollypopping," where structures are raised on stilt-like supports of varying heights. Local governmental agencies are in process of developing flood guidelines for such interventions. Currently, however, the landscape of the outskirts of New Orleans has changed dramatically with homes that are both elevated and not. This type of intervention, permissible for Venice, Louisiana, would not be permissible for heritage such as Venice, Italy, or any other protected landmark abiding by the current definition of preservation. To prevent the loss of built heritage in a future of rising seas, a different and less restrictive definition will be required. If so, what is necessary to establish a new one? How does one propose and pass regulations for the extreme and drastic measures that are required to make impactful change in the face of urgent circumstances?

Figure 3. A house on the outskirts of New Orleans, LA.

4. Case Study: *Projecting Change*

4.1 Newport, RI, USA

These were the questions facing the city of Newport, RI, one of America's oldest historic cities. Founded on the edge of the Narragansett Bay, the city is a treasure trove of built heritage, all protected by historic preservation guidelines. Newport, RI, USA, a city that holds some of America's greatest historic treasures from 18th century homes of the American Revolution to 19th century mansions of America's Gilded Age, is exemplary of other historic American cities on the Atlantic coast. The destination of the 17th century settlers who left England in search of religious freedom, the Atlantic Coast is dotted from north to south with waterfront cities - Plymouth, MA, to Newport, RI, Annapolis, MD, Charleston, SC, and St. Augustine, FL - that represent the earliest endeavors of the citizens of the newfound nation. These cities are preserved through strict standards and regulations aimed at maintaining them as cultural evidence of that period in history.

986 of Newport's historic structures and 53% of the acreage of Newport's homes are located in the flood plain (Union Studio & Conservation Associates, 2016). The project site, Easton's Point (or the Point Neighborhood), is one of the oldest neighborhoods of Newport. Founded in the 17th century, it is part of the Newport Historic District Zoning, created in 1964 and designated a National Historic Landmark District in 1968. The neighborhood is characterized by 18th century houses, many of which are built directly on grade. These historic homes experience flooding from precipitation, storm surge, and extreme high tides. High-model projections of the National Oceanic and Atmospheric Administration (NOAA) predict 1 foot (30 cm) of sea level rise by 2035, and 3 feet (91 cm) by 2065 and almost 7 feet (213 cm) by 2100. The built heritage of the historic Point Neighborhood, which already floods with each severe storm, will be under water without a careful plan for its future.

In 2017, the City of Newport provided for the protection of these and other assets through a recently approved Hazard Mitigation Plan. The Hazard Mitigation Committee's recommendations for flooding included: retrofitting flood risk structures, evaluating zoning to allow for flood retrofitting, constructing a sea wall. It also addressed floodplain management through inclusion in a recognized Federal Emergency Management Agency (FEMA) National Flood Insurance Program (NFIP). As part of the program, new home owners requiring federally insured mortgages, as well as current owners submitting flood claims, must comply with the FEMA requirement of elevating one's house above FEMA's design flood elevation.

All houses in the Point Neighborhood are sited below FEMA's design flood elevation of 13 feet above NAVD88 (Union Studio & Conservation Associates, 2016). Compliance with the FEMA requirement in the Point would destroy the historic fabric of this community of two-story homes on grade. Yet, without specific preservation flood guidelines in place, this was already taking place as new owners and current owners of flood related retrofits complied. In addition, some concerned owners with means have also selected to elevate their homes. Together, these houses are raised some distance from 3 to 7 feet (91 – 213 cm) above the FEMA flood elevation. This "lollypopping" of various heights is visible now on many of the Point Neighborhood's streets where the characteristic on-grade structures are slowly disappearing. These interventions are not in keeping with the principles of a National Historic Landmark District. But to keep the built heritage of the Point above water would require more than the raising of structures a few feet. Herein lies the clash of preservation's aim and that of responding to the effects of climate change.

Figure 4. The changing face of Bridge Street in the Point Neighborhood with the phenomenon known as 'lollypopping.'

4.2 Projecting Change

This was the context when, in 2017, graduate students in the Rhode Island School of Design's 1-yr post-professional Master of Art program in Adaptive Reuse undertook an investigation of the impact of sea level rise on the coastal heritage Point Neighborhood of Newport, RI. Sponsored by the van Beuren Charitable Foundation (vBCF) and the Newport

Restoration Foundation (NRF), the aim of the semester-long project, *Projecting Change*[ii], was to engage the 1000+ members of this historic coastal community threatened by sea level rise in discussions of their future. The objectives of the design studio were two-fold: first, to use design to redefine preservation in the face of significant future sea level rise and, second, to convey these implications to a community that had yet to discuss their future.

4.2a Projecting Change: Design

In meeting the first objective, 16 students worked in small teams to produce designs addressing the future of the Point Neighborhood, assuming NOAA projections for 2100. These designs ranged in approach as strategies for combatting sea level rise. Four projects were developed, representing the approaches of *retreat, defend or adapt*: *Memory Trace, Grey Green Blue, Living with Water* and *UpStruct*. The project *Memory Trace* accepts that the Point Neighborhood could not be maintained in its present location in rising seas. It chose to retreat as a strategy. Assuming future inundation, the project relocates the houses of the neighborhood to higher ground but leaves a memorial in situ consisting of the cast facades of the houses themselves. This proposal of reuse through translocation maintains James Marston Fitch's definition for preserving the physical buildings albeit through relocation to higher ground.

Figure 5. Casts of the houses are left as a memorial park in the project Memory Trace.

In contrast, *Grey Green Blue* employs an expansive strategy of both defense and adaptation in order to maintain the Point neighborhood in its historic moment and in situ. A proposed breakwater on the nearby shoreline defends the community while a system of blue streets and retention ponds are integrated into the neighborhood for accommodating water over time. In this project, the built heritage is envisioned as part of a blue system in which the individual houses will serve not only as domicile but as part of a vast adaptive intervention.

Figure 6. Water is brought into the neighborhood over time in the project Grey Green Blue.

Living with Water employs more experimental means to maintain the neighborhood exactly as it was. Assuming the NOAA projections for future sea levels, the project proposes to replace all existing building and infrastructural foundations with buoyant ones. Tethered together, the houses would rise and fall with the water as it rises over time. While the built heritage would be reused as adapted water vessels, they will remain in place together as originally built in the 17th century.

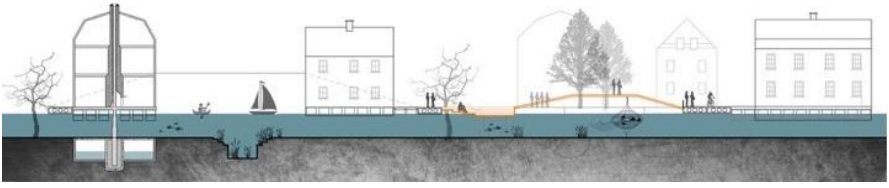

Figure 7. All the houses are placed on buoyant foundations in Living with Water. As the seas rise, the houses rise together with it.

Upstruct instead proposes to update the definition of preservation in the face of sea level rise. It posits that if the historic community as we know it today is premised on the relationship of the buildings to each other in a horizontal ground plane, why not redefine

this relationship through a configuration defined by water? It offers a new vertical grid that maintains the relationships of the historic houses to each other but in a different axis, the z. In a vertical future, houses would have redefined but similar relationships to one another through streets that rise up into the air, with neighbors above or below rather than to the side and back. *Upstruct* proposes the reuse of a heritage neighborhood as a skyscraper in the sea. While fanciful for the present, it offers a glimpse of future possibilities.

Figure 8. Historic communities are reinterpreted as vertical historic neighborhoods in the project Upstruct.

4.2b Projecting Change: Community Engagement

The demographics of the neighborhood were critical to achieving the second grant objective of engaging the community in a discussion on sea level rise. A neighborhood of approximately 550 households, the Point is sited on a long narrow strip of coast. Three primary streets parallel the waterfront and are intersected by 11 short streets. The heart of the neighborhood is situated on the southern side, bounded by Bridge and Elm Streets. This area is populated with households of various ages, the most prevalent being those in their 20s, 50s and 70s. (Statistical Atlas, https://statisticalatlas.com/neighborhood/Rhode-Island/Newport/The-Point/Overview)

At the start of the project, the students interviewed members of the households in the 5 most populated blocks. The neighbors' understanding of and reaction to the threat presented by sea level rise corroborated the 2018 Pew Research Center survey which found that only 59% of Americans view climate change as a major threat (Fagan & Huang, 2019). Even those who were in this slim majority believed that sea level rise would not happen in their life time and would not affect them personally. Most of all, they did not believe their own actions would make a difference.

To engage this somewhat disenchanted group, the students explored the potential of visualization to help spark the discussion. Their objective was to enable the neighbors to experience impactful interventions for coexisting with high water levels. Utilizing both virtual and augmented reality, the four projects were presented in a one-day neighborhood event called *Projecting Change*. Three activities were offered at 64 Bridge Street, the property of co-sponsor Newport Restoration Foundation. The first comprised a series of exterior augmented markers, located in the backyard of the house and along the adjacent side streets. Google cardboard lens were distributed together with a download of the software Entiti. This enabled users to point their phones at any of the markers and, depending on which, they were able to see one of the four design schemes in 'sensurround.' Simultaneously, two virtual reality stations with Occulus headsets were available inside the house. Those selecting this option were also able to access one of the four designs and, in addition, place themselves in various locations within the schemes. The participants of both activities experienced the streets of their historic neighborhoods turning blue, retention ponds spreading into their gardens, and their houses flying into an *Upstruct* high-rise configuration.

The third activity was in the form of an I-pad game, with the neighborhood as its gameboard. With the assumption that a storm and related flooding were imminent, players had 10 minutes to make decisions regarding their house and neighborhood. Selecting to save one's own home would advance one to the next level. However, in subsequent levels, the player realized that collaboration with one's neighbors was necessary for ultimate survival.

Figure 9. Using augmented and virtual reality, the members of the community experienced sea level rise interventions on their phones.

Figure 10. A section cut through Upstruct's vertical neighborhood.

Visualization allowed the members of the community - from middle schoolers to octogenarians - to finally experience what sea level rise might look like in their immediate surroundings. They were also able to understand what 'retreat, defend and adapt' might resemble as future scenarios. With this understanding, conversations about the future took place between neighbors as never before. Through visualization, *Projecting Change* connected the members of the community and introduced an unprecedented definition of preservation for a future yet to arrive.

Figure 11. On May 26, 2017, the Point Neighborhood community of all ages looked into their future using the visualization techniques of augmented and virtual reality.

5. Conclusion

Academic explorations in tandem with visualization were critical to the acceptance of sea level rise and the action required to preserve the Point's coastal heritage. Often constrained by the empirical, the common person may find it near impossible to embrace new ideas that threaten to upend the certainty of their known environment. The leeway granted to students at the Rhode Island School of Design, known for thinking 'out of the box,' resulted in new vistas unfettered by real world constraints. Similarly, visualization offered the ability to place one in unknown situations, otherwise untried. *Projecting Change's* unique combination of academia and visualization provided a bridge for discourse that would not have taken place. Presented through visualization, the projects served as a catalyst for dialogue amongst the members of the Point Neighborhood that spawned an interest in the opposing demands of historic preservation and climate change action, both locally and

globally. Community members requested that the visualization materials be displayed as a permanent exhibition of the local church, with the hope that ideas on climate change would become part of daily life, post-event. Newport law makers were interested in the use of the game for community discussions on sea level rise. Outside of Newport, the project was accepted and presented at 8 conferences in the US and Europe from 2017 -2019. This interest culminated in a 2019 *New York Times* article, *'We Cannot Save Everything': A Historic Neighborhood Confronts Rising Seas* (Dean, 2019). In 2020, this project was published in Chinese as part of an Adaptive Reuse issue of the Chinese journal, *The Architect*. This interest became impactful when, two and a half years after *Projecting Change*, "The City of Newport became one of the first communities in the country to adopt standards designed to help protect some of its most historic neighborhoods from the threat posed by rising sea levels" (Daily News Staff, 2020). Newport's historic preservation planner announced a new set of guidelines for elevating properties that considers contextual, architectural and material considerations – a direct response to the issue of "lollypopping." Furthermore, a permitting process will be implemented to allow for discussions that consider both historic preservation and climate change issues, in hopes that ultimate decisions will protect the historic neighborhood from vulnerability on both fronts. More importantly, the introduction of these guidelines acknowledged the urgent need for change in the preservation of Newport's coastal heritage. Within the current methodical but slow moving discussion on heritage and sea level rise, this local development of town governance was ground breaking.

The adaptive reuse of the built heritage of the Point Neighborhood – as memorial, as systemic intervention, as water vessel and as skyscraper in the sea – demonstrates the need to embrace change in the face of drastic conditions. In her 15th annual New Year's speech, German Chancellor Angela Merkel said of climate change action, "We need, now more than ever, the courage to think in new ways, the strength to leave well-trodden paths, the readiness to venture into new territory and the resolve to act more quickly…." (Schuetze, 2019). The willingness to consider new ways and the mustering of the strength to leave well-trodden paths are challenging, especially when these new ways and paths are entirely foreign to what we know and understand. This is all the more pertinent when considering change for scenarios in the future, a future we can understand but not see. Humans require proof to consider revolutionary change in thought and action. Today we have incremental proof of climate change but the ability to extrapolate to what it portends for our future demands a certain faith. Thinking in completely different and revolutionary ways about the management and reuse of our built heritage will be a test of our understanding. Visualization, however, can help one to 'see' beyond what one can understand. On a January morning in 2007, daffodils bloomed in Washington D.C., USA, months earlier than they should have. The physical presence in the depths of winter of these golden harbingers of spring was a physical proof of the effects of climate change that caused *New York Times* writer, Thomas Friedman, to pen his now famous editorial on climate change, "A Warning from the Garden." As we look to gather consensus on climate change and to plan for its impact on our historic built environment, visualization will be necessary to allow everyone to see into their future so as to take action now.

About the Author:
Liliane Wong received her BA in Mathematics from Vassar College and her MArch from the Harvard University Graduate School of Design. She is Professor and Chair of the Department of Interior Architecture at the Rhode Island School of Design that focuses on architectural interventions to existing structures. Her interest and teaching in this subject led her to co-found the *Int|AR Journal* on Design Interventions & Adaptive Reuse that promotes creative and academic explorations of sustainable environments through exemplary works of reuse. She is the author *of Adaptive Reuse_Extending the Lives of Buildings, co-author of Libraries – A Design Manual* . She was recognized by Design Intelligence for 2018-2019 and 2019-2020 as one of the top 25 most admired design educators in the US.A long-time volunteer at soup kitchens, her teaching emphasizes the importance of public engagement in architecture and design. Other teaching and research areas include design as social activism, preservation and sea level rise, the mathematics of curved space, affordable modular housing and technical textiles. A registered architect in Massachusetts, USA, she has practiced through her own firm, Mahon Wong Associates, as well as with the Boston firms of Perry Dean Rogers and FHCM. Key projects include the American Embassy in Jordan, Montclair Public Library, Hartford Public Library, and the design of the Kore Library Furnishings Line.

[i] The management of change is an idea that is prevalent in discussions and writings on historic preservation. Graham Fairclough in his essay, “Cultural Landscape, Sustainability, and Living with Change?” in *Managing Change: Sustainable Approaches to the Conservation of the Built Environment*, The Getty Conservation Institute, Los Angeles, 2001, summarizes these ideas in this quote: “The cultural landscape is central to the debate about managing change. It is entirely the product of change and of the changing interplay of human and natural processes; …… Change, both past and ongoing, is one of its principal attributes, fundamental to its present character. There is no question of arresting change. Change needs to be managed, however.”

Realising Discourse: A Strategic Design Solution to the Problem of Addiction.

Jason Hobbs

University of Johannesburg, South Africa
jason@jh-0.com

Abstract | This paper reflects upon new possibilities for strategy design. Information architecture (IA) is reconsidered as a tool for meaning-making with relevant links to discursive design methods. Together, these design forms provide an extension of synthetic reach into complexity and synthetic integrity to addressing deep socio-cultural change. A review of a design project conducted to address the challenges of addiction forms the basis of the discussion. Ontological complexity is revealed to be a defining feature of the problem of addiction and is considered in reference to the recent emphasis in design into considering human experiences. IA and discursive design are then discussed in reference to design artefacts created in ideating a strategy design solution. The paper concludes by offering an outline of a method and model for consideration as a pre-pattern derived from said project. Whether towards transformation or the sustainability of social ontologies, the solutions presented stand to assist design in theoretical, educational and practical terms.

KEYWORDS | STRATEGY DESIGN, DISCURSIVE DESIGN, INFORMATION ARCHITECTURE, ONTOLOGY, ADDICTION

1. Introduction

Designing solutions to wicked problems is no simple matter. This paper adds to the already complexity fraught domain, the manner in which socio-cultural ontological constructs can be central to their wickedness.

This discussion reflects on the socio-cultural aspects of synthetically determining a strategy design solution for U-ACT[1], an addiction treatment facility and provider of addiction recovery services in Johannesburg, South Africa by the author. The design project was undertaken employing a research through design[2] (RTD) methodology for an MA dissertation in Design (Hobbs, 2021) from the University of Johannesburg.

In the Thesis[3], a new form of information architecture (IA)[4], Conceptual IA (CIA), is posited and explored for *the design of a strategy* enacted through the Design Thinking (DT) process-method. The use of both strategy design and CIA take their cue from DTs theoretical response and relevance to the complexity associated with wicked problems in design (Buchanan, 1992).

IA is usually associated with activities supporting end-user sense-making in digital design. The thesis argues on constructivist grounds that sense-making and meaning-making are mutually inclusive concepts which tacitly constitute an internal meaning of design objects so intended for the world. In the conception of a CIA, which is enacted in a problem-led, non-assumptive manner following the DT process-method, all designed objects are argued to contain within them such semantic structures which constitute 'contrived ontology' (Hobbs & Fenn, 2019):

> "In essence, sensemaking and meaning-making in IA are the processes of decoding and encoding in DT where, from a humanities and cultural studies perspective, contrived ontology is understood as a subjective, constructed reality embedded in designed artefacts and systems." (Hobbs & Fenn, 2019, p. 764)

[1] Three entities exist to provide these services, referred to collectively as U-ACT herein: The Foundation Clinic (the treatment centre), The Recovery Wellness Programme (an outpatient and public-facing, peer-to-peer recovery programme) and the Ubuntu Addiction Community Trust offering accredited, experiential recovery coach training and certification.
[2] Specifically, Zimmerman, et. al.'s methodology (2007) designated as 'Research Through Design' by the authors, however not in reference to Christopher Frayling's (1993/4) conceptual category by the same name.
[3] To be referred to herein as 'the Thesis' (Hobbs, Applying Information Architecture In Design Thinking: Ideating Solutions To The Wicked-Problem Of Addiction, 2021).
[4] In digital design, IA (Rosenfeld, Morville, & Arango, 2015) is best described as a derivative application of, and from, Library and Information Science (Resmini & Rosati, 2012) frequently enacted within User Experience Design. Pervasive IA (Resmini & Rosati, 2011) positions IA for cross-channel, systemic design at similar levels of abstraction to Service Design.

The first section in this paper brings together related theory and perspectives from across the spaces of DT, strategy and service design and addictionology. The second section reports on the design project conducted, highlighting those aspects of the design relevant to this conversation. Lastly, drawing on insights which emerged from a reflection upon the extensibility of the design process and its artefacts (Zimmerman, Forlizzi, & Evenson, 2007), an outline of a method and model for use in and of strategy design will be presented.

As such, this particular method and model stands as a potential pre-pattern for consideration, rather than knowledge per se in any scientific sense. Hopefully its contribution will be found to be of sufficient value to warrant further study and validation, use, and experimentation with, in practice and ultimately inclusion in design education curricula.

2. The Problem of Ontology

Indeterminacy in Design, introduced by wicked problems as conceived by Richard Buchanan (1992), challenges traditional product-led approaches to problem solving in design. Since any particular artefactual outcome should not be assumed under these circumstances, a shift occurs in the object of design: from concrete product-making to abstract solution-creating (Buchanan, 1992) commonly understood in DT as Ideation or design-led innovation.

Service design, closely related to strategy design and human-centred design (HCD), resolves the 'design object-level' or product-level void by 'rising up a level' and orchestrating systems-level interactions in such a way as to manifest new experiences at the product-level 'below' (Polaine, Lovlie, & Reason, 2013). In a Service Dominant Logic framing (Lusch & Vargo, 2006), the ambition lies in co-creating value in-use with users for the purposes of the improvement of a systems wellbeing. Consequentially, the wellbeing of the system's system takes centre stage due to the constructive, networked nature of value co-creation (Vargo, Maglio, & Akaka, 2008). In many cases, the strategic act of problem-solving manifests as the use of design tools, often enacted with stakeholders in the immediate problem system, which facilitate and stimulate design's thinking at the system level (Stickdorn & Schneider, 2010). For example, the use of customer journey maps (Curedale, 2018).

Systems-level framings and their related design research methods, models, techniques and information are argued in the Thesis to be supported by CIA in accessing a further level of abstraction, a conceptual-level, 'above' the systems-level. In this wholly abstracted and conceptual domain, the dominant socio-cultural, political and economic logics of a subject-matter may be deconstructed in context. Based on theories of social practice and construction, such as Bourdieu's Habitus (1977), this meta-discursive space (Tharp & Tharp, 2019) in design may be described as a critical, conceptual immersion into the problem-ecology (Hobbs & Fenn, 2015) of the problem at hand. For example, if a bank asks for design assistance in improving their home loan / mortgage product, the brief may be taken at face value (product- / object-level). Alternatively, the designer may question home loans and

property ownership as the only, or best, potential solutions available for living (systems-level). And the designer may question further still, what the bank's place is, or could be, in the relationship between a home, shelter, society and available resources (conceptual-level).

It was at the conceptual-level of the abstraction of problems, that the strategic effort in resolving the wickedness of addiction, emerged. The reasons for this are best explained through the ontological nature of addiction as a problem in the world.

2.1 Approaching Addiction

One explanation for the wickedness of addiction can be extrapolated from the work of Guy Du Plessis who, writing from the perspectives of Integral Theory and clinical psychology, roots the challenge of addiction in its ontological complexity (Du Plessis, 2014). In short, his argument and approach (Du Plessis, 2017) lies in an analysis of addiction summarised as follows:

> "...the phenomenon of addiction is a third-order ontology, which can only be coenacted (brought-forth-in-the-world) when juxtaposed with associated methodological variety and epistemological depth (Esbjörn-Hargens, 2010). The notion of epistemological distance highlights that some facts of addiction speak louder than others and some elements of addiction are only enacted within certain worldviews. Methodological variety refers to the fact that:
>
> "The more epistemological distance and ontological complexity increase, the more methodological variety will increase. Thus, the more multiple an object becomes (the What), the more methods and disciplines you will need to study and make sense of it (the How), and the more perspectives there will be on what is or is not the nature of that object (the Who). (Esbjörn-Hargens, 2010, p. 162)"" (Du Plessis, 2017, p. 60)

A parallel may be drawn here to how the multiple perspectives of varying stakeholders are understood in DT (Kolko, 2012). If fact, he is only actually describing one aspect of the domain, being the positivist-oriented spaces of addiction's multiple object, such as the varying perspectives across and within areas like neuroscience, psychology and social science. His description does not include other related systems and their actors in the broader ecosystem such as healthcare systems, family and community systems, education systems, workplace, supply systems, a criminal justice system and the police officer knocking on your car window.

Post researching the domain (Hobbs, 2021) it is clear that no universally accepted etiology of addiction yet exists. Research has emerged over the last decade or so providing neurobiological accounts of how one comes to be dependent on psychoactive substances due to changes which take place in the brain's functioning (U.S. Department of Health and Human Services, 2016) but this research is unable to definitively explain why people become dependent in the first place. Furthermore, neither of the two prior points provide sufficient knowledge to determine what should be done to recover from substance dependence, other

than the rather uncreative yet largely ubiquitous suggestion of abstaining from such substances.

Du Plessis' likening of the ontological problem of addiction-in-the-world, as a wicked problem, to the ontological problem for an addict being-in-the-world, stem from his view that the problem, for both, is being-in-the-world. In other words, the condition is a fact of life in being a part of the human condition. His view is not dissimilar from how one might interpret Buchanan (1992) or Normal (2010) regarding wicked problems and complexity (though not in existential terms): that wickedness and complexity are natural states of (social) reality, beyond direct epistemological reach, which we frame in an attempt to understand and design within. Cross's (2006) conception of design's intellectual culture as being distinct from that of the sciences and humanities relates to this point.

In Heidegger's *existential* phenomenology, Dasein[5] refers to the experience of being human, or the experience of experiencing your being. As such, experiencing your existence gives rise to a self-awareness of your human condition. However, 'to be' through this act of experiencing, is not a (static) state of merely being alive but is rather a process of continually 'becoming' in relation to one's dynamic, embodied experience: the human 'being' alive in the world. In contemporary design discussions within HCD, interaction design and experience design (Hassenzahl, 2010) (Rogers, Sharp, & Preece, 2012) (Wilson, 2010) (McCarthy & Wright, 2004) – even in IA (Hinton, 2014) - we see a popular interest in phenomenology and the theories from fields such as embodied cognition and environmental psychology, amongst others.

In addiction terms, Du Plessis takes our existential human condition as his starting point for addressing recovery in addiction. As he wryly observes:

> "To talk at a molecular [neurobiological] level about addiction is like saying that an amoeba, which only primarily exists in a primitive level of ontological complexity, has abandonment issues originating from poor object relations" (Du Plessis, 2017, p. 97).

Du Plessis' view also draws on Max-Neef's theory of Human Scale Development (1989), where any fundamental human need, "… not adequately satisfied generates a pathology" (Du Plessis, 2017, p. 109). Du Plessis continues to explain that unmet fundamental needs manifest the experience of psychic or psychological pain, for which psychoactive substances are well suited in terms of pain relief (*ibid*). When coupled and left unaddressed, the use of psychoactive substances becomes a second, or third, problem to emerge as dependence develops as a neurobiological disorder (U.S. Department of Health and Human Services, 2016). As such, he describes addiction as "a misguided attempt at self-repair" (2017, p. 109).

[5] This interpretation of Heidegger's use of the term is not specific. These are common and largely accepted interpretations, outside of philosophical circles. Thomas Wendt's (2015) "Design for Dasein" is recommended as an entry point for considering Heidegger's concepts in Design.

3. A Design Response to Addiction

Strategy design is interpreted literally herein, meaning ideating a strategy through the DT process-method where the output, a strategy, acts as the object of design, the 'what', which will inform further making, such as in prototyping. In the Thesis, the design of the strategy lies in the synthetic resolution (Dorst & Cross, 2001) of the problem using CIA in a manner which followed Rumelt's (2012) 'kernel' of any good strategy. The kernel comprises a *diagnosis* of the problem, a *guiding policy* for the solution and *coherent actions* for the execution of the guiding policy (Rumelt, 2012, pp. 77-94).

Together, these various approaches merged to form a working theoretical model (Fig. 1) within which a strategy (design) was synthetically determined in complexity.

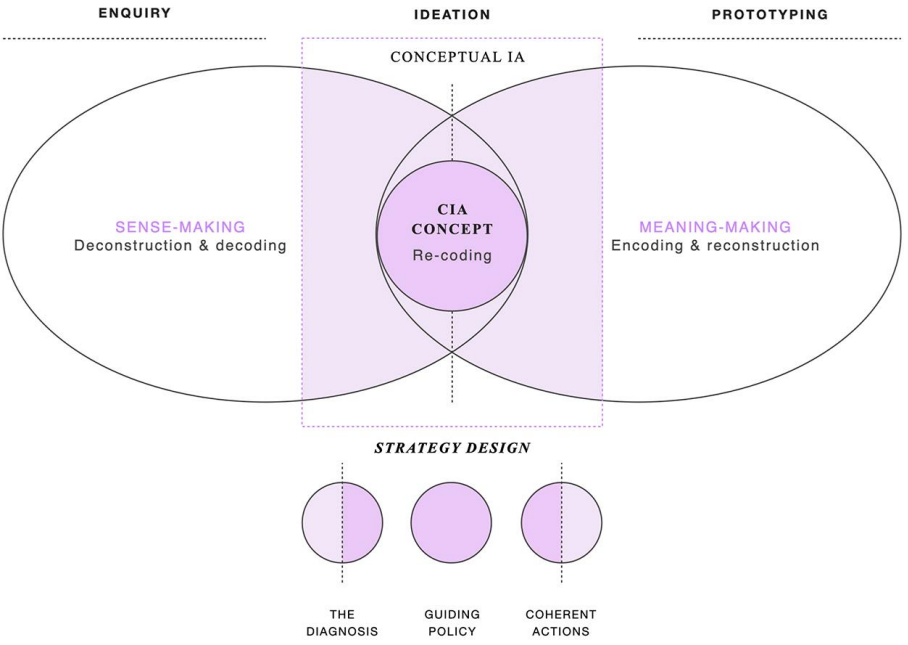

Figure 1. Illustration of the conceptual framework and working theoretical model employed in the Thesis[6] (Hobbs, 2021).

[6] A simplified categorization of the DT process-method is presented here. In the project execution nuances to be found across various descriptions of the process (Harris & Ambrose, 2009) (Stanford D.School, 2018) (Hasso Plattner Institute, n.d.) were applied.

Figure 2 presents activities performed across the DT process-method enactment (Hobbs, 2021). The model depicted builds upon IDEOs description of the HCD process (2009)[7] amended to represent the increased breadth and depth of engaging with the wicked problem. The three rows in the figure represent the levels of abstraction previously discussed: the product-, systems-, and conceptual-levels. Activities relating to the CIA and strategy design are depicted at the conceptual-level of abstraction during Ideation (within the pink rectangle).

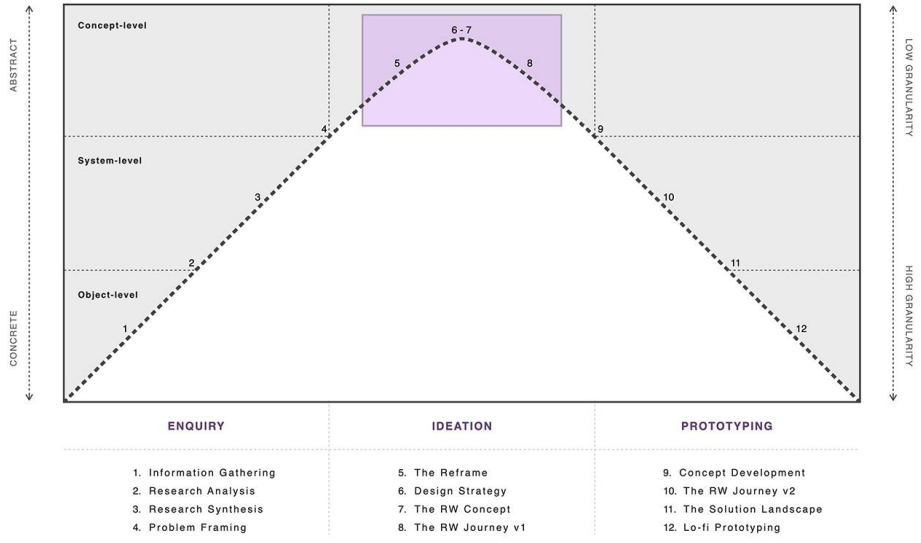

Figure 2. Design activities mapped to a conceptual model of the DT process-method enacted in the Thesis (Hobbs, 2021).

Lastly, figure 3 presents a detailed view of the various aspects of the strategy design as enacted in reference to Rumelt's (2012) kernel. (a) represents the reframing (*i.*) of the problem, being the *diagnosis*; (b) represents the strategic solution (*ii.*) at top and the CIA concept (*iii.*) below being informed by the reframe and constituting the *guiding policy*; and (c) identifies a journey map (*iv.*) created in response to the strategic solution and CIA

[7] The original version - to be found in the 'Intro PDF' (IDEO, 2009, p. 11) - consists of two rows. The lower row contains activities oriented within a 'concrete' modality and the row above includes activities oriented towards an 'abstract' modality. The movement is from the concrete (researching), into the abstract (Ideating) and back down into the concrete (prototyping).

concept, which contained the *coherent actions* within. These three aspects are discussed respectively in the sections to follow.

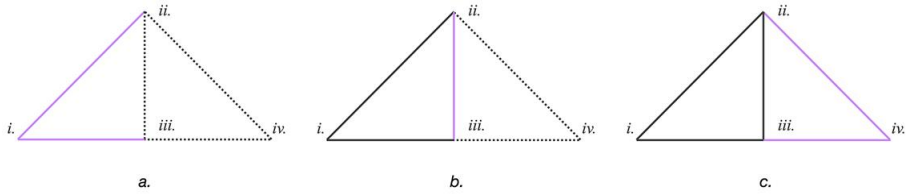

Figure 3. The strategy design and Conceptual IA illustrated through their creation in Ideation in the Thesis (Hobbs, 2021).

3.1 Shifting the conversation

In the design project conducted the problem of addiction was reframed from one centred on addiction and substances, to one centred on a consideration and prioritisation of the human condition across the lifecycle of addiction. By far, the near pervasive belief persists that the solution to addiction lies in abstinence from psychoactive substances either as a preventative or rehabilitative course of action (Hobbs, 2021). In the abstinence model, recovery from addiction is understood as a binary state of either being 'clean and sober' or 'using' (Solheim, 2015). Figure 4, presents a distillation of the author's interpretation of information gathered for the purposes of summarising a model[8] (Solheim, 2015) (Solberg, 1983) (U.S. Department of Health and Human Services, 2016) (White, 1996) (Collins, 2018) (DiClemente, 1998) (West, 2005).

[8] To the author's knowledge no such graphical or so modelled interpretation of the abstinence approach exists.

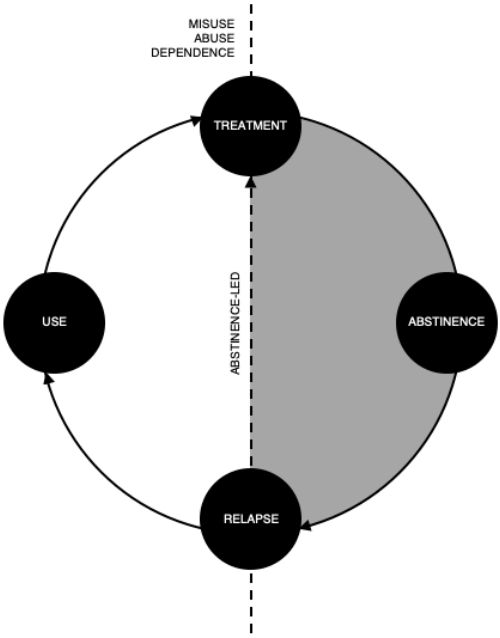

Figure 4. Use and abstinence in addiction conceived as a lifecycle model (Hobbs, 2021).

The reframe and descriptions which follow represent a subjective interpretation of the problem space premised upon research conducted and validated by U-ACT.

It needs to be noted that many South Africans, despite its constitution being one of the most progressively liberal in the world, remain in many ways and across many domains, a conservative[9] people living in the aftermath of a colonial, Calvinist Apartheid era (Collins, 2018) and indeed prior to Afrikaner rule.

In South Africa, the dominant negative socio-cultural logics with regards to psychoactive active substances (beyond alcohol, cigarettes and perhaps marijuana) imagine addiction to be a result of defects of character (lack of self-control, willpower or taking responsibility) or immorality (Collins, 2018). The moral recrimination applies largely due to most of these substances being illicit, and by implication the user too is 'bad' or 'wrong' or 'deserving of what they get'. This is in no small part a global inheritance of the USA's 'War on Drugs' (The Global Commission on Drug Policy , 2017).

[9] Today, SA has some of the longest jail sentences in the world for crimes relating to illicit drug-related crime.

A further dominant logic lies in the classification of addiction as a mental health disorder (Solheim, 2015). The issue thus moves into (mental) health or public health spaces (U.S. Department of Health and Human Services, 2016). Sadly, even here, the view emerges of the addict as a social abnormality and another to be pitied and / or treated differently. An example would be the non-disclosure of a substance disorder in general social terms or when applying for a job.

However, a 'resource model' of addiction[10], a term being coined herein, would suggest that addiction is better understood as the problem of problems, where a lack of internal and / or external resources available to an individual suffering from psychological pain - as a pre-existing condition - provides an arguably rational and reasonable inclination towards the (mis) use of psychoactive substances to ease the pain (Collins, 2018). This follows the views presented earlier by Du Plessis[11]. Left unaddressed, a dependency on psychoactive substances can result, leaving the individual with two problems rather than just the original, one.

In this reframing the addict possesses innate and intact dignity, where the implicit moral intent in the reframe, positions addiction alongside other critical theory discourses with their concerns for justice, equality and fairness. This view is most loudly advocated in the Recovery Movement and its practice known as Recovery Management. Solheim observes:

> " The goal of recovery [has become] repositioned as "improvement in key areas of life that were impaired by chronic SUD [substance use dependence], emphasizing the need for coordinated and comprehensive services" ... The literature has moved far beyond the ideas of cessation of substance use: we have entered the developmental realm of recovery management, embracing recovery as a process, not a state, a process that is experienced as a better quality of life." (Solheim, 2015, p. 13)

Du Plessis further notes that "QOL [quality of life] is applied as a fundamental concept across health care research… especially in mental health care and disability studies… QOL is increasingly recognized as a valuable indicator of the impact of treatment, need for health

[10] In the Recovery Management domain, the concept of *recovery capital* centres on a recovering addict being assisted in building up the resources required for long term, sustained recovery (Solheim, 2015).

[11] In citing Max-Neef, Du Plessis very cleverly contextualises addiction by connecting the individual to the larger socio-political system within which the addict suffers: "Each economic, social and political system adopts different methods for the satisfaction of the same fundamental human needs. In every system, they are satisfied (or not satisfied) through the generation (or non-generation) of different types of satisfiers…We may go as far as to say that one of the aspects that define a culture is its choice of satisfiers. Whether a person belongs to a consumerist or to an ascetic society, his/her fundamental human needs are the same. What changes is his/her choice of the quantity and quality of satisfiers." Max-Neef (in Du Plessis, 2017, pp.107-108).

care, evaluation of interventions, and for cost-benefit analyses." (Du Plessis, 2017, pp. 115-116).

It is in the context of these enormous shifts in thinking about addiction that the well-being of an addict (in recovery or not) needs to lie at the heart of any design intervention.

3.2 Message-Content and Message-Form

In a most unexpected turn, it would appear that an overlap exists between IA and Discursive Design which could have far reaching, and positive, implications both for Design and IA.

In Tharp & Tharp's (2019) "Discursive Design: Critical, Speculative, and Alternative Things" they describe **message-content** which refers to the content of the subject matter under discussion within a discourse, and **message-form** as the mode of discourse or form for sharing the content. It is in their considered and combined form that an additional level of meaning is conveyed which allows for complex handlings of content, form and context (Tharp & Tharp, 2019).

In its simplest form, IA is typically used to create the content structures of websites. This involves the identification and grouping of information into categories, all of which are labeled, and then modelled in an iterative top-down and bottom-up process to develop a structure, an IA, which people navigate through using a (graphical user) interface. This act has recently been reframed (Hobbs & Fenn, 2019) as the creating of a *structural logic* which through taking a form, referred to as a *semantic formation*, (trans)forms when realised (made *and* used) within design objects.

Although discursive design (DD) and IA have very different purposes and contexts of use, they use almost exactly the same constructs: message-content being structural logic; and message-form being semantic formation. For now, these constructs will only be highlighted for their likeness in relevance to the strategy design conducted. Later, the conversation will resurface again for other reasons.

The strategy design solution consisted of defining an aim for the design, a concept for the design and the approach to be taken to its execution. Sadly, there is only space within this paper to discuss the design concept and even then, at-a-glance.

The CIA concept, which emerged from the reframe, while also functioning in relation to the aim and approach, consisted of two parts: a set of 'experience drivers' (Fig. 5) determined through synthesis of the research; and a novel lifecycle or 'relationship model' (Fenn & Hobbs, 2017)(Fig 6) for a wellbeing centred recovery. The former operates as message-content / structural logic and the latter, as message-form / semantic formation.

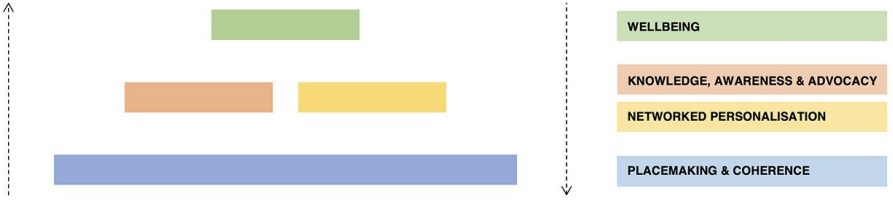

Figure 5. The experience drivers model as the message-content / structural logic (Hobbs, 2021).

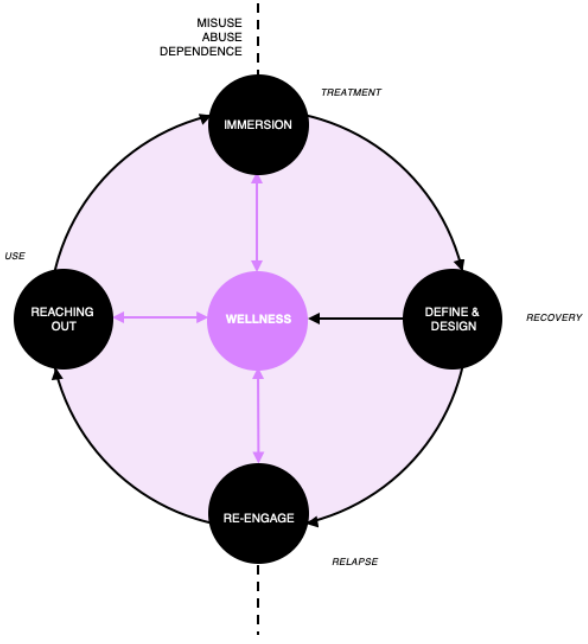

Figure 6. A wellness centred relationship model as the message-form / semantic formation (Hobbs, 2021).

Together, these two artifacts provide the structural semantic architecture as, and for, a new 'contrived ontology' for the solution intended for the world.

3.3 The Contrived Ontology

The experience drivers and relationship models provide something like a *kernel* for the IA of the entire solution to be built upon, thus providing a contrived ontology. The CIA concept's first instantiation took the form of a more familiar design artifact, a Recovery Wellness Journey (Fig 7). This journey is in essence a pervasive, cross-channel information architecture (Resmini & Rosati, 2011) functioning at a systems-level. In turn, and sustaining the thread from CIA concept, specific services and products (Fig 8) were able to be ideated and prototyped at an object- / product-level for stakeholders engaged across the ecosystem.

In figures 7 and 8, the relationship model is rendered in a linear form as the top line of five, black journey stages, reading from left: Immersion, Define & design, Wellness and re-engaging. The content depicted below, organised per stage, is colour coded in reference to the experience drivers model. In this way the coming together of the structural logic and semantic formation to form a *whole* is made visible.

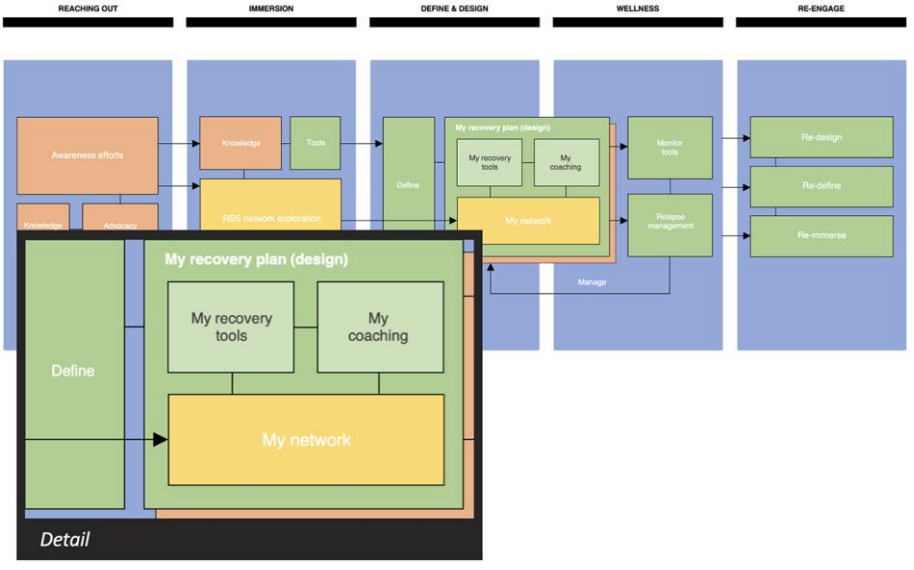

Figure 7. The version 1, lo-fidelity prototype of the Recovery Wellness Journey (Hobbs, 2021).

Figure 8. Mapping of cross-channel ideas generated into journey stages (top) and colour coded by experience driver (below) (Hobbs, 2021).

Figure 9 presents an example of one of the in-channel (website) user journeys created for the Immersion stage, transitioning towards the Define & Design phase in the same channel.

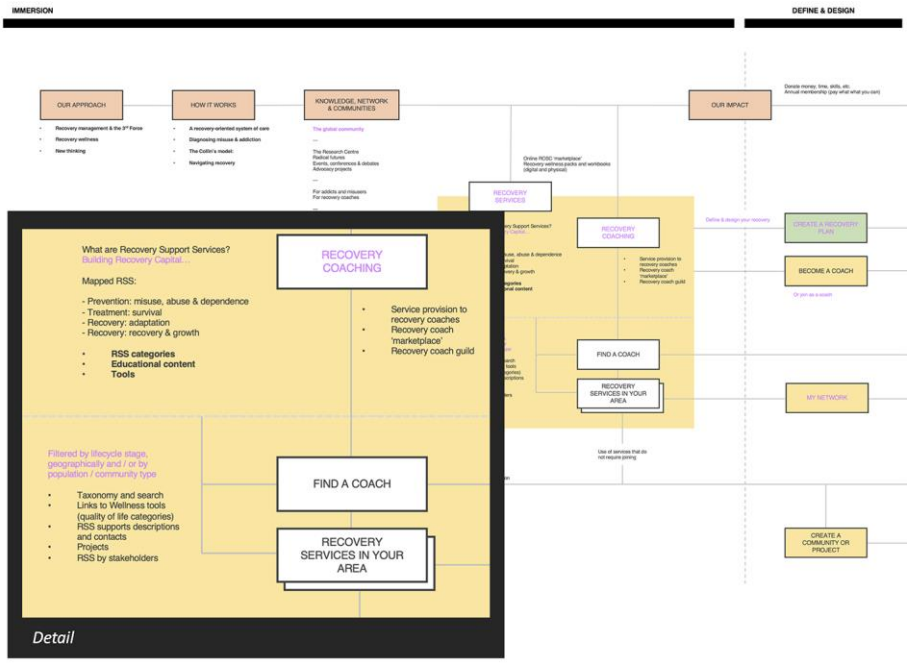

Figure 9. The 'Immersion' stage in the relationship model for the website user journey from the Thesis (Hobbs, 2021).

Visible across figures 5 to 9 should be the move from upper abstract levels of description downwards towards increasingly granular and concrete descriptions of the concept in design. Visible too should be the manner in which each successive level of ideation and description takes its logic, and **meaning,** from the prior level. Thus, *the form* of the CIA concept is both preserved and discovered through the DT process-method to ultimately manifest a contrived ontology as a meaning tacit within the user's experience of the solution[12].

[12] A distinction is made in the Thesis between a minimal conception of contrived ontology, being a meaning intended for the world, and a maximal conception, where the meaning transcends contrived intent to become an authentic ontology co-produced with users. The extent to which the maximal contrived ontology coheres with the minimal may be taken to be a measure of the quality of a design.

4. System Wide Synthetic Integrity

Synthetic integrity is a praxeological concept also referred to by its authors as a 'golden thread' (Fenn & Hobbs, 2017). Their original conception was of a horizontal, linear thread which, through the use of design journeys, made shifts in the meaning of information visible and traceable through design processes (Hobbs & Fenn, 2013). This is important in DT where, due to reframing, information used throughout the design process, such as research data or, even decision making, transforms in meaning due to deconstruction and decoding in Enquiry, recoding in Ideation and encoding and reconstruction in prototyping (Hobbs, 2021).

The Thesis expands upon the original notion where a second thread was observed operating 'vertically' forming, by way of analogy, an X- and a Y-axis. The X-axis represents the aforementioned golden thread. The Y-axis manifested through the CIA concept being employment across the three levels of abstraction from Ideation through to the end of Prototyping. Together the axes provide a scaffolding which pervades the design process.

It is in this way that the complexity of the wicked problem is harnessed through the use of IA and CIA in two ways: first, affording a *realising* of meaning, through sense-making in Enquiry at the point of reframing, through deconstruction and decoding; and second, *realising* the CIA concept as meaning-making in Prototyping through encoding and reconstruction.

It is worth restating that IA comes be discursive, though not necessarily critically so, when it shifts from applied science to Design (Hobbs, 2021). In this shift, how one considers and treats information derived from research and employed throughout the design process needs to be understood in the terms of Design's mediation of social reality (Hobbs & Fenn, 2019). Without this, it becomes extremely difficult for Design to take responsibility and be accountable not just for what it makes but also how it makes what it makes (Hobbs & Fenn, 2019).

The strategy design, sitting at the pinnacle of the process thus becomes a hinge for managing not only project, programme and even cultural design-related affairs, it provides for the management of the meaning in the system created and the networked meaning of this system in relation to others in its ecosystem. In this context, meaning could possibly be understood as *value* in the language of SDL (Vargo, Maglio, & Akaka, 2008) however, more consideration of these implications is required in general.

4.1 A Pre-Pattern?

The basis of a method and a model for praxis, a pre-pattern in RTD (Zimmerman, Forlizzi, & Evenson, 2007), has been developed in the Thesis which builds upon Buchanan's (1992) concept of *placements*. In this method we may observe an ontological reframing of what addiction could come to mean in the world. This shift in meaning is captured in the CIA concept, the Recovery Wellness Concept, which acts as a 'pivot' for exploring solutions. The mechanic for exploring and defining combinations of placements across space and time, in

the Thesis, was a journey map, which in turn inherited its structural logic and semantic formation from the CIA.

As the dual enactment of IA, and CIA, occurs across both X- and Y-axes a scaffolding, or semantic structure, comes to pervade the DT process-method providing system-wide synthetic integrity (Fig 10).

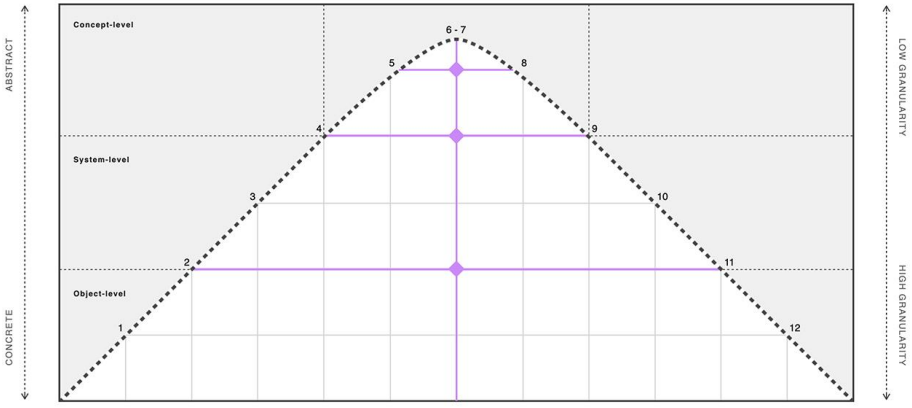

Figure 10. Diagrammatic representation of the synthetic, structural integrity created by a conceptual information architecture (Author).

What synthetic integrity then brought forth was a *concept* for a generalised architectonic for **systems of meaning** and **meaningful systems** as two parts of a gestalt whole (Hobbs, 2021). The system of meaning took the form of a *system of wellbeing* - from the relationship model as the semantic formation; and the meaningful system took the form of a *system to be well in* – from the experience drivers as the structural logic (Fig 11).

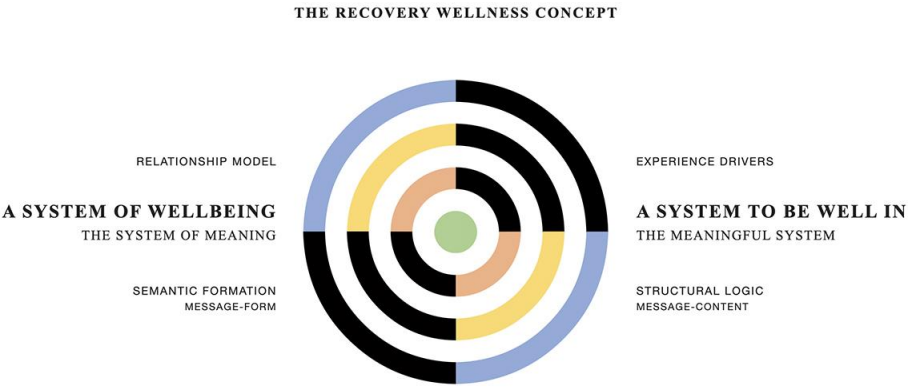

Figure 11. Communication device created for sharing the CIA concept in the Thesis (Hobbs, 2021)

In concluding this exposition of the project, a last observation is to be made. In terms of a coherent and consistent framework of meaning, the integral, structural nature of the system to emerge from the strategy design is one in which all instances of the system appear in the system itself, but in turn, the entire system can be observed in any particular instance. This last point provides the technical explanation of how the system's tectonics some to support the meaning for its architectonic.

Conclusion

This paper has provided an account of strategy design created through the DT process for the purposes of solutioning for the highly complex topic of addiction. Strategy design in this case, is demonstrated as a meaning-making process capable of emerging through synthetic resolution in Ideation. Through the use of conceptual information architecture (CIA) such meanings are capable of manifesting in the world as contrived ontologies within robust, transformative systems. In the identification of the shared semantic mechanics of discursive design (DD) and information architecture (IA) important and exciting opportunities become available to design, and the world.

Both DD and IA make meaning by *being* in social reality, however DD would emphasise a transformative social agenda and IA would likely default to a sustainability agenda (which should not necessarily be interpreted as a conservative socio-political stance). Where contemporary IA practice perhaps differs from DD is in its principal application in the design of increasingly pervasive digital spaces (Resmini & Rosati, 2011) which have shifted from our being related to, to our becoming dependent upon (Floridi, 2016).

These digital spaces are interactive and functional and thus, what were discursive 'readers' become discursive 'users' of semantic systems. In a sense, the nature of digital environments renders the message-form, in the first instance, as something to *be in* rather than to observe at a distance. The pre-pattern presented within allows discourse to become realisable as the environments within which we will soon be living.

Reframing development: A proposal on the role of design research in Latin America based on situated views of the world

Abstract | Design has gone, through the past decades, from looking for solutions to everyday problems to the production of actions on a systemic level. That path has led design into getting involved with the process of policymaking. But as many researchers have reported, a constant failure in the implementation of policies for innovation and development on so-called 'third-world' countries, might imply a necessity to investigate its possible reasons and implications. Design practices related to policy making have proposed possible frameworks to evaluate those failures and seek for solutions, however, these procedures might be based on the wrong assumption, that these failures are barriers to overcome, rather than embedded values to be encouraged in the design process of possible new systems and ideas of the preferred future. This paper considers some critical notions of embedded values on Latin-America communities and the implications for a growing role of design in devising actions that can lead us to a preferred future state of the system.

KEYWORDS | POLICY DESIGN, SYSTEMIC DESIGN, EMBEDDED VALUES, LATIN-AMERICAN DEVELOPMENT

1. Introduction

In the past 60 years, design theory has developed significant arguments about the nature and role of design as a discipline as a way of thinking (Polanyi, 1964; Alexander, 1967; Simon, 1969; Bucahanan, 1992; Banathy, 1996; Cross, Christiaans & Dorst, 1996; Sevaldson, 2017). Some of these arguments have been widely accepted and some are still discussed among academic communities, but from them we could establish certain principles and trends that can show us current exploratory practices and their possible impact in the future role of designers in the world. One of the most significant ones and the one on which this article is supported the idea of design thinking and design process as possible tools for the design of economic and political policies (Ingram, & Schneider, 1993; Soss, 1999; Skelcher, Mathur, & Smith, 2005, Hendriks, 2009, Kimbell, 2015).

This practice is located inside the conjunction between the capacity of design to look and research into possible preferred future states of the system (Simon, 1969; Banathy, 1996) with the purpose of producing tangible artefacts as catalyst for the required transformation, and the notion that design is by nature systemic (Sevaldson, 2017), and it is constantly looking for connections outside the initial scope and for solutions to larger or wicked problems (Rittel & Webber, 1973).

But most of the approaches presented in the research literature about the process of design for policymaking, assume the existence of a system in place, and focus on the systemic search for failures with the intention of producing formal solutions that fit into the system and improve its functioning, either by overcoming barriers (Woolthuis, Lankhuizen, & Gilsing, 2005) or by a participatory model that informs the process (Barbero & Bicocca, 2017). This methodology present significant problems when the view of the system moves from theoretical and structural to a real, complex and dynamic view, and factors like the culture and values are recognized, not as barriers to the adoption of a policy, but as leading principles of the real system. Leading to the question of how to make sense of those systemic failures as index of underlying principles of the community not capture by the design process.

This paper seeks to interrogate the idea of design for policy making, with the specific case of Latin-American models of development (Escobar, 1991), when concepts like situated knowledge (Haraway, 1988) and systemic values (Friedman et.al., 2013) are incorporated inside the design process; and what are the possible implications for the area of study.

2. Theoretical context

2.1 Designing for policy making

Design devises tangible means of transformation of the world (Simon, 1969) on a systemic level (Sevaldson, 2017), therefore its recent role on acknowledging different stakeholders

and the use participatory approaches to recognize possible spaces of transformation on governmental policies and produce viable possible alternatives to address those issues. Initially based on the application of 'design thinking' techniques (Buchanan, 1992) to include the targeted communities on the discussion and to search for creative solutions to complex issues on the governmental level, design for policy making has quickly turned to a systemic approach. This idea of a systemic and yet actionable approach that design brings, has created new opportunities for designers to get involved on the process of policymaking on a higher level (Bason, 2014).

But those design actions focused on the improvement of society have shown over the years to present significant problems on the search for the development of the so called 'third-world' (Escobar, 2012). Projects of social innovation and social awareness, have fell into oblivion when communities are unable to support or maintain those design solutions built for the covers of magazines. And large scale policies for development slowly bleed out their resources on the intent for acceptance and implementation. One possible reason is that there are several intrinsic factors in the systemic level of policy making, like the situated knowledge of the community, their cultural values and their views of the world, that are usually not incorporated by policy makers under the assumption that their role is to make their policies viable.

This notion of viability is a very dangerous statement, since it assumes the existence of one view of the world and one image of the future, and policies as the correct mechanisms to lead us there. In this model, the failure of policies is conceived as the result of a series of systemic barriers that must be identified and resolved to make the policy implementation possible (Woolthuis, Lankhuizen, & Gilsing, 2005). We could argue that a significant problem of many design processes is that they focus their attention on the production of artifacts (either images, objects, plans, service blueprints, etc.), but that the real objective of this artifacts, that is the actual transformation of the future system, is sometimes overlooked. Ideas like predictability or anticipation, that are coming from economical sciences and engineering, support this idea of the production of objects that intent to fill a predicted gap of the future and that their success is measured based on acceptance rather than on the unintentional consequences that they produce or the values that they support. This view eliminates one the most important principles of design: that it is about the actionable transformation of reality.

However, the application in the process of design of socio-political and cultural theories as systemic factors, might present a more critical way to devise policies that agree with the reality of the system and the stakeholders involved, or at least to a more critical understanding of the system and the real reasons for failure.

2.2 The importance of situated knowledge

One of the different struggles for policymakers to introduce new policies that support a specific model or view of the world, is the one that is presented when communities are

forced to accept policies that go against their current practices. This conflict between the traditional practices and the requirement to accept new ways of doing, is usually seen by policymakers as a deficit or inability of individuals to adapt or develop (Smith, 2000), even though those disregarded traditional practices, might sometimes have a better understanding of the ecosystem. This type of knowledge that is produced by cumulative experience of a tangible relationship with the world, or situated knowledge (Haraway, 1988), is not just built on a more systemic process, but is also intrinsically connected with cultures, traditions and ways of being in the world.

Besides the fact that communities who are subject to models foreign to their reality must deal with the erosion of their traditions, they also should tolerate the disdain of the situated knowledge that they have built through generations by the institutionalized structures of knowledge, and accept new methods that rely on notions sometimes built on a lab separated from reality, or based on theoretical ideas that have not been fully developed.

Escobar (2007) points out this phenomenon on his critique to the ideas of development,

> "…the forms of exclusion that went along with the development project, particularly the exclusion of the knowledges, voices and concerns of those whom, paradoxically, development was supposed to serve: the poor of Asia, Africa and Latin America" (p. 20).

This disregard of their traditions, this silencing of their voices, is not just a barrier to overcome or a matter of inclusion, it is a sign of a larger problem on a systemic level, and it raises the question of whether the role of design is to find a way to ease the transition, or to reframe policies and the notion of development in a systemic level.

This issue is not just a matter of cultural acknowledgement, it is important to recognize, that even though situated knowledge does not follow the paradigm of scientific knowledge, it is constantly producing hypothesis that are tested for even longer periods than the ones used on science process, and they are deployed under real conditions. It is also important to add, that a possible advantage of situated knowledge for problem solving, is that it seeks for actions on real instances, it does not rely in the ability to validate or explain, but on the pragmatic search for a solution. Finally, situated knowledge does not simplify or discretize reality like the scientific process, it works in a systemic way, connected to all possible variables and consequences (Haraway, 1988). Therefore, in the case of design practices, integrating this kind of knowledge to the construction of ideas for the future of these communities is not just adequate but necessary.

We can see several examples of this denial of situated knowledge by the political systems of hegemonic knowledge, and they extend far beyond 'underdeveloped' countries. Praxon (2012) argues that there is a political decision behind the imposition of these models and that their effect might put in danger a specific knowledge that has not been collected or recognized by other means; Marcellino et.al. (2001) also explains how the introduction of

modern technologies on the production of cheese has been eradicating ancient techniques and knowledge,

> "As traditional cheese making techniques are threatened or have been abandoned, the collection, characterization, and preservation of native strains of cheese-ripening microorganisms are critical..." (p. 4758).

This idea of a standardized knowledge eradicates the possibilities for conversation, and assumes a given truth about the world, ignoring that many of the problems that we face today were already resolved hundreds of years ago by the communities that inhabit those spaces.

That is the case of the flooding areas of the Zenú river in Colombia, where the larger hydraulic system of ponds, canals and floodgates of the Americas was set on place even before the arrival of the Spaniard Conquistadors, managing the caudal of the river to provide irrigation and organic material to the soils, bringing sustainable wellness to the local communities. This model that guaranteed prosperity for the whole community was based on the principle of governance as a service and management instead of ownership in terms of the use of lands.

However, the introduction of political decisions intended to provide benefit to individuals, and policies that disregarded that situated knowledge, transformed the overflown of the river into a constant focal point of humanitarian crisis, where, on yearly bases, families lose their crops and assets. As lands are no longer communal, communities are forced to deal with their own problems as individuals, and large scale actions are only reserved to a governmental level.

But cases like these are even more complex when indigenous communities that are still actively using that knowledge, and we can count that on hundreds of communities in Latin-America, are forced to face science, medicine or modernity. We see their lack of acceptance of these ideals as lack of development or understanding, ignoring that their knowledge of reality might be better connected to the natural system.

These statements are supported by different authors, some of them, like Escobar (1992), criticizes the notion of 'development' as a constructed ideal for the future that has been imposed by the mechanisms of power that are in place, to maintain control over the 'less-developed', ignoring their voices and their ability to produce their own idea of future. We live in a society that has taken for granted a single idea of what the future is, and the role of technology, science and politics in the construction of that future, ignoring that there are other communities sharing the space and dealing with the consequences of our ideas; communities with other views of the preferred future, that are based on cultural values different than those of the modern western world that have determined the path we have followed.

2.3 Embedded cultural values and their systemic repercussions

The discussion about embedded values in design have been getting more attention and discussion on research literature (Pereira, Buchdid, & Baranauskas, 2012; Friedman, et.al. 2006) and other design related disciplines on the fields of architecture and engineering have included the use of values on the definition of current projects, from infrastructure to big data and AI, human values have gained attention as significant variables on the construction of large scale system or environments. Values are strong forces pulling into specific directions, especially those with cultural origins, since they represent a shared view of our roles inside society; these intrinsically bounded cultural values of local communities, define a big part of their traditions and actions, since those have been historically oriented to the fulfillment of symbolic needs.

However, as stated by Escobar (2007), there is no way to assume that policies intent to fulfill the real needs and requirements of societies, especially since most of these (needs) are produced by a dialectical relationship with the ideals of the ideology on place. It is necessary to recognize that the role of design on communities where foreign values have been already introduced might go farther than applying participatory processes to recognize their needs, since those might be skewed from reality. As for those communities that have not been obligated to adopt external models or ideologies, these values could be leading into a different direction.

It is then important to understand that for many traditional Latin-American communities, the wellbeing of a community is more valued than individual interests, and the ecosystem is valued beyond the discrete idea of 'resources'. Those communities historically have looked for balance and flourishing rather than growth or development as a definition of future, for them notions like individual growth or private property are not only foreign but dangerous. In that sense, Riley (2000), points out about how non-Western indigenous communities still carry a deeply embedded notion of property as a value intended for the wellbeing of the community that clashes with the ideal of individual property of western copyright laws; adding to that, Redford & Stearman (1993) also argue on the dangers of imposing western notions like 'property' on the issues of land on indigenous communities, since the sustainability of many of the tropical forest areas of the Amazonia have been supported by a complex system of collaborative and communal management of those lands, and oriented to guarantee its persistence for present and future generations.

Isemberg (1992), also discusses how the delicate ecosystem of North-American communities was disrupted by the imposition of European policies, and how the practices of sustainability of Native American communities change from a system of multisource communal support to a nomadic economy of hunters, forcing them to abandon their traditional lands. He also points out the devastating consequences of the introduction of the notion of capital as a desirable value and a constant goal that is opposed to the wellbeing of communities. These factors present a significant learning for design in general and design for policymaking in particular, since it reveals the constant existence of embedded values on everything created

by humans, from everyday objects to large-scale policies, and the significance and implications of those values on human behavior and on the balance and survival of the system.

3. World-views and images of the future

Both the values and the situated knowledge represent the past and present of communities, the trends, patterns and lenses used to produce an image of both the present and the future system. They have been a significant part of what have produced specific 'world-views' or 'Cosmo-visions' on local communities. Therefore, any image of the future used on a design process (Banathy, 1996) that fails to incorporate those views will produce a natural resistance on the implementation process.

These views of the world might be significantly different to ours; particularly in Pre-Hispanic America, these visions were based on a sustainable and systemic view of the world, where nature was not defined as a set of human resources, but as a living organism, and the role of humans to maintain its balance. Escobar (2007) comments

> "…alternative political ecology, based on notions of sustainability, autonomy, diversity and alternative economies that do not conform to the mainstream discourse of development" (p. 21)

referring to the vision proposed by local black communities in Colombia on their process of trying to define their idea of future, and proving a systemic dislocation between large scale politics and the real intention of communities.

And yet, many policymakers still try to implement policies that are foreign to the reality of these communities, disregarding the lessons of the past. The implantation of policies based on unaligned world-views may produce unintended (or not) negative effects; as Isemberg (1992) points out, the imposition of modern 19th Century worldview of the evolutionary struggle of the species facing the cruelty of nature and the need for individual survival as the 'fittest' might have come with devastating consequences, like the nearly eradication of both American buffaloes and Native-American communities.

All these principles are embedded in communities and born through their relationship with the real world, but in the process of policy making are not commonly acknowledge as possible factors to seek the transformation of the current policies or even the reframing of notions like development or the underlying economic and political models that supports them. Woolthuis, Lankhuizen, & Gilsing (2005) explain this dislocation between policies, situated values and knowledge as a "Soft Institutional Failure" and argue that policy designers must overcome those to be able to implement the desired policy, disregarding the possible importance of these principles in the constructions of policies. Others, like Skelcher, Mathur & Smith (2005) argue for a participatory process for policy design, that allow communities to part on the definition of their future, but even in the participatory approach

the role of communities is reduced to the production of ideas for policy making, leaving outside the discussion if there is a real common view of the future, and if those policies are just patches sawed on a defective system.

If design is indeed a holistic process of understanding and transformation of reality based on a specific view of the world, and that both the understanding and the possible implications of design actions are supposed to be happening on a systemic level (Sevaldson, 2017), we should not be looking only into the production of artifacts to support the implementation of one single view of the future, or to ease transitions into what some stakeholders assume as the right direction. We should be able to reframe those notions of the future, to include the reality of the communities that we are working for, considering possible game-changing actions intended as catalyzers to the large-scale transformation of the current system, and if Escobar's (2012) argument of "Design has doubtlessly been a central political technology of modernity" (p. 5), we should also have a significant role to lead us pass that notion of modernity into a more inclusive view of the world.

We can see emerging cases of participatory future building in Latin America, like the one presented by de la Rosa, et.al. (2021) about the creation of the CIIC (Communitarian Center for Research and Innovation), where communities lead grass-root processes that seek to produce images of their future that can help them modify the policies that affect them. These actions do not seek to map problems or needs, but rather recognize their values, and their ideas of what a better future looks like for the community, and then plan for strategic actions that can lead into them.

On these practices design becomes an enabler of their process, it does not ask for problems or presents solutions, but recognizes the design process as its main contribution, and the constant reminder that the goal of the process is the future of the community, and the participation of every voice. In this process design is not the savior or the initiator, it does not take the credit or publish creative innovations on the cover of a magazine. It rather maintains a silent role of support and focus.

On the mentioned case of the CIIC, the design team organized a series of community-based workshops that used methods like value-mapping, cultural probes, self-ethnography, prototyping and collaborative analysis to create images of a future where community values where acknowledged and incorporated for the wellbeing of the community.

Although these processes emerge on very specific circumstances of socially concerned community values and a history of participation. The role of designers seems ideal for policy-making, facilitating discussions about the future on a systemic way, interconnecting intentions and agencies to produced strategic plans to incorporate voices and actions into the construction of that future.

4. Discussion

The problem for neglected communities could go as deep as the primordial principles of the capitalistic system and may explain the permanent seek of Latin-American communities of alternative systems, and their foreplay with communist ideals, that at the end become also imported views of the world. Escobar (2007) point out that

> "with their focus on discourse, the post-development proponents overlooked poverty and capitalism, which are the real problems of development" (p. 21).

This might determine the need to go even farther in the definition of future, and the idea of development, to seek from the perspective of policy design an approach that recognizes the real nature of communities as a foundation to produce new models, and as Escobar points out, enter the era of post-development, when communities become more involved in their construction of their future.

From the perspective of design, as a process that constantly seeks for the transformation of reality to achieve a preferred state, the question is, how do we define the notion of 'preferred'? Is it based on the view of the systems of power in place or is it really considering the preferred views of the members of the communities that those policies serve? And how deep into the system should design process look? Should it be just a tool to serve to patch the gaps of a failed system or a catalyzer of transformation of current models and institutions?

Design have historically play the role of facilitator, greasing the wheels of the power system, either as the building arm of the economic powers or the path maker that with the ideal of social innovation helps to maintain the inequity of the system. Giridharadas (2018) on this issue, quotes the 1891 essay by Oscar Wilde, referring to the actions of design thinking as a tool to alleviate poverty, rather than a radical force of change, as the good slaver who by actions of kindness covers the horror of slavery. Isn't it time then that Design assumes the role of truly aiming for a preferred future that we can all share, and not one that has been systemically designed to maintain poverty an inequity as a mechanism of control.

If Escobar (2012) is right is, the constant failure of the systems is related to the implementation of extraneous politics and models that are unaligned with the values of the communities they seek to represent, and do not recognize the nature of these communities. With the assumption that the role of design as a discipline is investigating the future to produce new artifacts, and that those artifacts are determined based on the structure of the system, working with a failed system as an initial parameter, will mostly produce inadequate results. Therefore, every intention to produce innovation and development in Latin-America might be by nature flawed and might require for design researchers as their priority to investigate the notions of development and future to produce new models that include the reality of the socio-cultural ecosystem of Latin-American communities.

This paper calls for design research communities in Latin-America to prioritize the design for policy making as their main initial preoccupation and to seek for ways to reframe the idea of development towards an inclusive, sustainable and responsible model of the future world from a systemic perspective.

Speculative Design for the Public Sector. Design Fiction as a Tool for Better Understanding Public Services.

Gianni Sinni[a]

[a]Università IUAV di Venezia
*gsinni@iuav.it

Abstract | This paper investigates how speculative design and particularly design fiction can be an effective educational approach to public sector design. The innovation and digitization of public services has been an important driver for the introduction of design thinking and service design methodologies in the public administration in recent years. Design for the public sector on the other hand affects the way the citizen-institution relationship is conducted and therefore requires an ethical and possibly critical approach. Likewise, the global challenges that await public policy choices are increasingly confronted with analyses and foresights of the future. Design fiction is a way through which, starting from the designer's educational path, design, politics, foresight and civic participation can be combined within a conscious and ethical narrative framework.

KEYWORDS | DESIGN FICTION, SPECULATIVE DESIGN, SERVICE DESIGN, DESIGN FOR SOCIAL INNOVATION, DESIGN FOR PUBLIC

> Without a utopian element, another world is not possible and would remain the expression of a pious ethereal wish without concrete consequences.
>
> *Gui Bonsiepe* (2010, p. 41)

The purpose of this paper is to investigate how speculative design can represent a useful didactic methodology for providing designers with the skills necessary to take on the challenges of digital public service design. In recent years, innovation and digitalization in public administration have been an important stimulus for introducing the methodologies of design - and service design in particular - into the field, especially in cases where design's capacity to promote inclusion and civic participation proves to be a useful resource. The result of this process is an increasingly intense and inevitable synergy between designers and the public sector.

1.Design for the public sector

This is reflected in the fact that international experiences concerning the design of digital public services have recently been on the increase. The effectiveness of digital public services, in fact, represents one of the policies monitored by the European Commission through the Digital Economy and Society Index (European Commission, 2019). One of the most significant ongoing experiences, in terms of originality and scope, is certainly the seminal work conducted by the British government through the activity of the Government Design Service (GDS), which began in 2011. Having employed to date over nine hundred designers (Downe, 2019b), the GDS is the proof in the field of how the sector of design for public administration represents a promising field of development for the near future. Jason Shupbach, Design Director at the National Endowment for the Arts during the Obama administration, left no room for doubt when he stated that "to me, that's where the real energy is on good governmental graphic design" (cit. in Budds, 2017). Professional opportunities, of course, are not the only question of interest here. Indeed far more significant are the civic and democratic ramifications that designing the relationship between citizen and institutions implies, and which makes public sector design so crucial. It is certainly not difficult at the present time to recognize that "democracy is a design problem" (Chisnell, 2016), particularly given the challenges implicit in the widespread and generalized distrust of politics. Training designers who are skilled in crafting services in the public interest thus constitutes a precious necessity which university-level education must ensure.

It is important, nevertheless, to dispel a series of quite common misunderstandings that view the design of public services as limited to the simple graphic rendering of an interface,

or as a problem of an exclusively technological nature. Public service design represents a classic example of one of those wicked problems that Richard Buchanan, using Horst Rittel's definition, so usefully described, identifying the design thinking approach as the only one capable of handling these specific sets of problems (Buchanan, 1992/2019). They present unique challenges to traditional solutions because they are symptomatic of numerous conflicts; they are problems that risk being aggravated rather than resolved by solutions that are isolated from the broader context. Naturally, public organizations are not enthusiastic when faced with these questions: "After all, wicked problems are (social) issues that no one entirely understands and that cannot be effectively addressed by any one person" (Schaminée, 2019, p. 31). Only through a holistic approach to design can we hope to structure effective paths for public service design that attribute the necessary importance to the "human factor." Participatory approaches and co-design, the involvement of the various stakeholders, and the creation of multidisciplinary coalitions are the necessary conditions for an effective approach to digital public service design, as the experience accumulated in recent years demonstrates.

But which characteristics should a service have in order to be considered effective? The answer provided by Lou Downe, ex-Design Director at the GDS, in his recent book *Good Services. How to design services that work* goes straight to the point: a well-designed service must be a *good* service for the user, a *good* service for the organization that provides it, and a *good* service for society in general (Downe, 2019a, p. 36).

Preparing to design a new generation of citizen-centered digital public services, therefore, means first creating the necessary skills in the designers of the year to come. Skills which cannot be limited to mere aesthetic and technological solutions, but must include the ability to guide and direct those processes that underlie the management of the services themselves. Without innovation in administrative processes, any action risks leading to the development of disappointing and ineffective services (Downe, 2016), yet public organizations are not always structured to grapple with the techniques and methods of design thinking. Where possible, it is necessary to build the necessary bridges between designers and public sector innovators to develop a shared method and language for the achievement of their common goals.

But dealing with the frequently contorted and bureaucratic reality and procedures of public administration can often prove frustrating, nullifying the enthusiasm of even the best intentions. Limited aptitude for technological innovation, antiquated procedures, overlapping competencies between various offices, and disagreements over how to manage change constitute some of the main hurdles in the interaction between designers and the public sector. At times, such obstacles can even provoke cases of "friendly fire," with the consequent slowing down - if not out-and-out stalling - of the innovation process (Schaminée, 2019, pp. 40-62; Tassi, 2019, p. 83). All of this clearly represents a significant impediment for designers' work in this particular field. As Mike Monteiro summed up, "for the most part, no one wants to be doing these things. They're not exciting. They're tolls for

existence" (Downe, 2019a, p. 8). Managing to understand this reality, establishing constructive dialogue, and getting the most out of the excellent resources that are present in the public sector constitute a necessary step in public service design. Thus emerges a responsibility on the part of the educational system, along with public institutions, to identify less common and potentially more intriguing ways of interesting students in the design of public services, fully conscious of the fact that only an active presence of designers can guarantee the development of *good* services. Ben Terrett, another former GDS Design Director, doesn't mince words when he argues that

> "every designer should work in the public sector. Being a civil servant and using your talents to help the people in your country is an honour. In an industry so often obsessed with novelty and persuasion, government is a chance to do real design work. If the government started a fast stream programme for design grads it would start to change the industry and make services better at the same time" (cit. in Pasqual, 2017, p. 199).

And it is here that higher education must intervene: in the creation of a shared workspace for design and the public sector. As Kees Dorst put it, "there's a lack of instruments and tools where organizations and design intersect. Moreover, there's not even a profession for that area" (cit. in Schaminée, 2019, p. 14).

Figure 1. The final exhibition at the 2016 Iuav Design Workshop (University IUAV Venezia) on the design of future public services.

Developing specific courses on government service design means preparing tools to make this field more attractive and stimulating, going down less traditional paths. This phase appears increasingly urgent because public service design provides a renewed opportunity with which, as Victor Papanek phrased it (1973, p. 19), "design can and must become a way in which young people can participate in changing society."

2.Design fiction and public sector

One of the most promising approaches in this perspective is represented by speculative design, and particularly by "design fiction," a method still little used in public sector design with the controversial exception of defence departments and the armed forces (Otero Verzier, 2018). Design fiction brings together the creation of objects not yet existing in reality with the construction of a fictional narrative context whose purpose is to stimulate "debate" and reflection on the part of the general public (Tharp & Tharp, 2019).

A story's ability to mold the public perception of government policies has been investigated on many occasions. We know, for example, how the mainstream media, particularly film and literature, have had a direct influence in orienting U.S. government policies regarding the reorganization of psychiatric institutions after the publication of Ken Kesey's novel *One Flew Over the Cuckoo's Nest* (1962), or in supporting the huge federal investments in space exploration through Hollywood's massive production of science fiction films (McCurdy, 1995). Cinema also has a long history of representing the machine of government, the bureaucracy and its functionaries, highlighting its merits or, more often, its downsides (Holley & Lutte, 2017). Similarly, the science fiction genre has repeatedly transposed onto the silver screen visions of public administration of the future – from the obsessive, obtuse bureaucratic system of *Orwell 1984* (1984) and *Brazil* (1985) to the lobby-like pressure groups in the Galactic Senate in *Star Wars: Episode I - The Phantom Menace* (1999), from the alien census in *District 9* (2009) to the ludicrous public health system of *Altered Carbon* (2018), in an alternation between utopian and dystopian visions (Lee, 2017; Sauvé, 1998). Speculative design brings a narrative, critical dimension –sometimes provocative and politically antagonistic – into the work of the designer.

The term "design fiction" indicates the method of creating alternative future scenarios through the design of particular objects or, to use the famous words of writer Bruce Sterling, "Design Fiction is the deliberate use of diegetic prototypes to suspend disbelief about

change"[1] (Sterling, 2013). In this approach the centre of interest is no longer design in itself, but rather the user and those changes, opportunities, and critical conditions that design can contribute to create. As highlighted by Dunne and Raby (2013), two of the most representative explorers of this approach, when it comes to speculative design,

> "rather than thinking about architecture, products and the environment, we start with laws, ethics, political systems, social beliefs, values, fears, and hopes, and how these can be translated into material expressions" (p. 70).

It is difficult not to see in this orientation the essence of that "design hope" discussed by Tomas Maldonado (1970, p. 60): "Politically speaking, the revolutionary sense of dissent is really only attainable through design. Dissent that rejects design hope is nothing but a subtle form of consent."

Design fiction has not often been used for the public sector precisely because it is so strongly connoted by this provocative vein, sometimes subordinated to the narrative, other times explicitly evoked to exploit its potential tension within participatory processes (Boer & Donovan, 2012). Of course this tension also constitutes a risk, and may sometimes even be the cause of rejection in those public milieus less inclined to innovation, or strongly opposed to changing their consolidated processes. The fact that speculative design is characterized, as we mentioned, by an explicit political outcome is certainly useful in stimulating discussion, but can become problematic when the bodies that use it have to present themselves as impartial, as is the case in the public sector.

Yet anticipating and imagining the future represents a meaningful way of evaluating the implications of the choices made in our present. With the global challenges humanity faces today – the climate crisis, social inequalities, migratory phenomena – we can ill afford to disregard a perspective so suitable for probing long-term consequences. Design, too, must therefore ensure that it does not lose sight of the consequences of its work for the next "seven generations," as the Great Law of Peace of the Iroquois required. And this is even more applicable when that work pertains to the public policy sector.

3.Policies and future

A growing number of organizations and international research centres have identified speculative design as a useful procedure in defining governance policies. In 2012 UNESCO

1 "'Deliberate use' means that design fiction is something that people do with a purpose. 'Diegetic' is from film and theatre studies. A movie has a story, but it also has all the commentary, scene-setting, props, sets and gizmos to support that story. Design fiction doesn't tell stories -- instead, it designs prototypes that imply a changed world. 'Suspending disbelief' means that design fiction has an ethics" (Sterling, 2013).

began constituting a Global Futures Literacy Network,[2] with 11 countries currently involved, that aims to develop operational tools for applying speculative design to government, business and community initiatives (Miller, 2018). The Organization for Economic Co-operation and Development (OECD) has utilized anticipatory scenarios to identify risks and critical issues for possible innovative paths in Brazilian public administration (OECD, 2019, pp. 105-118). The EU Policy Lab recently initiated "The Future of Government 2030+," a project whose approach to defining political responses combines forecasting, design and citizen involvement; the purpose is to answer the question of how citizens will model governments, policies and democracy from 2030 on (Vesnic-Alujevic et al. 2019). Forecast scenarios are the basis of the Danish Design Center's Future Welfare platform, whose purpose is to imagine that country's future healthcare system (Bason & Striegler, 2019), while Lancaster University's "Imagination" lab has conducted a series of design fiction-based workshops with senior citizens from various assisted living facilities to investigate how politics might innovatively confront the general aging of the population (Darby et al., 2015). Also in the United Kingdom, the Policy Lab, the Cabinet Office's consultative body for the introduction of new political tools and techniques, has frequently underlined the creative power of speculative design (Drew, 2015), while Nesta, an innovation foundation, underlines how important it is for governments to consider the future implications of their political choices with a forward projection of at least 15 years (Kolehmainen, 2016).

In all these cases, the "shock therapy" of provocation, at times implicit in the design fiction approach, becomes a stimulus for the institutions themselves, while the narrative aspect turns out to be particularly interesting in the context of a co-design of services, paying particular attention to citizens' hopes and fears regarding their own future and that of society. After all, citizen involvement is an essential step if we want to locate speculative design for the public sector within an ethical and, necessarily, empathic framework. Ethics and empathy are two important characteristics of speculative design that allow for the development a critical discourse, rather than limiting ourselves to a mere exercise in science-fiction narrative or techno-enthusiastic marketing (Jensen & Vistisen, 2017).

[2] https://en.unesco.org/themes/futures-literacy

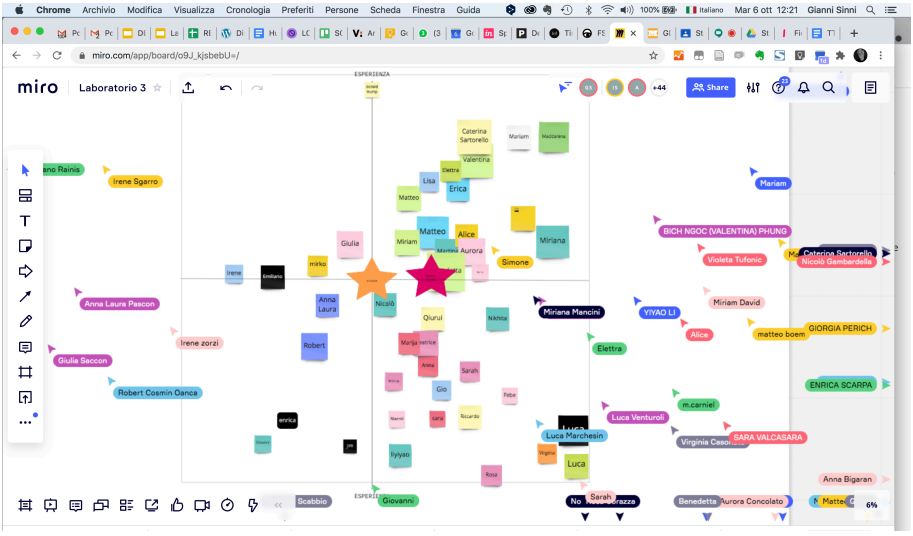

Figure 2. The Polak Game on Miro platform during the Communication Design Lab at Iuav University of Venice, 2020.

4.Tools

Within the practice of design fiction – from the anticipation of scenarios to the creation of diegetic prototypes – it is necessary, from an educational standpoint, to develop tools that are applicable to public design and give the necessary emphasis to the ethical dimension. A first important goal, therefore, is to try to infuse design students with an awareness of the implications that each project brings with it and the complexity of the ecosystem involved.

In this direction we can identify several examples of tools applicable to speculative design projects for the public sector, tested in workshops and university classes[3] [Fig. 1], that are characterized by a collective brainstorming process. One place to start is by assessing participants' expectations about the future through a version of the Polak Game where everyone is asked to indicate their own position with respect to the semiotic square of the experience of change (things are getting better/worse) and influence on change (I can do

[3] The experiences reported here were developed in the Hybrid media design Labs at the master degree course in Design at the University of the Republic of San Marino in the years 2017-2019; in the 2016 Iuav Design Workshop and in the Communication Design Lab at the Iuav University of Venice in the year 2020.

little/can do a lot) [Fig. 2] (Hayward & Candy, 2020).

Figure 3. A "What if" brainstorming workshop at the international symposium "Updating Values", University of the Republic of San Marino, January 2020.

With the "What if" question, starting from a specific argument – the narrative premise introduced by the phrase – a discussion group can construct a matrix of the scenario's implications such as the Futures Wheel: a visual representation in which participants hypothesize the future repercussions in various fields – social, economic, philosophical, religious, healthcare, juridical, ethical, environmental, and so forth (Glenn, 2009). For example, if the initial topic of the discussion is "What would happen if all cars became driverless?" we could mention as one of the social consequences the "drastic reduction of fatal accidents," while from the healthcare perspective we would note a "drastic fall in the availability of organs for transplants."

An even deeper immersion into the complexity of future projections is represented by the transformation of the above "What if …" narrative premise into an "If … Then … Else" conditional instruction, in which the many possible implications are developed on the basis of the first statement, before serving themselves as a point of departure for subsequent branches, a representation of the classic "butterfly effect." Applied to a chronological grid based on the "Futures Cone"[4] of Joseph Voros (2001) [Fig. 3], this representation of the

alternatives will outline the map of scenarios and turning points for possible futures, beginning from the choices of today: “IF all of our sensitive privacy data were grouped into a single database, THEN this would have to be managed by the government, ELSE it would be possible to request a public service of virtual reconstruction of our identity after death”.

Also worthy of mention as an introductory tool for public sector design fiction, lastly, is the immersive approach to storytelling and brainstorming represented by games of “reverse archaeology,” as in the case of the renowned “The Thing from Future.” Created by Stuart Candy at the Situation Lab, the game requires participants to create a story starting from a series of premises defined by playing cards – chronological placement, trend, context of reference, type of object, mood – with nearly endless possible combinations, culminating in the creation of an object-find from the future, the factual evidence of the story (Candy, 2015).

5.Conclusions

The general governmental trend toward offering digital public services makes the contribution of design thinking and service design increasingly crucial to designers’ approach to a given project. It also underlines the need to train an adequate number of designers capable of grappling with the peculiarities of working for the public sector. The creation of efficient services, of *good* services, has a significant impact on citizens’ civic participation, how they exercise their rights and are reminded of their duties, and thus plays a major role in delineating the perception and the boundaries of the relationship between citizens and institution. The crisis that has affected this particular relationship in recent decades and the emergence of new, increasingly complex and global challenge underline the need for innovative approaches in the definition of new public policies. For this reason the most sensitive international institutions have introduced specific research labs for the study of the future implications of today’s policies. Speculative design, and design fiction in particular, provides a stimulating method which, from a designer’s formative years, is capable of combining design, public policy, projections and civic participation within a conscious, ethical narrative framework.

[4] In Voros’s formula the future 4 P’s are represented as a cone of light projected forward in time, in which we can identify, starting in the centre, the probable future, the plausible future and the possible future, among which we try to orient ourselves toward a *preferable* future (Voros, 2001).

Abstract | This paper presents findings from a recent European-wide study on the use of Speculative Design approaches within education. The study included a survey of design educators and interviews with Speculative Design practitioners. This data has contributed to a mapping of the current educational landscape in Europe and will inform the development of an open set of resources for educators interested in Speculative Design and related approaches. Themes that emerged from the study are discussed in detail in the paper including; views on defining a curriculum along with metrics for assessment, the development of open guidelines and frameworks, attitudes towards generating change and implementing action, and understanding the distinguishing characteristics of Speculative Design within an educational context.

KEYWORDS | SPECULATIVE DESIGN, CRITICAL DESIGN, EDUCATION, INTERDISCIPLINARITY

1. Introduction: the survey and interviews

1.1 Speculative and related design approaches

Speculative, Critical and Fictional Design methods question the conventional practices of design, including interrogations around who has the rights and privileges to carry out the activity of designing. This alternative way of working foregrounds the freedom to use creativity to extrapolate from signals observed here and now, in order to ask questions about how the future - or indeed the present - could be, rather than merely how it should be (see e.g. Auger, 2013; Dunne & Raby, 2013; Sterling, 2009). This family of design methods, based around the blending of aesthetics and critique, has attracted much attention in recent years from both enthusiasts and sceptics, and many words have been written about the nuances of different styles and approaches (e.g. Bardzell & Bardzell, 2013; Malpass, 2017; Tharp & Tharp, 2019; Tonkinwise, 2015; Blythe & Encinas, 2018). In this paper we use the term Speculative Design in an inclusive manner, acknowledging that there is a broad range of related approaches, each with their own emphasis, and that these continue to evolve. This paper, however, focuses specifically on how Speculative Design - and related disciplines - is currently used as an educational approach, both within directly design-related disciplines as well as in other educational domains at undergraduate, postgraduate and professional levels. While conventional design practice often focuses on making technology easy to use, functional and desirable, in Speculative Design, an educational curriculum can propose a practice that engages further with social context. It uses design as a means of examining both the potential positive and negative implications of introducing something into everyday life; imagining possible, as well as preferable situations.

The inherently discursive and reflective nature of the Speculative Design approach makes it particularly useful for teaching both practice and theory. If applied effectively within an educational setting, the processes of creating speculative objects and narratives can encourage interrogation of prevailing assumptions and invite exploration of other, alternative states of being and doing. These activities can lead to a deeper understanding of, for example, the contextual, political and cultural factors that influence the activity of design, and in turn, consideration of the potential implications and effects caused by bringing new products and services into the world (Dourish & Bell, 2014).

Educational contexts are varied, with different motivations and expectations and therefore they require different pedagogical approaches. Speculative Design has tended to sit within art and design school curricula, especially within western European universities and within the art school tradition, but this is changing. As an approach, it has become relevant where there is a focus on imagining products and services that incorporate technology, and it is now increasingly finding a place within subjects such as computer science, engineering, and social sciences. It is currently being reinvigorated and reinvented in other geographical areas, such as south-eastern Europe, and in varied types of independent research and educational institutions.

1.2 The SpeculativeEdu Project

The SpeculativeEdu project began in 2018, at a point where Speculative and Critical Design practices were maturing and becoming widely discussed. The project offered a timely opportunity to take stock of how the domain had developed so far and to consider where it is heading as an educational approach into the future. The SpeculativeEdu project is situated within a European context, with partners across five European countries, but as authors and project partners, we are mindful of the expanding reach of Speculative and Critical Design. The project's stated aims are to "strengthen Speculative Design education by collecting and exchanging existing knowledge and experience whilst developing new methods. Its scope is to collect, exchange, reflect upon, develop, and advance educational practice in the area of Speculative Design and its self-critical approach" (SpeculativeEdu, 2018). At a time when many designers are becoming interested in alternative design approaches, disillusioned with the conventional, dominant narratives of innovation (Morozov 2013), problem-solving (Encinas et al. 2018) and technological growth, speculative, reflective and expressive approaches are offering fresh possibilities to practitioners and educators.

It is against this backdrop that the Speculative Design interviews and education survey were conceived; in order to examine and share knowledge and practices, and to collectively work towards developing educational techniques, especially those focused on the critical relations between technology and human society.

1.3 The Interviews

A primary activity during the SpeculativeEdu project has been the interviewing of key figures from across the Speculative Design landscape. These figures were chosen to provide a broad a range of perspectives – established practitioners in the field, recent graduates from Speculative Design programs and critics/curators who have provided valuable interrogations of the approach. For consistency, similar questions were used across the interviews, although in many cases the questions were customized for the interviewee – based on specific projects, articles or personal experiences.

1.4 The Survey

The Speculative Design in European university education programs survey was available online and open for responses from early 2019 until early 2020, available to anyone who wished to contribute. It was disseminated through the project's networks and social media and was aimed at educators involved in the development or delivery of a program that included an element of Speculative Design or a related topic. The survey gathered examples of current teaching practices and methods from a range of design-related disciplines, as well as asking for viewpoints about the direction that the field should take in the future. The survey in particular aimed to understand the breadth and variety of current speculative educational practice across different disciplines, including modes of delivery, examples of

teaching resources and assessment strategies. The survey also asked questions about the motivations and rationales informing the development of courses, and about plans and ambitions for the future.

2. Analysis: Interviews

2.1 Interview Questions

Speculative Design is a relatively new approach and as such its borders are quite blurred, its purpose can seem vague and its systems of evaluation immature. The interviews provided an opportunity to focus on these key issues:

1. **Purpose:** This can be relatively straightforward when considering the role of mainstream design (e.g. variants of form, function, desirability, market appeal). However, Speculative Design promises a diverse range of possibility; design for debate (Dunne, 2008), to improve government processes and policymaking (Kolehmainen, 2016), to critique current design practice (Auger, 2013) and re-think the technological future (Mitrović, 2015). Such claims have, on occasion, left the approach open to critique, for example, “Where is the debate?” “Who is it between?” “What is the impact?” One of the key questions asked of the interviewees was “what is the strength of Speculative Design?” The aim being to present a more coherent definition within the lifetime of the project.
2. **Metrics:** The design community is very fluent in evaluating the various qualities of traditional designed artefacts. Countless books have been written on this subject and relate to the straightforward notions of purpose listed above, and well-known lists guide students and practitioners towards (so-called) good design (Rams, 1976). Speculative Design suffers from the fact that its purpose is still unclear – without purpose, evaluation is impossible. After examining the question of purpose, we then asked interviewees to suggest an exemplary Speculative Design project and to describe why it stands out.
3. **Value:** The first two questions potentially paint a bleak picture for Speculative Design, so what is its true potential? We asked, how could Speculative Design become more politically active or more purposeful in its aim to challenge mainstream design?

3.2 Interview Themes

In comparing the interviews, we have identified a number of themes that encompass the responses from the interview participants:

- **The state of design:** a discussion of ideas on what Speculative Design has accomplished by placing it in relation to a particular understanding of the status of design as an established practice within the wider contexts of business, culture and politics. This might be due to the influence of Dunne and Raby´s (2013) well known "A/B List" a manifesto that positioned critical design against normative or non-critical design.
- **Existential angst:** a recurrent topic of discussion within the interviews was related to the agency and responsibilities of practicing Speculative Design. Who gets to future? What kind of privileges do speculative and critical designers enjoy? Or what does it mean to design a future for a context in which the designer does not participate?
- **Divergent references:** the materials that interviewees suggested varied greatly in terms of disciplinary background. There were references to texts belonging to politics, economics, history, literature, design and many others. The answer to the question; "what kind of knowledge should the education of a speculative designer include?" resists reduction in terms of defining a canon of suggested literature.
- **The "speculative" in Speculative Design and the "critical" in Critical Design:** most interviews involved a stage of setting the common ground between interviewer and interviewee through finding a consensus for the meaning of speculative and critical. Defining what speculative and critical mean seemed to be a necessary step in establishing the ground for further discussion on particular examples of Speculative and Critical Design.
- **The future as context:** while not specifically implied in many of the questions asked during the interviews, many participants chose to locate their arguments in a more or less distant future. This seems to be a characteristic of Speculative Design but not a necessary one because alternative presents or counterfactual stories abound in the history of Speculative Design. This is interesting because many of our respondents expressed the intentions of their designs in terms of having an impact in the here and now.

3. Education Survey Analysis

3.1 Survey Questions

The survey was constructed in separate parts and this paper describes two of these parts; the first asked for descriptive information about educational programs, and the second asked for further information about approaches and opinions. Each part was analyzed separately in order to keep the answer data anonymous. Throughout the survey, questions

included a mixture of multiple choice and open-ended questions where respondents could write as much or as little as they wished. The open questions were analyzed using a simplified thematic analysis approach. To do this, the authors each read the anonymized responses individually and then shared their own interpretations of the important emergent themes. These interpretations were then compared in order to arrive at the list of overarching themes.

3.1 Respondents

The Speculative Design survey was aimed primarily at European university education programs but participation was open to everyone, including educators working outside of universities, for example delivering short courses or workshops. By early 2020, the survey had collected 36 usable responses, of these there were a mix of courses described at undergraduate and postgraduate levels, with rather more at undergraduate and some at both levels. All the courses mentioned were based in Europe, spanning 12 countries. Over half of the courses mentioned were first presented from 2018 onwards, demonstrating rapid growth in recent years. The majority of the respondents reported that their courses were situated in design disciplines, mainly in Interaction Design, Product Design and Graphic Design, including Communication Design and Information Design, along with several situated in Art disciplines. Other design fields mentioned included Interior Design and Fashion Design. Of the remaining disciplines mentioned, a few were situated in Computer Science related disciplines, and some were situated in humanities, management and interdisciplinary disciplines, such as Futures Studies.

3.2 Current Approaches and Future Directions

The following sections describe some of the main findings from the online survey relating to current educational approaches, opinions and future directions. One of the first questions asked about the names used to describe the approach. Of the three options provided; Speculative Design, Design Fiction and Critical Design, there was an almost even distribution across the choices. Other terms were offered, most of which included the word “design”, and “future” also appeared frequently. Other words included “research” and “debate”, and some of the descriptions included words that could be described as provocative, such as “adversarial” and “inconvenient”.

3.3 Rationale and Motivation

When asked about the motivations for developing the course and why Speculative Design was used, two main themes emerged, firstly the importance of multidisciplinary and interdisciplinarity in preparing students for the future, and secondly the development of a mix of both practical and critical skills. This emphasis on interdisciplinarity was seen as important in order to equip students to work and contribute to society in an as yet unknown

future. The ability to work within various industries and with a range of stakeholders was often mentioned as a priority, as these respondents put it:

> "… as the world changes increasingly rapidly, we are educating future designers and other creative practitioners for jobs and contexts that don't yet exist. They instead need to be equipped to identify and exploit new opportunities by working across disciplines and considering multiple intervention points - from hard systems transitions, such as mobility or energy, to soft systems transitions, such as culture, identity or narratives."

> "The production of near future scenarios allows to uncover new opportunities and to produce professional profiles who are able to help organizations and institutions to deal with the transformation of society, of the environment, of cities and people's daily lives."

In terms of skills development, these can be grouped into two categories - practical and critical - which were both discussed by respondents and were seen as working in tandem in many cases. The development of practical skills included many of the pragmatic aspects that are familiar within design teaching, such as project-based skills and competencies, communication through design, the development of usable designs, research skills, lateral thinking skills, and the creative presentation of research insights. Speculative Design was also seen as a promising approach for developing criticality and systemic thinking, in particular for building the competencies and knowledge needed to address the world as it could be in the future, rather than the current status quo. Strategic, long-term thinking was seen as necessary for dealing with complexity, controversy, uncertainty, and societal, technological and cultural change. The ability to interrogate and debate, to understand relevant theoretical framings, and to reflect critically on the application of design methodologies were discussed. This comment illustrates these points:

> "…the … course proposes to read the challenges of a changing society through the controversies that animate it. The course trains students to decipher the latter via three complementary disciplines (theory of imaginaries, digital mapping of controversies and design fiction). They offer an original and unprecedented toolbox, whose instruments make it possible to locate the controversy in a field, to unfold its facets in the present while considering future blind spots and layers of representations inherited from the past, sedimented in the actors' discourses."

Approaches to support this type of critical skill development included challenging current approaches by promoting values. Students are often encouraged to question ideas such as; design as need-seeking and problem-solving, and design for comfort and convenience, as expressed by this respondent:

> "The course … investigates the potential of "Inconvenient Design" as an interrogative design approach, as well as critical design tactic and practice. It addresses the trend in the design discipline to design products, interactions and services (and thus, futures) with one aim: convenience. … Using tactics and mechanisms of Design

> Fiction and Speculative Design, we explore the design of discursive objects to express criticism and initiate discussion."

A theme of values was frequently evident in the survey responses, with a strong emphasis on social and environmental justice, and participatory citizenship. Across the survey there was evidence of a desire to go beyond the more accepted, rather passive Speculative Design aims such as; questioning stereotypical views of the future, critically reflecting on the roles of technology in society, and considering implications and consequences, and instead to take a more proactive role in shaping the future through activism. For example:

> "design futures could be framed as ways to develop and deploy prompts, artefacts and narratives to critically interrogate tomorrow's societal debates today; as such, it is intentional from the outset in its questioning of the dominant paradigm in the pursuit of preferable futures and therefore social and environmental justice."

> "This is a powerful opportunity for communities as well as for organizations and institutions, who can benefit from speculative designers in creating new strategies and to get communities engaged and involved in participatory, collaborative transformations."

3.4 Teaching and Assessment

Addressing the delivery of teaching and assessment approaches, a mix of theoretical and practical elements were evident. In the multiple-choice section of the survey, the most frequently used approaches mentioned were; practical creative work, group projects, and workshops, demonstrating the emphasis on collaboration and pragmatic skills development. Theoretical essays were used to some extent, while written examinations were rarely used. Other approaches mentioned that were not directly asked about in the survey included several types of research such as social, artistic and observational research, and cultural probes. Debates were also mentioned, especially involving external actors and stakeholders.

In answer to the question on the main teaching resources used, a very wide range of materials was mentioned, echoing the findings of the interview analysis discussed in Section 2. In addition to art and design texts, and writings on Speculative Design, Critical Design and Design Fiction, there was mention of texts and examples from such diverse subjects as storytelling, comics, science-fiction, film and television, architecture, urban design, foresight and futures, social science, and many others.

There was an open section in the survey for suggesting appropriate assessment metrics for evaluating student work within a Speculative Design approach. A total of over 40 individual metrics were proposed, some of which included more than one metric bound up within them. Here these are summarized into two categories, Process and Practice:

Process Assessment Metrics:

- Depth of research

- Criticality in research documentation and analysis
- Criticality of future trajectories
- Creative engagement with alternatives
- Experimentation and risk taking
- Communication to, and engagement with, intended audience and publics
- Self-reflection and self-assessment; critical discourse around the project
- Creating potential for stakeholders to adapt in changing situations
- Enabling and stimulating debate and critical reflection
- Team working, participation
- Understanding of context

Practice Assessment Metrics:

- Response to the brief, and ability to serve the needs of stakeholders
- Novelty, originality, innovativeness, imagination and challenging paradigms
- Plausibility and internal consistency; social, political, technological, environmental, etc.
- Action generation, potential to stimulate impacts and consequences
- Analysis of possible impact and consequences of the designed output
- Breadth and depth of worldbuilding and storytelling
- Quality and comprehensiveness of the proposal, presentation, exhibition or demonstration
- Evidence of rationale for design or technology artefacts, prototypes or representations
- Collection of, and engagement with, feedback from audiences

3.5 Defining a curriculum

The survey asked a question about how important it is, within the context of a design curriculum, for Speculative Design to be either fully defined; or whether there should be an open approach relating to sets of methods, tools and techniques. The majority of respondents favored an open or mostly open approach, but there was a substantial number of respondents who were unsure or favoring a defined approach. In the open comments, both sides were represented, citing, for example, the utility of explanations of specific

methods, but also the benefit in the diversity of approaches due to the “bottom up” and relative youth of the field. In fact, not all of the respondents answered this question which suggests that there is no consistently strong feeling over this issue, or perhaps that this is as yet an unresolved question for some educators. One respondent did indeed make the comment that they need to reflect further on this topic.

Some respondents mentioned working towards creating open source collections of their own design materials and resources. For future development, guidelines, frameworks and quality criteria addressing teaching approaches would be welcomed by some respondents, but openness and breadth of types of teaching materials were also mentioned. Briefly, some of the types of learning sources mentioned as potentially useful included; seminal films and videos, expressions of past future visions, theatre and improvisation, data tools and information visualizations.

3.6 Future Directions: Towards Action

Within the responses there was generally an optimistic view expressed of the development of the field as playing a transformative role in wider society, or at least training the practitioners of the future to use skills of transformation, underpinned by a methodological approach. However, there were reflections on some critical aspects of speculative practice such as lack of action, lack of political commitment, a need for decolonization and emancipation from the current economic and socio-political system. This theme of moving towards implementing active change, for example in policy making and citizenship, in addition to the development of design skills, emerged strongly in the survey. The desire to transition toward top-level influence was clear in some of the responses, for example in urban planning and government organizations, with a stronger influence on the "real world" and impact on more mainstream practice and educational approaches. There was an awareness expressed around the limitations of showing work only in “white cube” gallery spaces, and a desire to create broader impact in society and in professions. Comments often mentioned a need to include Speculative Design methods in more curriculum subject areas such as policy making, psychology, social and anthropological studies, economics, business and management.

Finally, here is a comment from one respondent who mentioned working with younger students, demonstrating the wide potential for the approach:

> “I really hope it will continue as a vibrant, diverse, pluralistic community of practice and that it won't become too much of recipe. I'd love to see these approaches more embedded outside design education as from our experience in working with over 200 STEM oriented teenagers we've seen how hugely transformative they can be in providing them with handrails upon which to imagine, explore and question how the world should and could work.”

4. Conclusion

As we, the authors, look over the results of the interviews and survey, representing a substantial collection of voices in the field, it is clear to us that Speculative Design and its related approaches remain an important and evolving domain, exhibiting a desire to reflect upon its own future. This is a domain that is no longer in its infancy or led by one or two institutions; as our study demonstrates, it is a broad and diverse field and as it enters its mature phase, educators and practitioners need to come together to create a shared vocabulary, collection of best practices, methods of evaluation, and more. At the same time, as the world has changed dramatically in the past two decades, so has the role of design – as the interviews and survey demonstrate, Speculative Design today has moved beyond its early function of provoking internal debates, to a more outward looking role of facilitating urgent discussions about the central role design plays in shaping our collective futures and society as a whole. One of the most striking themes that emerged from both the interviews and surveys was the clearly articulated desire to implement transformation and to create impact on the world through action. This desire was supported by discussion around the importance of defining underpinning values, including such ideas as responsibility and justice.

Targeting Design Intervention across Levels of Complexity

Abstract | As service design continues to expand its reach and blur the lines between disciplines to address value co-creation and deeper contextual based challenges, it becomes increasingly crucial to work within an ecosystemic perspective. For the sake of simplicity, designers build frames of reference and construct metaphors to better understand and target possible intervention and the roles, activities and consequences of that intervention. In reality, when addressing increasingly complex issues, design action may cross the boundaries constructed by these models making it more difficult to understand. Using a more fluid metaphorical model to target design intervention across levels of complexity enables designers to consider the ecosystemic nature of an intervention, the level of control they have over the end outcome and the potential consequences it may bring.

KEYWORDS | ECOSYSTEM, LEVELS, VALUE, CO-CREATION, CONTROL

1. Introduction

As a heterogeneous and emergent discipline, Service design has over the last two decades evolved to blur the lines between disciplines. By borrowing and adapting concepts from management, participatory design, marketing and anything else that works to face the current challenges in design practice, it has expanded its reach and objective. (Kimbell & Blomberg, 2017) This expansion has followed a logical shift from a goods-oriented perspective towards a service-dominant one, (Vargo & Lusch, 2004; 2008) and consequently, toward new conceptualizations of design objectives. (Kimbell & Blomberg, 2011; 2017; Meroni & Sangiorgi, 2011; Wetter-Edman et al., 2014) These new conceptualizations form the basis for arguing the relevancy of service design as a means of designing not only meaningful service encounters but also value co-creating systems and socio-material configurations (Kimbell & Blomberg, 2011; 2017).

With the shift toward designing *for* services - instead of the design *of* services - designers are increasingly introduced to the complexities of services on both the 'front' and 'back-stage' of service delivery. These complexities reach past the interaction between product and user and into value networks and service systems where value is co-created for both users and service providers, within the context of a complex constellation of actors, institutions, stakeholders and technologies. (Normann & Ramirez, 1993) As the recognition of contextual effect on services grows, so also does the need for new ways of thinking and adapted tools to design for service ecosystems that additionally consider and even emphasize value created in-context (Nelson & Stolterman, 2012; Vargo & Lusch 2004).

1.2 From Linear to Ecosystemic

While some value propositions are conveniently constrained to linear service encounters and walled off from other channels of delivery, others "straddle digital and physical spaces; instantiated by individual actors moving freely and at will between locations, devices and contexts." (Lindenfalk and Resmini, 2016). Lindenfalk and Resmini (2016) go as far as to claim it is a "myth that the service designer can design a perfectly bounded artefact and simply drop it in place within a dynamic environment." Although they admit there are benefits to focusing on the experience of a single touchpoint, if complexity is unnaturally constrained to a linear path it can result in jarring over simplification.

To address this complexity designers can shift their perspective from linear to ecosystemic to focus on more than one perspective within the context of an ecosystem. Where a linear perspective considers the entire end-to-end experience, an 'ecosystemic' perspective also considers the many vantage points that make that experience work. To implement this shift, designers have to start considering both the different possible perspectives of actors and the possible value not just created in-use but created in-context, at each level of the ecosystem (Vink et al., 2017; Lindenfalk and Resmini, 2016). This infers the designer may also have to give up some control over each interaction in favor of the value that can be created in the

context of the greater ecosystem. This perspective refocuses the goal from a complete instance of value creation designed and controlled exclusively by the designer, to potentially creating the favorable conditions for interactions and relationships to co-create value - Kimbel (2011) describes such a shift from service design to design for services.

To guide further discussion on designing for ecosystemic value creation we will use the analogy and framework of an organism, which under different magnification can be viewed at an atomic, molecular and organism level with varying degrees of relational complexity. In its most complex and complete form, this analogy refers to an ecosystemic organism with emergent and adaptive qualities. As each level is no more important to the survival of the organism than the other, it produces value within its own sphere and as a part of a whole.

After outlining each level we will then discuss how being able to target a design intervention across these levels can help designers consider and target areas of intervention within complexity using a more fluid organizational model and visualization. This model outlines each level's characteristics, but only loosely constrains them to allow interventions to be framed and considered across multiple levels. The intention is not to propose new methodology or tools for working with ecosystems but possible ways of seeing and thinking about the objectives and goals of service design. Such a discussion can help form a clearer conceptualization of a context informed design process, and offers insights into the different roles and opportunities for designers within that process. This model also potentially frames the design intervention not just as design action but also as design consequence which can help designers better consider potential impact and the consequences of their participation in the intervention.

2. Atomic Level

2.1 The Encounter

According to Kimbell and Blomberg (2017), interactions at this level are conceptualized as 'The service encounter' which they propose is one object of service design and focuses, "on the experiences people have as they engage in interactions with touchpoints provided by others." This objective implies that the goal at the atomic level is that of new service development (NSD) and is outcome focused (Homlid et al., 2017).

Considered within the perspective of designing for service ecosystems, however, the goal expands to designing interactions as a means of reconfiguring the relationship between humans and the service to evaluate and create strong value propositions that clearly fulfil what Christensen et al. (2016) call the 'jobs to be done.' Although micro in comparison to the organism, interactions at the atomic level are crucial to the survival of the system as they form the basic arguments for desirability— the reasons why customers hire products and services to achieve their desired outcome (Christensen et al., 2005).

Focusing on relationships, channels and value propositions as part of the experience at this level connects it to the greater ecosystem and emphasizes the need for more co-design based practices to consider multiple perspectives when designing the digital and material artifacts that guide the service encounter (Vink et al., 2017). These value propositions also form the basic assumptions of interaction at the molecular level to consider even more complex relationships and value co-creation strategies.

2.2 Atomic Consequence

Uber, the American born ride-sharing service claims that, “In the United States alone, more than 45 rides on Uber happen every second” (West, 2019). From the Atomic level perspective Uber is a digital application that allows anyone to easily find and pay for a ride. As a relatively simple service, at least in concept, most experiences include one mobile interface and two dominant touchpoints, the application and the vehicle. As a relieving service the Uber app has many features designers have consciously included that allow riders to fulfil the Job-to-be-done and more are added each year to further personalize the experience. Many of these design choices are benign and solely focused on creating a good experience. Others are not so innocent and even an omission or lack of consideration can have serious ecosystemic implications.

In December 2019, Uber released its first Safety Report that reported “3,045 sexual assaults during its rides in the United States in 2018, with nine people murdered and 58 killed in crashes” (Conger, 2019; West, 2019). To combat these safety issues, starting in 2018 Uber has released many safety features including, pin identification, audio recording and even emergency response integration (Marshall, 2019; Dicky, 2018; Singh, 2020). Whether the possible consequences of a service like this were considered before seven years after its launch may be a mystery but we can clearly see how design decisions at this level, to include safety features or not, can not only influence the success of the experience but have very serious consequences for participants, the company and society as a whole.

3. Molecular Level

3.1 Value Co-creating System

At the molecular level of the organism the focus turns from the service encounter to the value co-creating system. Here, the materials and objectives fundamentally change from the orchestration of touchpoints to form positive service journeys (Blomkvist et al., 2018), to dynamic reorganization of resources to form arrangements between actors to achieve mutually beneficial outcomes and value creating relationships. (Kimbell and Blomberg, 2017; Vargo and Lusch, 2004) Typical tools used at this level include service ecosystem maps and value constellations to focus on the negotiations between actors, their desired outcomes and how they account for those outcomes (Kimbell and Blomberg, 2017; Patricio et al., 2011;

Normann and Ramirez, 1993). Although this level can involve professional designers working with methods and tools, a service eco-systemic perspective recognizes that design activities are not single actions in the process and that value co-creation is ongoing and collective in nature; each actor participating in the relationships they have entered into to realize preferred change (Vink et al., 2017; Manzini, 2016).

3.2 Beyond the Experience

To create value in context it is not enough to design a good experience. Designers must, as Normann and Ramírez (1993) put it, "redefine the roles, relationships and organizational practices," of the business itself. Almost two decades later Normann and Ramírez's example (1993) of IKEA in the furniture industry, still stands as a successful implementation of just such a redefinition of in-context value co-creation. In this example, IKEA ultimately shifted the responsibility of the assembly of their product from the business to the shopper. To do this they not only designed the assembly experience but the entire ecosystem around it. Judging by IKEA's current success as #39 on Forbes top valued brands for 2019 valued at $15.8 Billion with revenues of $45.8 Billion (Forbes, 2019), IKEA continues to re-evaluate their value co-creating systems to keep them at the top of the industry.

3.3 Business modeling

While ecosystem maps and value constellations emphasize a focus on reconfiguring actor relationships and resource exchange, developing and investigating business models is another way of understanding and experimenting with creating value in-context (Osterwalder and Pigneur, 2010). This includes both the context of the business itself and as an entity within a market environment. Mapping the market forces, macro-economic forces, industry forces and key trends surrounding a business model and its parts can offer an environmental and eco-systemic view of issues and opportunities crucial to reconfiguring or maintaining the right value proposition, relationships and competitive edge. (Osterwalder and Pigneur, 2010, 2014; Porter, 1979)

This indicates that the value proposition, albeit crucial, is not the only element of a business model that describes how an organization creates and exchanges value (Osterwalder and Pigneur, 2010) and various forms of business modeling techniques and experience building tools can be used to organize these elements to create new services. New service development (NSD), however, is not the only purpose of service design at the molecular level. Holmlid, Wetter-Edman and Edvardsson (2017) argue that only viewing service design within an NSD process limits its scope and potential by treating services like goods— to be developed through the same type of process. In an ecosystemic perspective, however, the scope of service design expands to potentially include active participation in the development and reconfiguration of actors and resources, and implies a change in practice to arrange for implementation (Holmlid et al., 2017). This could be considered what Martin

calls ‘the design of business’ (Martin, 2009) and of which more traditionally falls in the camp of strategy, management and operations.

4. Organism Level

4.1 Emergent Value

While reconfiguring service encounters and value co-creating systems at the atomic and molecular levels takes into consideration the ecosystem, the value created at the level of an organism can be very different due to its emergent and adaptive qualities. The object of service design at this level also expands further to focus on the socio-material configurations that impact assemblages of people, entities and institutions; both formal and informal. (Kimbell and Blomberg, 2017; Vink et al., 2017). It is worth noticing that while such configurations are not exclusive of this level, unlike other levels, the focus here is on the broader ecosystem.

According to Nelson and Stolterman (2012), within an ecosystem, elements are interdependent and value is created both between relationships and as an aggregation of value co-creating systems. This value emergence co-occurs with the intentional actions and behaviors of actors as they pursue their desired futures and cannot be completely controlled through the design process (Vink et al., 2017; Jones, 2014; Manzini, 2016). This implies that the goal at the organism level is similar to what happens at the molecular level and is not to create a final product but to create the favorable conditions for the right relationships to happen (Kimbell, 2011; Vink et al., 2017). The main difference between these two levels, however, lies in how much control is relinquished to focus on allowing for value to emerge out of the context of the ecosystem and the potential for self-maintenance and reproduction of the ecosystem (Sangiorgi et al., 2017).

4.2 Blurring Boundaries

In the example of IKEA, Norman and Ramírez (1993) describe how the company redefines relationships internally and with its suppliers to form an efficient and successful machine. Although IKEA goes about doing this with consideration for the ecosystem, redefining relationships in this way relies on an amount of control as each entity in the system carefully negotiates desired outcomes. This control indicates that value created here, although created both in-use and in-context, does not directly facilitate uncontrolled emergence like an organism, and could be viewed as molecular in nature. On the other hand one example of emergent value does illustrate how these levels may not have as clear cut boundaries as often modelled.

IKEAHackers.net has since 2006 gathered IKEA furniture customizations into a blog to be viewed free by anyone. In 2014, however, IKEA threatened to take legal action claiming

IKEAHackers.net was infringing on intellectual property. After a vast public outcry, IKEA back-peddled and apologized about the situation claiming that they are actually excited about how this site and customization movement fuels desire for their products (Hanesgarde, 2014; Winston, 2014). In this case, value emerged from the arrangements of both formal and informal actors outside of the original design and context. Reportedly, some IKEA staff have even used IKEAHackers.net for inspiration in the design of new products (Winston, 201), and IKEA has since then continued to open their doors to new ideas of customization (Chaudhuri, 2017). While the initial move to threaten legal action may have been short-sighted, the continued decisions to embrace and use this movement exemplifies an understanding of ecosystemic thinking and emergent value co-creation within a market.

4.3 Designing 'Space'

At both the atomic and molecular levels, interactions in value co-creating relationships are typically dyadic. Even if one entity has relationships with many others each relationship is negotiated separately as one to one agreements with different aggregations of resources and value exchanged. At the organism level, however, these relationships can become entangled forming 'many to many' interactions, relationships and networks. With so many variables and negotiations happening between multiple entangled actors it becomes difficult to control a final outcome. In some cases the complexities become so dense that no single entity can understand the system. As such, the goal and object of service design can shift from designing the experience or relationships in the system to designing the service providers role in the service ecosystem and the 'space' or institutional arrangements needed to facilitate the emergence of relationships and co-created value (Sangiorgi et al., 2017; Jones, 2014).

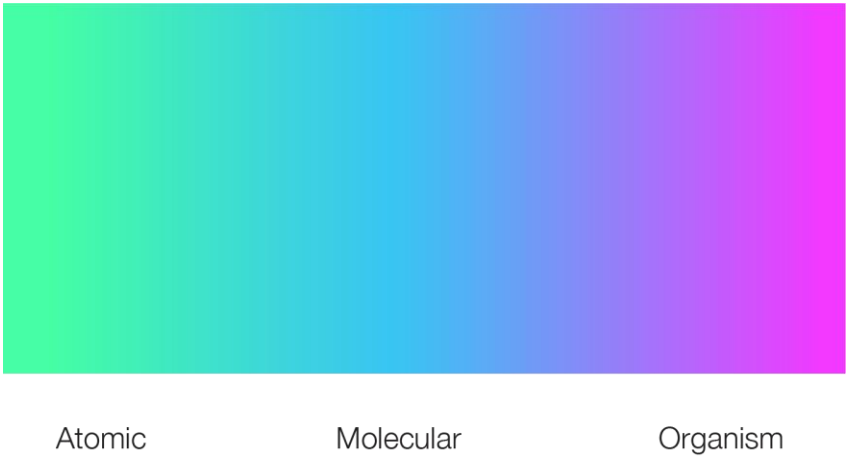
The creation of 'space' to facilitate the emergence of value can refer to the design of platforms (both digital and social) that provide the necessary tools and conditions for "communities of contributors [to] build on…to create new services that expand the ecosystem." (Sangiorgi et al., 2017). Although platforms can be broadly defined they all are characterized as 'pull based' and "[allow] each of us to find and access people and resources when we need them, while attracting to us the people and resources that are relevant and valuable, even if we were not even aware before that they existed." (Hagel, 2016, Hagel et al., 2010). The opposite being 'push based' which is characterized by product 'pushed' out into the market and requires anticipating customer demand to align the right amount of resources or inventory to meet that predicted demand (Hagel et al., 2010).

Platforms are also defined by Hagel (2010) as,

> "a governance structure, including a set of protocols that determines who can participate, what roles they might play, how they might interact, and how disputes get resolved."

Based on recent tech trends, it is easy to think of platforms as only digital. Although trends in technology have allowed digital platforms to become the almost default option for bringing parties together, platforms can also be created in physical and social space, and may be more or less defined by set protocols (Björgvinsson et al., 2010). Examples of such a 'space' include maker's spaces or communal gardens that provide a physical platform for value creation, and tools and elements to engage people in an interaction without prescribing the details of the interaction or the possible outcome. These spaces must also constrain the interaction with set protocols or rules to keep participants safe and to protect against liability.

4.4 Institutional Creation and Disruption



In some cases the object of service design at the organism level focuses less on roles and 'spaces' and more "as a means of reshaping the institutions that guide value co-creation in service ecosystems." (Vink et al., 2017). In this consideration, the word 'institution' relates to the 'rules, roles, norms and values,' that support an entity as they pursue a desired future (Vink et al. 2017). Institutions can be built, maintained or disrupted to facilitate preferred futures (Björgvinsson et al., 2010). Similar to how things present opportunities to realize new behavior, prototyping preferred futures and alternative institutional arrangements with participating actors can expose them to new ways of working and allow them to "iteratively develop and establish new [institutions] to support their preferred future" (Vink et al., 2017). In inconceivably complex ecosystems like healthcare, transportation or climate change, where the end outcome is difficult to control, reshaping or disrupting institutions to guide actors to pursue one desired future over another, can have a powerful effect on the emergence of patterns, properties and value, albeit with ethical concerns and considerations of unforeseen consequences and representation (Sangiorgi et al., 2017; Jones, 2014; Irwin, 2015). Partly due to its complexity, this level is still being understood and defined.

5. Targeting the Intervention

5.1 A More Fluid Model

So how does an understanding of these levels help designers target a design intervention and for what purpose? As we consider all of the levels as part of an ecosystem and present at varying degrees within a design intervention, the boundaries between each level start to dissolve (See Figure 1). To visualise this we propose using a gradient model. Rather than placing over simplistic and limiting boundaries between each of the levels, a gradient facilitates a fluid way of thinking across each level. (See Figure 1.) For example, Atomic level action within an intervention may grow in scope to start looking more like Molecular action as it navigates partnerships and value potential, or as discussed in the beginning of this paper, have far reaching effects at the Organism level.

It does not matter, necessarily, if a design action is strictly targeted to one level as long it is considered along the gradient. Although heuristics may be derived at each level, this more fluid way of seeing complexity better facilitates discussions of scope and designer roles as well as the consideration of actions and effects— rather than constraining them to limiting silos where exceptions abound and disagreements of nomenclature grow. Even while writing this paper some examples seemed to be able to be seen from more than one level. Business modelling, for instance can be used in a molecular setting to understand and coordinate the

elements within a company, but it can also be used to manipulate or provoke changes within a market context. Both may lead to creating value for the business but with different levels of controlled and uncontrolled emergence.

Figure 1. With no strict boundaries, a gradient show how each level flows into the other.

This model also provides a way for designers to start seeing 'control' as a key element of their participation in a design intervention, their role and the ultimate effect. Within an intervention the control a designer has over the end outcome shifts to inversely correspond to its complexity. (See Figure 2) This shift plotted along a curve illustrates that at the Atomic level a designer will have more control over the end outcome as they have more power to constrain the agency of the end user. At the Organism level, a designer will have less control over the end outcome and a user or participating actor will have less constraints placed on their agency. Used as a scoping tool designers can target how much control they actually have over the outcome of the intervention and plan the corresponding action. When used to define and align roles, designers can see where their specific skills fit into the intervention while still considering the ecosystemic effects of their decisions. From the previously discussed example of Uber (West, 2019), we can see that an absence of this consideration

can be far reaching and more dangerous than might be expected when only considered at one level alone.

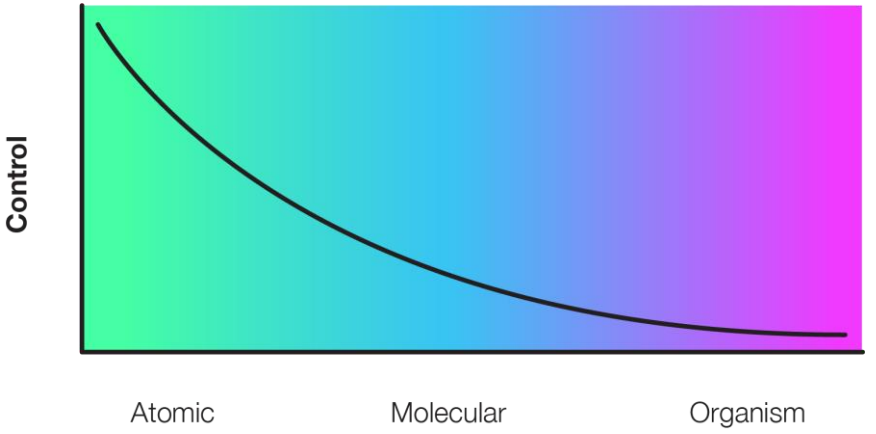


Figure 2. Control: The amount of control a designer has over the end outcome inversely corresponds to the level of complexity.

6. Conclusion

This perspective and model, although functional, can have an even deeper purpose of guiding designers to critically consider their decisions and actions as constraining, directing or enabling individual choice with corresponding levels of consequence. While some choices may be individual, facilitating the conditions to enable many individual choices can create a more ecosystemic consequence and ultimately an uncontrolled emergence of value.

As service design continues to expand its reach to address increasingly complex and contextual based challenges, it becomes crucial to consider the potential for this emergent value, whether positive or negative. Understanding opportunities, roles and effects at each level and within an ecosystem offers insights into the expanding roles designers play in the development of services within ecosystems and how to adapt processes and methods to fit the contextual inquiry (Author 2, 2016; Vink et al., 2017). As this expands the potential for strategic impact on business and society, does it also expand the responsibility to explore and consider the designer's place as they contribute to that impact?

The Agency of Discursive Design Exists in the Industrial

Karma Dabaghi

School of Architecture and Design, Lebanese American University
karma.dabaghi@lau.edu.lb

Abstract | Can there be a closer collaboration between academic design and the industrial world? This paper outlines common territory between Discursive Design and industrial market forces and proposes a partnership for a more sustainable future. In contrast to the commercial product, I advocate for the *Twenty-First Century Activist Discursive Object*. This object acts as a catalyst for change, rejecting the antiquated model of the designer aspiring to create a perfect aesthetic in favor of a collaborative, team-based multidisciplinary practice where comprehensive solutions are offered to the global commons. This paper envisions a future where intellectual criticality is capable of positively influencing practices that exacerbate societal and environmental ills, thus proposing a more sustainable future. As ideas generated in Discursive Design grow and become integrated into commercial culture, their positive effects will become palpable, and the status quo will transition into a friendlier, more sustainable reality.

KEYWORDS | DISCURSIVE DESIGN, DESIGN ACTIVISM, RESPONSIBLE DESIGN, INDUSTRIAL DESIGN, ETHICAL DESIGN.

1. Introduction

In a world where consumerism, environmental degradation, and inequity are ubiquitous, this article analyses the role of design in creating positive change within society. Specifically, I address the difficulty of introducing effective systemic change within the existing consumer-driven culture using design. I also showcase how Discursive Design can serve as a tool to normalize the integration of ethical principles into commercial practices.

I begin by presenting the need for industry to embrace a new mind set and highlight how Discursive Design can play a potent role in influencing the methodologies of the business world. Then, I define Discursive Design and its activist dimension within communities and illustrate its close link to a sustainable capitalism that has been proposed by ever increasing segments of industry in recent years. Following the study of these seemingly dissimilar fields, I argue that the most effective kind of agency for Discursive Design exists when conceptual designers are able to work in close partnership with industry and the public. Finally, I study the positive contributions of an industrial discursive product and illustrate the importance of further fruitful collaborations to demonstrate my argument.

This collaboration between the discursive and business fields is central to the establishment of more sustainable economies and the idea of global citizenship. The ultimate goal of the paper is to demonstrate that Discursive Design is able to go well beyond the parameters of theory and infiltrate industrial production and consumer culture. Helped by industry, Discursive Design has the power to remodel long-established realities and to reinforce values of social fairness and sustainability. And while a successful discursive object is one that engages with the user, thus bringing about its activist dimension and transformative power, I am proposing that discursive objects that are imbedded in the digital culture of the twenty-first century have greater power to achieve this end. These are what I call *Twenty-First Century Activist Discursive Objects.*

2. The Collaboration of the Business and Discursive Design Worlds as a Solution to Unsustainability

2.1 Failure to Address Issues of Sustainability

Throughout the twentieth century, product designers served industry by creating an endless stream of appealing objects. The job of product designers was to create beautiful objects and to increase a consumer's desire to buy (Andrews, 2009). The capitalist industry became associated with self-serving actions and pursuit of profit. As a result, ecological and social systems that we depend on throughout the world have been negatively affected and find themselves in decline. Our supply of materials and energy is suffering, and the disparity in wealth is increasing as are a multitude of educational and health problems (Thorpe, 2003).

Since the publication of the *Brundtland Report, For Our Common Future* by the World Commission on Environment and Development in 1987, a multitude of theories have been posited to explain the "principles of sustainable development." Summing up the underpinnings of these theories are three core principles: environmental stewardship, social equity and justice, and economic stability (Walker, 2006, p. 36). Designers have discussed the benefits of potentially integrating these values into production, but have failed to open up new spaces for practice beyond the conventional market model where design is seen as an engine to create goods for the market (Margolin, 2003).

2.2 The Need to Introduce a Change in Mentality

Given the urgency to address structural unsustainable practices and the process of what Tony Fry has called "defuturing" (2011), it is important for designers to create strong collaborations that result in more favourable conditions for the planet (Fry, 2011). Ethics within design practice need to be reformulated, and producers need to be held accountable for their impact on communities and the environment.

Today, designers and industrial producers will need to bear responsibility for the impact of their practices and collaborate to create a more meaningful material culture (McCoy, 1995). Designing for sustainability and working to increase a global sense of citizenship are matters that touch on both design and industry. To address contemporary issues, such as the globalization of industrial capitalism, environmental degradation, and social disparity, both designers and producers need to question the structure of the current material culture. New design solutions will need to be critical of a consumer culture that focuses on results that are fashionable at the expense of more ethical considerations (Walker, 2006). The challenge for a sustainable economy hinges on finding new ways to capture values of sustainability and citizenship within a commercial system that can nevertheless remain profitable (Thorpe, 2007).

Behaving ethically and showing a strong sense of global citizenship in the field of product design is a mentality that the designer, industry, and the consumer need to adopt. To succeed in this endeavour, all stakeholders must be accountable for the consequences of the resulting industrial production. The transition from the current practice model, which relies on mass production of consumer goods, toward a more meaningful material culture, requires new kinds of design solutions that address both environmental and social conditions (Hart, 2010). This transition to a new reality requires both grass-roots behavioural changes and a strong sharing of ideas among players (Manzini & Jegou, 2003).

A tight collaboration between the community of discursive designers and industry is in fact mutually beneficial. The market is not inherently bad and is able to offer many benefits to the discursive world, especially as it relates to commercialization and reaching a wider audience (Tharp & Tharp, 2018). Discursive Design is a tool that can be used by corporations to create innovative approaches and bring about societal good in ways that would be financially beneficial in the long term.

2.3 The Potency of Discursive Design

Discursive Design is a branch of design that focuses on research and the formulation of positive change. In opposition to commercial design, its priority is to criticize non-sustainable behaviours and propose design in the context of possible futures that lead to better social conditions. It enriches societies with new knowledge and aims to introduce some level of sociocultural change (Tharp & Tharp, 2018, p. 7). Discursive Design is often dismissed because of its highly poetic or unrealistic qualities. Still, given its high concern with issues of sustainability, matters of citizenship, as well as its courageous stand against destructive behaviours, it has a mentality that can positively influence industrial approaches.

Collaboration between Discursive Design and industry is therefore possible. The Discursive Design world, though young as a field, has matured into a domain with well-defined parameters and approaches (Tharp & Tharp, 2018). At the same time, the industrial world is ready to embrace innovative ideas, and commercial players are eager to embody technological advancement, introduce disruptive ways of working, and change industry's dynamics (Lefkofsky, 2007; Harmut, 2009).

3. Discursive Design

3.1 The Function of Discursive Design

This paper considers Discursive Design, a design approach focused on articulating criticism of the status quo, to be an essential pillar of our quest for a better future (Dunne & Raby, 2013). The function of Discursive Design is in the debate, and this function is what is critical. In their book, Discursive Design: Critical, Speculative, and Alternative Things, Bruce and Stephanie Tharp (2018) define Discursive Design as

> "…the creation of utilitarian artifacts whose primary purpose is communicative…. They encourage reflection and also often aim to subsequent debate and response" (p. 51).

Discursive Design acts in the tradition of many art and design movements, which are rooted in activist principles. Design has a long history of demanding change (Tharpe, 2014). The activist nature of discursive objects is clear: they freely challenge the conventional and call for change in adopted behaviours and accepted realities. Their interventions purposefully disrupt the routine by revealing and speaking out against societal ills.

Because Discursive Design challenges convention, it gains the quality of an activist tool. Design activism is displayed when buildings, objects, and systems act similarly to social movements by identifying an ethical concern and creating designs that call for social change and seek to influence public opinion. Anne Thorpe (2010) defines activist design as any intervention that "addresses largely progressive social and environmental issues, over and

above profit-driven or aesthetic agendas that are most common in design" (p. 276). Because of its focus on criticizing existing circumstances and proposing different ones, Discursive Design could be described as essentially activist.

The activist role of discursive design takes on the task of promoting a future that is safe for all. The strategy of getting to that future is to conduct research that leads to creating functional or pseudo-functional products that can be used within our current daily lives. Discursive design creates products that are either dystopian, when they represent the result of our destructive behaviour, or utopian, when they represent the possibilities of science. I propose three examples that illustrate this point.

The Huggable Atomic Mushroom, designed by Anthony Dunne and Fiona Raby (2004), was created for people afraid of nuclear destruction. The object challenges people to face their fears of nuclear devastation and provides a reminder of the negative impact of a nuclear explosion, both on people and on the environment. By addressing a genuine concern, this discursive object goes beyond the functional and opens important ethical, social, and political discussions with the goal of creating better future conditions.

Figure 1. The Huggable Mushroom by Dunne & Raby, 2004. (source: http://dunneandraby.co.uk/content/projects)

Between Reality and the Impossible is another example of a project by Dunne and Raby that criticizes overconsumption and addresses the notion of a future parallel but possible world. Foragers 1, 2, & 3, shown in Figure 2, are products that visualize technologically advanced devices that city-dwellers might need in the future as humans run out of food and must develop objects that assist them in filling the gap between the food they have and that which they need to survive (Dunne & Raby, 2010).

Figure 2. Foragers 1, Foragers 2, Foragers 3, Between Reality and the Impossible, by Dunne and Raby 2010. (source: http://dunneandraby.co.uk/content/projects)

In his book *Design Activism: Beautiful Strangeness for a Sustainable World* (2009), Alastair Fuad-Luke elaborates on Dunne & Raby's work and emphasizes its activist dimension. Fuad-Luke defines Design Activism as an agent for change that influences behaviours and facilitates a transition toward more sustainable ways of living. He considers *The Placebo Project,* designed by Dunne and Raby, to be an example of successful activist design.

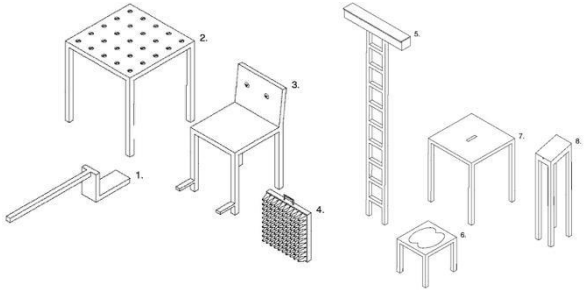

Figure 3. Placebo Project, 2001. (source: Dunne, A., & Raby, F. (2001). Design noir: The secret life of electronic objects. Basel: Birkhauser).

The Placebo Project created a series of functional objects that encourage awareness of electromagnetic fields inside the average home by building pieces of furniture that react when a device that emits an electromagnetic field is placed on or close to them. As opposed to Dunne and Raby's *The Huggable Mushroom* and *Between Reality and the Impossible,* this project does not just speculate about the future, but makes tangible an invisible effect of the industrial world, and thereby calls our attention to its possible negative effect on humans. The project analyzes people's relationship with electronic objects and warns against the adverse effects of electromagnetic waves generated by everyday products like GPS systems, mobile phones, and computers.

Fuad-Luke (2009) explains that these objects

> "stimulate the imagination of the users while simultaneously raising their awareness as to the invisible landscape and territories of electromagnetic radiation, a topic rarely touched upon in social discourse" (p. 121).

Fuad-Luke considers this experimental project to be effective both in delivering a message and in transitioning toward the commercialization of safer electronic products. In this manner, he views discursive products as activist entities that not only raise pressing concerns, but also put forward a new aesthetic and significance to electronic products. These objects redefine our interaction with consumer electronics and reformulate our relationship with the digital, amounting to a visualization of a new kind of technological industrial product.

3.2 The Failings of Discursive Design

The subjects addressed by the Discursive Design world are timely and relevant. Yet, this design approach still has many limitations, most notably limited reach, oversimplified semiotics, and resultant semi-utilitarian designs. The audience of this design approach tends to be restricted to conceptual designers, theoretical thinkers, and highly informed segments of the public.

To make Discursive Design more relevant, its products need to become more usable by the average consumer. The criticism expressed by discursive products needs to be a starting point for design processes, as opposed to the end result of the product itself. A stronger collaboration with the industrial world might partially compensate for the failings of Discursive Design. In this case, industry's expertise could introduce products that address more utilitarian functions, open up new markets, and launch production in large quantities with advanced technologies, all while effecting the social, political, and ethical goals of the discursive designer.

4. The New Paradigm of the Competitive Business World

Long gone are the times when corporations are seen as the avaricious "enemy" to be controlled with penalties and fines (Hart, 2010). The world no longer considers ethical implications as an absolute impediment; sustainability and ethicality are the new values at the forefront of the corporate agenda in order to remain profitable in the long term.

This new kind of global sustainable capitalism, which takes into account natural and social capital, is the new paradigm that helps the industrial world make decisions about the design, fabrication, and distribution of products. Conducting a sustainable business is the new managerial methodology of competitive capitalist economies. To succeed within the new global economic order, businesses are thinking in terms of the "triple bottom line": economic prosperity, environmental quality, and social justice (Elkington, 2002). As a result of this mentality, new partnerships between entities that might have previously been opponents are embracing technological advancement and collaborating to reach these triple bottom line goals.

Corporations are proposing alternative design solutions to benefit communities. This practice is changing the current model of industrial production. Markets open to competition are producing de-materialized, highly technological products that intervene in the political, the economic, and the social (Elkington, 1999). Profitable companies are able to improve their business performance by taking into consideration the environmental and social impacts of their production, resulting in a merging of corporate and societal needs. As a result, creative approaches are allowing for new kinds of collaboration and for social innovation that benefits communities (Hart, 2010).

It thus becomes increasingly clear that industry's new agenda is similar to the values of Discursive Design. Both fields are proposing new and unexpected interruptions to the conventional by taking into consideration the wellbeing of communities and humans' impact on nature.

5. The Agency of Discursive Design Exists in the Industrial

5.1 The Discursive Industrial Product

Discursive objects may be impractical and difficult to grasp, but their real value exists in their intellectual content, researched content, and disobedience. They criticize questionable practices and visualize new findings without any reservations. In order to extend the discursive object's agency beyond the intellectual realm of the elite, product designers and producers need to deepen their understanding of Discursive Design's approach and help it step out of the gallery.

In his book, *Design for Life: Creating Meaning in a New Distracted World*, Stuart Walker (2017) envisions a new kind of design defiant of the existing profit-driven model. Walker's proposal for a different path relies on ethical thinking and creative criticality. He encourages the incorporation of the "pragmatic and the philosophical" with

> "learning to find a more equitable balance between, on the one hand, rationalism, intellectual pursuits and 'progress', and on the other, intuition, experience and expertise" (pp. 184-185).

Anthony Dunne (2008) refers to Jack Kevorkian's Suicide Machine as an example of an industrial design that enters the realm of Discursive Design. Dunne describes this invention as "a powerful 'unofficial' design that materializes complex issues of law, ethics, and self-determination," and "shows how an industrial invention can be a form of criticism" (p. 43). He also proposes a

> "role for design objects as discourse where functionality can be used to criticize the limits that products impose on our actions" (p. 43).

Through his analysis of this industrial invention, Dunne recognizes the power that industry has in creating functional Discursive Design that can criticize existing behaviours and propose new laws. The suicide machine showcases how industry can generate controversial discussion as it defies existing laws by addressing human fears and unusual needs. The more industrial entities succeed in manufacturing discursive products, the more likely it is that alternative models will be able to replace, or at the very least complement, existing industrial systems and reshape the conditions of material culture.

Figure 4. Jack Kevorkian's Suicide Machine. (source: Dunne, A. (2008, p 44). Hertzian tales: Electronic products, aesthetic experience, and critical design. Cambridge, MA: MIT Press.).

5.2 The Immaterial Dimension of the New Discursive Industrial Product

The new discursive industrial product focuses on social issues, introduces new mentalities and behaviours, and will see its impact increase considerably as it becomes designed within social and digital platforms. Discursive Design can become a particularly potent influencer as it embraces technological advancements and allies itself with other complementary design disciplines that are well-established within industrial circles, by developing digital connectivity—namely Service Design, Interaction Design or Transformation Design.[1] A path toward a meaningful consumer culture becomes within reach as discursive designers collaborate with user-experience designers and producers with digital knowledge. By working with industry to apply strategies of co-design and user participation, designers are able to form effective channels of activism.

[1] Transformation Design introduces innovations to encourage more sustainable behaviours within society (Wolfgang, 2016). It encourages the creation of new markets to modify existing ones (Polanyi, 1944). This design approach focuses on an ethical agenda and introduces participatory techniques to tackle the complex challenges of our society and introduce long lasting change (Sangiorgi, 2010).

6. Case Study

6.1 Twenty-First Century Activist Discursive Object

A meaningful collaboration between the discursive and the industrial world would introduce an industrial technological product that rejects unsustainable practices and encourages enhanced participatory citizenship to build continuous change. In the context of this paper, I am referring to a product with the potential to change the status quo and introduce new behaviours relating to a heightened sense of citizenship as the *Twenty-First Century Activist Discursive Object*.

This object would manifest the critical input and activist intention of the research world and be produced and distributed efficiently by the industrial world. The object's influence can increase if the design has a digital component that designers are able to capitalize on to expand its reach via already-existing digital platforms. This product would be able to shape new experiences and create new behaviours, unlike objects limited to a more static function.

A model example of an *Activist Discursive Object* that is relevant to the twenty-first century is the *BuggyAir,* designed by Superflux, a British design practice that defines itself with the words "Translating future uncertainty into present day choices" (BuggyAir, 2018). Superflux describes the *BuggyAir* as "an accurate mobile sensing kit that helps parents understand their children's exposure to air pollution" (BuggyAir, 2018). It is designed to hang easily on strollers and measure ground-level air pollution. Superflux built ten sensor kits, each consisting of a research booklet and the product itself, and made them available to approximately fifty caregivers for two to three weeks. This product that spread knowledge about pollution was developed with the help of industry and saw its activist transformational power realized as users contributed to the design process.

Figure 5. Images of the first BuggyAir prototype, 2014. (source: https://superflux.in/#)

6.2 Discursive Dimension of the *BuggyAir*

By acknowledging the fear that parents can experience living in an urban polluted area, Superflux offered industry an opportunity to address genuine human needs not typically taken into consideration within consumer culture. Rather than clean the air, the design is meant to empower the urban dweller by opening a discussion about ignored situations that, in the eye of the user, need to be addressed.

Figure 6. BuggyAir sensor kits (Source : https://superflux.in/#)

6.3 Digital Activism

BuggyAir is an activist initiative targeted at generating public discourse with the aim of changing acquired behaviours and with the ultimate goal of seeing new laws against pollution implemented. To reach as many people as possible, the *BuggyAir* was introduced to the public as a technological product that exists within a well-designed digital ecosystem, similarly to how the iPod exists within the wider Apple framework. *BuggyAir* is directly connected to the *Internet of Things Academy*, described by Superflux as "a website with a core mission to show how people use their data as evidence for change" (BuggyAir, 2018). The intention is to collect data that measures pollution levels, which would later be put forth as evidence to reshape accepted behaviours, "influence regulation and policy, encourage a culture of civic innovation and change corporate practices" (BuggyAir, 2018).

Figure 7. Images of the first BuggyAir prototype in use (the product) and logo of the Internet of Things Academy (the platform). (source: https://superflux.in/#)

Users become active participants in the design process by walking, measuring, and logging the amount of pollutants *BuggyAir* detects. As users create the content in the research kit and digital interface, the activist and discursive aspects of the initiative merge. Users become a primary actor in designing the object as the co-creation process facilitates the development of a product that reaches a fuller discursive potential through involving the public. In this manner, we see how active citizen involvement and participatory thinking become essential components to creating a *Twenty-First Century Activist Discursive Object.*

Figure 8. Images of the booklets distributed with the prototypes. (Source : https://superflux.in/#).

6.4 Creating a Sense of Global Citizenship

As users become citizen-designers, who share information and inform other users about the least polluted routes, the product becomes an example of how discursive designers can help people connect with the realities around them and take control of their situations. In the case of *BuggyAir,* transformational change becomes evident as caregivers start adjusting their daily routine according to this newly acquired knowledge about pollution that exists in their former routes.

Figure 9. Meeting with users. (Source : https://superflux.in/#).

6.5 Connection to Industry

BuggyAir's initial website came to be with the financial help of Nominet Trust, a company that supports "ventures using digital technology to create real social impact" (BuggyAir, 2018). To develop the product itself, Superflux worked with private-sector partners, ScienceScope and Virtual Technologies. By collaborating with the corporate world, Superflux received the technical help it needed to launch its product while showing producers new possibilities and consequently influencing the mentalities of those who determine commercial culture. It proposed a project to industry that explores and criticizes consumers' impact, as opposed to the more common projects that are designed to ignore or deny their own carbon footprint.

6.6 Value Beyond the Function

BuggyAir is not an air filter; it does not give an immediate solution to the problem of polluted air. Yet, its activist dimension has value that is superior to that of a fully functional object. It refuses the status quo and pinpoints ecological and societal failings. It engages the public in solving one of the biggest issues of our time and draws its strength from direct engagement with communities. The product guides participants in designing their path toward a better future and uses the power of digitized ecosystems to create platforms that link designers, scientists, citizens, and industry.

Product designers face the challenge of breaking away from restrictions of form to explore alternative practice models with the goal of introducing transformative change that allows for a resilient existence. It is the responsibility of product designers and industry to face up to pressing problems, confront change, and explore the power of science to influence the adoption of behaviours that are more fitting with the planet's conditions. Discursive Design has a role to play in this quest for new ways of producing, especially as the field begins to join forces with industry to create the *Twenty-First Century Activist Discursive Object.*

7. Conclusion

This paper proposes how discursive designers and industry can work together to push the boundaries beyond their current collaboration to support our common, ongoing quest to create better conditions for the future. To reach the potential of the progress they both seek, producers and designers need to commit to a wider awareness of each other's fields and the unsustainable realities we are living. Such action will allow for an exchange of ideas that leads to transformational collaborations.

The challenge of establishing a meaningful material culture lies in the active participation of all stakeholders: designers, producers, and users. Discursive Design has an important role to play in this development; it defies the negative impacts of commercial dynamics as they exist and displays the possibilities of scientific progress for the benefit of society. Nevertheless, without close collaboration with industrial entities, the impact of this design approach will remain too limited. Industry has proven itself more equipped to promote and normalize ideologies and concerns born of discursive discourse than designers, governments, or other players. Industry, with input from discursive designers, holds the key to guide society toward an increasingly sustainable and equitable future.

About the Author:

Karma Dabaghi earned her Master of Design in Designed Objects from the School of the Art Institute of Chicago after completing a B.S. and B.Arch. from McGill University in Montreal. Dabaghi is an architect and product designer, who taught at the School of the Art Institute of Chicago, where she ran a number of studio-based and lecture classes between 2009 and 2016. She also led multiple Design Thinking workshops and helped build the Executive Design Thinking Program for Professionals. Outside of academia, she worked with a start-up company, imagining design solutions for various projects. Her design work includes collaborations with international commercial design companies such as Bruce Mau Design, where she contributed to a research project on the future of Chicago's Burnham Plan. Her collaborative work with DuPont and Danese Milano was featured in Intramuros and Core77, and exhibited at Neocon, Chicago and at FuoriSalone, Milan. She is presently working on establishing a conceptual studio practice that addresses academic design discourses and simultaneously aims at changing existing social conditions.

The Patient Revolution. New design perspectives in healthcare innovative processes.

Carla Sedini[a*], Laura Cipriani[b], Massimo Bianchini[c], Barbara Parini[d], Stefano Maffei[e]

[abcde]Design Department, Politecnico di Milano
*carla.sedini@polimi.it

Abstract | This paper explores the emerging role of patients and caregivers as user innovators within design processes. The phenomenon of user-driven healthcare has been recently renamed 'patient innovation' (Olivera et al. 2015). The first part of the paper presents a literature review to explore the phenomenon of patient innovation, especially in Italy. The second part analyses a range of European research projects on patient innovation, carried out and participated by makerspaces and fab labs, according to several indicators, such as the role of patients, the role of healthcare' stakeholders/providers, the design processes implied and the outputs of these design processes. The final part of the paper systematizes the results and use case analysis in order to qualify the nature of collaboration between different healthcare stakeholders as a key to design innovative roles, skills, spaces for patients, doctors and institutions.

KEYWORDS | PATIENT INNOVATION , USER - DRIVEN HEALTHCARE , MAKERSPACES , DISTRIBUTED DESIGN FOR ALL , DIGITAL HEALTHCARE

1. Introduction

Nowadays, we observe an increasing need and willingness for patients, patient associations and caregivers to be involved in cure and recovery processes for economic, time, social, and psychological reasons. However, a major role of patients should not correspond to the absence of the medical staff from the whole process. The involvement of patients in the cure and in processes to envision new solutions might be the right answer to avoid the so-called do-it-yourself care and medicine. Indeed, more than 47,4% of Italian citizens prefer self-diagnosis (Eurispes, 2017) and self-care.

Within the healthcare system, the personal relationship between patients and general practitioners has been reduced and replaced with specialist visits augmenting and disintermediating human relations. Patients and doctors nowadays seem to be more distant than in the past: 54.3% of citizens are not satisfied with our health system, only 57.8% are confident in the effectiveness of influenza vaccines (Eurispes, 2017).

Enabling innovation communities and spaces such as Makerspaces and Fab labs can favour technological and social innovation in healthcare. Design can act as a mediator between different stakeholders, and as a facilitator of innovative processes; makerspaces can act as platforms for co-creation. As the design process and its results are concerned, “Research has shown that many users ‘drop out’ of the innovation process before having realized a prototype and may be doing so too early for what is socially optimal, leaving potentially valuable ideas undeveloped.” (Svensson & Hartmann, 2018: 278). Makerspaces and Fab Labs can act as enablers of patient innovation processes avoiding cases of dropout. Italy can be considered an advanced country in this area, and Italian makerspaces collaborate and operate on these issues together with patient associations, policy-makers and RRI experts in several European projects.

2. Framing the Patient Innovation

Healthcare needs are changing according to society changes. One of the most relevant highlights stressed by OECD Health Statistics 2018 is the need for health systems to be more people-centred, in particular in facing life-threatening diseases and to be able to exploit the potential of new digital technologies to strengthen prevention and care.

The approach to health as a system, the focus on people (both as patients but also caregivers), the exploitation of digital technologies and robotics (Butter et al., 2008; Brose et al., 2010) can be identified as relevant elements that have to be taken into consideration when we talk about Patient Innovation.

In order to talk about Patient Innovation is necessary to frame this phenomenon within the wider concept of Grassroots Innovation, which is defined as “a network of activists and organizations generating novel bottom-up solutions for sustainable development and

sustainable consumption; solutions that respond to the local situation and the interests and values of the communities involved" (Seyfang & Smith, 2007: 585). For the discussion here presented we find in this definition two main relevant keywords: network and sustainability.

The need for communities and networks in order to be able to activate and implement an innovative solution is particularly relevant. Indeed, the capability to have a systemic view and rely on a critical mass of intentions and interests are fundamental elements for the success of an innovative idea. The very first limit to the development of an innovative solution is based on the fact that patients (in many cases) are not experts or entrepreneurs, and their objective is basically and clearly oriented to the improvement of their own critical condition without any regards to the market or other users. For this reason the concepts of "network" and "alliance" are very relevant; first of all this concept refers both to the geographical and value-oriented proximity of members of these networks (Boschma, 2005). In addition to that, even if Grassroots Innovation is primarily generated by civil society (Tang et al., 2011; Hossain, 2016), it has to engage other relevant stakeholders, such as government and business, especially when innovation happens in the healthcare domain. Indeed, these networks include a "social dimension" composed by people who have different needs and goals; hard components, such as tools and devices; normative components like permissions, obligations and power (El-Hassan, Fiadeiro, and Heckel, 2008). This view is very close to what Harvey Molotch (2003) called "lash-up", that is an integrated and networked system which is at the basis of the creation of a product or a design solution: "Tracing the connections in products can show how the social and the material combine to make, depending on circumstance, both change and stability happen in the world" (Molotch, 2003: 3). Every innovation to be effective, in this sense, enroll a socio-technical network, different stakeholders, tools and technologies. Harvey Molotch uses the "lash-up" concept also to address the issue of sustainability, which is very important also for our discourse.

The concept of sustainability is very relevant but complex, as well. Sustainability has multiple facets and does not refer only to the environmental sustainability but also to the economic and social ones. Also sustainability has to be approached with a multidimensional perspective (Davico, 2004). Therefore, when we take into consideration healthcare, it is very important to look at the ethical-social sustainability, which refers to issues of social equity between individuals, groups, between broader social aggregates, fair distribution and equal access to services in order to strengthen the population's capacities and opportunities (Davico 2004).

The Open approach is very much related both with the discussion on network and sustainability. Indeed, innovation owns the characteristic of openness when it is participated by subjects that usually do not enter in these processes (such as patients and caregivers), and when it is free to be used and shared (not for business purposes). As the NESTA report "Open Innovation in Health" (Gabriel, Stanley, and Saunders, 2017) states that innovation in order to be "open" has to involve a wider range of people that "can generate better ideas, at lower cost. They can also democratise innovation, giving a wider range of people a say in

setting priorities" (Gabriel, Stanley, and Saunders, 2017: 4). As the economic sustainability is concerned, the affordability of solutions implemented, according to the Frugal Innovation approach, is connected with low-cost and low-tech productions.

Previous research (Dreier et al., 2016) identified some common characteristics to define a "low level" of Patient Innovation:

1. independence: in most of the cases the idea was born from the personal condition and to face a personal issue;
2. repetition: in many cases the solution identified already existed but the patient did not know;
3. sharing: when a solution was found in general patients tend to share their positive experience with other people in their same condition lack of connection with doctors and professionals.

In this view, Design might act as an important mediator, connector of health services and institutions with patients and citizens, and as an activator, thanks both to tangible (availability of facilities and infrastructures) and intangible (knowledge and networks sharing) factors.

2.1 The "space" for Patient Innovation

Grassroots Innovation and co-creation processes can happen in those places where networking between different actors is facilitated and performed, where knowledge is shared, where experimentation is easily performed (in terms of availability of tools and competences). Focusing on design-driven innovation, Makerspaces and Fab Labs are places where it is possible to face the previously mentioned issues of independence, repetition and sharing which characterize Patient Innovation at a very first stage. Makerspaces and Fab Labs are facilities but also actors of a socio-technical system, where social and economic sustainability can be performed thanks to the adoption of processes of open and distributed production.

The first, open production, refers to an emerging production model, based on cooperation between different subjects. Often this production model is connected to open design approaches that lead to the development of projects (under free IPR Creative Commons license) based on the sharing of digital project files released freely to allow their replication or distributed production (Maffei, et al. 2017). The second, distributed production, is essentially a decentralized form of production developed by organizations or individuals who use a network of structures and production technologies geographically located through ICT technologies. This form of production is the basis of the Maker movement (Anderson, 2013; Dougherty, 2016) or the Do-It-Yourself culture and allows remote production of objects, at a microscale close to the end user. In technologically more advanced forms distributed production is present today in the concepts of Industry 4.0 (Europe) and Smart

Manufacturing (USA) with the introduction of cyber-physical systems or the development of autonomous systems managed by Artificial Intelligence (Maffei, et al. 2017).

From the socio-technical network point of view, we want to stress here the importance of Makerspaces and Fab Labs to be in connection with wider networks of stakeholders; in many cases, Universities, Research Centres, Hospitals, etc. take part in these networks. In addition to that, there are some examples of Makerspaces, Fab Labs, Innovation Centres which are not only located but even promoted and managed by Universities (e.g. POLIFACTORY at Politecnico di Milano, Lab4Living at Sheffield Hallam University, UCL Centre for Co-production in Health Research at University College London, Helix Centre located at the St Mary's Hospital in London but managed by Imperial College London and The Royal College of Art); this means that theoretical and applied research can be performed in very close connection. In addition to that, the reputation of Universities as "reliable" institutions can favour the involvement of different stakeholders, since, according to Quadruple Helix approach (Carayannis & Campbell, 2009), innovation is favoured and better performed thanks to the connection and the collaboration among Academy, Government, Civil Society, and Enterprises. In the following section, we are going to focus on the Italian context, presenting a selection of case studies of Design-driven Patient Innovations (DPI).

3. Patient Innovation case studies

The following case studies were selected looking also at previous research, such as MakeToCare1 and MakeToCare2,(Maffei et al., 2017; Maffei et al., 2019), La cura che cambia (NESTA, 2018), Digital Social Innovation: DSI4EU platform[1].

The 5 selected case studies are: NEXT STEPS, CAREABLES, BODYSOUND, Patient Innovation Platform, Hackability. We are going to present them according to three main sections:

1. DESCRIPTION: which will contain general information about the typology of project and funding, the partner we are going to take into consideration, area of interest of the project, actors involved.
2. PROCESS: will be dedicated to the research and design processes used in Patient Innovation journeys.
3. OUTPUTS: resulting from the process previously described; typologies of outputs and their distribution.

Finally, according to the identification of several variables, a model for the comparative analysis and synthesis will be proposed and used on the selected case studies.

3.1 NEXT STEPS (Distributed Design Market Platform)

DESCRIPTION. NEXT STEPS is an experimental initiative developed by Polifactory, the makerspace of the Politecnico di Milano[2], within the Horizon2020 project Distributed Design Market Platform[3] (DDMP, Creative Europe Programme 2017-2022) that stimulates designers, makers and patients to co-design and prototype a collection of open source walking aids that can be distributed through digital platforms and materialized in Fab Labs, starting from the Design Distributed Market Platform perspective. The initiative developed in collaboration with AIG – Associazione Italiana Glicogenosi[4], a patient association that represents people affected by Glycogenosis.

PROCESS. The project was divided into several phases involving patients, caregivers and designers through participatory activities and workshops both in presence (at the Fab Lab) and remotely. The results collected by a survey were the starting point for the co-design workshop aimed at collecting project ideas for mobility aid solutions. During the following phase, called "Makers in Residence", patients worked in close collaboration with designers and makers supporting them in the development and prototyping of open source walking aids. Technical and scientific support was provided by Polifactory' researchers; medical and scientific support was provided by Sanofi Genzyme (a pharmaceutical company) with a specialty care unit focused on rare disease.

OUTPUTS. Five solutions have been developed:

- Twistr: a parametric stick generated through a scanning made by a Kinect Cam;
- Taylor: a generative stick based on three parameters: gender, height and weight;
- Wander3d: an hacking project to transform a traditional walker into a motorized and sensorized rollator. Users can decide to activate the motors according to their needs.
- Clip Clap: a family of 3D printable clips for personalizing crutches;
- Crutches adds-on: a system of accessories that integrate on crutches to facilitate users' movements and activities (hooking systems, battery charging systems, lights, tips, holders, etc.).

All projects files and the INSTRUCTIONS FOR FABRICATION are distributed with a Creative Common License (CC BY-SA) on the distribuddesign.eu platform and Polifactory website.

Figure 1. Taylor one of the solutions developed within the NEXT STEPS project.

3.2 CAREABLES (made4you)

DESCRIPTION. Made4you it's an Horizon 2020 project (2018-2020) that involves several Fab Labs around Europe, participated by the Italian Fab Lab OpenDot. The project was aimed at connecting local communities of citizens with disabilities, their families, and healthcare professionals with makers and designers. The collaboration between these separate communities was based on the development of open-source interventions and solutions, so called "Careables".

PROCESS. In made4you project people became creators, not only users of innovation. Patients, their families, healthcare professionals and designers were involved in a co-design process as experts in their specific field, and were asked to collaborate with makers, who are -on the other hand- experts in the use of digital tools, such as 3D printers, laser cutters, etc. OpenDot chose a method already tested in other projects on the development of healthcare through co-design. This method is composed of 8 main steps, as shown in *Fig. 2.*

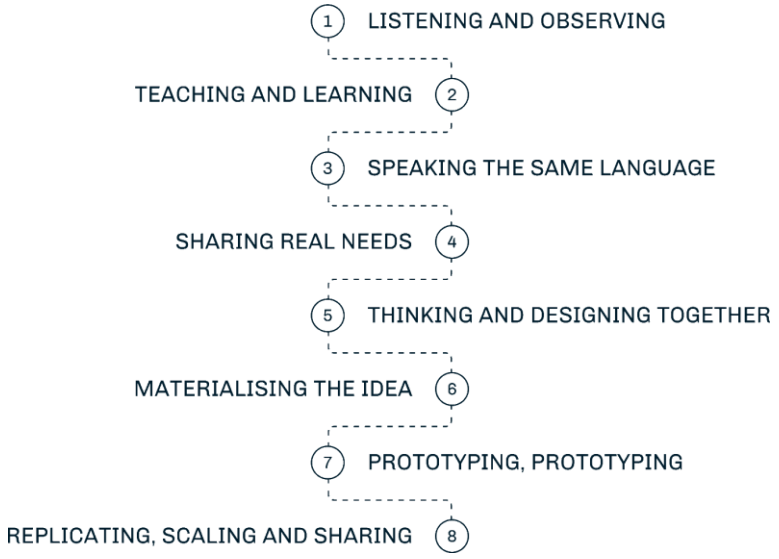

Figure 2. Steps of Method developed by OpenDot from 2015 with the TOG Foundation and other organizations, ranging from patient associations to companies operating in the field of healthcare, extract to "manifesto of co–design for health and care" inside Made4You project.

OUTPUTS. Made4You project had a series of different outputs both connected to co-design, prototyping and open distribution. Careables products are solutions for healthcare co-designed, replicable, accessible, adjustable, and shareable online, using digital technologies. These products are collected and distributed on the platform careable.org, where also a wider collection of open products is available to be downloaded. The platform collects about one hundred products and solutions, such as:

- *Davido*: a musical instrument that allows children with motor disabilities to maintain a rhythm, produce music and play alongside other people;
- *Hack a toy*: DIY low-cost mod to help turn toys into accessibility devices;
- *3D printed orthotic swimming fin* for the arm suitable for rehabilitation after a stroke.

3.3 BODYSOUND

DESCRIPTION. The Horizon2020 project SISCODE Co-design for Society in Innovation and Science (2018-2020) is aiming to understand the co-creation phenomenon that is flourishing in Europe and to analyse the context and conditions that support its effective introduction, scalability and replication. Within SISCODE, 10 pilot projects have been developed, involving different stakeholder in the co-creation of solutions addressing societal challenges. One of

these pilot projects, called BODYSOUND, is run by Polifactory, in collaboration with the Patient Association FightTheStroke; it investigates the physical-motor needs of children diagnosed with cerebral palsy.

PROCESS. BODYSOUND was developed starting from the process developed and proposed by the project leaders (Politecnico di Milano) in collaboration with other partners.

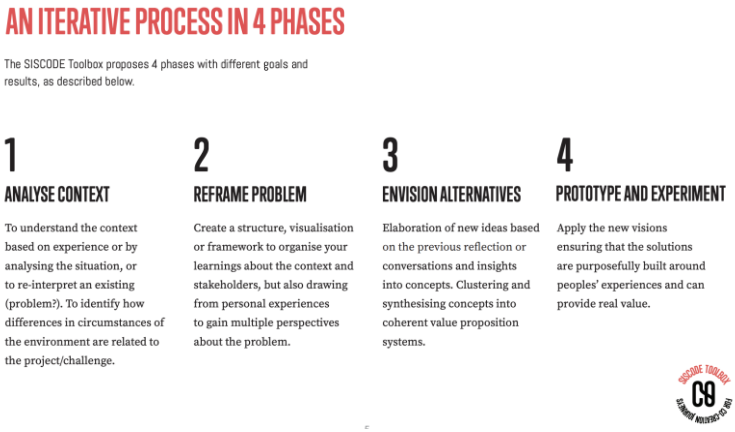

Figure 3. Process within the SISCODE toolbox for co-creation. and co-design.

Different moments of co-creation have been conceived and planned, in order to involve different stakeholders:

- the patient association FightTheStroke, who took part in the whole process from the definition of the challenge;
- children and families who have been involved in co-design workshops, experimental laboratories, and tests;
- therapists, sports doctors and sports scientists who were involved to test the solution and during the service co-design workshop;
- policy makers who were also involved in different moments of the process, through interviews and during the service co-design workshop.

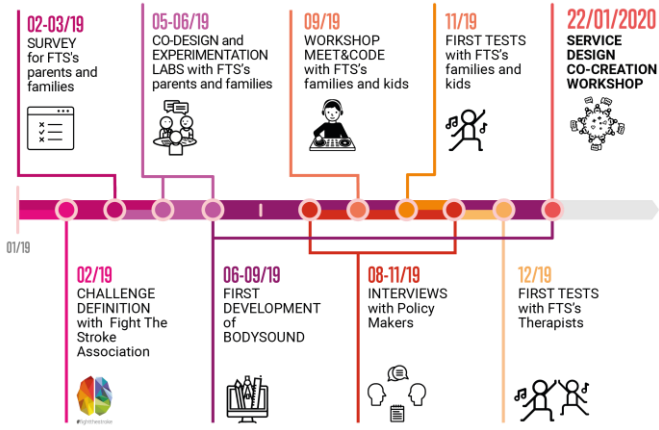

Figure 4. BODYSOUND pilot co-design process timeline

OUTPUTS. The output of BODYSOUND will be a product-service system intended for all children, with particular attention to the needs and requirements of children with cerebral palsy, aimed at motor reactivation through music that uses touchless technologies and will be able to collect data related to the movement. In particular, the product BODYSOUND will be a system based on coreutics and on the transformation of movement into sound. Within this system, children can perform a “choreography” and transform it into a “melody”.

3.4 PATIENT INNOVATION PLATFORM

DESCRIPTION. Patient Innovation platform was an output of the research "Visualizing user innovation in the healthcare" (2011), supported by Pieter Pribila Foundation, The Portuguese Science and Technology Foundation and Carnegie-Mellon Portugal Program, in collaboration with Universidade Católica Lisbon with Università di Roma Tor Vergata and the Universität Innsbruck. The project was aimed at studying user innovation developed by patients and non-professional caregivers. During the project, the need for these innovations to be shared with other patients, researchers and makers, became clear. For this reason, the Patient Innovation Platform was created in order to open distributing these solutions.

PROCESS. The process here presented it has not to do with the development of the platform in itself but with the process that the platform follows to collect (patients) innovations. Anyone interested in sharing an idea or solution can join an existing Patient Group or create a new group and can post information and multimedia content that can be implemented over time. Platform managers enable user-innovators interested in sharing their product-service solutions: solutions are analyzed by the Patient Innovation medical team, only those validated are published, thus ensuring a security check.

OUTPUTS. An international, multilingual, non-profit platform, and social network that connects patients and caregivers, and enables the sharing of their solutions. Since the launch of the platform, over 650 care and disability product and service solutions from over 40 different countries have been presented by patients (non-professionals) or caregivers, validated and then shared online.

3.5 HACKABILITY

DESCRIPTION. Hackability is a Non-Profit Organization born in Italy (2013) that aims to identify, invite, inform, interest and involve makers, designers, technicians, Fab Labs and people with disabilities, in an on-line and off-line community, to realize products for everyday life using new (or improved) digital fabrication processes. The initiative was born in Torino, but today in Italy there are several Hackability communities. The initiative is based on a meeting formula inspired by hackathons aimed at developing solutions based on the needs of patients and caregivers.

PROCESS. The challenge of Hackability is to build strong relationships between the local communities of makers and people with disabilities. This is done by encouraging people of both communities to work together with the aim of developing an assistive device, which solved a specific need expressed by a person with physical impairments. The basic idea behind the process is that people with disabilities already are hackers and makers since they often modify or develop their own ATs solutions.

OUTPUTS. Hackability developed three kinds of outputs:

- *Event*: standardization of a format inspired by hackathons (popular events in the community of makers) to propose systematic occasions where people with disabilities and makers can meet and work together, creating workgroups that are led by patients (i.e., begin-user).
- *Products:* are solutions for healthcare co-designed inside Hackability events by patients and designer/makers, to solve a personal need. These solutions are documented and distributed with on hackability Platform, we mention here only few examples like *Tournée (*folding table for wheelchair completely made by 3D printing), *Hackability Geo* (interactive 3D map of Italy for blind children).
- *Platform:* collects the documentation related to projects developed with the Hackability co-design methodology. All material is released as Open Source, with a Creative Commons License (CC-BY-SA-NC).

3.6 Synthesis

Case studies previously presented are going now to be synthesized according to 5 main characteristics. The variables identified for each of them are limited to our case studies but -

for sure - they should have to be improved if other Patient Innovation case studies would be taken into consideration (see Tab.1).

Table 1. Grid analysis with variables to be considered in designing for patient innovation

The leading subject	Research center
	Fab Lab
	Association
The involved stakeholders	Patients
	Caregiver
	Patient associations
	Healthcare professionals
	Designer and makers
	Researcher
	Policy makers
The process	Co-design
	Co-production
The outputs	Products
	Platform
	Product-services
The characteristics of the outputs	Accessible
	Customizable
	Digitally fabricated
	Open
	Distributed

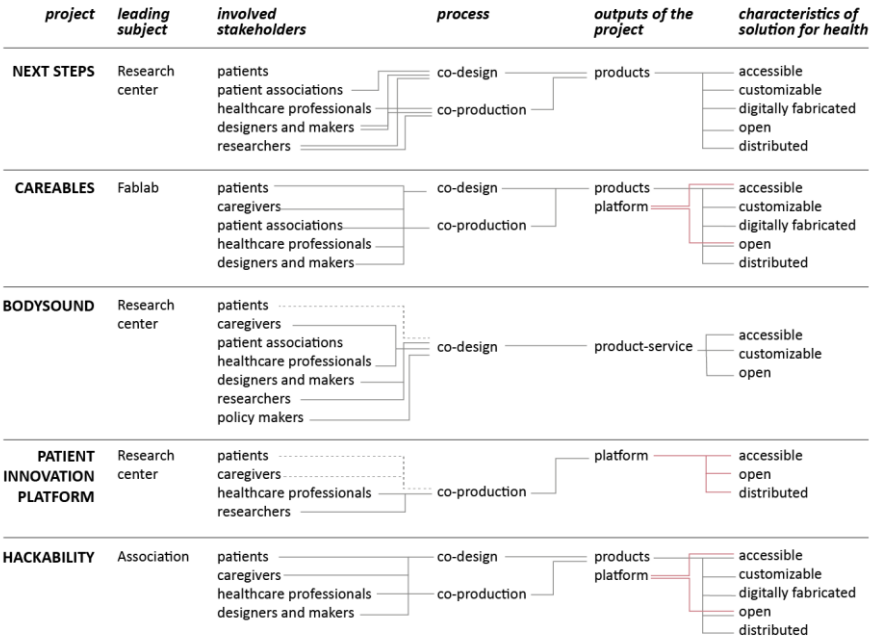

Figure 5. Summary table of the case studies analysed

As it is possible to see in the chart above, design-drive Patient Innovation pays great attention to different stakeholder in the healthcare field. Therefore, both patients and caregivers are involved and often, as we will see later, asked to work in close collaboration with designers and makers. However, innovation, in general, and Patient Innovation, in particular, need to communicate, engage and discuss in order to be efficient and effective both with researchers, healthcare professionals and policy makers.

These stakeholders are usually in co-creation processes. In the wide definition of co-creation, we could distinguish between:

- Co-design processes, which put in place specific actions of co-creation, where collective creativity is applied across the whole span of a design process (Sanders and Stappers, 2008; Sanders and Simons, 2009; Freire and Sangiorgi, 2010)
- Co-production processes, are temporally following actions to co-design and refer to the collective materialization or creation of knowledge.

Co-design and Co-creation processes, which we can collectively name, Co-creation are often *ad hoc* designed by researchers and designers and they can also be very different one from

the others. Since we took into consideration especially Fab Labs (and in one case - BODYSOUND - a Fab Lab which is part of a Research center) outputs are mainly products; however due to the nature of these projects, in many cases platforms are other very important outputs since they represent the virtual spaces were to disseminate and distribute these projects. Looking at the outputs, we could define their main characteristics. The accessibility of these products is very relevant. Indeed, in many cases these solutions answer to needs connected to the economic accessibility of healthcare products.

Accessibility is also very much connected with the possibility to customize these products. The customizability of a solution has to be taken into consideration in the very first-stage of the design process; therefore products have to be thought in parametric perspective to ensure that even a non-expert can enter his/her preferrable measurements.

The digital fabrication consent to use the same "language" which can be easily distributed and shared (open). Finally, openness and distribution are characteristics at the basis of the maker philosophy, as we discussed before.

4. Conclusion

Design-driven Patient Innovation is based on the observation and the recognition of a fact: patients (especially chronic patients) are daily facing issues connected with their disease, of which they become experts. The expertise is very relevant in managing these problems and, especially in cases of physical impairments, they tend to adapt the (standardized) medical aids which they need to use. However, to be so, innovation has to be known and shared, and not all the patients have the knowledge and the power to go beyond a personal level of innovation. To this end, Makerspaces and Fab Labs can act, in connection with other relevant experts, to empower patients who own an innovative idea, providing them the "space for innovation", composed by infrastructures, tools, methods, networks and money, thanks also to public or private fundings, which are more and more taking into consideration Patient Innovation as part of Responsible Research and Innovation domain. In addition to that, research and calls focusing on patients involvement, allow engaging in co-creation processes also those patients who aren't already conscious and confident not only in their possibilities but also of their capabilities and opinions. In order to make innovation possible, design-driven Patient Innovation looks at the whole healthcare ecosystem and to the need of a product or service to be inserted in a socio-technical framework in order to stimulate the conversation between healthcare providers and patients, but also improve the healthcare professional acknowledgment on patients' preferences and values. Finally, another important aspect is to propose more flexible medical aids and even cure processes, taking into consideration patients' general wellbeing and quality of life.

Abstract | The design field has been increasing its efforts to address societal issues with research and initiatives developed to provide adequate response. However, the gap between design's best intentions and the still rather poor effects of ambitious designs for social innovation suggest these responses may not be enough. To overcome this gap the authors offer two design frameworks addressing the growing social and environmental pressures: DEFT and the CONCERN CANVAS. These frameworks were developed based on the authors' research and work in the U.S., Europe and China, where they could witness these issues firsthand. The paper presents preliminary results of applications of the CONCERN CANVAS in corporate and educational contexts, as well as new ways to engage in the fight on climate change through the DEFT framework. While still in progress these frameworks provide tools for the emerging communities that reconnect designers with their roots as agents of change.

KEYWORDS | TRANSFORMATION, CONCERNS, CANVAS, CLIMATE CRISIS, STORYTELLING

I am pitting a world-around, bloodless, constructive, design transformation revolution against a world-around destructive bloody revolution. The Design Science revolution can be won by all. The bloody revolution can be won by none.

R. Buckminster Fuller 1969: Utopia or Oblivion

1. Context and Approach

1.1 Design for social innovation in a new context

In recent decades design has been reconnecting with its roots in social innovation. New fields of design research and practice were established, including design for social innovation, socio-ecological design, transition design, and transformation design. There is already much consensus for these design efforts in the academic world. However, with growing social and environmental pressures these design responses may not be enough. There seems to be a large gap between design's best intentions and the still rather poor effects of ambitious designs for social innovation, suggesting the latter may be ill suited to address the contemporary context.

1.2 Where we stand

The complex challenges individuals, communities and societies face can be designers' opportunity to shine. After all, designers are well equipped to address wicked problems and have expanded their scope beyond products and experiences to designing organizations and systems (Norman & Stappers, 2015). However, designers, as well as design educators are generally hardly able to offer ways for transformation. We believe the crucial point is to better align design knowledge with the changing contexts, so designers can work within different systems to eventually transform them. As current frameworks of design provide only little guidance on how to do this, we propose new concepts of how to engage in strategic design for transformation.

There seems to be much consensus on the WHY and WHAT of socially engaged design, but at the same time there is a lack of understanding on HOW to proceed. Tools and methods are crucial for delivering measurable empirical results, broaden the knowledge base of designers and make them legitimate members of heterogeneous teams working on transformation and social innovation.

1.3 Closing the gap

To overcome the gap between social ambitions and real-world projects, as well as the abovementioned shortcomings we present two frameworks: DEFT and the CONCERN CANVAS. These frameworks were developed based on the authors' research and work in the U.S., Europe and China, where we could witness these issues firsthand. The presented tools are work in progress. They are published open source for co-development by a community that we hope to build of designers and non-designers alike.

The overall goal of these frameworks is to provide designers with new possibilities of action to address society's critical needs, such as the climate crisis. Similar attempts for paradigmatic change in fashion (Fletcher & Tham, 2019) and architecture (Architects Declare, 2019) are still in nascent stages, but at the same time there is a growing understanding that design needs to move beyond focusing mainly on increasing economic value in the narrow sense of the word (Sheppard, Sarrazin, Kouyoumjian, & Dore, 2018). As IDEO's Tim Brown (2019) pointed out recently, the challenge is to redesign design in order to address urgent societal problems.

2. DEFT: Define, Evaluate, Feel, Tell

2.1 A Design Framework for the Era of Climate Crisis

Climate change is considered the most critical issue of this era, but designers do not seem yet up to the challenge, at least not in terms of making the issue central to their work. While there are some emerging signs of designers focusing on the climate crisis[1] and organizing to declare climate emergency (Architects Declare, 2019) — for the most part designers still apply design thinking and other design methods that pay very little attention to climate impacts.

Exploring effective ways to engage in the fight on climate change will require designers not only to be truly human-centered, but also to have adequate tools that are grounded in this new context. The DEFT (Define, Evaluate, Feel, Translate) framework was created to be such a tool, offering a roadmap for designers navigating their way in a rapidly changing environment that is shaped by the climate context. It synthesizes existing design tools (i.e. back-casting, storytelling) together with more radical lens around systemic changes.

The DEFT framework includes four steps:

1. Define the journey – articulating a desired mental model and backcasting to the present

[1] See for example https://www.climatedesigners.org/

2. Evaluate your solution – using affordability, practicality and meaningfulness to assess potential solutions
3. Feel the Bern – deciding whether to accept or reject the system in which you operate
4. Translate your solution into a compelling story (see Figure 1).

The following part will describe each one of these steps in detail.

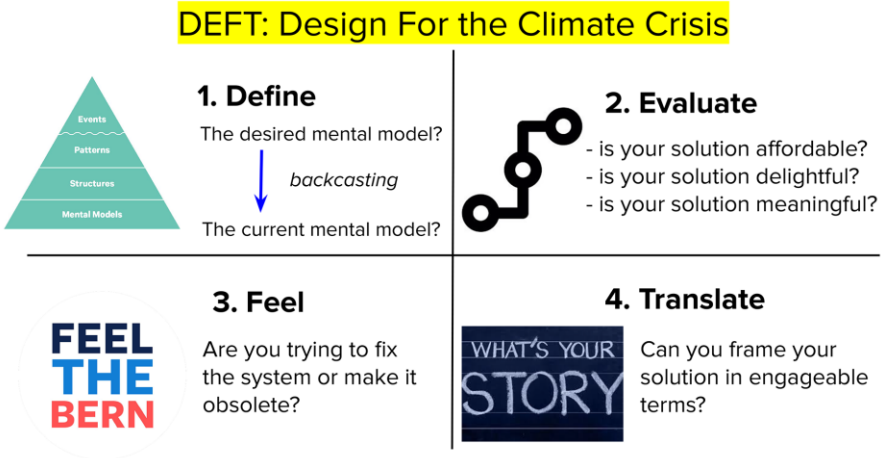

Figure 1. DEFT Framework's Four Steps: Define, Evaluate, Feel and Translate.

2.2 Define the Journey

The first step in the DEFT framework is to formulate the journey: Articulating a desired future in terms of a mental model and identifying a desired or ideal future and projecting backwards from it, i.e. starting with the mental model the designer wants to see in place in five, ten or twenty years from now and working their way backwards to the present.

Backcasting through the lens of mental models allows designers to lead from the future (Scharmer, 2009) giving them permission to ignore the (mental) limitations of the status quo. It also allows designers to maintain flexibility – similarly to The Natural Step's process of backcasting from sustainability principles (Broman & Robèrt, 2017) it allows designers to consider different solutions as long as they are aligned with the new desired mental model.

2.3 Evaluate your solution(s)

With the scaffolding provided by the first stage, the designer can move on to consider and evaluate different potential solutions. Choosing the evaluation criteria is critical as it provides a clear understanding of the most important elements we believe the designer should be looking at: Affordability, delightfulness and meaningfulness. These elements are translated into three questions:

Is it affordable? This question reflects the need to ensure equitable access to climate solutions, acknowledging that the climate crisis is a social justice issue. It suggests that designers should redefine climate solutions around affordability and assess when they consider possible solutions in transportation, housing, energy, food, etc. if the majority of people can actually afford it.

Is it delightful? New experiences we are offered are designed to be more convenient, easy-to-use and frictionless. Solutions offered to fight the climate crisis cannot be any different and need to meet the same level expected from all other experiences in order to be adopted at scale. This question requires designers to prioritize innovation offering consumer delight and as little trade-offs as possible.

Is it meaningful? Designers should consider the impact and materiality of the solution evaluated, i.e. does the solution support rapid reductions in carbon emissions along the lines of the IPCC report's (2018) recommendations? This question is also meant to ensure that solutions to be considered offer more than just an incremental response, i.e. "a slow process, which modifies the landscape only slightly" (Roggema, Vermeend, & Dobbelsteen, 2012).

2.4 Feel the Bern

Framed as homage to Democratic presidential candidate Bernie Sanders this step is focusing on the designer's posture. Similarly to the Transition Design framework (Irwin, 2015) it acknowledges the importance of designers' mindset and posture. Designers need to ask themselves a fundamental question: Do they believe in trying to fix the system in which you operate (i.e. mobility, energy, healthcare, fashion, etc.) or in replacing it with a new one?

The climate crisis requires designers not only to consider what is at stake, but also to reflect on their own values and whether they are willing to stand up for them. Designers may need to go against the inherent preference of any system to preserve itself and reject significant changes. Eventually, the real question they may be asking themselves is about courage, reflecting E.F. Schumacher's notion that "any intelligent fool can make things bigger, more complex, and more violent. It takes a touch of genius — and a lot of courage to move in the opposite direction." (Schumacher, 1973, p. 22)

2.5 Translate your solution into a compelling story

In the final stage of the process, after considering the overall alignment with the desired end point (step 1), the assessment criteria (step 2) and the designer's posture (step 3), designers are ready to narrow down and focus on the proposition they find most suitable. The focus of this step nevertheless is not on prototyping or testing, which will be pursued along the lines of the design process, but about shaping the narrative of the proposition.

Storytelling has been key to sustainability and the climate crisis is no different – as Segal explains climate change "has a considerable narrative weight and that it is something we understand through storytelling" (2017, p. 122). For designers it suggests that the effectiveness of the solution also depends on the story developed around it. In order to translate a climate-based solution into a compelling story designers will need to pay attention to three questions: *Is the story clear? Is it relevant (to the audience)? And is it exciting?* Synthesizing these factors (clarity, relevance and excitement) is key to realizing the solution.

2.6 Testing the DEFT framework

The DEFT framework has been initially introduced in a couple of design courses, where students experimented with it to explore questions around the future single-use soda bottles, circular models in the furniture industry, and the value of recycling. These exercises helped refine the framework and further articulate the questions it poses for designers.

Our ongoing interaction with design students, educators and practitioners suggests there is a growing interest in frameworks with the contextualization offered by the framework – grounding solutions in the urgency of the climate crisis, while integrating radical thinking with practicality (e.g., Fletcher & Tham, 2019). We plan to continue testing the DEFT framework in the upcoming months in workshops with different organizations, looking into the value the framework creates for designers in different environments (corporate, entrepreneurial, educational, etc.).

3. The ConcernCanvas

The ConcernCanvas (CC) is a diagrammatic tool that helps to render a comprehensive view of complex socio-technical contexts and facilitates to find starting points for design and interventions.[2] The canvas traces the driving forces of the stakeholder's mindset by linking

[2] The ConcernCanvas is part of a series of tools for transformation design including the "Hypercycle of Transformation", "Cultural Formats", and the "Two Layers of Scenography", see www.designingtransformation.org

the psychological and material factors and thus overcome a traditional perspective that treated both of these influences separately.

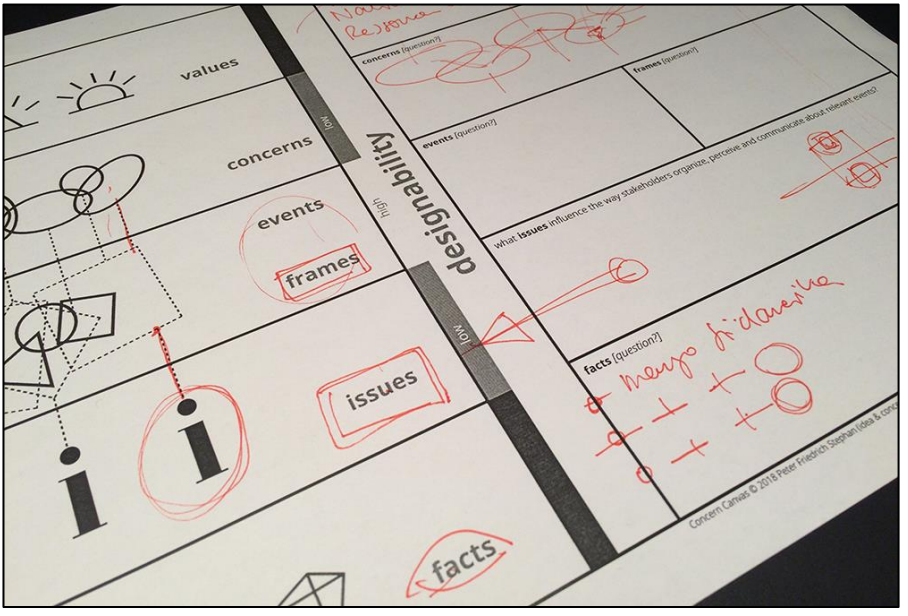

Figure 2. The ConcernCanvas links facts and values and asks for their designability.

3.1 The design of the Concern Canvas

At its center the CC asks about the relation of *events* and *frames* for different stakeholders. Observing and discussing relevant events and their impact on the mindset of people is important to build a common understanding of the situation that is the design objective. In the diagram events and frames both are linked symmetrically up to the most comprehensive view and down to the most concrete details. In the direction up frames are influenced by *values* and *concerns*. In the direction down frames are influenced by the mediated or material set of circumstances that are identified as *issues* and *facts*.

The CC challenges the design team to explore the causalities and interdependencies of *values, concerns, events, frames, issues* and *facts* by asking questions that address each of these aspects like: *Which events can you identify in the stakeholder's world?* Or: *What are the facts that determine the stakeholder's experiences?* To answer these questions the design team needs to observe, find, describe and discuss their views on the situation. This is how the ConcernCanvas can work as a catalyst to build a "trading zone of knowledge" (Galison, 1997) for the design team.

3.2 “Concerns” as a foundation for Transformation Design

The Concern Canvas introduces the new category of »concerns«.[3] Concerns are conceived as »values in action« that drive the motivation and decisions of people. Whereas values are more stable over time and more general, concerns are specific and may change more quickly. An individual’s situation at a given time may be described by a set of concerns. Everything that has an impact on your subjective view and feeling of »being in the world« can be considered to be a concern.

Concerns are a mix of rational and irrational aspects, and large- and small-scale topics that raise enough energy to influence your mind and behavior. Concerns are non-normative: The concern »health« might mean not eating too much in some countries, whereas in other places it might mean to have access to clean water. Concerns are non-hierarchical (in contrast to Maslow’s pyramid of needs): A lost match of your local soccer team might have more impact than some distant war. Also, for concerns there is no natural or authentic status: »Nature« used to be a threat to man and became a concern. The concept of concerns acknowledges the fact that trends, memes, images and narratives are designed, produced and controlled by an industry.[4]

The non-normative concept of concerns replaces the normative concept of needs and thus opens new perspectives for design especially in its functions as social innovation and transformation. If the concept of Transformation Design is based on concerns it is not limited to socio-ecological issues but addresses a broader range of topics. We suggest using this starting point in order to first describe and understand transformation as a universal process that is happening for better or for worse and that does not wait for designers. We can always bring in normative socio-ecological issues later but the foundation of a science and design of transformation should not limit its analytical perspectives from the start.

3.3 Context, culture and concerns

Especially in western cultures there is still a gap between the humanities on the one hand (concerned with values and sensemaking) and the hardware on the other hand (concerned with trivial materials). Only recently the cultural and social sciences took a *material turn* trying to close this gap. Designers of course were always concerned about material culture and can only wonder that it took the humanities so long to catch up. Designing for transformation and social innovation will largely depend on tools and methods to

[3] The notion of »Concerns« is a *terminus technicus* with a more specific meaning than in its usual use in the English language. It was first introduced by Bruno Latour in his *Actor-Network-Theory* (Latour, 2005) that built upon the difference of *matters of concern* and *matters of fact* (see Author, 2016).

[4] For an example see the magazines at a newsstand with titles such as *Happy Way, Slow* and *Hygge* to push concerns such as happiness, security, and cocooning (see Cabanas & Illouz, 2019).

understand the "two kingdoms" of values and facts comprehensively and provide a starting point for designing interventions.[5]

One of the attempts to do so is the *Causal Layered Analysis – CLA* (Inayatullah, 1998). Here the mechanisms of sensemaking are traced in cultural settings and structures. Another approach aims for "Positive Design" (Pohlmeyer & Desmet, 2013). Both concepts introduce psychological foundations that are more sensitive to the possible impact of design than the "rule of thumb" used in design so much. The notion of *positive* however implies a normative direction that might be naive at best and dangerous at worst. Both concepts, as well as other approaches that are ethnologically inspired, ask the proper questions: As traditional structures, narratives and sensemaking processes vanish how will the new cultural formats be defined? (e.g. What is a workplace? What is a family? How can we design trust and organize mobility, energy, education, and security?).

All of these questions can be addressed by using the concept of concerns and the ConcernCanvas together with the aforementioned approaches. There are differences in focus and direction of the presented approaches. But as for now Transformation Design is still in its infancy we should concentrate on the common goals first and try to build a toolbox as rich as possible. We might shift attention to the differences of concepts later when a more mature field of socially engaged design will have emerged.

3.4 Do we need another canvas?

A canvas is defined as "a two-dimensional, poster-based tool that guides a heterogenous team with a particular challenge or task" (Thoring, Mueller, & Bakde-Schaub, 2019, p. 595). Canvases offer a method to go from linear thought to planar action or even space if used by groups simultaneously and became popular tools used in processes of innovation and creation.[6] Canvases structure group thinking and facilitate involvement. By the means of graphical representation and interaction crucial issues are detected more easily and become more approachable.

If the concept of concerns is adopted a proper way of putting them in context is needed. With the complexity of concerns given there is no way of rendering their context linearly. A canvas however can display the interdependencies of different aspects and can also show the areas that need to be explored. Just like a map that does not only chart the known territories but also gives hints to the address the unknown a canvas can not only show existing issues but can also ask for the missing elements that need to be researched.

[5] This also was Buckminster Fuller's mission: "(…) I am confident that we have, in reality, closed the science-humanities gap with kindergarden conceptuality." (Fuller, 1969, p. 144)

[6] In an empirical study 123 canvases were analysed (Thoring et al., 2019). However there are some approaches that pretend to be a canvas but do not meet the requirements. The "Digital Transformation Canvas" for example is only a list of Do's and Don'ts, see https://kmu-transformation.ch/der-digital-transformation-canvas

3.5 Working with the ConcernCanvas

The ConcernCanvas was developed based on experiences in Transformation Design projects. One of these projects was a redesign of a mission statement and its communication for a German bank.[7]

Figure 3. Mission Statement and visualization for the DEG, a subsidiary of KfW, the third biggest bank in Germany, June 2018.

Introducing the concept of concerns opened new ways to articulate the non-normative drivers of people's mindsets that could not be covered by the traditional concept of needs. The ConcernCanvas proved useful as an additional module for the designer's toolbox just as other tools like design thinking, user journey, personas etc. These modules can be combined for an individual set of tools that fits the given task and situation.

[7] See https://www.deginvest.de/International-financing/DEG/%C3%9Cber-uns/Wer-wir-sind/Unser-Leitbild

3.6 Workshop on “Re-starting Development Aid”

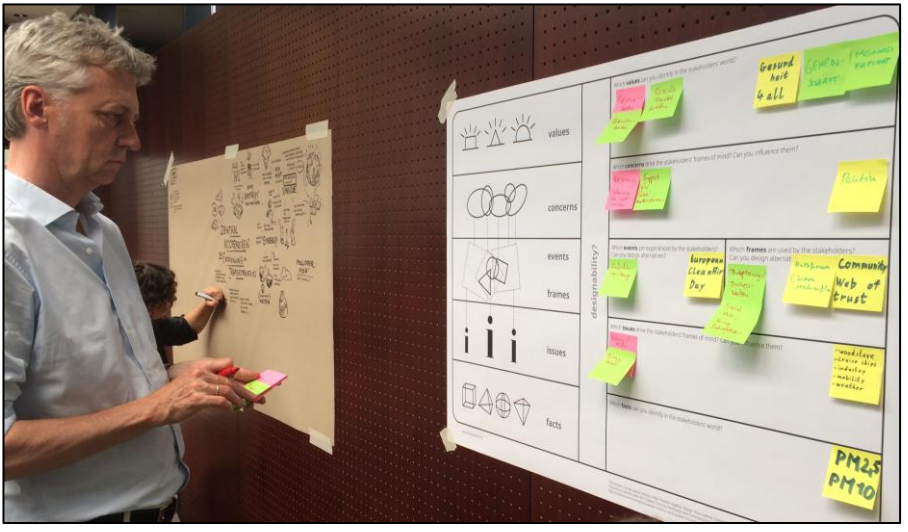

Figure 4. The ConcernCanvas is used in the Workshop “Restarting Development Aid”, Berlin June 2019.

At the Weizenbaum Institute for the Networked Society – The German Internet Institute we conducted a workshop on “Re-starting Development Aid”. The ConcernCanvas was helpful for identifying the different stakeholder’s perspectives such as the beneficiaries and the benefactors, political institutions, banks and NGOs.

3.7 Workshop on "21st century design education"

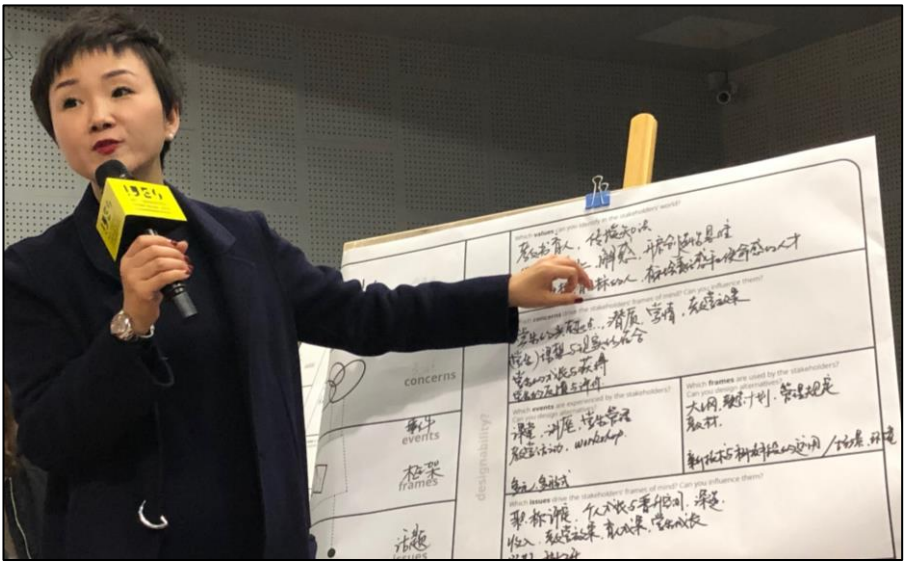

Figure 5. The ConcernCanvas is used in the Workshop »21st century design education«, Beijing/China, October 2019.

At the Beijing Institute of Fashion and Technology – BIFT in Beijing/China we conducted a workshop on redesigning design curricula. Stakeholders such as the students, the faculty, the industry, the party, and the family/parents used the ConcernCanvas to articulate their concerns. It was the first time for this Chinese university to articulate these different perspectives and take them as a starting point for discussing further development.

3.8 Results and Outlook

The results of the mentioned workshops were quite promising. The ConcernCanvas proved useful to open new ways for the participation of stakeholders and to deliver new insights for the design team. The Canvas was revised and fine-tuned and is now part of a series of tools for transformation design.[8] Further development is expected from the use of the ConcernCanvas by other design teams. As to date no empirical data is available as there were no means to integrate an independent and parallel observation from social sciences (as is the case most of the time in design). Paradoxically most data on the impact of designing concerns comes from marketing analysts. These inquiries were made for commercial purposes that are fundamentally different from the goals of design for social innovation and

[8] see www.designingtransformation.org

transformation. Metrics to measure the non-commercial impact of design are hard to find but will be most welcomed. We hope to gather empirical data in the future thanks to a growing community of developers sharing their experiences with the new tools for transformation design.

4. Conclusion

The new tasks in the emergent fields of socially ambitious design demand new forms of research, practice, and education as well as new frameworks and tools. We suggest that the frameworks presented in the paper can help close the gap between designers' ambition and results in the emergent fields of socially ambitious design.

The proposed frameworks should serve the community of design researchers, practitioners and educators in coping with the rapidly changing context of their work, adding to their knowledge base and providing them with new lens to address the challenges they work on. We hope these frameworks can help designers play a more prominent role in the public discourse and make a greater impact in real world projects. Educators can use the frameworks as a starting point for discussion and development for a new generation of designers.

Designers are at a crossroads now. They are uniquely positioned to be agents of change (Banerjee, 2008), and the need to fulfill this premise has never been more critical. At the same time, most designers still work on projects with limited societal impact. Designers need to make a choice if they want to shape and drive change or be driven by it, working to execute change strategies and policies created by others. As Fuller noted: "We need the philosopher-scientist-artist – the comprehensivist, not merely more deluxe-quality technicians-mechanics." (Fuller, 2001, p. 114). We agree with Fuller and hope the frameworks we present in this paper will serve as an invitation for designers and researchers to further explore opportunities to reshape this field.

Time and Design. Time as a key parameter for a survey on contemporary design

Enza Migliore

AIIT, Tokyo Metropolitan University, 1 Chome - 10 - 40 Higashiōi, Shinagawa-ku, Tokyo, Japan
enza.migliore@gmail.com

Abstract | This paper defines an exploratory pattern that, employing time as a key factor, reviews its recent dynamics, evolutions and interpretations critical to the field of Design, to establish which are urgent issues to be challenged and to select and map relevant approaches, methods and agencies. Starting from an analysis of the obsolescence of the linear conception of time, based on the Modernist ideal of progress and undermined by the manifestation of humanity as a planetary-scale geological force (Anthropocene), it is proposed a contemporary characterization of it. Time is presented as Object-Oriented, Archetypical and Topological and it calls for updated design roles, methods and objectives beneficial to a sharp understanding of our present. Para-fictional and Material Speculation are proposed as suitable approaches and sustainability, information and hybridization as crucial issues for our time. They are explored through the time parameter: Time and Objects, Time and Knowledge and Time and Making. Some case studies are selected to discuss which design practices respond to the contemporary time challenges. This recognition identifies also some tools and modalities which support and help the design to accomplish its critical, reflective and political role.

KEYWORDS | TIME, GREAT ACCELERATION, OBJECTS, KNOWLEDGE, MAKING

1. The Great Acceleration: the linear time of Modernism

The Earth contains, along its whole circumference, a thin layer of radioactive materials sedimented starting from 1945 (Morton, 2013). This layer represents a decisive shift towards a new geological era characterized by an impressive terraforming of our Planet, named Anthropocene (Crutzen et Stoerman, 2000; Crutzer, 2002). After the Second World War, we assist at the beginning of a phenomenon called "the Great Acceleration" (Mcneill, 2014), an exponential increasing growth rate of human progress leading to such an uncontrollable increasing impact of humanity on the planet that "in a single lifetime humanity has become a planetary-scale geological force" (Steffen et al., 2015). The machine became the icon of the progress and the assembly system the base of the Industrial Capitalism. The myth of a global and endless space for both production and consumption generated a model of time associated with the Enlightenment idea of endless progress and with the Modernist ideal of mass production. The nineteenth century narrative in based on a linear conception of time, where the future would automatically bring progress, improvement and endless development.

Today, humanity is facing the consequences of its anthropocentric, modern and technological attitude. Catastrophic scenarios are arising, which are the manifestation of what Morton (2010; 2013) defines the end of the world, intended as the end of what we have been considering, for the last three centuries, as "world", that is the projection of the human being's space, time and activity. He claims that big entities, called hyper-objects, shows up as uncontrollable objects, distributed in time and space, of which we can know, experience and visualize nothing but a very small part of the whole. They can be a black hole, the global warming, the solar system. They make the ecological denialism and the apocalyptic environmentalism obsolete and inaugurate a new phase of hypocrisy, weakness and instability. Man has lost his central position of absolute control and power on the world and he has to rethink human existence on the same level of the existence of nonhuman objects (Harman, 2002). This circumstance asks for a new way of thinking, subvert our certainties and even break them up.

The Design discipline, view its responsibility and role in the anthropocentric vision of global production and consumption, of progress and, above all, in defining the relationships between objects, contexts and the human being, is facing a questioning phase: which are, in this scenario, the reflections, directions and decisions taken or to be taken?

This paper highlights the need to bring the thought, the philosophical reflection and the cultural dimension at the centre of design, starting from an exploration on the concept of time, and its influence on the project dimension. Time is investigated as both a quantitative and a qualitative variable and it is proposed, on the base of meaningful intellectuals' theories, such as Serres, Latour, Jung and Zolla, a contemporary characterization of it.

2. Another Time: Object Oriented, Topological and Archetypical

The loss of an anthropocentric perspective requires philosophical reflections to reconsider human activities and, for the purpose of this paper, design priorities. A valuable support comes from the Speculative Realism, which is a movement in contemporary continental-inspired philosophy that defines itself in its stance of metaphysical realism (Meillassoux, 2008). In metaphysics, realism about a given object is the view that this object is ontologically independent of someone's conceptual scheme, perceptions, linguistic practices and beliefs (Armstrong, 1980). One of its approaches is the Object-Oriented Ontology, OOO (Harman, 2002, 2018; Bryant, 2011), a 21st-century Heidegger-influenced school of thought that rejects the privileging of human existence over nonhuman objects.

The Modernist conception of Time, as a linear sequence of events motivated by the dream and the design of the future and interpreted in terms of human history, is clearly renegotiated according to a new objected-oriented perspective, where time can be considered an object such as the humanity itself. We could imagine time as a hyper-object of which man can only get and experience small parts, moments. This feature of the object-time to be unintelligible in its entirety, escaping the rules of only human will and purely scientific and technological reason, requires an effort of reconciliation and collaboration between science and humanities and the redefinition of archetypal imaginaries, or, in Jung's words (2014; [1968]), of a collective unconscious, to mitigate the sense of anxiety, frustration and helplessness and rather to direct them towards an awakening. As Morton (2013) states:

> "[…] the ostentatious conviction that the world will end if we don't act immediately is, paradoxically, one of the factors that most inhibits an aware and effective commitment of human beings to an actual ecological coexistence on the Earth. The end of the World already happened, and we only have to wake-up from the dream and start acting in a conscious way." (p.20)

In this perspective, an interesting consideration arises to inspire new human professional attitudes: there is no need for acting in a rush; on the contrary, we should accept the reality and take time to reflect and speculate as much as possible on it, breaking the chain of a defective consideration of time as velocity and outrageously future oriented. This seems to be a good starting point for Design to rethink its priorities and agencies. Isn't it the time for designers to make substantial decisions? It's time for reflection, speculation and new commitments.

In order to understand the more intimate human condition, it is beneficial to refer also to theories of recent psychoanalysis. Jung (2014; [1968]) speaks of a loss of a collective unconscious, that is, of archetypes that help man to orient himself in the world, deprived of symbolism by the modern logic. Logic is a prerogative of conscience: man selects, makes sense, recognizes. His unconscious, however, is guided by instinctive tendencies,

represented by those “ancestral” forms of thought, which are precisely the “archetypes”. The “archetypal memory” therefore remains the main structure of our being men.

Our present, in order to be comprehended, needs the invention of new forms of thought. A substantial contribution is Michel Serre’s work about the spatialization and topologizing of time (1995; 1997). He offers ways of thinking time spatially and morphologically. Serres, in fact, discloses topologies of space and time which are inclusive forms holding together science and culture, and incubating new forms of historical poetics (Abbas, 2005). He provides a model, topology, and tools, such as maps and storytelling, for a reinterpretation of history, in order to know and reconciliate who and what we are in relation to the world (Connor, 2004). Topology may be defined as the study of the spatial properties of an object and it is not concerned with exact measurement, which is the domain of geometry, but rather with spatial relations, such as continuity, neighbourhood, insideness and outsideness, disjunction and connection (Croom, 1989). In place of the line of history, Serres proposes a series of different configurations of time, based on dynamic volumes, or topologies. It can be a crumpled handkerchief, in which apparently widely separated points may be drawn together into adjacency (Serres and Latour, 1995, p.60-1).

Through this investigation about a renewed conception of time, it is proposed its contemporary characterization which might drive current design directions and engagement. Our time is Object-Oriented, since we have lost an anthropocentric vision of the world, that is, also, of history and time. In this perspective design must enhance its ecology-driven approach and methods. Time is Archetypical, as we need to restore and redefine an archetypical memory or collective unconscious to face “the end of the world” and to wake up our political actions and decisions. From this point of view, design must focus on its semantic, symbolic, anthropological and social value. Time is Topological, as it is no more based on a linear line but on a fluidity of polychronic connections between local and global and design must engage with complexity empowering its holistic and interdisciplinary attitude. This definition of time is instrumental to outline contemporary design perspectives and to inspire decisions. These three features meet and merge in a state of emergency where the human actions need to be affranchised from the anxiety for the future through a deep critical and speculative focus on the present, intended as the moment of actual knowledge (Zolla, 1981).

3. Design approaches with a Time perspective: from Design fiction to Para-fictional and Material Speculation

Design, operating on the boundaries between technology, science and society and through both cultural, economic and social lenses, has an active role in this current scenario and is called upon to contribute to its understanding and evolution, inquiring the present and forecasting possible futures. The supremacy of a techno-scientific thought has been influencing our society sharpening the contemporary condition with apocalyptic scenarios as

a means to criticize human behaviours and choices in a brutal and destructive way through a sensationalist and dehumanized aesthetic. Above all, the trend of Science Fiction has been proposing scenarios loaded with anxiety and tension, which, thanks to technological potentials, are extremely falsified and deprived of any form of balance, desire and care for the present hopes, the past teachings and the eternal human fears. Here the Design can make the difference. It can intervene with its care for the balance between both technical, semantic, anthropological and emotional variables. To respond to this task, in the last decades, Design has been setting up established approaches, such as speculative (Dunne & Raby, 2001; 2013) and critical design (Ratto, 2011), largely incorporating practices of fiction design (Sterling, 2005; Retzinger, 2008; Bleeker 2009), aimed at exploring and questioning emerging issues to imagine and discuss possible, probable and more suitable futures (Gaver and Martin, 2000). Design fiction works to offer an alternative to science fiction binary utopian/dystopian environments. The co-founder of *The Near Future Laboratory*, Fabien Girardin, distinguishes design fiction from science fiction: "Design Fiction doesn't so much 'predict' the future. It is a way to consider the future differently" (Girardin, 2015). The emphasis of speculative design has been on building alternative versions of the future and constructing different fictional environments within which new objects, products or services can be re-thought and virtually trialled.

This paper, in light of its premise and goal, identifies Design Fiction as a legitimate and suitable design approach, but argues that its evolutions of Para-fictional (Norris, 2018; 2019) and Material Speculation (Wakkary et al., 2015) fit better for our time.

Jane Norris claims that Design fiction is still largely trapped within Modernist linear conceptual structures that continually prioritize the new (Norris, 2018; 2019). What this approach does not address very effectively, are issues focusing on material use in the present, unless it is by inference or contrast. She focuses on the possibilities of a 'para-fictional' approach to design. It is a provocation to rethink how we view materiality. As Leith et al. (2018) state:

> "This use of para-fiction is a design strategy she has developed by assigning narratives to contemporary objects in use, […]. This strategy offers an alternative form of design fiction to the established use of speculative design that is more future orientated. She situated her use of para-fiction, within a current, wider cultural debate on how post-enlightenment thinking might be used to consider fresh design strategies." (p.4-5).

As complementary to design fiction, Wakkary et al. (2015) introduced the concept of Material Speculation and stated that:

> "Material speculation emphasizes the material or mediating experience of specially designed artifacts in our everyday world by creating or reading what we refer to as counterfactual artifacts. Material speculation utilizes physical design artifacts to generate possibilities to reason upon. We offer material speculation as an approach to critical inquiries in design research." (p. 97).

This approach advances the notion that the material existence of specifically designed artifacts situated in the everyday represents a unique and productive approach to critical inquiry.

As we can see, both of the approaches show a focus on the present and on the materiality, which evokes ancestral feelings and impulses laying in the deepest layers of the individual, generating modes of immediate and multi-sensory narrative (Hekkert & Karana, 2014).

The main focus of Design are no longer products, services, systems, but rather ways of thinking and doing that challenge, critically question and design solutions to or opportunities for complex social, environmental, economic and even political issues. In fact,

> "Before being a technique, design is a capacity for critical analysis and reflection, with which design experts produce knowledge, visions, and quality criteria that can be made concrete in feasible proposals." (Manzini, 2016, p.54).

4. Design priorities and practices for re-thinking Time: a recognition through case studies

After the investigation about a new perspective on the present time and the proposal of approaches suitable to respond to the emergent situation, this paper identifies crucial issues to be challenged by the discipline and undertakes to depict contemporary patterns of practices. In light of the analysis on the urgent reflections about a) the human impact as a geological force, b) the lack of an understanding of unintelligible entities, in this paper treated as hyper-objects, and c) the call for reconciliation between humanities and science, which also means for interdisciplinarity, the paper highlights and select three main critical issues: sustainability, information and hybridization. They are explored through the time parameter: Time and Objects, Time and Knowledge and Time and Making.

Time and Objects is an inquiry on the concept of sustainability, in terms of obsolescence and impact of objects and materials on the ecosystem, from the perspective of geological eras and not of historical times, following the Object-Oriented Ontology theories (Harman, 2018) and considering time as a hyper-object (Morton, 2013) of which we can know, experience and visualize nothing but a very small part of the whole. Time and Knowledge highlights the correlation between human awareness and information with respect to past, present and future and responding to human obsession for prediction (Vespignani, 2019). Practices of contemporary design acting as knowledge facilitators that mitigate human fragility with respect to time, through the design of polychronic experiences (Serres, 1997; Herzogenrath, 2012), are illustrated. Time and Making explores experimental practices where time is highlighted as an opportunity for interdisciplinary collaboration and exchange, but also the different connotation that time takes in each discipline, i.e., linear vs. circular measurement, making through temporal sequences vs a non-chronological kind of time (Bennett et al., 2011).

4.1 Time and Objects, Sustainability

Talking about objects, it is necessary, today, to redefine, understand and redesign the material apparatus, the relationship between the user and the products' physicality, in accordance with the new paradigms of a more conscious, ethical and demanding consumerism. At the same time, the experience of the physicality of things is, today, both disorienting and exciting. It is displaced by the lack of connections between the material and the place of origin, fruition and processing; between the material and its place in our individual and collective memory made up of associations between aesthetical and functional properties and resources, geographies, landscapes, traditions, skills, tools and processes. The concept of a non-anthropocentric time asks for design agencies which try to make an understanding of it through empathy and ancestral thoughts and borrowing, from art, the performative dimension of the project. The performance seems to convey the contemporary paradigm. It "happens" in the place of the outdoors, of the displacement, of the fragmentary, of the experience. The performance is a hypertext in which the artist's action and audience experience are mutually inscribed. (D'Alto, 2017). The experience of the event refers to the behavioural and procedural sphere, and therefore actions do not represent something, rather they define or build something.

In the case of design, the performativity of the project consists mainly in bringing to light the process, the phenomenological value, the invisible hidden behind the shape and function of the object, which becomes less critical. The performative aspect represents the political dimension of the project. A significant example is Olafur Eliasson and Minik Rosing's project 'Ice Watch' [fig.1], whose first edition was in 2014. Twelve large blocks of ice, calved from the Greenlandic ice sheet, were harvested from a fjord outside Nuuk and brought to the centre of Copenhagen, and then to other cities such as London and Paris, in response to the publication of the UN IPCC's Fifth Assessment Report on Climate Change. The designer didn't create any objects but displaced "objects". He calls for attention about the hyper-object called Climate Change making the ice itself talk about the consequences of human actions and decisions on the planet and triggering an ancestral, emphatic connections of people with the destiny of the melting ice.

Figure 1. Olafur Eliasson – Ice Watch, 2014, Bankside, outside Tate Modern, London, 2018, photo: Justin Sutcliffe.

In the last years, the exhibiting and narrative choices made by distinguished curators, museums and designers are representative of how the attention and priority are shifting from the physical results to the crucial role that design can play in our environment and its responsibility to look beyond the edges of its borders. Emblematic are the cases of *Geodesign* and *Cambio.* The first is the exhibition platform of the Design Academy in Eindhoven, that, from 2018 carries on a stratified narration about different global complicated situations capturing the deep transformation phase of the productive and cultural system, in an osmotic relationship with the world of design. This year the topic has been "*Sand. The Building Block of Modernity*", curated by Martina Muzi at Van Abbemuseum [Fig.2]. The exhibition uses sand as a raw material in order to narrate the imbalances which dominate the increasingly interconnected global scenarios. It is considered as the second most used natural resource on the Planet Earth after water and its extraction is often one of the primary causes of ecosystems collapse.

Figure 2. Romain Laval and Baiba Soma, "Landscope", Geodesign: Sand. The Building Block of Modernity, at Van Abbemuseum, Eindhoven, 2020, photo: Joep Jacobs

This year, 2020, Formafantasma began an investigation into the governance of the timber industry, called *Cambio* and commissioned by the Serpentine Galleries [fig 3].
It is explored and displayed the evolution of timber's commerce over time, and its tentacular expansion across the globe. It grew during the nineteenth century becoming one of the largest industries in the world both in terms of the revenue it generates and the impact it has on the planet's biosphere.

4.2 Time and Knowledge, Information

Our way of exploring and experiencing the new conception of topological time and also the kind of data we get from the outside, from the natural and cultural world we inhabit, ask for new ways and tools to visualize, interpret and evaluate information in order to produce original knowledge. Moreover, we need Public information, awareness and engagement towards the complex dynamics that regulate our world and society. Design, through its aesthetic production, makes the complex dynamics that regulate our expectations more visible and tangible (Krippendorff & Butter, 2008).

A powerful way that Design exploits, today, for manage and interpret complex systems is that of Data visualization, used both as a tool for analysing the amount of fragmented and networked information in a visual synthesis and as a modality to return that knowledge. An interesting case of design praxis making use of a singular form of data analysis and visualization is that of Polychronic objects by Jane Norris [fig 4]. Her research combines temporal theories with material experimentation to identify possible paradigm shifts in making for a networked society. Norris (2016) uses time-based making strategies to combine materials from different historical eras, integrating these material times into one polychronic object. This approach opens up a different set of making possibilities by folding together

materials and techniques unlikely to have been combined in previously historically linear and hierarchical approaches to materiality. (Norris, 2016, p.2)

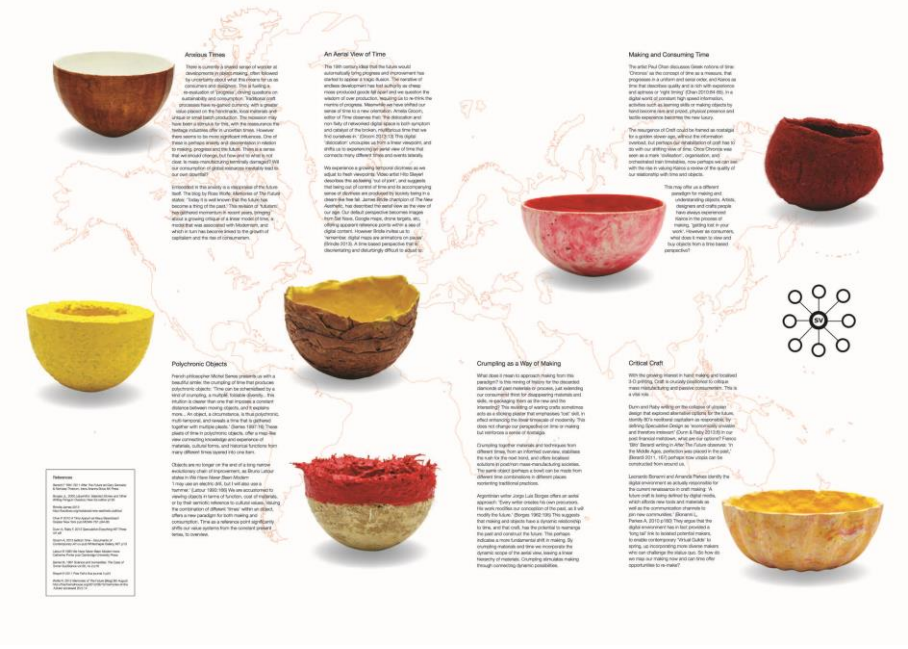

Figure 4. Jane Norris, Polychronic Objects, digital time and our choice of materials, 2014.

She proposes an aerial view that connects many different times and events laterally in a single object, offering a new knowledge about materials and manufacturing through the visualization of unusual, non-chronological combinations.

Another meaningful example is the work of Rhyzomatiks, a Japanese Design Studio with a strong research approach based on digital media and especially on data visualization that makes it simpler to understand very obscure and/or complex systems and phenomena. Their 2013 project named “traders” [fig 5], is an installation with bit coins, which, in addition to experiments using automatic trading system, develops a system to visualize block chains. It is a work raising a problem for contemporary finance and trading system. Another example is the 2016 project "3776: the digital anatomy, Dissecting Mount Fuji" [fig 6]. Data around Mount Fuji were visualized to create a spatial performance and projected on an outside monumental installation 6m tall and 23m wide, made by Seijun Nishihata. There is also a special website made from the 3D data of Mount Fuji.

Figure 5. Traders, 2013, GLOBALE: New Sensorium.

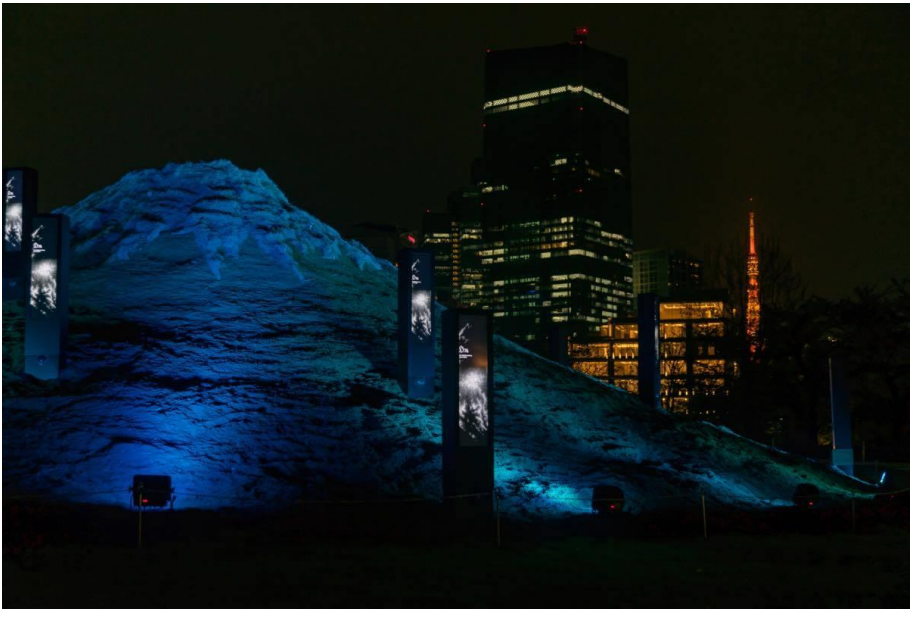

Figure 6. "3776: the digital anatomy, Dissecting Mount Fuji", 2017.

4.3 Time and Making, Hybridization

In order to understand and manage the complexity of our Topological Time, made of infinite connections, we are exploring approaches other than disciplinary, because, as Neri Oxman (2016) says:

> "knowledge can no longer be ascribed to, or produced within, disciplinary boundaries, but is entirely entangled. The goal is to establish a tentative, yet holistic, cartography of the interrelation between these domains, where one realm can incite (r)evolution inside another; and where a single individual or project can reside in multiple dominions." (para.1)

To really succeed handling emergent issues researchers and professionals in different disciplines have to engage with their mutual activities. This paper embraces the idea that, as a method to trigger this engagement, they have to get used to work together, literally meaning sharing the same workspace and work time, even not necessarily collaborating on the same project, but becoming mutual supervisors, because "Each expert knows a piece of the puzzle, but the big picture is too big to comprehend." (Hillis, 2010). An effective way to trigger and enable interdisciplinary practices is to hybridize methods, such as mixing the deductive approach of making experiments typical of science with the synthetic one of creative disciplines. A credible circumstance is to involve designers in projects dealing with hardly scientific content and, vice-versa, scientists in creative ones. This interdisciplinary practice starts to be applied in educational programs in order to shape new figures of designers capable to deal with extremely complex issues, scenarios and topics.

One example, among others, is the collaboration settled by the Paris-Sud University / CNRS and the design school, ENSCI-Les Ateliers, called Design and Physics. Between 2010 and 2017, physicists and designers collaborated on fundamental physics topics such as quantum physics, superconductivity, optics. Each time, a workshop of 4 months allowed about fifteen students supervised by professional designers to explore one of these subjects, in close collaboration with the physicists. Students have produced popularization and science communication tools, in other cases they have been inspired by physics to produce design objects or installations, sometimes they even imagined the future; the results are productions with a hybrid status [as in fig 7].

Figure 7. No-Contact, Marion Gros, Design and Physics, superconductivity demonstrated in sport accessories, Paris-Sud University / CNRS and the design school, ENSCI-Les Ateliers.

A sensible field where, today, this hybridization turns to be useful and meaningful, is that of healthcare. The designer Jetske Visser with the project "Forgotten memory", 2012 [fig 5] steps into the world of dementia. An invisible and hidden world is exposed. She wonders how daily things look like with the view of a demented person. How do they experience their environment? What is a teapot if you don't know what a teapot is? She states that, as a designer, we study how people experience environment and we always should be aware of the perspective of someone else. For this project, she collaborates with the care home "De Landrijt", with scientists and researchers and directly with demented elderly, trying to show their shadowy and uncertain world. The result of this collaboration is an associative movie. You see recognizable objects being transformed combined with demented elderly as a metaphor for the disease.

Figure 8. Forgotten memory", 2012.

5. Conclusions

This paper's contribution to the field of Design consists in a characterization of the present time which helps to identify priorities for disciplinary research and practice and to inspire relevant directions through a critical overview of methods, tools and approaches.

Starting from an analysis of the obsolescence of the linear conception of time, based on the Modernist ideal of progress and undermined by the manifestation of the Anthropocene, it is proposed a contemporary interpretation of it.

Time is presented as Object-Oriented, Archetypical and Topological. In this perspective, man has lost his central position and his certainties (Object-Oriented Time) and needs to rebuild his role in relation with the world, restoring an empathic connection with his present, to identify himself with his time (Archetypical Time). Moreover, he needs new tools and ways to understand a time that is no more intelligible as the Modern linear history, but relative and based on infinite space-time connections (Topological Time).

To deal with this kind of time, the paper identifies Design Fiction as a legitimate and suitable design approach, as an alternative to the Science Fiction binary utopian/dystopian

environments and argues that its evolutions of Para-fictional and Material Speculation fit better for our time. Both of them are based on a focus on the present and on the materiality, which evokes ancestral feelings and impulses laying in the deepest layers of the individual, helping to rebuild a set of values, symbols and believes, archetypes.

After the characterization of the current time and the identification of disciplinary approaches to deal with it, the survey highlights the priority for Design to reflect on three main issues: 1) the human impact as a geological force, 2) the lack of understanding of unintelligible objects, in this paper treated as hyper-objects, and 3) the call for reconciliation between humanities and science. These reflections are addressed as Sustainability, Information and Hybridization and explored through the time parameter: Time and Objects, Time and Knowledge and Time and Making. Few emblematic case studies are selected to provide a recognition of representative design directions, agencies and tools, as, among others, the performative dimension over the representational one, the political engagement of curatorial projects, the polychronic data visualization, both with physical and digital means, and the interdisciplinary hybridization.

Abstract | Most acknowledge a lack of specific and unilateral criteria for defining creative research. In some cases, it is defined by the activity itself (i.e. being creative in how research is conducted by the researcher) and in other cases defined by the outcome of the research project (i.e. as a creative artifact.) Creative research in the world of fine art has often been a means by which to examine the impact of cultural and social attitudes as well as practices on the world. In design, creative practices have been incorporated less into the upfront research process, instead relying on more positivistic methods in an attempt to isolate and examine how users interact with design artifacts. But as designers are increasingly interested in addressing systemic and root cause issues, many of the current design research methods show limitations in their ability to forecast and imagine the future at this larger scale. This paper will examine the ways that creative research is increasingly used in design as well as the humanities, social sciences, math and sciences as a means by which to examine the longer-term impact of design and research activity as a speculative, critical and participatory tool.

KEYWORDS | DESIGN RESEARCH, CREATIVITY, CRITICAL THINKING, DESIGN THEORY, DESIGN PRACTICE, TEACHING

1. Introduction

Most designers consider themselves "creative" but often notions of creativity are relinquished to the conceptualization, ideation and production phase of the design cycle. Research is done as a means to help one become creative, but the activity itself is not necessarily considered creative. We are interested in exploring how creativity, specifically the act of creation, can be a means to engage in the research process. We suggest that creativity itself can help designers gain new insights and be more critical of the conclusions that they are drawing in the research phase because the very nature of it forces us to consider alternatives, test assumptions, and evaluate research as a product that is pressed out into the world for others to engage with—as a form of creative research. But there is little agreement as to what defines creative research, especially in design. By first outlining the various terminology and definitions underscoring how creative research is understood, we provide a preliminary foundation for how creative research is applied across many disciplines, including design. This foundation is then used to define three key outcomes or uses of creative research in design, and to evaluate and explain design-specific case studies that the authors have engaged as further evidence of the multi-dimensionality and unique outcomes that it affords for design research and practice. By exploring creative research from multiple disciplines, we seek to define the specific ways creativity might be used to critically engage with information and findings in the design research process.

1.1 Creativity + Research ≠ Creative Research

There are multiple dimensions and interpretations among all disciplines of the term's creativity and research. In some cases, creativity is looked at as an individual activity—such as Edward De Bono's (1972, 1995) work on lateral thinking. Mihaly Csikszentmihalyi (2015), on the other hand, characterizes it as a much more complex system that expands from individual to field to discipline. Still others look at creativity

> "as a parallel construct to intelligence, but it differs from intelligence in that it is not restricted to cognitive or intellectual functioning or behavior. Instead, it is concerned with a complex mix of motivational conditions, personality factors, environmental conditions, chance factors, and even products." (Feldhusen and Goh, 1995, p. 231-232)

In each of these definitions, that act or state of being creative reinforces ideas of production that are usually associated with ideation. However, they are also useful in thinking about the construction of research because they encourage an approach that is multi-dimensional, multi-scalar and constraints-based.

In a field that relies on novelty and invention, devising strategies for discovery is paramount. Much of the background research used for design practice has relied on more positivist methods that isolate and examine how users interact with design artifacts, thereby testing what exists, rather than what might be. This is not a universal truth—the emergence of

research methodologies like participatory design and design anthropology seek to discover new opportunities for design intervention. While creativity is sometimes used in the design of the research, it is not necessarily central to the methods themselves. Designers acknowledge the value of creative research mostly as a speculative and critical activity. A well-deserved critique of this speculative method is that often its final resting place is in the museum, or in books, rather than out in the world where the artifacts of design are meant to be encountered and manipulated. As designers are increasingly interested in addressing systemic and root cause issues, many of the current design research methods show limitations in their ability to forecast and imagine the future at this larger scale. Designers are trained to be creators, to model phenomenon in form, to visualize patterns, and translate the abstract into the concrete. How then, can we use the relevant components of creativity which are propositional in nature—modeling, visualization, the pressing out of something "real" into the world to act as a mediator? How can these methods also force critical thinking with both designer and participants and act as a primary method for design research? In what ways can this method of research raise critical questions in diverse contexts? The answer is not simply to inject creativity into the research design process, but rather to use creativity as a key strategy for raising questions, interacting with users and reflecting on the discipline.

2. Creative Research Across Disciplines

Reviewing the ways that creative research has been developed across disciplines provides a critical first step to evaluating its usefulness as a critical activity. More specifically, the value of creative research across disciplines might be understood in the following ways:

- Using creative methods as a mechanism of critique and participatory dialogue;
- Using creative methods to engage in data collection, analysis and evaluation, and to facilitate critical discovery.
- Using creativity to look at problems from divergent perspectives.

Different disciplines naturally gravitate towards one or the other of these dimensions. But what becomes particularly apparent is the value that comes from the combination and recombination of them in different disciplines and contexts. Below is a preliminary overview of some of the more innovative researchers and contexts for creative research through the disciplines and across the years. While not necessarily self-characterized as such, they provide interesting insight into how creativity can be used to explore and expose critical questions.

2.1 Creative Research in the Arts and Humanities

Probably the most obvious and notable is the long history of creative research in the fine arts, which began as early as the Renaissance. Research for artists like da Vinci meant the

practical application and deep integration of design knowledge, engineering processes, and the sciences alongside fine arts.

More recently, creative research in the fine arts is a mechanism for critique and participatory dialogue. In 1967, Experiments in Art and Technology (E.A.T.) was started by artists Robert Rauschenberg, Robert Whitman, and Bell Labs engineers Billy Klüver and Fred Waldhauer. In an interview Billy Kluver (2000) stated that "E.A.T. saw itself as a catalyst for stimulating the involvement of industry and technology with the arts" (Kluver, 2000). Over 2000 artists and 2000 engineers were recruited and paired, the collaborators were encouraged to create works that both investigated and catalyzed dialogue on emerging technology. Artist Lillian Schwartz, was a participant in the 1960s group. She worked with computer graphics innovator Ken Knowlton to develop animation techniques that laid the foundation for Hollywood special effects and the computer games industry.

In a more recent example, artist Joe Davis and Dana Dal Bo (2019) partnered with scientists from the University of Kentucky to create the Lucky Mice Project as a means of critique and dialogue on genetic engineering and the human-animal relationship in the sciences by asking the hyperbolic question, "Can we breed luck?" In their work, Davis and Dal Bo set up the conditions to study the correlations of serendipity and genetics by selectively breeding mice that rolled unique combinations of die (i.e. "snake eyes"). The project aimed to address issues of genetic selection while simultaneously questioning the policies that drive the humane and ethical treatment of animals in scientific experimentation. While both of these examples demonstrate the potential for creative research to raise questions, in other fields they are equally as critical for better understanding the dimensionality of complex issues (Davis, J., & Dal Bo, D. 2019).

2.2 Creative Research in the Sciences

In the social sciences, Helen Kara (2017) argues that expanding methodological boundaries across all of the social sciences are driven by the fact that researchers are tackling more complex questions and traditional research methods are too limiting to adequately handle these complexities. Kara states that creative research methods allow researchers to accurately reflect the multiplicity of meaning that exist in social spaces, such as arts-based research, research using technology, mix-methods research and transformative research frameworks (Kara, 2017).

Narrative research—perhaps one of the most widely used forms of creative research—can be defined as using narrative and storytelling as a participatory means by which to collect information (Manney, 2016) or as a methodology for synthesizing, analyzing and ultimately disseminating qualitative data (Crouch and Pearce, 2018)

> "…which place research participants as collaborators and give rise to emotion and sensory understandings of the self as well as allowing for unexpected experiences and knowledges to emerge" (Bryant, 2015, p.1).

This definition is important because it integrates narratives into the information collection phase and gives rise to the potential of unexpected and undirected outcomes.

W. E. B. Du Bois, a famed African American sociologist, academic and civil rights activist practiced creative research in the late 19th century. He along with his sociology students were engaged by the US government to collect and represent data on newly emancipated slaves in the US. They crafted beautiful hand-drawn and colored visualizations. When the government failed to publish the data portraits, DuBois curated them into an exhibition for the 1900 Paris Exposition—in part to reframe American and European perceptions on race and the lives of African Americans living in the south. The authors, Whitney Battle-Baptiste and Britt Rusert (2018) write that,

> "[t]he cross-fertilization of visual art and social sciences here marks an important transition moment in the history of the disciplines while offering alternative visions of how social scientific data might be made more accessible to the populations and people from whom such data is collected." (Battle-Baptiste & Rusert, 2018, p.13)

As a companion to narrative research, the activity of visualization is perhaps the most obvious, and relevant, mode of creative research. Through the crafting of the visual story, critical decisions are made about how content and data is framed. The combination of qualitative and quantitative data most evident in the social sciences provide a rich context for this intersection, as a form of convergent thinking. But there are also opportunities to think about how creative methods might enhance divergent thinking as a complement.

In the physical sciences creativity and creative research is often used to examine problems from divergent perspectives. In the following example, we can see the importance and value of using alternative forms of knowledge, in this case the embodied knowledge that manifests itself in a physical model. Hyperbolic geometry, and also known as non-Euclidean mathematics is the math that underlines general relativity, and helps explain the shape of the universe, animals such as corals, jellyfish, and plants for example, lettuce and curly kale.

The Institute For Figuring (IFF) was begun by Margaret Wertheim, a science writer, and her sister Christine, an arts professor, to explore the aesthetic dimensions of science, mathematics and engineering through the playful use of materials. The Crochet Hyperbolic Coral reef project uses Diana Taimina's (2019) concept of crochet as a means to understand hyperbolic geometry to model a crocheted coral reef, inviting participants to have a hands-on playful interaction with the complex math of Hyperbolic geometry. In a 2009 Ted talk, Wertheim (2009) argued for the value of creative research, stating that "we live in a society that completely tends to valorize symbolic forms of representation, algebraic representations, equations, codes. We live in a society that's obsessed with presenting information in this way, teaching information in this way" (Wertheim, 2009). She continues with the proposition that crochet is a form of play that engages abstract theories and makes them concrete.

In a similar way to the craft of crochet, origami—the ancient art of paper folding—has helped spark a scientific revolution, propelling a wave of innovation related to how we understand both man-made and natural structures. Origami is informing scientists like David Baker, who studies how amino acids fold in our bodies or the engineers building a satellite telescope's star shade at NASA'S Jet Propulsion Laboratory (Allington et. al. 2017). As a creative method, this act of prototyping is another form of visualization, and allows the researcher to iteratively "write" and "read" the model and to test out cause and effect in addition to a divergence of ideas about how something does (or might) work. As we look to the arts, humanities and sciences for evidence of the origins of creative research, the question that emerges is to what degree the mode of creative research is similar and different in design?

3. Creative Research in Design, Principles and Case Studies

Like many of the previous examples, creative research in design is often used to raise questions and test out answers. Nowhere is this more evident than with the interactive design pioneer Muriel Cooper, an educator at the Massachusetts Institute of Technology's Visible Language Workshop—today known as MIT Media Lab. Cooper was highly experimental in her use of tools, and technology, finding new and experimental ways to test out visual interfaces before they existed. She also didn't limit her work efforts to a single format or material—her work spanned from print to software interfaces.

In the early days of interactive and screen-based interface design which Cooper was developing, there were no models for Cooper and her students to interact with—to iteratively test out the cause and effect of certain design decisions. What's relevant for this paper was the absence of a model for Cooper and her students to interact with screen-based interfaces. Cooper engaged in the creative process to form critical opinions, collect data and evaluate the new technology. In a 1994 lecture Cooper states,

> "Our goal has been for a very long time to try to examine in the so-called emerging technologies what the new form and content of design, of communication, might be. And to that end for many years we have been building prototype visualization tools that would allow us to do something that seems relatively intuitive in order to say "What if we did this, then what would happen?" but to really visualize this stuff in as tight an iterative loop as we possibly could. So, we're looking for the new design principles, umm we're not at all sure what they are." (Massachusetts Institute of Technology Media Lab, 2018)

Cooper is a prescient example of the ways that creative research—through experimentation in visualization, modelling and prototyping—can be used to raise critical questions.

Based on the survey on creativity and creative research in the different disciplines outlined in the first section of this paper and related to the three purposes of creative research also

mentioned, we suggest that creative research holds the most potential for design research in the following ways:

- As a means to engage in critical discourse about what is “true” and “factual” and to challenge the biases that are informing design decisions;
- To design better data gathering, analysis and evaluation methods that help designers see a problem from multiple perspectives;
- Building trust and openness between participants and researchers in participatory and co-creative methods.

Most importantly, creative research holds myriad possibilities for opening up new paradigms of design research, challenging the biases that are inherent in any design approach—from the context of the project, to the way we conduct our research, to the solutions that we ultimately propose—and engage people (i.e. users) in both creative and critical research methodologies.

Design research and design research methodologies are still very much in their infancy. Over the past 30 years, discourse surrounding methodologies have been trying to decide if design research is a science, a liberal art, or a new domain in and of itself (Cross, 2011; Poggenpohl, 2009; Margolin & Buchanan, 1996). With roots in engineering, computer science, and manufacturing, the historical perspective of the designer has been to aim for objectivity, using research to “collect data” in order to make informed, and unbiased decisions. But increasingly designers are recognizing the act of interpretation as key to the design research process, and that biases are inherent in any process that is propositional. The use of abductive reasoning, core to the design process involves judgement, and that judgement is closely tied to research, experience and habitus—or the way we view ourselves in the world, and as part of a field of study (Cross, 2011; Crouch and Pearce, 2012). Paramount to decolonizing the activity of design is to situate the act of interpretation at the center of design research and dislodge the notion of the designer as an objective actor. We think creative research is a good opportunity to reframe this, as it positions the designer at the center of the interpretive process, confronting them with qualitative analysis and decision-making as a core part of the research process. As Crouch and Pearce (2012) quote the french philosopher Jacque Bourdieu on the value of creativity—it is an ‘acquired system of generative schemes' (pp.36-37) and

> “[t]hinking of creative practice in design as a dynamic relationship between the habitus and field empowers the researcher because it locates design thinking in the context of a dialectical engagement between ideas and the material world, positioning design in a continuously changing social environment (Bourdieu, 1977, p. 95).” (Crouch & Pearce, p. 37)

Creative research as a critical activity is based on the idea that through the creative process—one that involves making decisions in the very act of productivity—creativity can help designers challenge their own research findings and give a means by which to test the assumptions and conclusions they are drawing. Embedded in the act of creation are the

qualities of framing, orientation, organization and scale, which all contribute to the activity of synthesis, analysis and evaluation. In addition, the process of creativity requires translation from one form to another, which necessarily involves encoding, summarizing and including certain pieces of information while excluding others (Allen & Queen, 2015).

3.1 Case Study: Creating visualizations that illuminate gaps in research and knowledge

In "Groupthink: The Brainstorming Myth", social scientist Charlan Namath argues that "debate and criticism do not inhibit ideas but, rather, stimulate them relative to every other condition…because it encourages us to engage more fully with the work of others and to reassess our viewpoints" (Lehrer, 2012, para.10). Creative Research—and in particular visualization as a means by which to engage in the examination of a phenomena, can be particularly effective in prompting this critical discourse because the visualization acts as a sort of "truth" that can be contested. In visualizing causal relationships, visualizations can also foreground the relationship between cause and effect; as a movement it can visualize the collective consciousness through pattern-creation; and in both structuralism and post-structuralism it can emphasize the myriad network and connections that inform the interpretation of an problem—potentially bringing in more diversity and depth of understanding to similar or related sets of information.

In a graduate seminar at NC State entitled DIY cartography, students created a series of maps that looked at the history of urban development in Raleigh, NC with the aim of better understanding the myriad complexities of how a small southern US city had grown over the last 150 years. In using maps to engage in research, this class used creative research in its most basic form—as a mediator to disseminate and explain research findings. Invisible social issues such as segregation, civil rights, and discrimination are also formally manifested in the map, thereby becoming "real".

In the class, maps were used as a critical tool to raise questions about what the gaps were in the existing narrative of urban development in the city, but also in the student's own research. In one example, a student used the map to examine the role that public schools played in the city of Raleigh's development. Do schools crop up as a result of housing development or is there a concerted effort to develop both simultaneously? Of particular concern was the disparity between neighborhoods where housing value and income was low, and the access those students had to quality public education. Through the creation of the map, the student looked broadly at such data as land value and the proximity to schools (Figure 01). Additional information such as the "score" the school had was included to overlay a more qualitative angle to the research. Finally, the student included a series of case studies that highlighted two houses in close proximity to each other, and where the children in each attended school. These case studies added yet another layer of qualitative examination by visualizing the incredible difference in distance of travel between the two. The lower income student had to travel 3 times the distance as the higher income student. Students then created additional visualizations that looked at the "network" of information that contributed to their findings (Figure 02). Their final visualizations were more experiential—specifically about a site that was pivotal to their research. This final visual was

meant to test their findings “on the ground” (Figure 03). For the student conducting the research, the map itself became a powerfully persuasive tool. It also encouraged the student as well as the whole class to think through the implications of this disparity, and what is “fair.” Of primary concern through these maps was to illuminate gaps in knowledge, to use the map as a creative tool to force synthesis of information and as a critical tool to discuss correlation and causation of observed patterns and phenomena.

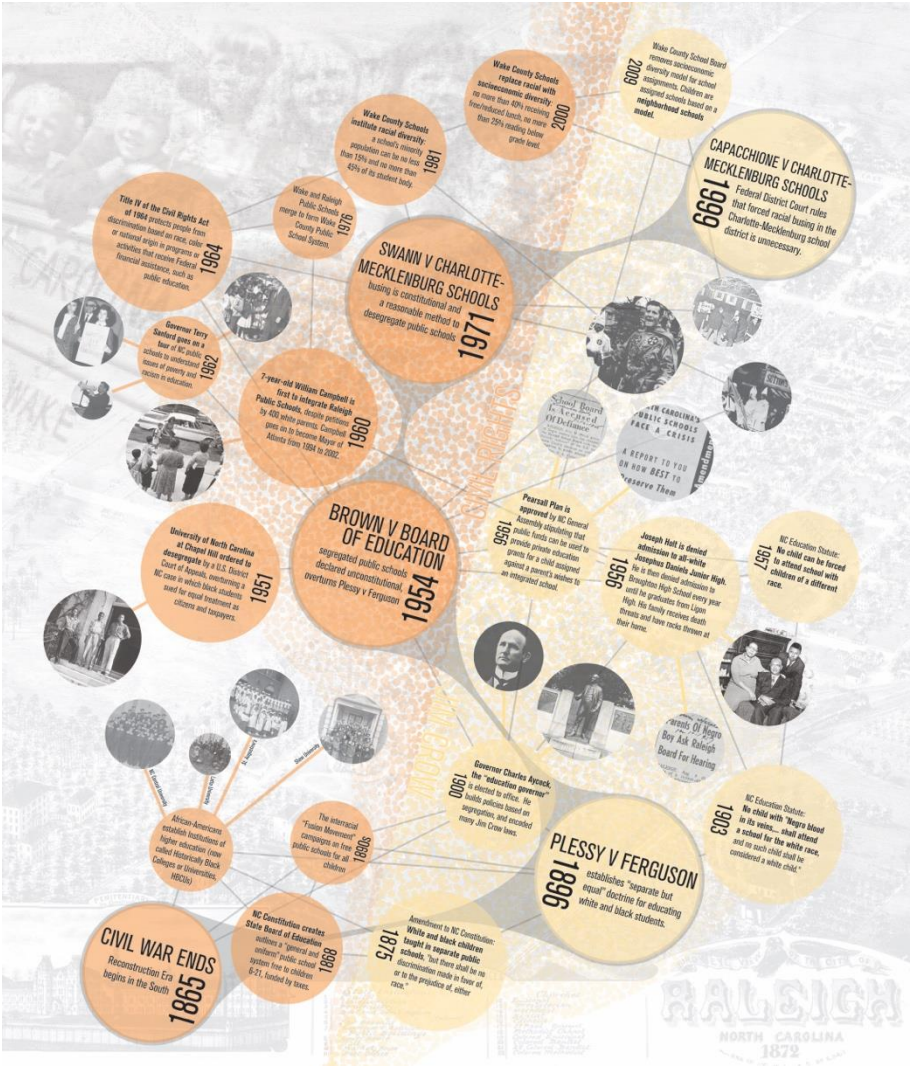

Figure 2. History of Education Access.

Figure 3. Oberlin Village and the History of African American Education.

3.2 Using Creative Engagement in Participatory Design and Co-creation: Building Trust and Critique Through Games and Play

Participatory research has roots in anthropology in the sense that often the researcher is a participant-observer—simultaneously observing the culture or condition they are studying while also recording and interpreting their observations about its "peculiarities" (Geertz, 1973). It often implements a co-creative approach by asking participants to actively engage

in finding the answers to design problems. Participatory methods are inherently creative in the sense that both the designer and the user are making something together.

Creativity within the participatory process could help raise new and novel questions—and potentially set up conditions for entirely new problems to emerge because of the open-ended nature of the creative process. In addition to engaging in a mutually creative experience, the creative process can help engage in a more critical examination of the problem definition. Could creative methods be used to augment or re-define the problem at the end stages of the design process? How might the tools that we are generating as a part of the research process be rethought as more inherently discursive tools? In traditional definitions of creative research, the idea of the research instrument as a mediator between the researcher and subject is not a new one, but possibly one that we can look at again in terms of how to negotiate meaning in novel and unique ways. Especially if we look at the purpose of the interaction as a reciprocal tool for this negotiation.

One of the challenges with participatory research is in building the trust necessary between audience and researcher, and between users themselves. In her Book, *Reality is Broken*, Jane McGonigal (2011) argues that one of the main values of gameplay is the trust that is built between the players—trust that is built as a result of mutual expectations of "following the rules" of the game. McGonigal also argues that games encourage us to take risks because the stakes are contained within the space of the game itself. How can we take advantage of the liberation of the game, and use creative research to build that trust to take risks and engage in meaningful critique as part of a participatory design process?

In a research project examining collaboration in online environments, ideas of gameplay were implemented to help participants build trust and spark conversation throughout the design process. As the study was focused on design collaboration, all of the participants were designers. Each time the group met, there was a different goal for what was to be produced with the end results living in the written journal, *Margin*. The research was also set up for both synchronous and asynchronous work. One of the first tasks was a writing exercise similar to the "telephone" game that children play. In that game, an initial statement is made. In this case, the first participant was given a passage from Shakespeare's *Merchant of Venice*—which they created a response to (Figure 04). Some participants translated line for line, others created a more original piece that responded to the ideas presented in the excerpt. Participants were also tasked with collecting and generating images that would complement the writing. The images were put into a shared repository for all to draw from and ultimately turned into a series of visual essays (Figures 05-07). Ultimately, this charrette provoked important conversations about the nature of collaboration, especially as it related to scale, authorship and outcome. The project was meant to engage participants in deeper conversations about collaboration, and in many ways, it was successful in breaking apart a collaborative process for closer examination. But more so as a creative exercise it helped participants gain a measure of trust with each other, and facilitate conversation. Through the activity of creation, it also gave specific testament to the way that collaboration was happening—as a proof of concept. And because of the

constraints imposed on the participants, it forced a measure of risk-taking and liberation in the process.

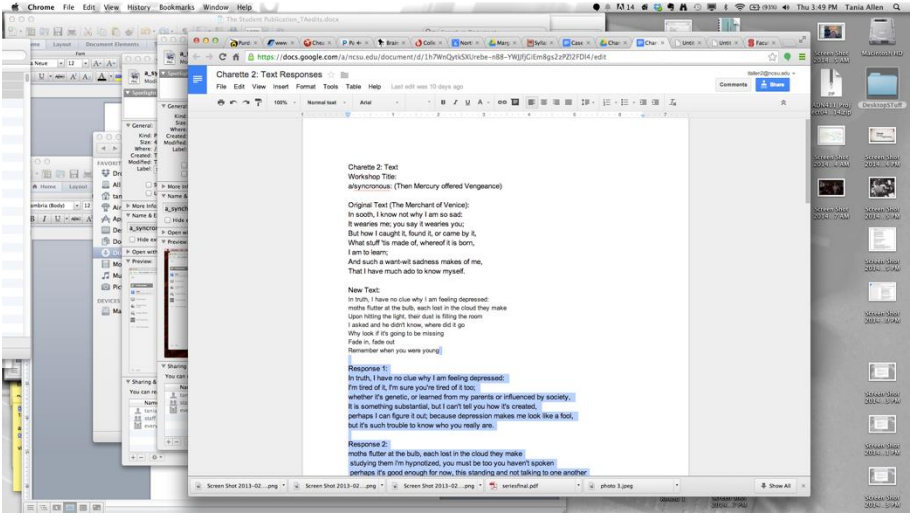

Figure 4. Writing "telephone".

The artifacts generated from creative research are powerful tools that have a multiplicity of purpose. They capture and illuminate the intricacies of a problem, they help synthesize research gathered, recognize gaps in individual or group knowledge and help users form critical opinions on the inquiry.

4. Conclusion

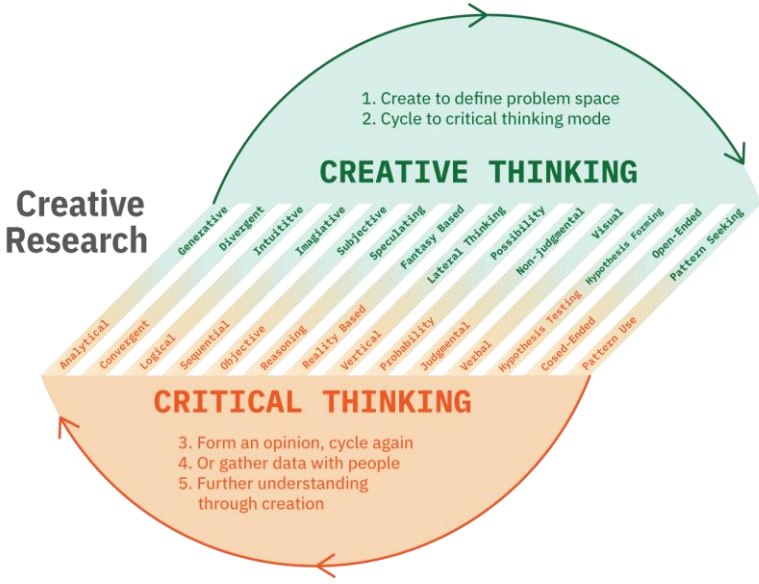

Figure 8. A model for critical and creative research in design.

Looking at examples from the humanities, social sciences, math and science, we start to see the value of using creativity in myriad ways throughout the research phase. We are not suggesting that creative research should be a substitute for other methods, nor that creative research should be the only type of research designers engage with. Rather, we are suggesting it as a critical part of a mixed methods approach that encourages designers to challenge their assumptions, seek new perspectives and engage in critical dialogue with participants and with their own ideas. The figure above (Figure 08) is a preliminary visualization of the way that creativity and criticality intersect, and the reciprocal relationship between the two. The act of creativity, and the thinking that is involved, is directly linked to critical thinking through analysis and selection. Critical thinking is enhanced by creative thinking through the need to remain open-minded, while simultaneously rationally examining what is in front of you.

In her book, *Creativity from Constraints*, Patricia Stokes (2016) argues that, “Successful solutions are reliable, not surprising; predictable, not novel; already accepted, not creative”.

(p. xi). As the problems that we engage with become more complex, messier, more "wicked", it's increasingly critical to move beyond historical ideas of what is successful—and challenge our deeply-held assumptions about how to engage in design and research. Using creative methods to encourage a more open-ended approach to design research might be a critical first step in fundamentally rethinking the approach we take in this regard.

About the Authors:

Brooke Chornyak is an experienced designer, educator, and collaborator who has presented papers both nationally and internationally in a wide variety of settings. In 2004 she earned her BFA from Rochester Institute of Technology and her MGD from North Carolina State University. She currently teaches systems and interaction design at Maine College of Art in Portland, Maine and Northeastern University in Boston. Brooke is the co-founder of Collective IQ, a human-centered design research lab located in Portland, Maine.

Tania Allen is a visual designer, consultant and Associate Professor at North Carolina State University. She is the co-director of the design research group co-lab, which focuses on critical mapping as a participatory design research tool. Through teaching and community-focused projects, co-lab is currently developing a methodology for critical mapping that simultaneously embraces cartography as a powerful analytic and synthetic research tool, while also challenging the assumptions that the mapping and visualization process embeds within it. Recent publications have included "*Beyond the Map: Unpacking Critical Cartography in the Digital Humanities" in Visible Language* (Fall 2015), co-authored with Sara Queen.

Why we need more somatic culture in design

Silvia Sfligiotti [a]

[a]ISIA Urbino, Italy
silvia@alizarina.ne

Abstract | Drawing from multi-disciplinary literature, this paper argues why somatic culture is essential to designers and can promote a radical change in the way we respond to contemporary challenges. Somatics is "the field which studies the soma: namely the body as perceived from within by first-person perception". Somatic practice can influence design on several levels. It can shift our focus from a neutral point of view to a situated one; prepare us for intersubjectivity; help us develop relational and empathic skills that contemporary designers should be equipped with; and enhance our perceptual skills to widen the knowledge of ourselves and our environment. Finally, in a field where professional uncertainty is ever increasing, it can give us tools to counteract negative side effects. A turn towards somatic culture in design practice and educational approaches can therefore be an appropriate answer to the complexities that design is encountering.

KEYWORDS | SOMATICS, DESIGN EDUCATION, MOVEMENT, PERCEPTION, AGENCY

Introduction

Confronted with the continuous evolution of the social, economic and technological contexts in which it operates, design is a practice in constant redefinition. Studies and reports strive to establish new areas and required skills (AIGA Designer 2025) while designers and institutions struggle to keep cognizant and up to date. Hasty curriculum innovations run the risk of only providing buzzwords and superficial answers; expectations towards design and its ability to bring solutions to complex problems are increasing; new solution-oriented design practices are emerging but at the same time are being criticized for having a weak and reductive culture (Manzini 2016). So how can designers prepare themselves for the inevitable changes to come?
In this paper I will argue that somatic culture can provide a foundation to a new design culture and can also promote radical change in practice and education.

Somatics: a definition

Somatics was defined by philosopher and movement therapist Thomas Hanna as "the field which studies the *soma*: namely the body as perceived from within by first-person perception" (Hanna 1986, p. 341) as opposed to the third-person perception prevailing in science. Somatic learning relies on the ability of the *soma* to sense actively and regulate itself: through focused awareness it allows us to learn the unlearned (Hanna 1986). This term now includes many different methods and practices, ranging from Feldenkrais Method and Alexander Technique to dance forms such as Contact Improvisation, which all share the intent of bringing individuals to a higher awareness of themselves and their environment through conscious movement experiences. According to Hanna, "somatic learning (…) expands the human soma's range of action as well as perception" and "the more [that] is learned in this manner, the greater the range of voluntary consciousness for the constant task of adaptation with the environment" (Hanna 1986, p.351).
The purpose of this paper is to underline the (self)-educational relevance of somatic practices, which are always grounded in experience, which aim at awareness and integration, and which can provide a rich and fertile terrain for the development of design practice.

Contemporary design culture and human experience

The international design community is trying to address the changing scenarios affecting it by way of discussion and debate, most often through the forms of scholarly conferences, papers and reports. One such example is AIGA's Designer 2025 report, which proposes seven trends that should inform the evolution of design and its education in the medium term,

listing what college students and educational institutions should do to respond to each of these expectations (AIGA Designer 2025).

Design is a collaborative practice and requires practitioners to be receptive towards people, behaviours, environments, materials, and much more. Any kind of design, even at the smallest scale, requires interaction with a number of "others" – be they institutions, clients, regulators, collaborators, experts, producers, publishers, distributors, etc. – along with the great number of other people who, in many design projects, are still placed at the receiving end of the process: users, citizens, audiences, consumers, participants are only some of the different names designers use, according to their culture, to define the people they design "for", or sometimes "with" and, unfortunately, even "against" (Sfligiotti 2011).

Many methods have been developed over time to interact with and account for this "receiving end". As a result, essential words originally used to define human life and relationships, such as *empathy*, *experience*, *collaboration*, *sharing*, have been co-opted into the design vocabulary with a purely functional – if not perfunctory – intention. For instance, in *design thinking* methods (as if anything such as a unique way of thinking shared by all designers actually existed), a designer is usually asked to "empathize" with someone as a required step in the process of delivering a new or better product or service to that individual or entity. In order to develop this empathy, activities are suggested such as conducting interviews with users and visiting their living environments (IDEO 2015). This approach, however, seems to take it for granted that a designer who uses specific methods, will automatically be able to empathize with others - indeed a questionable assumption. As discussed by Devecchi and Guerrini, the heart of the issue depends on what we mean by "empathy". We can see it as a tool for "understanding others' experiences and emotions", or we can give it a deeper meaning as an intersubjective experience, as "the skill to be (...) really involved in the face-to-face encounter with a concrete Other, acquainting and accepting his/her otherness"; in short, from empathy as a tool to empathy as an end in itself, as a response to a widespread need for meaning, dialogue and sociability (Devecchi & Guerrini 2017, p. S4361-2).

Several authors agree that these empathic skills can be developed through somatic practices. Albright (2019) believes that we can "learn how to engage with one another in the face of (rather than in the absence of) difference" (p.15), and Höök (2018) claims that somatics "connects the self (…) with empathic engagement with others" (p. XVIII).

Methods and processes

Designers and design institutions rely on methods to improve their effectiveness, to claim authority over their field of practice, to gain credibility, and to promote their brands. Design methods are usually presented as procedures, with steps to be undertaken in order to find a solution to a given problem: their description seldom takes failure into consideration. Whatever method we adopt, however, needs to be supported by our capacity to see its limits, to adapt it, and to consider each situation at hand whilst engaging with it and acting

within it, without being blinded by assumptions and preconceptions (which are usually a side effect of methods learnt top-down in abstract environments). As dancer and scholar Ann Cooper Albright (2019) points out, “practice is a way of committing oneself to being present in a situation, no matter what the outcome. In this sense, it is always an act of improvisation” (p. 5).
This requires abandoning the idea that design should always be fast and deliver predictable outcomes. In order to develop an open and receptive attitude, designers can use somatic practice to reach a state that – borrowing a title from psycho-somatic therapist and educator Thea Rytz (2009) – could be described as “centred and connected”, where they can “attune their awareness toward themselves, others, and their environment” (p. 15) and learn to be responsive instead of reactive.
It also implies allowing more time for the process: only over time can relationships be established, situations understood, and proposals organically developed without recurring to default, standardised “solutions”. This slowing down might prove itself revolutionary because it requires a radical change of attitude over the whole spectrum, and it is surely something worth investing effort in.

“The privilege of partial perspective”

The way we conceptualize knowledge and practice shapes the way we design. For instance, while the notion that design should be impersonal, objective and neutral was central to the development of Western Modernism, ever since the late 1960s the notion has been seriously questioned. To quote feminist designer and educator Sheila Levrant de Bretteville, “‘Designed’ has almost come to mean exclusive, universal, clear and simple, rather than inclusive, personal, ambiguous and complex” (De Bretteville 1974, p.115). I propose adding two adjectives to the discourse, “situated” and “intersubjective”, which I believe can contribute to a more articulated account of design.
In 1988 feminist scientist and philosopher Donna Haraway introduced the term “situated knowledges” in an attempt to contribute a new perspective to the debate on scientific objectivity. As she argued, knowledge is never separated from its subject and location, and only by embracing our situated, partial point of view can we make rational, responsible, objective claims: “the view from a body, always a complex, contradictory, structuring and structured body, versus the view from above, from nowhere, from simplicity” (Haraway 1988, p.589). This perspective seems to resonate with Hanna’s viewpoint when he states that “the soma has a dual talent: it can sense its own individual function via first-person perception, and it can sense external structures and objective situations via third-person perception” (Hanna 1986, p.346).
If we adopt this perspective, we are likely to recognize that it is impossible for our individual experience and (physical and ideological) position in the world not to shape the way we act as designers; thus, it helps us to eschew the perception of our opinion and ideology as neutral or absolute. At the same time, it allows us to acknowledge other people’s own

"situatedness" and their multiplicity of experiences: that is, it prepares us to design with, and for, a plurality of human beings.
Intersubjectivity is a concept used in philosophy and psychology, defined as "the sharing of experiential content (e.g. feelings, perceptions, thoughts, meanings) among a plurality of subjects" (Zlatev et al. 2008, p. 2). It was used in design theory by Giovanni Anceschi in his discussion of Josef Albers's teaching approach, which was based on guiding students through a shared observation and evaluation of effects: "the validity of the results is based on a method of acquisition and judgement that is neither objective nor subjective, it is an intersubjective approach" (Anceschi 2010, pp. 45-46).
Somatic practice can facilitate situated and intersubjective attitudes; Höök, for instance, emphasizes how "focusing on our own soma is a preparation for intersubjectivity" (Höök 2018, p. 147).

Movement, knowledge and learning

The fact that forms of tacit knowledge acquired through movement and perception exist in addition to discursive, language- and mind-based knowledge has been part of philosophical and psychological debates for several centuries, just as it has been a principal concern in art and design education. Architecture historian Zeynep Çelik Alexander (2017) coined the term "kinaesthetic knowing" to identify an idea of embodied, experiential knowledge developed over the course of the 19th century and within a German lineage of educational-reform to which the foundations of the Bauhaus can in part be traced.
Introducing somatics in design culture is a way to acknowledge the relevance of this tacit knowledge in learning and in the design process. Moshe Feldenkrais, the founder of the somatic method of the same name, described a "learning in which quantity grows and turns to a new quality, and not the mere accumulation of knowledge". He affirmed that "most truly important things are learned this way", referring to all our essential human abilities (Feldenkrais 1977, p. 7).
Furthermore, somatic practices provide us with unique information coming from proprioception (Hanna 1986). According to psychologist James L. Gibson (1968), proprioception "considered as the obtaining of information about one's own action" does not depend on specialized receptors (p. 34) but is the result of combined (muscular, articular, vestibular, cutaneous, auditory, visual) information. This ecological view goes beyond the traditional idea of the senses working separately in a specialized way and can help us transcend the primacy of the visual that tends to guide many design choices.

Movement and perception at the Bauhaus

The belief that breathing and movement exercises should be an essential part of a designer's education was a defining feature of the early Bauhaus.

This belief did not emerge in a vacuum, but related to ideas that had developed previously in Germany – such as those promoted by German education reformers in the 19th century (Alexander 2017) and by the *Lebensreform* movement, which became newly relevant in the wake of the First world war (Ackerman 2019, Wick 2019) – and was parallel to other utopian projects from the same period, such as the Loheland and Schwarzerden women's communes (Neugärtner 2019). These examples, however different from each other, all shared the conviction that the body was central to the development of a new idea of humanity and society.

In the early Weimar period, Johannes Itten in the *Vorkurs* and Gertrud Grunow in the *Harmonisierungslehre* proposed breathing and movement exercises to improve psychical and physical capabilities, to activate artistic expression and to achieve a "spiritual enhancement of the body" (Burchert 2019). Both teachers, even if they relied on different theories, saw regulated, rhythmic physical activity as a remedy to the negative effects of modern life, and as a way to find balance and achieve individual development. Inspired by Mazdaznan philosophy, Itten put an emphasis on the three human spheres of body, spirit and intellect (Burchert 2019); thus bodily care and practice were essential as a means to a higher goal, to develop "the human being as a physical, mental and spiritual entity" (Wick 2019).

In 1923, with the arrival of László Moholy-Nagy – who along with Lucia Moholy had already visited the Loheland and Schwarzerden communes – his organic, integrated view of senses and human experience was introduced at the *Vorkurs*.

Moholy-Nagy embraced modernity and technology, but believed that – in order to fully participate in modern life – human beings need to develop an "organic confidence" before approaching specialized education; his belief was that "each human being is gifted" and has the capacity to "participate in all the joys of sensory experiences" (Moholy-Nagy 1929, p. 11). He rejected, as the Futurists before him, the traditional distinction of the five senses (Botar 2014). His exercises addressed visual, spatial, equilibrium and especially tactile explorations (Wick 2019) with an experimental, comparative, rational approach (Alexander 2017). However, these *Grundlerlebnisse* (elementary experiences) were not aimed at achieving a direct design outcome because "not the object but the human being is the purpose" (Moholy-Nagy 1929, p. 14).

Even if these early examples of the centrality of the body in design education cannot be considered "somatic" the way we intend it here, Moholy-Nagy's idea of "organic confidence" strongly resonates with the integrated awareness that can be fostered through somatic practices; they also remind us that any real change can only start from the ground up, by giving a new base to our learning and doing: this is in fact what the Bauhaus' *Vorlehre* – also known as *Grundkurs* – was about.

Training somatic skills for design

Interaction designer Kristina Höök (2018) discusses several aspects of the connection between somatics and design: in her view, somatic practice can both lay the ground for and be an essential part of design research processes. Even if the author's research originates in the field of Interaction design, I am convinced that many of her theses and proposals can apply to all fields of design. While it is easier to establish a one-to-one correspondence between specific movement practices and their application to interaction design, in other design fields the relation between somatic training and its effects on design projects is less obvious; it can be found, as discussed above, mostly in a different attitude throughout the design process, and in the capacity to deeply relate to others and the environment, which in turn will affect the outcome of a project.

Höök draws on Richard Shusterman's concept of Somaesthetics – "the critical, meliorative study of the experience and use of one's body as a locus of sensory-aesthetic appreciation (*aisthesis*) and creative self-fashioning" (Shusterman 1999) – to invite designers to learn how to direct and deepen their own experiences and be thus able to use them as a source of information in the design process: "learning about your soma is a prerequisite to designing with it" (Höök 2018). The richer and more articulated the experiences we have are, the better we will be able to fully understand and respond to complex design situations.

Albright (2019) describes six states of being that can be experienced through somatic practice: *falling*, *disorientation*, *suspension*, *gravity*, *resilience* and *connection*; these can be seen as different ways to respond to contemporary conditions, such as social uncertainty, attention overload, digital hyper-connection, and disembodiment, which have consequences on the way we design. She also underlines "how perception is a learned behaviour and how intentional practices can structure new ways of thinking" (p. 7).

"Ways to defy the pressure to perform"

The contemporary design context gives us other reasons to turn to somatics for a new grounding. Many of the current narratives about design describe it in an idealistic way, as if it were always a successful process, where designers act as respected consultants providing effective solutions to like-minded clients. These narratives are often reinforced in design education, both in mainstream institutions educating the next generation of corporate designers and in niche schools catering to a smaller audience of independent practitioners.

Reality is often very different, and designers find themselves operating in the midst of complex power negotiations – where economic, political and social powers come inevitably into play in the decision-making process, adding to and interfering with the design process (as it is expected to be). Moreover, young designers often work in a precarious position (Design Census 2019), frequently as freelancers or interns, and feel forced to adapt to a self-

promotional attitude, moulded on a success- and performance-driven narrative which – even when harshly criticized (Verwoert 2008, Elzenbaumer & Franz 2015) – still dominates the conversation.

In his aptly titled article *Exhaustion & Exuberance. Ways to defy the pressure to perform*, contemporary art critic Jan Verwoert points out some of the contradictions that haunt the so-called creative professions: "In a high performance culture, we are the avant-garde but we are also the job-slaves" (Verwoert 2008, p. 90). It is essential to counteract the side effects of this unstable position and develop the capacity to stand one's own ground; in order not to be continuously pushed off-centre designers need to find their own balance and autonomy: "(…) we then face a two-fold challenge: 1. to understand the conditions of our agency in order to enable us to define them according to our own terms; and 2. to imagine another logic of agency, an ethos, which could help us defy the social pressure to perform and eschew the promise of the regimented options of consumption." (Verwoert 2008, p. 91).
These issues are not entirely new. Moholy-Nagy (1929) expressed similar concerns: "Today's creative human being knows (and suffers from it) that the deep values of life are being destroyed under external pressure (moneymaking, competition, business mentality)" (p.13). It was extremely clear to him how this suffering was deeply connected to each person's body, to the "exploitation of his vitality, from the flattening out of his instincts, from the levelling of his biological tensions".

Somatic practitioners might easily agree with this idea: the body is the place where the problem is most strongly felt, and can therefore offer the path to overcome it, a way to find one's own agency. Albright (2019), for instance, suggests embracing physical experiences of falling and disorientation as an opportunity to reorient ourselves and rethink our own assumptions. Hanna (1986) describes "somatic freedom" as "a state of autonomy" and "the optimal human state". To me this means we can develop the capacity to respond to uncertainty without uncritically accepting the conditions that cause it.

Somatics in design research and education today

In and outside academia, there are a number of design research projects, courses and workshops that take a somatic or body-centred approach.
One remarkably articulated example is the Somaesthetic Design project that Kristina Höök and her team have been working on at the Royal Institute of Technology (KTH) in Stockholm. Their approach has led to the development of a prototyping and testing method, a teaching curriculum (Tsaknaki et al. 2019) and several interactive design projects, such as Soma Mat, Breathing Light and Sarka (Höök 2018). In spring 2019 I had the opportunity to participate in one of their workshops in Milan. Before and after a session guided by Elisa Ghion, a Contact improvisation teacher, we were asked to record our bodily sensations on specially made "body sheets"; we were then asked to engage in the testing of several interactive

prototypes. The heightened awareness achieved through the initial session allowed us to give a detailed feedback on the quality of interactions, and the shared experience facilitated the exchange of ideas. This way of working also provides a valuable common ground for teamwork, which is key to all design work.

Other cases, just to mention a few examples in Europe, are Riccardo Blumer's courses at the Accademia di Architettura in Mendrisio, Switzerland, where students practice specific body movements to prepare themselves to design objects around them (Seratoni 2017); Lotte van Gelder's teaching in several departments of the Gerrit Rietveld Academie, which includes group movement sessions and individual project work (van Gelder 2016); Emma Hoette's courses at Goldsmiths and other universities; and Amanda Montanari's "From body consciousness to design praxis" at the Design Academy Eindhoven.

An analysis of such cases would call for separate research and discussion; nevertheless, these are signals of a growing interest in the centrality of the body in design research and education that cannot be easily dismissed.

My position and experience

I myself have been practising as a designer since I was in my early 20s, and I began teaching just a few years later. This early start made my approach dogmatic at first: I tended to rely on established rules that could give me "authority" towards clients, colleagues and students. In my thirties I started a regular dance practice (Release technique and later Contact improvisation) and more recently began practicing the Feldenkrais method.
At first, I thought these activities were only addressed at personal well-being, while designing and teaching were something I did with and for others. Over time, though, the information I acquired through somatic experiences ended up influencing my daily life, my professional activities and my teaching. Once I acknowledged this, I started creating open and informal spaces for movement in my teaching and developing research workshops (outside the academic context) to test somatic activities that addressed design-related themes such as perception of space, relation with others, and collaboration in a group. These experiments, carried out in 2018 and 2019 and now collected under the name *es_ design somatics*, have provided me with many useful insights that I can use in my teaching and research thanks to the participation of a supportive group of artists and designers.

Somatic practice can also bring visible changes in teaching attitudes, modifying the quality of interactions with students; in my experience it has caused a move away from typical educational settings and hierarchical roles, a clearer positioning and expression of my views, and a greater openness towards the possible outcomes of the projects I propose.

I must admit I feel slightly awkward discussing somatic subjects in the form of an academic paper; without direct experience many of the statements made here may sound abstract.

However, I decided to take up this challenge anyway, in an effort to add my contribution to the existing attempts at including these issues in academic discussion.

Proposals and conclusion

Since most educational institutions tend not to be open to radical change, especially to the kind of innovation discussed here, I invite whoever is interested, students or educators, to pursue this field of inquiry independently and informally. Several somatic disciplines, after initial training, can be practiced in self-organized research groups or labs, where participants work together experimenting, developing and discussing "materials" around commonly chosen subjects. The presence of students and educators who adopt a somatic culture and practice will inevitably – albeit indirectly – bring change to the institution itself. Therefore, I believe a somatic turn should not be an individual endeavour but a collective one, going beyond personal well-being to aim at making a wider and deeper impact. As Martha Eddy described in writing about "Social Somatics" (Eddy 2017), this process can have substantial social and political implications: its potential is explored, for instance, in the practice of Generative Somatics, an activist organisation using a soma-grounded approach to social change and trauma healing. In their view, "a politicized somatic theory understands the need for deep personal transformation, aligned with liberatory community/collective practices, connected to transformative systemic change. (...) A politicized somatics can act as a fundamental collective practice of building power, deepening presence and capacity, and developing the embodied skills we need to generate large-scale change" (Generative Somatics 2014). A political perspective on somatics is gaining relevance in the face of the growing attention to racism and other forms of systemic oppression: its use in the context of design is worth further research and discussion.

A somatic attitude based on self- and collective care can be applied in everyday life. Simple questions such as "How do I feel today?", "What do I need?", "What happens around me?" and "What does this situation require?" can activate a conscious and sensitive attitude towards any activity to be undertaken during the course of a day. Allowing time for the observation of ourselves, for recognizing the repetitive patterns we often fall into and imagining alternative ones, for connecting to the needs and desires of the people we interact with, are just a few examples of what can be achieved through practice and what can have a positive impact on our learning and doing.

I would like to conclude with the words of Anna Halprin – ground-breaking dancer, choreographer and educator – as quoted in an article on the pioneers of postmodern dance: "Halprin, who early on saw dance as a social corrective and pathway to personal healing, creating community-based work (...) is also attuned to the more minor injustices of modern life. 'That one's a graphic designer,' she said to me of one of the students in her California studio. 'When else does he get a chance to connect to his spirit? He doesn't'" (Guadagnino 2019).

It is now up to us to create space for these possibilities to happen.

Postscript

This paper was written and delivered to the Cumulus platform in February 2020, immediately before the first Covid-19 pandemic outbreak in Europe, and the notification of acceptance came in Autumn, at the beginning of a second wave. As with many other aspects of our lives, our habits and practices in both education and the professional world were disrupted. The international community is still working to figure out better methods for communicating and collaborating in the new conditions, and although these collective efforts have successfully supported professional and educational activities, our daily life experiences have lost breadth and depth, and our perceptual reality has been further limited; most of all, many people have undergone traumatic experiences. The current situation makes a somatic approach even more necessary; when being physically close to each other is not possible, adjustments and new strategies will be required. However, there is still a wide space to be explored, with new motivations adding to the pre-existing ones: through somatics, we can find other ways to achieve presence and closeness, and to preserve intersubjectivity.

Always ordinary, never straightforward: Considering the work of Lorraine Wild

David Cabianca[a]*,
[a]York University, Department of Design, Canada
*cabianca@yorku.ca

Abstract | Designer, educator and writer Lorraine Wild has had a distinguished career that spans nearly 40 years. While she has maintained a prodigious output of design work and writing, her contributions remain critically unexamined. Beginning with Aldo Rossi's *L'architettura della città* (1966) and Robert Venturi's *Complexity and contradiction in architecture* (1966), and later, Venturi, Denise Scott Brown and Steven Izenour's *Learning from Las Vegas* (1972), this essay touches upon the impact these books had on visual culture on a broader scale. Lorraine Wild's affinity and support for the mundane and vernacular or "unschooled" forms of graphic design falls in line with what would become postmodern narratives of the 1980s and 1990s, narratives put in motion by Rossi, Venturi, et al. This essay will consider a number of Wild's designs with respect to how they reflect the conditions of modernity circulating at the time of their respective production.

KEYWORDS | LORRAINE WILD, VERNACULAR, BOOK DESIGN, CRITICAL PRACTICE, MODERNITY

1. Introduction by way of a detour

I wish to start this essay with a detour. The years 1966 and 1972 saw the publication of a number of books which were to have a significant impact on the production of architecture: Aldo Rossi's *L'architettura della città* (1966)[1], Robert Venturi's *Complexity and contradiction in architecture* (1966), which was followed by Venturi, Denise Scott Brown and Steven Izenour's *Learning from Las Vegas* (1972). Among architects, claims about their significance are rather self-evident, but what is not so self-evident is the impact that these three streams of discourse would have on other disciplines.

For a short period in the early 1970s, from 1972 to 1975, Rossi was asked to teach at the Eidgenössische Technische Hochschule (ETH), also known as the Swiss Federal Institute of Technology in Zürich. Prior to Rossi's presence at the school, labour unrest and the protests of 1968 had shaped discourse at the ETH — like many schools of architecture across the globe — with a deference to the social and behavioural sciences. Given this context, Rossi presented an about-face bulwark of resistance to the growing influence of the social sciences. His insistence on architecture's primacy as a form of material and cultural production has been described as nothing less than traumatic for a generation of architects. (Davidovici, 2018; Caruso, 2012)[2] Rossi's emphasis on architecture's autonomy, where form and history were the only things worth thinking about, struck this group like a bolt of lightning. Rossi linked form with the collective memory of a place, which is to say that past architecture and urban forms have a way of "cascading forward," a kind of domino-effect on future architectural production. For Rossi, form was always a reflection of a singular moment structured by an organizing principle: Form is a manifestation of a particular place during a particular time, which was by default linked to the social and political conditions which brought about its existence. Each era manifested form differently based on the particular conditions which resulted in its actualization, but whose cohesiveness is steered by common patterns of social habit and custom. (Aureli, 2012) While Rossi's emphasis was on form per se, it was not devoid of social intent. By grounding architecture in the manner by which form had developed over the course of hundreds of years, Rossi sought to heal the rupture Modernism had generated between form and society.

Post 1968, many architecture schools linked the role of the architect with that of the social activist: form was a secondary — if not residual — concern. The impact of Rossi and Venturi's respective books was to instil a revived interest in history within architectural

[1] While Diane Ghirardo and Joan Ockman's English translation of *The architecture of the city* would not appear until 1982, Rossi's writings were familiar to a number of North American-based architects and architect educators who could read Italian. For an excellent study of the early link between Italian historicism of the 1950s and Venturi's contributions which postmodernism of the 1970s

[2] A few of the luminaries of this generation include Jacques Herzog, Pierre de Meuron, Roger Diener, Christian Sumi, Kaschka Knapkiewicz, Axel Fickert, Miroslav Šik, and Marcel Meili.

discourse, but while Rossi emphasized the traditions of the southern European city, Venturi looked to broader horizons. Venturi's first book, *Complexity and contradiction in architecture*, included examples from the traditional European city as well as the commercial chaos of main street America. But it was Venturi's later book, co-authored with Denise Scott Brown and Steven Izenour, *Learning from Las Vegas*[3], that resonated with Swiss sensibilities. *LLV* brought a more pragmatic or realist sensibility to the discussion. In contrast to Rossi's emphasis on the urban forms of the southern European city, *LLV* recognized the state of the contemporary city as it exists, full of suburban commuter centres, urban sprawl and the car's dominance in urban planning. And while *Complexity and contradiction* recognized the messy reality that informs architectural decision making, *LLV* sought to remind architects of architecture's forgotten tradition of communicating symbolic value.

This Rossi/Venturi influence fostered an interest in the mundane forms that comprise our world. In contrast to the heroic Modern quest for grand statements and self-absorbed spectacle buildings, the Swiss pursued an architecture of simplicity. Today, the works of Herzog & De Meuron, Diener & Diener, Peter Zumthor, and Marcel Meili among many others, are celebrated for their understated nature. From an urban design perspective, many of their built works follow Rossi's sense of design decorum, his respect for the city and the forms that enhance activity on the street; and similarly, many of their works can be described as examples of Venturi's simple "decorated shed": spatially banal "boxes" that direct architectural pleasure to an articulation of the building's surface treatment. The forms of these architects are *common*, which is to say that they might otherwise be indistinguishable from the commercial construction that makes up the majority of the urban fabric. While some may see their emphasis on mundanity a limitation, it recalls American poet William Carlos Williams' claim that it is through contact with local conditions that gives rise to truth. It is a position that opposes the heroic modernist stance that from Williams' perspective, represented a long distant world. An appreciation for the mundane brought one closer to the truth of life which included the subtle, nuanced world of "things seen."

2. Post detour: The ordinary in graphic design

A fascination with the charms of common or vernacular form has always existed in graphic design, so it should come as no surprise that a book that presented a meaningful context for the mundane reality of commercial design practice should be of interest, especially a book such as *LLV* which deals with the manner by which form visually communicates[4]. But overall,

[3] Hereafter referred to as *LLV*.

[4] It must be noted that in the late 1980s through the 1990s, while graphic design underwent a significant technological transformation, it was (and continues to be) resistant to self-reflective critical discourse. The introduction of the personal computer (Apple introduced its first computer in 1984) and PostScript printing language (Adobe introduced PostScript in

graphic design was slow to formally embrace the ideas found in *LLV*[5]. In the 1990s, "vernacular" was equated with "unskilled" rather than "ordinary." The work of luminaries David Carson and Ed Fella was considered avant-garde design because it ignored accepted conventions. It seems a cliché to call it that now, but it was groundbreaking at the time because entrenched rules of propriety set limits on what was acceptable and the above designers, among others including Art Chantry, Elliott Earls, Jeff Keedy, and Carlos Segura, purposely flaunted the limits of acceptability — so much so that their work was deemed "ugly" in the infamous essay, "The cult of the ugly" by Steven Heller (1993) (Figure 1). But times change.

Figure 1. Design work included in Steven Heller's essay "The cult of the ugly," 1993. [left to right] Ed Fella, Menno Landstra (with type by Jeff Keedy), Art Chantry and Carlos Segura (also using type by Keedy).([left to right] Fella, E. (designer), (1988). Interior spread from Creative Vision, Chicago design conference [Promotion booklet]. Retrieved from https://www.printmag.com/post/how-conference-brochure-by-carlos-segura/)

While current graphic design tastes do not reach the same levels of visual excess produced in the 1990s era of "grunge," the fact remains that today's work draws from some of the same sensibilities, including irregular word spacing, malformed typefaces, gaudy colour choices, and awkward text placements (Figure 2). Graphic designers are fascinated by the

1986), granted graphic designers unprecedented visual freedom. Typesetting was no longer constrained to a right-angled grid, and typeface design was no longer solely the domain of "experts."

[5] Also noted by Katherine McCoy in (1990) The evolution of American typography: American graphic design expression. *Design Quarterly*, (148), 13–14.

vernacular because it is without pretence (Caruso, 2008). Unlike graphic design that is a product of a formalized education, the vernacular exists outside the self-conscious parameters defined by institutionalized learning. It is about presence rather than appearance.

Figure 2. A selection of recent book cover designs that self-consciously make use of "vernacular" design features: irregular word spacing, handwritten typography, lowbrow typefaces, random word breaks, word breaks without hyphens, or the lack of a grid. 3. The Persistence of Lorraine Wild

It is here that I wish to draw attention to the work of a designer who has always had an interest in the vernacular, as poet William Carlos Williams describes, "the essential contact between words and the locality that breeds them." (1920, p. 10). Lorraine Wild has always sought out complexity in her work, often purposely juxtaposing conflicting ideas of propriety against orthodox Modernist sensibilities. *Perspecta* 19, the Yale School of Architecture student journal (Figure 3), is an early example of Wild's interest in "the richness and ambiguity of modern experience, … elements which are hybrid rather than 'pure,' compromising rather than 'clean.'" (Venturi, 1966, p. 22) Wild's design drew the ire of her faculty at the time, most notably the strident Modernist Paul Rand.

Wild's design was ground breaking. Contrary to Modernist "rules of clarity," Wild used a single typeface to typeset the journal: The body text was set in Bodoni roman, but the various levels of hierarchy (pull quotes, subheads and footnotes) make use of Bodoni bold and bold small capitals. The darker colour applied to such secondary information goes

against the grain of convention, but in no way impedes legibility. Perhaps most revolutionary for the time, Wild's use of Scotch rules reintroduces a historical motif newspapers used to divide sections of information and aid navigation. The design was "impure" because it mixed both modern and historic design vocabularies, or more accurately, design tropes. To Wild, design can be viewed as a repository of figurative allusions. Hers is an engaged approach to design because it places the designer at the center of the visual communication process. The designer acts as both the conductor (in the sense that one orchestrates visual content through a conscious will) and conduit (in the sense that the designer provides the means for visual expression) through which form is generated.

Figure 3. Wild's design for Yale Perspecta, no. 19. (Wild, L. (designer), (1982). Cover and interior spread of B. Healy, & N. McBride (Eds.), Perspecta: The Yale Architectural Journal, (19).)

Wild's interest in the immediacies of context and the ambiguities that are otherwise passed over can be traced to a formative experience she had while still in high school:

> "I think it's really funny that I spent the last three months of my high school education working on a paper about Michael Heizer — he had been invited to do a piece at the Detroit Institute of the Arts, and he ended up tearing up the museum grounds by dragging a giant piece of stone across the lawn. This caused a major fuss in Detroit (and got the curator, Sam Wagstaff, fired) but the whole incident inspired me: *how could such a simple act carry so much meaning and elicit such an intense exchange of ideas?"* (Wild, 2018) [6]

Her question underscores the inherent complexity (and contradiction) of unified narratives. Even at this young age, Wild understood that moments of conflict are symptomatic of a bigger issue. These moments of acceptability or repression, reflect the limits of a discourse,

[6] Emphasis in italics is mine.

or as has often been the case in Wild's writing, they reflect the discipline bearing down on what it is willing to accept.

Wild has always maintained theoretical underpinnings, either explicitly through her writing, or through more diffuse forms in her design work. Her writing has ranged from optimistic, "I'm interested in how designers strategize for the future." (Wild, 1998, p. 15) to the less sanguine, "[S]uddenly, the 'graphic' in graphic design seems constrained or parochial." (Wild, 1996, p. 21) But all times, she has looked to the affairs of culture and society, imagining a place where graphic design most vividly communicates the tone of the present. The presence of theory may not be explicit, but her past work — whether writing or design, on through to her current output — reflects an awareness of contemporary directions in design. It is an awareness of shifting societal interests displayed in many of her essays, which often begin with a narrative that describes some mundane or seemingly innocuous personal experience that slowly builds to a unveil a significant conflict currently percolating in graphic design. Wild's approach to writing falls in line with one of her idols, the multifaceted designer Alvin Lustig who asserted that "My relationship to all subjects is unfortunately always personal, so I will start out in that fashion." (Lustig, 1958, p. 12) Lustig first penned those words in 1952, at a time when the cool detachment of Modernism was just beginning to make an impact on visual culture. Lustig's apology runs counter to the universal flattening that Modernism was to level against personal experience.

Wild uses personal experience as merely a symptom of a greater problem that she will soon unpack through reflection and analysis. It is a method to approach design in an oblique manner, not through dogmatic declarative statements or dry academic analysis, but rather though local idiom. Her *contact* (with language – to borrow yet again from William Carlos Williams) is through lived experience, not the language of the ivory tower, and this makes sense given Wild's own explanation of writers whom she admires:
